USING LORCASERIN FOR WEIGHT MANAGEMENT PRIOR TO BARIATRIC SURGERY: MODELING THE COST IMPLICATIONS FOR CALIFORNIA STATE MEDICAID

Knoth RL, Nikonova E, Wang Z
Eisai Inc., Woodcliff Lake, NJ, USA

OBJECTIVES: Many commercial health care plans and state Medicaid programs commonly provide coverage for bariatric surgery for patients with BMI ≥40 or BMI 35–39.9 with ≥1 obesity-related comorbidity. Coverage for anti-obesity medications, on the other hand, is less common, though some patients may benefit from anti-obesity medications and avoid bariatric surgery. This study modeled the pharmacy and medical cost implications of treating patients with lorcaserin, an FDA-approved anti-obesity medication, prior to bariatric surgery, in the California Medicaid (MediCal) population. **METHODS:** The model assumed that severely obese patients (BMI ≥40) whose weight was reduced to <35 following lorcaserin treatment would avoid bariatric surgery. Model inputs included the size of the adult (age 21-64) MediCal population (6.67 million), national rate of bariatric surgery (.001%), and average cost of bariatric surgery in California ($21K). Lorcaserin treatment and outcome variables were based on results from three Phase III clinical trials (BLOSSOM, BLOOM, BLOOM-DM) evaluating the efficacy and safety of lorcaserin for weight loss. Medication specific inputs included proportion of patients responding to lorcaserin treatment (achieving ≥5% weight loss from baseline at week 12), expected weight loss, and medication acquisition costs ($145/month). The model generated cost estimates over a 2-year timeline from the payer perspective. **RESULTS:** The number of patients predicted to undergo bariatric surgery was 6,140. Of these, 2,609 (42.5%) would respond to lorcaserin treatment with 459 (17.6%) obtaining a BMI<35 at one year. Medication costs for those using lorcaserin totaled $6.23 million. Bariatric surgery costs totaled $119.29 million. Predicted cost savings for patients who would avoid bariatric surgery were estimated at $2.82 million. **CONCLUSIONS:** For MediCal, using lorcaserin to treat obesity prior to bariatric surgery may lead to significant cost saving over a 2-year horizon. Real-world, long-term evidence is needed, however, to further evaluate of the role of lorcaserin for weight management in patients considering bariatric surgery.

MO2

DEVELOPMENT AND VALIDATION OF AN ALGORITHM FOR IDENTIFYING PATIENTS WITH HEMOPHILIA A IN AN ADMINISTRATIVE CLAIMS DATABASE

Lyons J[1], Desai VC[1], Jemison J[1], Xu Y[2], Ridgeway G[3], Finkle W[3], Solari PG[2], Sullivan SD[4], Lanes S[1]
[1]*HealthCore, Wilmington, DE, USA,* [2]*Genentech Inc., South San Francisco, CA, USA,* [3]*Consolidated Research, Inc., Los Angeles, CA, USA,* [4]*University of Washington, Seattle, WA, USA*

OBJECTIVES: Develop and validate an algorithm to identify patients with hemophilia A in an administrative claims database. **METHODS:** We first created a screening algorithm using diagnosis and treatment codes to identify potential hemophilia A patients from administrative claims data in the US HealthCore Integrated Research Database between 01/01/06 and 04/30/15. Medical records for a randomly selected subset of patients were reviewed to confirm case status. In this validation sample, we used lasso logistic regression with cross-validation to develop a predictive model using covariates in claims data to estimate the probability of being a confirmed hemophilia A case. **RESULTS:** Using the screening algorithm, we identified an initial cohort of 2,252 patients with potential hemophilia A. Of 400 medical records reviewed, 248 (62%) patients were classified as hemophilia A cases, 131 (33%) were false positives, and 21 (5%) were of indeterminate status. The lasso regression model evaluated 36 potential covariates and identified several strong predictors of hemophilia A that were not included in the screening algorithm, including: ≥1 inpatient, outpatient or emergency room visit for hemophilia A; diagnosis after clotting factor level tests; diagnosis made by a hematologist and ≥1 hemophilia A diagnosis over 3 months. A probability threshold of ≥0.6 resulted in a PPV of 94.7% (95%CI: 92.0-97.5), sensitivity of 94.4% (95%CI: 91.5-97.2), and specificity of 90.1% (95%CI: 85.0-95.2) in the validation sample. We applied this model to the initial cohort to identify a refined cohort of 1,507 patients. The refined cohort was more likely to be male, be under the care of a hematologist, and have fewer comorbidities. **CONCLUSIONS:** We developed and validated an algorithm to identify hemophilia A cases in an administrative claims database with high PPV, sensitivity and specificity. This algorithm uses widely available variables that can be applied in other claims databases.

MO3

MODELLING ALZHEIMER'S DISEASE PROGRESSION USING A MULTIVARIATE MODEL FOR THE ASSOCIATED OUTCOMES OF COGNITION, BEHAVIOR AND FUNCTIONING: DATA FROM THE ICTUS STUDY

Saunders O[1], Asseburg C[2], O'Reilly K[3], Sly IE[1], Lee D[1]
[1]*BresMed, Sheffield, UK,* [2]*The Swedish Institute for Health Economics (IHE), Lund, Sweden,* [3]*Otsuka Pharmaceutical Europe Ltd, Wexham, UK*

OBJECTIVES: The ICTUS study provides longitudinal data on markers of Alzheimer's disease (AD); ADAS-cog, NPI, ADL and IADL questionnaires measuring cognitive, behavioural and functional decline, respectively. Available literature indicates that it is important that models predicting AD progression account for the joint evolution of decline. The objective of this project was to develop a model to understand AD progression using ICTUS study data. **METHODS:** AD progression was studied in the subset of European ICTUS patients (n=982/N=1375) treated with AChE inhibitors with biannual follow-up over 2 years. A multivariate linear growth model was fitted including fixed and random covariates for years since baseline for each marker, allowing the rate of change for each marker to vary for each patient. The multivariate model structure allowed quantification of the correlation between the rate of decline across markers. The model also included baseline and time-dependent covariates, including baseline age, MMSE and concurrent treatment. Exploratory modelling revealed implausible covariate estimates and unsatisfactory residual diagnostics for NPI. NPI was therefore removed as an outcome and included as a baseline covariate. **RESULTS:** The model showed a strong multivariate relationship between the rate of change in cognition and functioning. There was a strong positive correlation in the in the rate of decline of ADL and IADL (rho=0.65) and a strong negative correlation between the rate of decline of ADAS-cog and ADL and ADAS-cog and IADL (rho=-0.70 and -0.55, respectively). ADAS-cog showed an annual increase of 4.55 [95%: 4.15,4.94; p<0.001], ADL a decrease of -0.49 [-0.54,-0.44; p<0.001] and IADL a decrease of -0.87 [-0.95,-0.79; p<0.001]. **CONCLUSIONS:** This study demonstrates the strength of correlation between cognition and function; providing an example of how to account for this within predictions. Whilst behaviour is also considered a conceptually important marker for AD progression; within this study it was not feasible to model all four markers simultaneously.

MO4

PREDICTORS OF DISEASE MODIFYING THERAPY INITIATION IN PATIENTS WITH MULTIPLE SCLEROSIS USING ELECTRONIC HEALTH RECORDS DATA – A MACHINE LEARNING PERSPECTIVE

Icten Z[1], Hitchcock C[1], Davis S[2], Ciofani D[2], Sanky M[2], Hadzi T[1], Khalil I[1], Alas V[1]
[1]*GNS Healthcare, Cambridge, MA, USA,* [2]*Optum-Humedica, Boston, MA, USA*

OBJECTIVES: To identify predictors of disease modifying therapy (DMT) initiation among treatment-naïve multiple sclerosis (MS) patients using machine learning and structured data from a large, geographically diverse electronic health records (EHR) database. **METHODS:** Optum-Humedica de-identified EHR dataset was used to select MS patients, ≥18 years with no prior DMT experience, from integrated delivery networks (1/1/2007-12/31/2013). First observed MS diagnosis was the index date, and patients had evidence of continuous clinical activity 12-months pre- and post-index. We used a proprietary machine learning platform, Reverse Engineering and Forward Simulation (REFS™), to build an ensemble of models to examine the association of patients' baseline characteristics and DMT initiation post-index. The area under the curve (AUC) statistic assessed accuracy of prediction models, and we validated prediction models in an independent dataset. **RESULTS:** Sample selection yielded 12,516 MS patients (DMT initiation=25%; mean age=49.9 years; females=76%). Predictors identified in every model of the REFS™ ensemble included year of MS diagnosis, geographic location of the patient, and prescriptions for oil-soluble vitamins. Patients diagnosed in 2012 (versus earlier years) had the largest median odds ratio (OR) in the ensemble for DMT initiation (OR, interquartile range [IQR]: 3.10, 3.09-3.12) followed by patients living in the Northeast and West (respectively, 2.59, 2.57-2.60; 2.55, 2.50-2.58). Additional predictors of DMT initiation with selection frequency >90% included eye disorders (1.44, 1.43-1.45), stimulants (1.72, 1.69-1.73), and income (1.73, 1.70, 1.74). When validated in an independent dataset AUC was 0.71. **CONCLUSIONS:** Using REFS™ to analyze structured EHR data, we identified demographic and clinical predictors of DMT initiation with moderate to strong predictive accuracy. Further analyses should be completed using additional

granular data from unstructured fields in this data source and machine learning to refine the accuracy of our models and the predictors of DMT initiation in the MS population.

PRICING AND REIMBURSEMENT STUDIES

PR1

ONCOLOGY DRUG FUNDING IN CANADIAN PROVINCES: DOES A HIGHER ICER DELAY LISTING?

Syed IA, Huang H, Laliman VA, Hancock-Howard R
Amaris, Toronto, ON, Canada

OBJECTIVES: The Canadian Agency for Drugs and Technologies in Health (CADTH) pan-Canadian Oncology Drug Review (pCODR) provides recommendations for oncology drug's funding to Canadian provinces (except Quebec) and territories, based on clinical, cost-effectiveness, and patient input. Funding decision-making by provinces following a pCODR recommendation is not well understood. Our objective was to investigate the relationship between incremental cost-effectiveness ratio (ICER) and the time-to-listing for each Canadian province. **METHODS:** Data were extracted from the CADTH "Find a Review" database. We identified oncology drug submissions that received either a "recommend" or "recommend with (any) conditions" decision between the creation of the database (2011) and October 20, 2016. The provincial funding summary and the economic guidance document provided dates of provincial funding and the ICER, respectively. The analysis used the highest ICER proposed by the Economic Guidance Panel. We investigated the relationship between provincial time-to-list (derived from dates of recommendation and provincial listing) and the ICER through box-cox transformation and generalized linear models in SAS. **RESULTS:** A total of 57 (of 72) submissions had "recommended" or "recommended with (any) conditions" decision. Of these 57 positive decisions, 52 reported a non-dominant positive ICER, and 39 had sufficient information to derive the time-to-list in at least one province. Ontario, British Columbia, Alberta, Manitoba, Saskatchewan and Newfoundland had positive non-linear and Prince Edward Island had a positive linear (Additional 274 days [95%CI:74-474;p-value=0.012] per 100,000CAD increase in ICER) relationships between time-to-list and ICER – higher ICER leads to longer time-to-list. However, there was insufficient power to determine the strength of the ICER-time relationship. **CONCLUSIONS:** Positive pCODR recommendations are not considered similarly by provinces, and higher ICERs may lead to longer provincial funding decision-making periods. Not considering other factors (e.g., budget impact, burden of disease, patient input) in decision-making and data scarcity were limitations of this analysis.

PR2

ASSESSMENT OF TECHNOLOGY APPRAISALS OF CHRONIC PAIN DRUGS IN FIVE SELECTED EUROPEAN COUNTRIES

Aluko PO[1], Aawar N[2], Sermon J[3]
[1]*Newcastle University, Newcastle upon Tyne, UK,* [2]*Cardiff University, Cardiff, UK,* [3]*Janssen-Cilag NV, Beerse, Belgium*

OBJECTIVES: Few studies have focused on Health Technology Assessment (HTA) and reimbursement of chronic pain drugs. With a number of products in pipeline for chronic pain, difficulty in characterization and treatments, coupled with the dynamic market access landscape mean more research is necessary to understand the HTA requirements for chronic pain drugs. **METHODS:** A review was carried out in the five selected EU countries (Germany, England, France, Italy and Spain) on HTA guidelines, technology appraisals of selected chronic pain drugs together with criteria and policies for pricing and reimbursement. Selected drugs were based on countries' approved treatment pathway with focus on osteoarthritis and chronic low back pain. **RESULTS:** Despite the similarities among countries' HTA requirements, variations were observed, such as definition of standard of care as comparators. Italy and Spain comparators are limited to pharmaceutical treatments while other countries include non-pharmaceutical treatments thereby affecting HTA outcomes. Findings also showed that HTA and reimbursement requirements underestimate the clinical and economic value of chronic pain drugs. The subjectivity and complexity of chronic pain makes it difficult to demonstrate clinically relevant differences in outcomes which is not considered in the HTA of a chronic pain drug and in number of cases, the limited impact on clinical outcomes is nullified by side effects resulting in unfavourable judgments. Surprisingly, no technology appraisal was carried out in Germany on the selected drugs while the last full appraisal carried out in England was from 2000. Nevertheless, France's assessment revealed that chronic pain drug assessments have changed over the years with more attention being focused on the risk benefit ratio of the treatment. **CONCLUSIONS:** Complexity and subjectivity of chronic pain may hinder proof of superiority and innovativeness of a new treatment, hence, special consideration is required in term of outcome measures considered for the HTA requirements.

PR3

THE PRICING TRENDS OF ORAL PHARMACEUTICAL PRODUCTS ASSOCIATED WITH LOSS OF EXCLUSIVITY

Bartolome L[1], Varga S[2], Ko JJ[3]
[1]*University of Florida, Orlando, FL, USA,* [2]*Thomas Jefferson University, Philadelphia, PA, USA,* [3]*Novartis Pharmaceuticals, East Hanover, NJ, USA*

OBJECTIVES: Loss of exclusivity (LOE) of pharmaceuticals allow generic market penetration increasing patient access and decreasing the price of medications. The objective of this study is to evaluate the trend and magnitude of price change for oral medications that lost their exclusivity during the years of 2013/2014. **METHODS:** The list of medications that reached LOE in 2013/2014 was gathered from gray literature. Data on generic entry dates, manufacturers, and pricing history were collected from the FDA and AnalySource. The cost of medications was evaluated using WAC pricing after standardizing for dosage form, strength, package size and formulation. The analysis timeframe was from 2011-2016, capturing price changes before and after LOE. The analysis was limited to oral pharmaceutical products with eight or more generic companies currently on the market. **RESULTS:** The medications included in the analysis were rabeprazole and duloxetine (LOE in 2013), and celecoxib and eszopiclone (LOE in 2014). The number of generic manufacturers present on the market are 8, 16, 10 and 11 for rabeprazole, duloxetine, celecoxib and eszopiclone, respectively. After the first year of LOE, the prices of generic rabeprazole and eszopiclone decreased by 84-93% of their branded price while the price of generic duloxetine and celecoxib decreased by 75-80% of their branded price within 2-3 years of reaching LOE. **CONCLUSIONS:** As the number of generics entering the market increases, the price difference between the brand and generic increases. This case analysis might suggest that branded products with a higher number of generic companies entering the market lead to a steep drop in pricing. Although there are many complexities that contribute to product pricing trends, it is important for payers to consider the product lifecycle and LOE time as formulary decisions are made. Future research should focus on effects of the size of molecules (small vs. large) on the LOE price change.

PR4

HOW DOES ACCESS AND REIMBURSEMENT INFLUENCE PHYSICIANS' PRESCRIBING OF TYPE 2 DIABETES THERAPIES IN THE SECOND-LINE SETTING?

Koris CM[1], O'Connor E[2], Moore R[3], Lewis C[3]
[1]*Decision Resources Group, Burlington, MA, USA,* [2]*Decision Resources Group, London, UK,* [3]*Decision Resources Group, Nashville, TN, USA*

OBJECTIVES: In patients with type 2 diabetes (T2D), metformin is the standard first-line therapy. Unfortunately, many patients are unable to control their HbA1c on metformin alone, and progress to a second-line therapy. Physicians' drug selection in the second-line is typically based on patient characteristics and comorbidities. However, market access and reimbursement restrictions may limit patient access to a physician's preferred therapy, particularly for premium-priced branded therapies. By comparing physicians' actual prescribing practices with their expressed preferences, this research investigates how influential market access restrictions and pricing can be on actual clinical practice. **METHODS:** 145 U.S.-based endocrinologists and primary care physicians (PCPs) were surveyed electronically between May 2 – 9, 2016 about their actual versus preferred prescribing practices for different drug therapies in various T2D subpopulations. 29 managed care organization pharmacy and medical directors were also surveyed during this time. **RESULTS:** In the absence of payer controls, 58% of surveyed endocrinologists prefer a GLP-1 receptor agonist in their T2D patients with obesity. However, actual patient share for this class is only 18%, despite 60% of their patients being obese. Among T2D patients with renal insufficiency, 21% of endocrinologists selected the DPP-IV inhibitor linagliptin as their preferred agent – surveyed patient share is 6%. In T2D patients with heart failure, 50% of endocrinologists expressed a preference for SGLT-2 inhibitors, yet only 16% of patients receive this class in the second-line. Surveyed PCPs (12.3%) are more likely than endocrinologists (9.7%) to select access and reimbursement issues as the most influential factor on prescribing. Surveyed payers indicate that prior authorization is the primary cost-containment strategy utilized for premium-priced T2D agents. **CONCLUSIONS:** According to primary research with U.S. physicians and payers, market access and reimbursement factors significantly influence physician prescribing practices among T2D patients. Improved payer coverage and reimbursement of T2D therapies will impact prescribing and increase market uptake.

BREAKOUT SESSION 2

INFECTIOUS AND RESPIRATORY DISEASE STUDIES

IN1

RESOURCE UTILIZATION AND COSTS OF HIGH VELOCITY NASAL INSUFFLATION COMPARED TO NON-INVASIVE POSITIVE PRESSURE VENTILATION FOR RESPIRATORY FAILURE

Pietzsch JB[1], Geisler BP[1], Whittle J[2], Kearney J[3], Ashe T[4], Garner AM[1], Bublewicz M[5], Doshi P[6]
[1]*Wing Tech Inc., Irvine, CA, USA,* [2]*University of Tennessee, Chattanooga College of Medicine, Chattanooga, TN, USA,* [3]*McLeod Regional Medical Center, Florence, SC, USA,* [4]*Athens Regional Medical Center, Athens, GA, USA,* [5]*Memorial Hermann The Woodlands Hospital, The Woodlands, TX, USA,* [6]*University of Texas, Houston, TX, USA*

OBJECTIVES: High velocity nasal insufflation (HVNI), a form of high flow nasal cannula, can provide respiratory support to many patients with respiratory failure more comfortably than non-invasive positive pressure ventilation (NIPPV). Our objective was to assess clinical resource utilization and cost impact to payers and providers associated with the use of HVNI versus NIPPV in the treatment of acute-care patients presenting to the emergency department with acute respiratory failure. **METHODS:** Treatment-specific resource utilization data were collected in a randomized multi-center trial of 204 patients conducted in the United States. Patient-level reimbursement data were calculated based on Medicare fee schedules. Hospital-specific resource costs were collected from participating sites and published literature. For both strategies, unit-specific length of stay, intubation rates and duration were analyzed. Cost differences were evaluated from the Medicare payer and hospital perspectives. Differences in non-normally distributed data were assessed with the Wilcoxon ranksum (Mann Whitney U) test. **RESULTS:** HVNI was found to be associated with the same total length of stay (6.75 vs. 6.01 days, p=0.51) and the same utilization of cost-intensive ICU care (1.50 vs. 1.85 days, p=0.56), a trend towards reduced intubation rates (5.7% vs. 13.0%, 0.095), and a potentially clinically important, but not statistically

significant, reduction in ventilation hours for intubated patient (82.3 vs. 127.3 hrs., p=0.69). Resulting mean costs to payers ($10,633 vs. $11,848, p=0.41) and hospitals ($12,122 vs. $12,655) were similar. **CONCLUSIONS:** Our analysis suggests that HVNI, at outcomes clinically comparable to NIPPV, is associated with no additional cost or resource utilization. Potential decreased need for intubation and ventilation, with attendant known sequelae, need to be further evaluated and confirmed in future studies.

IN2

ACUTE INFECTION FOLLOWING TRANSFUSION AMONG ELDERLY MEDICARE BENEFICIARIES IN THE UNITED STATES, AS RECORDED BY LARGE ADMINISTRATIVE DATABASES DURING 2012-2015

Menis M[1], Forshee RA[1], Izurieta HS[1], Kessler Z[2], McKean S[2], Warnock R[2], Verma S[2], Kim B[2], Worrall CM[3], Kelman JA[3], Anderson SA[1]
[1]FDA, CBER, Silver Spring, MD, USA, [2]Acumen LLC, Burlingame, CA, USA, [3]CMS, Baltimore, MD, USA

OBJECTIVES: Acute infections following transfusion (AIFT) are serious transfusion-related complications which can result in fever, chills, sepsis, septic shock, and death. The study objective was to assess AIFT occurrence and potential risk factors among inpatient elderly Medicare beneficiaries, ages 65 and older, during 2012-2015. **METHODS:** This retrospective claims-based study utilized large Medicare databases for calendar years 2012-2015. Blood transfusions were identified by ICD-9-CM procedure and revenue center codes, whereas AIFT was ascertained via diagnosis code. Our study evaluated AIFT rates (per 100,000 inpatient transfusion stays) among elderly, overall and by calendar year, age, sex, race, blood components and number of units transfused. Fisher's exact tests were performed to compare AIFT rates, and Cochran-Armitage tests were used to ascertain AIFT occurrence trends by calendar year, age, and transfusion volume. **RESULTS:** Among 7,899,680 inpatient transfusion stays for elderly beneficiaries during 2012-2015, 188 had an AIFT diagnosis recorded, an overall rate of 2.4 per 100,000 stays. AIFT rates by number of units transfused were: 1.6 for 1 unit, 2.1 for 2-4 units, 3.4 for 5-9 units, and 5.0 for >9 units ($p<0.001$). AIFT rates by blood component groups were: 2.0 for RBCs only, 1.1 for plasma only, 8.7 for platelets only, 3.1 for RBCs and plasma, 13.6 for RBCs and platelets, and 3.2 for RBCs, plasma and platelets. AIFT rates for age categories 65-69, 70-74, 75-79, 80-84, 85 and over were 2.8, 2.7, 2.5, 2.4, and 1.6, respectively ($p=0.0173$). Females and males had AIFT rates of 1.8 and 3.1, respectively ($p<0.001$). **CONCLUSIONS:** Our large population-based study shows significantly elevated AIFT risk with greater number of units transfused and suggests higher AIFT rates for platelet transfusions. The study also suggests potential effects of advancing age and gender on AIFT occurrence, which need further investigations. Study limitations include possible underrecording or misrecording of transfusion procedures, units, and diagnosis codes.

IN3

ANALYSIS OF MOBILE HEALTH APPLICATIONS FOR CHRONIC OBSTRUCTIVE PULMONARY DISEASE MANAGEMENT USING THE MOBILE APPLICATION RATING SCALE AND GOLD GUIDELINE RECOMMENDATIONS

Choi ME[1], Electricwala B[2], Hur P[1], Xiang P[3]
[1]University of Maryland, Baltimore, MD, USA, [2]Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA, [3]Baylor Scott & White Health, Temple, TX, USA

OBJECTIVES: To identify and assess the quality and functionality of mobile health applications in the patient management of Chronic Obstructive Pulmonary Disease (COPD). **METHODS:** The following search terms were used to identify mobile applications in the Android "Google Play" and Apple "App Store": "COPD", "emphysema", "bronchitis", "chronic airway obstruction", and "Chronic Obstructive Pulmonary Disease". We included applications in English, free to use, patient-focused, and pertaining to the management of COPD. We excluded applications that were specific to a drug, required additional devices (e.g., portable spirometer), and were games not related to disease management. Applications were assessed independently by at least two reviewers using the Mobile Application Rating Scale (MARS) and Global Initiative for Chronic Obstructive Lung Disease (GOLD) guideline recommendations for management of COPD. **RESULTS:** Of the applications identified, 24 met inclusion criteria. Fewer than half (46%) of the applications had acceptable MARS scores (> 3.0) with mean MARS score of 2.3. COPD Navigator and CareTRx Asthma & COPD Journal applications had the highest overall MARS mean scores (3.8 and 4.1, respectively). The MARS category with the highest mean score across all applications studied was Functionality (3.3) and the lowest scoring category was Engagement (2.8). Of the applicable 11 GOLD guideline recommendations, the median number offered by applications was three. COPD education was offered most frequently (54% of applications). The least offered function was emotional support (17% of applications). The application with greatest consistency with GOLD guidelines recommendations was COPD Navigator, which met 10 recommendations. **CONCLUSIONS:** Among the health applications available through mobile platforms for patient management of COPD, less than half had acceptable MARS scores and the number of COPD Guideline recommendations addressed in applications was often low. There is a need for further development of mobile applications geared toward patient management of COPD, specifically in Engagement and emotional support.

COMPLETENESS OF IMMUNIZATION INFORMATION SYSTEM VACCINE INFORMATION: A SYSTEMATIC REVIEW

Hastings TJ, Hansen RA, Garza KB, Qian J, Westrick SC
Auburn University Harrison School of Pharmacy, Auburn, AL, USA

OBJECTIVES: Immunization information systems (IIS) consolidate immunization information from participating providers within defined geographic areas. State laws regarding IIS reporting requirements vary, and impact on the completeness of IIS vaccination information is unclear. The objectives of this systematic review were to 1) compare completeness of IIS data to medical records, 2) compare completeness of IIS data to personal records, and 3) explore characteristics of IIS policy that may influence completeness. **METHODS:** Databases searched included Medline, PsychINFO, and CINAHL. Search terms used were ((immunization registry) OR (immunization information system)) AND ((accuracy) OR (complete) OR (quality)) AND ((medical record) OR (EMR) OR (personal record) OR (self report)). Grey literature and reference lists were hand-searched, extracting articles previously unidentified. Studies of registries outside the U.S. or not including a comparison data source were excluded. Studies selected included those measuring completeness through percentage of individuals up to date or receiving a particular vaccine. **RESULTS:** 255 title/abstracts were identified after removal of duplicates. 185 were determined to not be relevant and excluded. 70 full-text articles were assessed, resulting in a total of ten articles included for qualitative synthesis. The findings show that IIS data was more complete in 4 of 9 comparisons to medical records and in 3 of 6 comparisons to personal records. However, the difference was less than 10% for the majority of studies in which IIS was less complete. Among studies conducted in states with mandatory reporting, one of three found IIS data to be more complete than medical and personal records. This was also the only study taking place in a state requiring explicit consent. **CONCLUSIONS:** More research is needed to assess the completeness of IIS data compared to other sources of immunization information. Factors other than legislation may play a role in IIS data completeness and need to be considered.

MEDICARE STUDIES

ME1

TREATMENT PATTERNS AND PREDICTORS FOR OVERALL SURVIVAL IN PATIENTS WITH METASTATIC MERKEL CELL CARCINOMA IN THE UNITED STATES

Steuten L[1], Fedorenko CR[1], Sun Q[1], Garmo V[2], Phatak H[2], Sullivan SD[3], Nghiem P[3], Ramsey SD[1]
[1]Fred Hutchinson Cancer Research Center, Seattle, WA, USA, [2]EMD Serono, Inc., Rockland, MA, USA, [3]University of Washington, Seattle, WA, USA

OBJECTIVES: This study analyzed real-world first-line treatment patterns and predictors of 1-year and 5-year overall survival (OS) among Medicare enrollees diagnosed with metastatic Merkel cell carcinoma (mMCC), a rare neuroendocrine carcinoma of the skin. **METHODS:** We analyzed Surveillance, Epidemiology and End Results (SEER)-Medicare data of patients aged ≥65 years diagnosed with stage IV MCC from 2006-11. Patients were required to have non-HMO Medicare eligibility for ≥12 months before and ≥4 months after diagnosis. Treatment received within 4 months after diagnosis was considered first-line treatment. One-year and 5-year cumulative OS were analyzed using Kaplan-Meier estimators. Predictors for 1-year and 5-year OS were analyzed using Cox regression with months of survival as a dependent variable and age at diagnosis, Charlson comorbidity score, type of first line treatment received, race, gender, and median zip-level income estimate as predictors. **RESULTS:** We identified 94 patients diagnosed with mMCC. At diagnosis, mean age was 81 years (SD=7.8), 72% (N=68) were male. Mean length of follow-up was 14.2 months (SD=11.3 months). The cumulative proportion of mMCC patients surviving was 56% at 1-year and 16% at 5-years. Eighty-three percent (N=78) of patients received first-line treatment, including surgery in 38% (N=36), radiation therapy in 39% (N=37), and chemotherapy in 46% (N=43). There were no significant differences in 1-year survival by age, sex, comorbidity, race, income, or type of treatment received at follow-up. Age ≥70 years (p=.018) and comorbidity score ≥1 (p=.013) were negative predictors of 5-year OS. Type of initial treatment did not predict OS at 5 years. **CONCLUSIONS:** Survival for mMCC patients is generally poor, and is adversely impacted by older age and higher comorbidity at time of diagnosis. Type of treatment received at diagnosis does not appear to impact survival, although unmeasured factors influencing selection of treatment may impact our findings.

ME2

IMPACT OF PATIENT COMORBIDITIES ON INFECTION WITHIN 90 DAYS OF PRIMARY AND REVISION JOINT REPLACEMENT

Chitnis A[1], Lerner J[2], Holy CE[1]
[1]Johnson & Johnson, New Brunswick, NJ, USA, [2]DePuy Synthes, Inc., Raynham, MA, USA

OBJECTIVES: Primary and revision total hip and total knee arthroplasties (THA and TKA, respectively) are increasing in frequency due in part to the aging population. The impact of preoperative comorbidities and patient presentation on post-operative complications is not well understood. **METHODS:** Using MarketScan Commercial and Medicare databases (2009-2015), patients were identified by the following diagnosis (International Classification of Diseases, 9th edition (ICD-9)) or Current Procedural Terminology (CPT) codes within inpatient or outpatient settings: primary THA (P_THA: ICD-9 81.51 or CPT-4: 27130), primary TKA (P_TKA: ICD-9 81.54 or CPT-4: 27440-7), revision THA (R_THA: ICD-9 00.70-7, 81.53 or CPT 27134, 27137-38) and revision TKA (R_TKA: ICD-9 00.80-4, 81.55, CPT 27486-8). All patients had at least 365 days pre- and 90 days post-index continuous enrollment. Patients were categorized based on pre-existing diabetes (ICD 250.X), obesity (ICD 278.00, 278.01, 278.03, V85.35-45), osteoporosis (ICD 733.X) or smoking (ICD 305.X, V15.82) codes. Occurrence of 90-day infection (ICD 998.X, 686.9, 038.9, 711.05-6, 730.05-6) was queried for all patients. **RESULTS:** The 90-day infection rates were 1.9% (4,828/260,801), 1.95% (2,511/130,617), 9.5% (1,361/14,331) and 6.7% (777/11,657) for P_TKR, P_THR, R_TKR and R_THR, respectively. For primary procedures, comorbidities with the greatest effect on the odds of infection were obesity (OR: 1.814, 95%CI: 1.640-2.007 for P_THR and 1.558, 95%CI: 1.454-1.669 for P_TKR) and diabetes (OR: 1.686, 95%CI: 1.541-1.846

for P_THR and 1.344, 95%CI: 1.262-1.430 for P_TKR). Osteoporosis had a small but statistically significant effect on the odds of infection for primary procedures. For revision procedures, only diabetes (OR: 1.468, 95%CI: 1.242-1.735 for R_THR and 1.309, 95%CI: 1.162-1.474 for R_TKR) and obesity (OR: 1.324, 95%CI: 1.061-1.653 for R_THR and 1.350, 95%CI: 1.176-1.550 for R_TKR) increased the odds of infection. **CONCLUSIONS:** Diabetes and obesity are significantly associated with 90-day infection rates in patients undergoing primary or revision total hip or knee replacements.

EFFECTS OF MEDICATION ADHERENCE AMONG MEDICARE CANCER SURVIVORS

Lu K[1], Yuan J[1], Wu J[2]
[1]University of South Carolina, Columbia, SC, USA, [2]Presbyterian College, Clinton, SC, USA

OBJECTIVES: With the increasing availability of oral chemotherapy drugs, the use of oral chemotherapy continues to grow because it offers more advantages over intravenous chemotherapy, including convenience and less severe side effects. While adherence to oral chemotherapy plays a key role in achieving optimal cancer care, few published studies have investigated the impact of adherence to oral chemotherapy on clinical outcomes. The objective of this study was to access the effects of adherence to oral chemotherapy on the use and costs of medical services. **METHODS:** A retrospective cohort study was conducted using national representative sample obtained from Medicare Current Beneficiary Survey. Cancer patients aged over 65 who initiated oral chemotherapy during 2006 through 2010 were included in the analysis. Selected oral chemotherapy drugs were identified using pharmacy claims and self-reports. Measures of medication adherence included number of fills and proportion of days covered (PDC). Negative binomial models were used to estimate healthcare services use, and generalized linear models with gamma distribution and log-link were used for healthcare costs. **RESULTS:** Four hundred and fifty-nine elderly beneficiaries with cancer had at least one fill of oral chemotherapy drugs. For each additional fill of oral chemotherapy drugs, the likelihood of having hospitalizations and outpatient visits reduced by 7% (0.003 visits/year; p=0.006) and 3% (0.16 visits/year; p=0.03), respectively, after adjusting for socio-demographic and clinical characteristics. The adjusted costs for hospitalizations decreased by 15% ($590/year; p=0.02), while the prescription drug costs increased by 9% ($403/year; p<0.001). Similarly, a high level of PDC was associated with lower risk of hospitalization, reduced medical costs, and increased drug costs. **CONCLUSIONS:** Improved medication adherence to oral chemotherapy drugs was associated with better outcomes in terms of medical services use and costs. Higher costs for oral chemotherapy were more than offset by medical cost reductions, leading to a net reduction in total healthcare costs.

COST OF MALNUTRITION IN ELDERLY MEDICARE ENROLLEES WITH DIABETES

Goates S, Ahmed N, Chakraborty S, Mustad V
Abbott Nutrition, Columbus, OH, USA

OBJECTIVES: Diabetes is prevalent condition in elderly Medicare enrollees, and has been linked to costly comorbidities. The cost of malnutrition in this population, however, has not been quantified. Our objective is to estimate the cost of malnutrition in elderly Medicare enrollees diagnosed with diabetes. **METHODS:** We used claims data from 2000 to 2013 for a random sample of 15,000 Medicare enrollees (age>= 65) diagnosed with diabetes while enrolled in Medicare (96,370 subject years). Malnutrition was identified by ICD9 codes in the claims data. Cost data were reported for each subject year, and were categorized by service type (Part A, Part B and Part C) and payer (Medicare, Primary Insurance or Beneficiary). The impact of malnutrition on healthcare costs was estimated using two way random effects panel regressions. Results are reported with and without controlling for comorbidities. **RESULTS:** Nearly 16 percent of enrollees received a malnutrition diagnosis during our study period (15.9%). Enrollees who had been diagnosed with malnutrition had medical costs that were $33,648 higher than other enrollees controlling for age and gender (p<0.01). When cardiopulmonary disease, kidney disease, cancer and depression were included in the regression, malnutrition raised total costs $23,698 per year (p<0.01). For comparison, a diagnosis of lung cancer (the next most costly condition) raised total cost $16,820 (p<0.01). The majority of malnutrition associated increased cost was borne by Medicare, which paid $21,605 more per malnourished patients after controlling for age, gender and comorbidities (p<0.01). Medicare Part A had the highest increase in malnutrition associated cost ($18,007; p<0.01) followed by Part B ($3017, p<0.01) and Part D ($281, p<0.01). **CONCLUSIONS:** Diabetes is a common and costly disease, which is made more costly by malnutrition. Health care providers should carefully monitor the nutritional status of patients with diabetes and integrate nutrition into patient care plans.

THE ASSOCIATION BETWEEN HOSPITAL CHARACTERISTICS AND READMISSION FOR ENDOMETRIAL CANCER PATIENTS UNDERGOING SURGERY IN THE US

Moriarty JP[1], Nickles Fader A[2], Dowdy S[1], Borah BJ[3]
[1]Mayo Clinic, Rochester, MN, USA, [2]Johns Hopkins University, Baltimore, MD, USA, [3]Mayo Clinic College of Medicine, Rochester, MN, USA

OBJECTIVES: To analyze whether patient and hospital characteristics are associated with all-cause readmissions among endometrial cancer patients undergoing surgery. **METHODS:** The 2013 Nationwide Readmission Database (NRD) was used. The NRD, managed by the Agency for Healthcare Research and Quality, includes readmissions for both insured (commercial vs. government) and uninsured patients in the U.S., and is designed to produce readmission rates at the national level. The study population consisted of hospitalized patients undergoing surgery for non-metastatic endometrial cancer. Surgeries considered were vaginal, laparoscopic or robotic-assisted hysterectomy (minimally invasive) as well as open hysterectomy. Outcomes analyzed were 30-day, 60-day, and 90-day all-cause readmissions. For each outcome the study cohort was restricted to patients having an index hospitalization in 2013 while ensuring that the study patients also had enough time for the respective outcome. Multivariate logistic regression was performed to assess factors associated with hospital readmission rates. **RESULTS:** The 30-day, 60-day and 90-day cohorts included 23,006, 21,071 and 18,885 patients, respectively. Factors associated with hospital readmission rates were: type of surgery, patient age, comorbidity count, hospital teaching status, and hospital urban-rural designation. The following were common across the three readmission outcomes studied: 1) open surgery had approximately two times the odds of readmission compared to minimally invasive surgeries (Odds ratio or OR for 30-day outcome: 2.073, 95%CI: 1.738 -2.473); and 2) metropolitan non-teaching hospitals had approximately 26% less odds of readmission compared to metropolitan teaching hospitals (30-day OR: 0.741, 95%CI: 0.603-0.910). Furthermore, for 60-day and 90-day readmissions, small metropolitan hospitals had approximately 20% less odds of readmission compared to large metropolitan hospitals (e.g., 60-day OR: 0.789, 95%CI: 0.669-0.932). **CONCLUSIONS:** Surgical type, hospital teaching status, and hospital urban-rural designation were associated with differing all-cause readmission rates. More research is warranted to understand why and how these factors may be associated with readmission outcomes.

CN2

IMPACT OF DIFFUSE LARGE B-CELL LYMPHOMA ON VISITS TO DIFFERENT PROVIDER SPECIALTIES AMONG ELDERLY MEDICARE BENEFICIARIES: CHALLENGES FOR CARE COORDINATION

Garg R[1], Sambamoorthi U[2], Tan X[2], Basu SK[3], Haggerty T[1], Kelly K[1]
[1]West Virginia University, Morgantown, WV, USA, [2]West Virginia University, School of Pharmacy, Morgantown, WV, USA, [3]University of Louisville, Louisville, KY, USA

OBJECTIVES: Newly diagnosed Diffuse Large B-Cell Lymphoma (DLBCL), a cancer with vague symptomatology, can pose significant challenges to care-coordination. We utilized a multi-level model to understand the impact of DLBCL diagnosis on visits to primary care providers (PCPs) and specialists, a key component of care-coordination, over a 3 year period of cancer diagnosis and treatment. **METHODS:** We used a retrospective longitudinal study design with SEER-Medicare linked dataset to analyze visits to PCPs and specialists by DLBCL patients (N=5,455) compared to non-cancer patients (N=19,215). Multivariable logistic regression and hurdle models were used to examine the association of DLBCL with any visit to specialists and any visit to and number of PCP visits respectively. **RESULTS:** DLBCL patients were more likely to visit PCPs (AOR [95%CI]: 1.19[1.13, 1.25]), and had greater number of visits to PCPs (beta, SE: 0.361, 0.013) than non-cancer patients. Similarly, DLBCL patients were more likely to have any visit to cardiologists (AOR [95%CI]: 1.33[1.26, 1.39]), endocrinologists (1.27 [1.08, 1.49]), and pulmonologists (1.36[1.24, 1.50]) than non-cancer patients. Among DLBCL patients, the number of PCP visits markedly increased during the treatment period compared to the baseline period (beta, SE: 0.490, 0.028) and then decreased to baseline levels (-0.464, 0.022). **CONCLUSIONS:** Visits to PCPs and specialists were much higher for DLBCL than non-cancer patients, which drastically increased during the DLBCL treatment period for chronic care. Treatment adverse effects and more frequent contact with healthcare system may have increased the visits to PCPs and specialists. Interventions to improve care-coordination may need to target the DLBCL treatment period, when care-coordination is most vulnerable.

CN3

PERFORMANCE OF CHARLSON VERSUS ELIXHAUSER COMORBIDITY SCORE IN PREDICTING SURVIVAL IN BREAST, PROSTATE, LUNG, AND COLORECTAL CANCER

Mehta HB[1], Sura SD[2], Adhikari D[1], Kuo Y[1], Goodwin JS[1]
[1]University of Texas Medical Branch, Galveston, TX, USA, [2]University of Houston, Houston, TX, USA

OBJECTIVES: The National Cancer Institute (NCI)'s refined Charlson comorbidity score (developed specifically for cancer) and the Agency for Healthcare Research and Quality's Elixhauser comorbidity scores are two popular methods to control confounding due to comorbidities in observational studies. The relative performance of these scores in cancer studies is unknown. The objective was to compare the performance of the Elixhauser and the Charlson comorbidity score in predicting survival in four cancers (breast, colorectal, prostate and lung). **METHODS:** This cohort study used the Texas Cancer Registry linked Medicare claims data from 2005-2011. Four cancer-specific cohorts were created: breast (n=19,082), colorectal (n=16,963), prostate (n=23,044) and lung (n=26,047) cancer. Baseline one year diagnosis claims were used to define Charlson and Elixhauser comorbidity score. Consistent with Charlson and NCI methodology, the outcome was 2-year non-cancer mortality; cancer mortality was treated as a competing risk. Competing risk models were created to determine the performance of Charlson and Elixhauser comorbidity score in predicting 2-year survival while controlling for age, gender and stage of cancer. Models were compared using Akaike information criterion (AIC), Bayesian information criterion (BIC) and c-statistics (c). **RESULTS:** The 2-year non-cancer mortality was 5.7% (breast), 11.5% (colorectal), 4.1% (prostate) and 14.5% (lung). Elixhauser (breast: AIC=9084, BIC=9101, c=0.776; colorectal: AIC=17977, BIC=18002, c=0.681) performed slightly better than Charlson (breast: AIC=9112, BIC=9129, c=0.769; colorectal: AIC=17992, BIC=18016, c=0.679) for breast and colorectal cancer. Whereas, Charlson (prostate: AIC=8379, BIC=8391; c=0.780, lung: AIC=34915, BIC=34943, c=0.581) had slightly better performance than Elixhauser (prostate: AIC=8387, BIC=8400, c=0.779; lung: AIC=34927, BIC=34955, c=0.577) for prostate and lung cancer. **CONCLUSIONS:** Performance of both scores were

comparable, with the slightly better performance of Elixhauser for breast and colorectal, and Charlson for prostate and lung. Evidence from this study can be used for selecting appropriate comorbidity score for cancer-specific observational study.

CN4

PROGRESSION-FREE SURVIVAL WITH ENDOCRINE-BASED THERAPIES FOLLOWING PROGRESSION ON AN NON-STEROIDAL AROMATASE INHIBITOR AMONG POSTMENOPAUSAL WOMEN WITH HORMONE RECEPTOR POSITIVE, HUMAN EPIDERMAL GROWTH FACTOR RECEPTOR 2 NEGATIVE ADVANCED BREAST CANCER: A NETWORK META-ANALYSIS

Ayyagari R[1], Tang D[2], Patterson-Lomba O[1], Zhou Z[1], Xie J[3], Niravath PA[4]
[1]Analysis Group, Inc., Boston, MA, USA, [2]Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA, [3]Analysis Group, Inc., New York, NY, USA, [4]Houston Methodist Cancer Center, Houston, TX, USA

OBJECTIVES: This study aimed to quantify the comparative efficacy of currently available and emerging endocrine-based therapies (ETs) for postmenopausal women with HR+/HER2- ABC after NSAI progression. **METHODS:** Randomized clinical trials (RCTs) of ETs in first or later line for HR+/HER2- ABC were identified via a systematic literature review using Medline, EMBASE, Cochrane Library and key conference proceedings from 2013-2016 as search databases. RCTs with the following criteria were considered: 1) focused on women with HR+/HER2- ABC, 2) included patients who previously received ETs or chemotherapy as first-line therapy, 3) included ET as monotherapy or in combination with targeted therapy as study interventions, 4) reported PFS outcome, and 5) were published in 2007 or later (when HER2 testing became standardized). Regimens were compared using pairwise hazard ratios (HRs) and 95% credible intervals (CrIs) of PFS obtained from a Bayesian MTC model. Treatments of different approved dosage strength were pooled into the same arm. In addition, anastrozole and exemestane were pooled as aromatase inhibitors [AIs] due to clinical similarities. **RESULTS:** A total of 4 trials and 6 regimens (palbociclib+fulvestrant, everolimus+fulvestrant, everolimus+AI, fulvestrant+AI, fulvestrant, and AI) were eligible. Palbociclib+fulvestrant and everolimus+AI had 50% and 55% reduced hazard of progression or death vs AI (95% CrI upper bound $\leq$1), respectively. Palbociclib+fulvestrant, everolimus+AI and everolimus+fulvestrant had 54%, 58% and 40% reduced hazard of progression or death vs. fulvestrant (95% CrI upper bound $\leq$1), while palbociclib+fulvestrant and everolimus+AI had 52% and 55% reduced hazard of progression or death vs. fulvestrant+AI (95% CrI upper bound $\leq$1), respectively. No other significant differences in PFS between treatments were found. **CONCLUSIONS:** These results indicate that, compared to those who received fulvestrant alone, postmenopausal women with HR+/HER2- ABC who have previously failed an NSAI and received palbociclib+fulvestrant, everolimus+AI or everolimus+fulvestrant had longer PFS.

COST OF ILLNESS AND RESOURCE UTILIZATION STUDIES

TRENDS IN READMISSION RATES AND HOSPITAL CHARGES FOR PATIENTS WITH CHRONIC OBSTRUCTIVE PULMONARY DISEASE IN FLORIDA FROM 2009 TO 2014

Jiang X, Park H, Xiao H, Segal R
University of Florida, Gainesville, FL, USA

OBJECTIVES: To examine trends in hospital readmission rates and charges associated with chronic obstructive pulmonary disease (COPD) in Florida and to identify patient-level risk factors associated with 30-day readmissions. **METHODS:** A retrospective analysis of adult COPD patients (18 or older) was conducted using Healthcare Cost and Utilization Project (HCUP) Florida State Inpatient Database (SID) 2009-2014. The 30-day readmission rate was calculated by dividing the number of hospitalizations with at least one subsequent hospital stay within 30 days of an index hospitalization by the total number of index hospitalizations for COPD. Weighted least squares regression was used to perform tests of trend. Multivariable logistic regression was employed to identify patient characteristics associated with readmission. **RESULTS:** Overall, 269,790 patients were identified as having COPD. The unadjusted rate for COPD-related 30-day readmissions in Florida did not change between 2009 and 2014 (8.16% to 7.95%, P=0.375). However, readmission rates for patients aged 64-84 years decreased significantly (8.07% to 7.21%, P=0.023), whereas readmission rates for patients aged 44-63 years increased significantly (9.34% to 10.50%, P=0.037). Average total charge for 30-day COPD-related readmissions was significantly higher in 2014 ($35,383) compared to that in 2009 ($31,758) after adjusting for inflation rates (P=0.027). Factors associated with increased COPD-related readmission rates included male (Odds Ratio [OR]=1.133; 95% confidence interval [CI]=1.098-1.169), older age:44<=age<64 (OR=2.045; 95%CI=1.790-2.336) and 64<=age<=84 (OR=1.658; 95%CI=1.446-1.901), Medicaid beneficiaries (OR=1.401; 95%CI=1.325-1.482), lower income (OR=1.187; 95%CI=1.130-1.246), longer length of stay in hospital (OR=1.004;95%CI=1.001-1.007), alcohol abuse (OR=1.086; 95% CI=1.019-1.158) and a higher burden of medical comorbidities including obesity (OR=1.085; 95%CI=1.032-1.140), osteoporosis (OR=1.150; 95%CI=1.080-1.224), acquired immune deficiency syndrome (OR= 1.196; 95%CI=1.002-1.427) and ischaemic heart disease (OR=1.037; 95%CI=1.001-1.075). **CONCLUSIONS:** Despite national efforts to reduce the burden of COPD, the overall COPD readmission rate has not changed in Florida. Instead, financial burdens on the COPD readmission consistently increased.

CS2

THE DIRECT AND INDIRECT ECONOMIC BURDEN OF HYPOTHYROIDISM IN THE UNITED STATES: A RETROSPECTIVE CLAIMS DATABASE STUDY

Hepp Z[1], Lage MJ[2], Espaillat R[3]
[1]AbbVie Inc., North Chicago, IL, USA, [2]HealthMetrics Outcomes Research, LLC, Bonita Springs, FL, USA, [3]Abbvie, North Chicago, IL, USA

OBJECTIVES: To examine the direct (resource utilization and associated medical cost) and indirect (productivity costs) economic burden associated with hypothyroidism in the United States. **METHODS:** Using the Truven Health MarketScan® databases, patients who received 2 or more diagnoses of hypothyroidism in the calendar years 2012, 2013 or 2014 were identified (N=834,713) and examined for 1 year post initial diagnosis of hypothyroidism (index date). Healthy controls were matched 1:1 to the hypothyroidism cohort based upon patient characteristics (age, sex, region, and insurance type) and availability of productivity data (absenteeism, short-term disability [STD], long-term disability [LTD], and worker's compensation [WC]). Multivariable analyses compared resource utilization, annual medical costs, and productivity costs between hypothyroidism and controls. **RESULTS:** Hypothyroidism was associated with a significantly higher probability of hospitalization (8.79% v 5.05%; OR 1.53, 95% CI 1.52-1.55) or ER visit (21.71% v 14.99%; OR 1.74, 95% CI 1.72-1.76) and a longer hospital length of stay (1.00 v 0.42 days) compared to controls (all P<0.0001). This additional utilization is consistent with the finding of incremental annual total medical costs of $6,928 per patient associated with hypothyroidism. Specifically, patients with hypothyroidism (N=799,466), compared to healthy controls (N=799,466) had significantly higher total medical costs ($15,737 v $8,809), as well as significantly higher inpatient ($3,027 v $1,495), outpatient ($6,456 v $3,973), emergency room (ER) ($733 v $423), drug ($5,637 v $3,273), and laboratory costs ($104 v $50) (all P<0.0001). For the subset of patients with available productivity data, patients with hypothyroidism, compared to controls, had significantly higher costs associated with absenteeism ($5,946 v $5,775), STD ($414 v $300), LTD ($36 v $19) (all P<0.0001) but significantly lower WC costs ($49 v $55; P<0.0001). **CONCLUSIONS:** Findings of this large study demonstrate the substantial direct and indirect economic burden associated with hypothyroidism.

CS3

HEALTH RESOURCE UTILIZATION AND COST IN PATIENTS WITH CLINCAL ATHEROSCLEROTIC CARDIOVASCULAR DISEASE AND PRIOR STATIN USE

Boatman B[1], DiMario S[1], Burton T[2], Seare J[3], Patel J[1], Harrison DJ[1]
[1]Amgen Inc., Thousand Oaks, CA, USA, [2]Optum, Boston, MA, USA, [3]Optum, St. George, UT, USA

OBJECTIVES: Patients with clinical atherosclerotic cardiovascular disease (ASCVD) require aggressive treatment and risk factor modification to lower risk of cardiovascular events. The objective of this study was to determine 1 year health resource utilization (HRU) and cost in these patients. **METHODS:** This was a retrospective study of adult (18+) commercial and Medicare Advantage (MA) enrollees in the Optum® Research Database. Patients indexed on their first diagnosis code of clinical ASCVD, defined by 2013 American College of Cardiology/American Heart Association criteria, from 1/1/2011 to 3/31/2014. Patients were continuously enrolled 1 year pre- and post-index, or until death, filled a statin during baseline, and had $\geq$1 LDL-C result $\leq$90 days before index. All-cause and ASCVD-related HRU and cost were calculated during follow-up and reported separately for the total sample, commercial, and MA populations. **RESULTS:** The study included 31,831 patients; mean age 64 years, 44% female, 50% commercially insured, and mean baseline LDL-C 95 mg/dL. The proportion of patients with an ASCVD-related visit was higher in MA patients versus commercially insured; ambulatory (54.8% vs 49.7%), emergency (6.6% vs 4.6%), and inpatient (10.3% vs 6.7%). More than half of all ambulatory and inpatient visits (52.6% and 51.2%), and 17.7% of emergency department visits, were ASCVD-related. Patients with MA had over 50% more ASCVD-related inpatient visits than commercially insured patients, and almost 50% more ASCVD-related ED visits. Mean total annual costs for the entire sample was $15,942. ASCVD related costs were 29.3% of total costs, 54.6% of inpatient cost, 19.3% of ambulatory cost, and 18.1% of pharmacy cost. In general, costs for commercially insured patients were higher than costs for patients with MA. **CONCLUSIONS:** ASCVD-related costs contribute a large proportion of the economic burden in patients with ASCVD. Improving clinical care might help manage costs.

CS4

ASSOCIATION OF TUMOR LOCATION AND ECONOMIC OUTCOMES IN THORACIC LOBECTOMIES: RESULTS FROM A NATIONAL HOSPITAL BILLING DATASET

Kalsekar I[1], Ghosh SK[2], Kassis E[3], Yoo A[1]
[1]Johnson & Johnson Co., New Brunswick, NJ, USA, [2]Ethicon Inc, Cincinnati, OH, USA, [3]Medical Affairs, Ethicon, Inc., Cincinnati, OH, USA

OBJECTIVES: Identification of factors affecting economic outcomes in patients undergoing thoracic lobectomies for cancer may assist with procedural risk adjustment. This study assesses whether lobe anatomy affects outcomes such as Operating Room Time (ORT), Length of Stay (LOS), and total hospital costs (COSTS). **METHODS:** The study used the Premier Perspective® Database, which contains billing data from over 600 U.S. hospitals. Elective lobectomies with a primary diagnosis of upper, middle, or lower lobe lung cancer from 2012 to 2014 were identified. Resource utilization parameters of ORT (mins), LOS (days) and COSTS (2014 US-Dollars) were computed from billing data. Generalized estimating equations accounting for hospital-level clustering and controlling for patient, procedure, and hospital factors were used to evaluate the association of tumor lobe anatomy and resource utilization. **RESULTS:** A total of 8,750 thoracic lobectomies for lung cancer were identified: upper lobe (n=5,284), middle lobe (n=512), and lower lobe (n=2,954). A slightly higher fraction of surgical approaches were traditional thoracotomy (54.2%;n=4,746) compared to Video Assisted Thoracoscopic Surgery (VATS) (45.8%;n=4,004). Mean ORT was 249.0 mins (SD=232.7), with mean LOS of 7.0 days (SD=5.3) and COSTS of $25,710 (SD=$18,862). Results of the multivariable analysis showed that the adjusted mean LOS (95% CI) was significantly higher for upper lobe [7.0(6.8-7.2)] compared to middle [5.8(5.4-6.3)] or lower lobe [6.6(6.4-6.8)]. Similar results for higher economic burden for upper lobe was observed in adjusted COSTS [Upper lobe: $26,177($25,132-$27,266); Middle lobe:$23,109($21,683-$24,629); Lower lobe:$24,557($23,450-$25,717)]. Mean ORT was also higher for upper lobe [254.1 (242.2-266.6) compared to lower lobe [235.2(226.4-244.3)] but no differences were observed compared to middle lobe [243.5(217.0-273.2)]. Results were consistent when the data was sub-analyzed by approach. **CONCLUSIONS:** This analysis shows that

tumor lobe anatomy in lobectomies is significantly associated with in-hospital economic outcomes, with upper lobe tumors having increased LOS, ORT and COSTS compared to lobectomies of the lower or middle lobe.

COST-EFFECTIVENESS ANALYSIS OF HLA-B*5801 GENETIC TESTING PRIOR TO INITIATION OF ALLOPURINOL THERAPY TO PREVENT ALLOPURINOL-INDUCED STEVENS-JOHNSON SYNDROME/TOXIC EPIDERMAL NECROLYSIS IN MALAYSIAN POPULATION

Chong HY[1], Lim YH[1], Prawjaeng J[2], Chaiyakunapruk N[1]
[1]Monash University, Selangor Darul Ehsan, Malaysia, [2]Naresuan University, Phitsanulok, Thailand

OBJECTIVES: Studies found strong association between allopurinol-induced Stevens-Johnson Syndrome (SJS)/ Toxic Epidermal Necrolysis (TEN) and HLA-B*5801 allele. HLA-B*5801 screening-guided therapy may mitigate the risk of allopurinol induced SJS/TEN. This study aims to evaluate the cost-effectiveness of HLA-B*5801 screening prior to allopurinol therapy initiation compared with current practice of no screening for Malaysian patients with chronic gout whom hypouricemic agent is indicated. **METHODS:** This cost-effectiveness analysis adopted societal perspective with a lifetime horizon. A decision tree model coupled with Markov models was developed to estimate the costs and outcomes, represented by quality-adjusted life years (QALYs) gained, of three treatment strategies: (a) current practice (allopurinol initiation without HLA-B*5801 screening); (b) HLA-B*5801 screening prior to allopurinol initiation; and (c) alternative treatment (probenecid) without HLA-B*5801 screening. The model was populated with data from literature review, meta-analysis, and published government documents. Cost values were adjusted to the year 2015, with costs and health outcomes discounted at 3% per annum. A series of sensitivity analysis including probabilistic sensitivity analysis were constructed to determine the robustness of the findings. **RESULTS:** Both HLA-B*5801 screening and probenecid prescribing were dominated by current practice. Compared to current practice, HLA-B*5801 screening resulted in 0.226 QALYs loss at an additional cost of USD281, while probenecid prescribing resulted in 1.744 QALYs loss at an additional cost of USD1,875. One SJS/TEN case would be avoided for every 552 patients screened. At the cost-effectiveness threshold of USD8,982 per QALY, the probability of current practice being the best choice is 98%, in contrast with 2% and 0% in HLA-B*5801 screening and probenecid prescribing respectively. This is due to low incidence of allopurinol-induced SJS/TEN in Malaysia and lower efficacy of probenecid compared with allopurinol in gout control. **CONCLUSIONS:** This analysis demonstrated that HLA-B*5801 genetic testing before allopurinol initiation is unlikely to be a cost-effective intervention in Malaysia.

PM2

DEVELOPING A TAXONOMY OF NON-HEALTH VALUE FOR GENOMIC-BASED DIAGNOSTIC TESTS

Eden M[1], Daker-White G[1], Black G[2], Payne K[1]
[1]The University of Manchester, Manchester, UK, [2]The University of Manchester and Central Manchester University Hospitals NHS Foundation Trust, Manchester, UK

OBJECTIVES: Genomic-based diagnostic tests provide information with the potential to improve health and non-health outcomes for patients and families with rare inherited conditions. To date, no practical solutions to using cost-effectiveness analysis exist that take account of non-health benefits and recognise the existence of opportunity cost. This study aimed to identify all relevant non-health outcomes to define a taxonomy of value potentially deriving from genomic-based diagnostic tests. **METHODS:** Meta-ethnography was used to synthesize published qualitative evidence in an interpretive manner. Systematic bibliographic searches identified studies using electronic search strategies and terms relevant to genomic testing combined with synonyms for qualitative research in four databases (MEDLINE, Embase, PsychInfo and HAPI) from time of inception to April 2016. Two researchers identified studies for inclusion using pre-defined criteria. Data analysis and synthesis, using meta-ethnography, aimed to consolidate themes and concepts in existing qualitative studies to create a taxonomy of value grounded in empirical evidence. **RESULTS:** Thirty-seven studies were included and analysed in two stages concerned with: (i) multiple genetic conditions (12 studies); single inherited conditions (25 studies). Three types of value were identified and defined: (i) value of informed decision-making (ability of genomic-based diagnostic information to facilitate important health and life decisions); (ii) value of benefit to others (recognition of impact of information on others); (iii) value of knowing (value per se from genomic information). **CONCLUSIONS:** This study developed a taxonomy of value for genomic-based diagnostic tests. This is a necessary first step to move towards understanding how to take account of health and non-health effects in cost-effectiveness analyses and also consider opportunity cost within a constrained healthcare budget. A potential next step is to use stated preference methods to quantify how people trade between health and non-health outcomes to capture the value of genomic-based diagnostic tests.

PM3

THE OPTIMAL TREATMENT REGIME TO DELAY THE ONSET OF MUCOID PSEUDOMONAS AERUGINOSA PULMONARY INFECTION ON PEDIATRIC CYSTIC FIBROSIS PATIENTS

Jiao T[1], Zhang Y[1], Liou T[1], Stevens V[2], Young D[1], Brixner D[3]
[1]University of Utah, Salt Lake City, UT, USA, [2]VA Salt Lake City Health Care System, SLC, UT, USA, [3]Personalized Health Care, University of Utah Health Sciences Center, Salt Lake City, MA, USA

BACKGROUND: Pseudomonas aeruginosa is the most common and significant life-threating pathogen for CF patients. The transition from non-mucoid to mucoid PaPI indicates disease progression, after which the lung function deterioration would be exacerbated. To treat continuous deterioration of lung function, CF patients need to use lung maintenance therapies chronically for an average of 20 years. However, majority of evidence identifies only short-term follow-up. Moreover, no guideline suggests when a treatment change is needed, nor the order of prescribing those treatments. **OBJECTIVES:** To investigate the comparative effectiveness of different treatment regimes to delay the acquisition of mucoid PaPI. **METHODS:** Using the Cystic Fibrosis Foundation Patient Registry, this retrospective cohort was applied to emulate an RCT under a casual inference framework. Pediatric patients (n=4970) who were diagnosed with non-mucoid PaPI before mucoid PaPI during 2006-2011 were included. A rational treatment change score was created using machine-learning method including patients' demographic characteristics, clinical signals and treatment histories. According to different thresholds of the score, which steered the decision of treatment change, 25 regimes were built. Each patient was hypothetically randomized to follow all regimes independently. A fixed parameterization of the dynamic logistic marginal structural model with the constant-time hazard was applied to investigate the effectiveness of different regimes. **RESULTS:** Using the effect of patients whose treatment changes followed a specific regime as the reference, patients whose treatment changes did not follow any regime caused 17% greater hazard of mucoid PaPI during 6-year follow-up. Compared with the reference regime, the hazard ratio ranged from 0.98 to 1.07 for other regimes. **CONCLUSIONS:** In this study, changing treatments irrationally, not followed any clinical signals, caused the worst outcome. The differences of effect were trivial among regimes. To achieve better outcomes, physicians should follow a regime, logically the optimal one, in changing lung maintenance therapy.

PM4

A TEST AND VALIDATION OF GENETIC ALGORITHMS AND CROSS-VALIDATION IN VARIABLE SELECTION AND MODEL BUILDING

Zur RM[1], Sherman S[1], Aballéa S[2]
[1]Creativ-Ceutical, Chicago, IL, USA, [2]Creativ-Ceutical, Paris, France

OBJECTIVES: When developing statistical models to predict health care costs, resource utilization or clinical outcomes, obtaining a reliable set of predictors that most impact the outcome can be challenging. The objective of this analysis is to test and validate genetic algorithms (GA) for variable selection with integrated cross-validation (CV) for a prediction regression model. This proposed method was compared to forward selection (FS). **METHODS:** A simulation study was performed to test and validate the integrated GA and CV (GA-CV) algorithms with repeated random selection of 50 test sets. To overcome variability from different random folds, 20 different random selections were performed. The optimal set of variables was identified based on the proportion of times each variable was included in the models that minimized the mean squared error of the predictions. Number of events was modeled from Poisson distributions in this exercise, and included a treatment variable (yes vs. no), 3 integer covariates, and 3 continuous covariates. The covariates were either: 1) unrelated to the outcome, 2) moderately associated with the outcome, or 3) highly associated with the outcome. **RESULTS:** The GA-CV algorithm selected the covariates associated with the outcomes in 96% of the simulations, and did not select the covariates unrelated to the outcomes in 57% of the simulations, compared to 83% and 55% of the simulations for FS algorithms. **CONCLUSIONS:** The GA-CV algorithm successfully identified covariates associated with outcomes while avoiding covariates not associated with outcomes in a simulation study, performing better than FS for identifying impactful variables, and equivalently to FS for identifying non-impactful variables. The integrated GA-CV algorithm should be considered when building models of count data and should be studied for its effectiveness when modeling other outcomes.

TREATMENT PATTERNS STUDIES

PREDICTORS OF PROGRESSION TO ADVANCED THERAPY AMONG RHEUMATOID ARTHRITIS PATIENTS WITH INADEQUATE RESPONSE ON CDMARDS

Grabner M[1], Boytsov N[2], Zhang X[2], Raval A[1], Curtis JR[3]
[1]HealthCore, Inc., Wilmington, DE, USA, [2]Eli Lilly and Company, Indianapolis, IN, USA, [3]University of Alabama at Birmingham, Birmingham, AL, USA

OBJECTIVES: The 2015 American College of Rheumatology guidelines recommend advanced therapy (biologic disease-modifying antirheumatic drugs [DMARDs] or Janus kinase inhibitors) for patients with rheumatoid arthritis (RA) who have inadequate response (IR) to conventional DMARDs. Given limited existing evidence, we investigated real-world cDMARD-IR rates and factors associated with progression to advanced therapy. **METHODS:** Administrative claims from the HealthCore Integrated Research Database were used to select adult patients with $\geq$1 claim for cDMARDs between 01/01/2007 and 11/30/2014 (first drug claim = index date), $\geq$12 months of enrollment before (baseline) and after index, $\geq$1 claim for RA diagnosis and no fills for any DMARD over baseline, and no claims at any time for other conditions where advanced therapy is indicated. A previously-published algorithm was applied to identify cDMARD-IR status. First fill for advanced therapy over 12 months post-index was set as progression date. Patient demographic/clinical characteristics and utilization metrics were assessed over baseline and up to the progression date. Factors associated with progression were determined by logistic regression. **RESULTS:** Out of 11,274 cDMARD initiators, 9,426 (84%) were cDMARD-IR, of whom 2,046 (22%) progressed to advanced therapy. Most patients progressed to etanercept (49%), followed by adalimumab (23%) and infliximab (17%). Median (range) time-to-progression was 126 days (62-219). The top 5 factors associated with progression were index claim for methotrexate (OR 3.05, 95% CI 2.63-3.53),

post-index cDMARD adherence (3.02; 2.39-3.81), any outpatient IV medication use (2.84; 2.49-3.24), laboratory tests (1.76; 1.43-2.15), and glucocorticoid use (1.57; 1.38-1.79). Age (0.97; 0.96-0.98) and baseline Quan-Charlson comorbidity score (0.91; 0.86-0.97) were negatively associated with progression. **CONCLUSIONS:** A majority of patients (84%) in this real-world population were cDMARD-IR, but only 22% of them progressed to advanced therapy over 12 months, indicating barriers to such treatments. Factors associated with progression may help in identifying patients at higher need for intensive treatment.

TP2

FIRST-LINE TREATMENT PATTERNS AMONG YOUNGER VERSUS OLDER PATIENTS NEWLY DIAGNOSED WITH MULTIPLE MYELOMA IN THE US

Yong C[1], Seal B[1], Lingohr-Smith M[2], Menges BL[2], Noga SJ[1], Lin J[2]
[1]*Millennium Pharmaceuticals, Inc., a wholly owned subsidiary of Takeda Pharmaceutical Company Limited, Cambridge, MA, USA,* [2]*Novosys Health, Green Brook, NJ, USA*

OBJECTIVES: To describe first-line treatment (1LT) patterns among patients with newly diagnosed multiple myeloma (NDMM), stratified by age group. **METHODS:** Patients with NDMM who did not receive stem cell transplant were identified from the MarketScan Commercial and Medicare claims databases (1/1/2009-9/30/2015). Patients had continuous medical/prescription coverage 12 months before (baseline) and ≥12 months after the index date of MM treatment initiation. Demographics and clinical characteristics were evaluated during baseline and 1LT patterns were compared among patients aged <65 and ≥65 years. Duration of 1LT and time to second-line treatment (2LT) were analyzed using Kaplan-Meier (KM) curves. **RESULTS:** Among the overall population with NDMM (n=3,238), 1,315 were <65 years old (mean=56.7 years), and 1,923 were ≥65 years old (mean=76.6 years). The average time from MM diagnosis until 1LT initiation was similar between age groups [2.8 vs. 3.0 months, p=0.52]. Proportions treated with triplet-, doublet-, and mono-therapy regimens in 1LT were 45.3%, 36.9%, and 10.5%, respectively, among younger patients versus 31.8%, 53.4%, and 10.9%, among older patients (p<0.001). Among younger patients, 22.7% were treated with immunomodulatory drug (IMiD)-based, 29.7% with proteasome inhibitor (PI)-based, and 38.8% with IMiD+PI combination regimens; among older patients, proportions were 32.1%, 35.1%, and 21.9%, respectively. Based on KM analysis, among younger patients median duration of 1LT was 8.8 months and time to 2LT was 32.3 months; among older patients, median duration of 1LT was 10.1 months and time to 2LT was 36.2 months. MM severity was not adjusted for due to limitations of the database. **CONCLUSIONS:** Treatment initiation occurred almost 3 months after initial MM diagnosis. Older patients were less likely to receive triplet or IMiD+PI regimens compared to younger patients. Average 1LT duration was 9-10 months. Future studies should investigate the influence of patient and physician preferences on time to treatment initiation and the implications on outcomes.

TP3

BREAST CONSERVING SURGERY OR MASTECTOMY: A TREND ANALYSIS USING NATIONWIDE INPATIENT SAMPLE

Chen C, Wang W, Xiao H
University of Florida, Gainesville, FL, USA

OBJECTIVES: Breast cancer is the most common type of cancer found in women. Most breast cancer patients receive either breast cancer conserving surgery (BCS) or mastectomy as a surgical treatment. Considering the high prevalence of breast cancer, it is important to understand the utilization of surgery and the determining factors for the surgery selection. This study aims to examine the trend and patterns of two major surgical procedures among women with breast cancer from 1998 to 2011. **METHODS:** Healthcare Cost and Utilization Project (HCUP), National Inpatient Sample (NIS) data was used to obtain a yearly proportion of surgeries in breast cancer women by surgery type, age, region, race, primary payer, and severity. BCS and mastectomy procedures were identified using ICD-9 procedure codes; severity was estimated by whether or not axillary lymph node dissection was conducted. Discharge weight was applied to extrapolate a national estimate. Surgery selection was modeled as a function of time to examine temporal trends controlling for age, race/ethnicity, region, payer, severity, and number of diagnoses at discharge by logistic regression. **RESULTS:** Examination of time trend graphs and regression analyses indicates that overall surgery rates increased overtime from 1998 to 2011. Among those who received one type of surgery, BCS decreased while mastectomy increased since 2003, when the American Cancer Society screening guideline was published. Elderly (>60 years), black patients with axillary lymph node dissection who received care in Northeast were most likely to choose BCS over mastectomy. Medicare recipients had higher overall surgery rates, and patients covered by private insurance were more likely to choose mastectomy over BCS. **CONCLUSIONS:** Overall surgery rates have increased overtime in women with breast cancer. Patient demographic and clinical characteristics play a significant role in the choice between breast conserving surgery and mastectomy.

GEOGRAPHIC VARIATION OF INAPPROPRIATE PRESCRIPTION OPIOID USE AMONG DISABLED MEDICARE BENEFICIARIES

Zhou L[1], Kwoh CK[1], Gellad WF[2], Donohue JM[3], Roubal A[4], Hines L[5], Malone D[1], Bhattacharjee S[1], Lee JK[1], Lindermann J[6], Bell M[1], Westra J[1], Lo-Ciganic W[1]
[1]*University of Arizona, Tucson, AZ, USA,* [2]*Center for Health Equity Research and Promotion, VA Pittsburgh Healthcare System, Pittsburgh, PA, USA,* [3]*University of Pittsburgh, Pittsburgh, PA, USA,* [4]*Robert Wood Johnson Foundation, Princeton, NJ, USA,* [5]*Pharmacy Quality Alliance, Springfield, VA, USA,* [6]*ESRI Inc., Broomfield, CO, USA*

OBJECTIVES: To address the opioid epidemic in the US, the Pharmacy Quality Alliance (PQA) recently developed quality measures of inappropriate prescription opioid use that address 1) high-dose use, 2) receipt of prescriptions from multiple providers, and 3) concurrent benzodiazepine use. Our objective was to examine the patterns of inappropriate opioid use among disabled Medicare beneficiaries across regions from 2011 through 2013. **METHODS:** Among 186,055 non-cancer, disabled Medicare patients who had >2 opioid prescriptions, we identified patients with high-dose use (>120 daily morphine milligram equivalents for ≥90 consecutive days) and multiple providers (having prescriptions from ≥4 prescribers and ≥4 pharmacies) each year; and concurrent benzodiazepine use (≥30 cumulative days) in 2013 when Part D began coverage for benzodiazepines. We used multivariable logistic regression to obtain adjusted annual rates of problematic opioid use across 306 hospital referral regions (HRRs), adjusting for sociodemographic, health status, and access-to-care factors. **RESULTS:** Adjusted annual rates of high-dose use (~9%) and having multiple providers (~5%) remained stable over three years. In 2013, 33.6% of beneficiaries used benzodiazepines concurrently. The ratios of 75th percentile to 25th percentile rates of inappropriate use across HRRs were 1.89 for high-dose use, 1.86 for having multiple providers, and 1.38 for concurrent benzodiazepine use. The top 5 HRRs with the highest rate of high-dose use were Sarasota, FL(17.2%), Sun City, AZ (17.2%), Lawton, OK(16.1%), New Brunswick, NJ(15.8%), and Pueblo, CO(15.8%); of multiple providers were Arlington, VA(11.6%), St Cloud, MN(8.7%), Pueblo, CO(7.8%), Provo, UT(7.7%), and Anchorage, AK(6.9%); and of concurrent benzodiazepine use were Miami, FL(50.0%), Slidell, LA(48.1%), Panama City, FL(47.5%), Clearwater, FL(47.3%), and Paterson, NJ(46.6%). **CONCLUSIONS:** Substantial concurrent benzodiazepine use and geographic variation in problematic prescription opioid use exist among disabled Medicare beneficiaries. Areas with high rates of problematic use may benefit from targeted interventions (e.g., lock-in programs) to reduce inappropriate opioid use.

DIFFERENCES IN DISEASE PROGRESSION, RESOURCE UTILIZATION, AND HEALTH OUTCOMES RELATED TO INITIAL ADHERENCE TO ORAL ANTIDIABETIC MEDICATIONS AMONG VETERANS WITH INCIDENT DIABETES

Gatwood J[1], Chisholm-Burns M[2], Davis R[3], Thomas F[3], Potukuchi P[4], Hung A[5], Kovesdy C[4]
[1]*University of Tennessee Health Science Center, Nashville, TN, USA,* [2]*The University of Tennessee Health Science Center College of Pharmacy, Memphis, TN, USA,* [3]*University of Tennessee Health Science Center, Memphis, TN, USA,* [4]*Memphis VA Medical Center, Memphis, TN, USA,* [5]*Vanderbilt University School of Medicine, Nashville, TN, USA*

OBJECTIVES: To examine the impact of oral antidiabetic medication (OAD) adherence on clinical measures, macrovascular events, and microvascular complications among veterans with incident diabetes mellitus (DM) in the first year of OAD therapy. **METHODS:** The VA Corporate Data Warehouse was used to identify the first diagnosis for uncomplicated DM during 2002-2014. OAD use was assessed by proportion of days covered (PDC) for the first year of therapy using outpatient VA pharmacy records, and those with a PDC>80% were deemed adherent. Changes in clinical measures, outpatient visits and impatient admissions, and the odds of cardiovascular outcomes, cerebrovascular events, revascularization, and microvascular complications were assessed during the first year of therapy with a focus on differences due to OAD adherence while controlling for baseline demographic and clinical characteristics. **RESULTS:** A total of 159,032 veterans were included and 99,430 (62.5%) were deemed initially adherent to OADs. Adherent patients had significantly larger unadjusted decreases in hemoglobin A1C, systolic blood pressure, and estimated glomerular filtration rates (all p<0.0001) over the first year. When adjusted for baseline characteristics, those nonadherent to OADs had significantly fewer outpatient visits (IRR: 0.84; 95%CI: 0.8310.849) but a higher number of inpatient admissions (IRR: 1.29; 95%CI: 1.230-1.343). Few macrovascular events were observed but nonadherent patients had a higher adjusted odds of having a stroke or transient ischemic attack (OR: 1.4; 95% CI: 1.10-1.74). Those nonadherent to OADs were also more likely to be diagnosed with nephropathy (OR: 1.1; 95%CI: 1.05-1.19) or experience a hypoglycemic event (OR: 1.7; 95%CI: 1.27-2.25) but less likely to have been diagnosed with neuropathy (OR: 0.65; 95%CI: 0.62-0.688) or retinopathy (OR: 0.78; 95%CI: 0.731-0.837) within the first year of OAD use after adjusting for baseline characteristics. **CONCLUSIONS:** Adherence to OADs has important consequences among patients starting DM therapy and suboptimal use can lead to complications, even in the first year of treatment.

DB2

RACIAL DISPARITY IN ACCESS TO NEWER CLASS ANTI-DIABETICS AMONG ADULT PATIENTS WITH DIABETES IN THE U.S.

Zhao Y, Cooley K
Xavier University of Louisiana, New Orleans, LA, USA

OBJECTIVES: Poorer diabetes care and outcomes that are common in racial and ethnic minority populations, may partially be attributed to more barriers to medications among minority populations than whites. This study aimed to examine racial differences in the use of newer class pharmacological treatments in the US, using a nationally representative sample of non-institutionalized population. **METHODS:** This cross-sectional study analyzed the 2014 Household Component and Prescribed Medicines files of the Medical Expenditure Panel Survey (MEPS). Use of newer class pharmacological treatment was defined as any record of prescription fill for type 2 sodium-glucose co-transporter (SGLT2) inhibitors, dipeptidyl peptidase 4

(DPP-4) inhibitor and glucagon-like peptide-1 (GLP-1) in 2014. The use rate was reported and compared between non-Hispanic whites and minorities. Estimates were weighted to the total American non-institutionalized population (WTP). Logistic regression models were employed to assess the association of racial groups and use of any newer anti-diabetics. **RESULTS:** 2,591 (WTP: 24,272,685) individuals with diabetes were identified in 2014. Among those treated with pharmacological therapy (96.2%, WTP: 23,359,737), 4.0% (WTP: 931,236) used GLP1, 6.6% (WTP: 1,538,691) used DPP4 and 1.8% (WTP: 417,955) used SGLT2 respectively, yielding 11.7% (WTP: 2,735,890) who had used at least one class of these newer antidiabetics in 2014. A higher proportion of non-Hispanic whites were found to receive newer antidiabetics than minorities (13.5% versus 8.8%, p=0.0036). After controlling for age, education, insurance coverage and diabetes duration, minorities were still less likely to use newer anidiabetics compared to their white counterparts (OR=0.69, 95%confidence interval=0.49, 0.98). Consistent racial disparity was found within each of SGLT2, DPP-4, GLP-1 classes. **CONCLUSIONS:** Racial disparity in access to newer treatment options among Americans with diabetes is observed. Persistent difference in barriers to new health technology between racial/ethnic groups needs to be examined in broader socioeconomic context and addressed promptly and effectively.

DB3

RESULTS, RATIONALES, AND TRENDS IN HEALTH TECHNOLOGY ASSESSMENTS FOR NOVEL DIABETES AGENTS

Clark RS, Campbell CM, Meyer KL
Xcenda, LLC, Palm Harbor, FL, USA

OBJECTIVES: As the global prevalence of diabetes continues to rise, the emergence of newer mechanisms of action, like sodium-glucose cotransporter-2 (SGLT-2) inhibitors, glucagon-like peptide-1 (GLP-1) receptor agonists, and dipeptidyl peptidase-4 (DPP-4) inhibitors, has increased the number of treatments available to patients. By balancing clinical benefit alongside cost, health technology assessment (HTA) decisions aim to prudently manage access to diabetes therapies. The objective of this analysis was to evaluate recent HTA decisions and their rationales to identify trends in selected countries. **METHODS:** HTA surveillance was conducted for Australia, Canada, France, Germany, and the United Kingdom (UK) from January 1, 2012 to October 31, 2016 (58 months). HTAs for diabetes therapies were evaluated by therapeutic area, drug class, decision, and rationale for the decision. Decisions were categorized as favorable, unfavorable, mixed (both favorable and unfavorable), and neutral (neither favorable nor unfavorable). **RESULTS:** 109 diabetes HTAs were published in the study timeframe. Across the studied nations' HTAs, 49 (45%) were favorable, 41 (38%) unfavorable, 16 (15%) mixed, and 3 (3%) neutral. Australia had the highest number of favorable decisions (26/39; 67%), followed by Canada (6/9; 67%), France (15/26; 58%), the UK (2/6; 33%), and Germany (0/29; 0%). Favorability among selected product classes were as follows: DPP-4, 46% (23/50); SGLT-2, 41% (13/32); and GLP-1, 37% (7/19). Mixed decisions, which were more common in the UK and France (67% and 31%, respectively), primarily depended upon whether there was a contraindication to a preferred treatment option or which antidiabetic agents were to be used in combination. Nearly all of the HTA submissions in markets that evaluate cost-effectiveness used cost-minimization analyses, and those favorable decisions that did provide an incremental cost-effectiveness ratio (ICER) were within the typical range. **CONCLUSIONS:** As the SGLT-2, GLP-1, and DPP-4 classes become more crowded, quality pharmacoeconomic evidence highlighting cost offsets becomes increasingly important.

DB4

POSTPRANDIAL GLUCOSE CONTROL AND HEALTH CARE RESOURCE UTILIZATION

Pfeiffer KM[1], Sandberg A[2], Buchs S[2], Nikolajsen A[2], Brod M[1]
[1]*The Brod Group, Mill Valley, CA, USA,* [2]*Novo Nordisk A/S, Søborg, Denmark*

OBJECTIVES: Postprandial glucose (PPG) control is considered necessary to achieve recommended glycemic goals for people with diabetes, but there is yet limited research on the impact of PPG control on patients' daily lives and healthcare use. The purpose of the study was to investigate the association between PPG control and healthcare resource utilization among adults diagnosed with diabetes. **METHODS:** A web-based self-reported survey of adults with type 1 or type 2 diabetes, treated with basal and bolus insulins, was conducted in Italy, UK and USA. Recruiting targets ensured inclusion of respondents with differing levels of PPG control and PPG monitoring behavior. Average highest PPG was estimated from the two highest PPG values measured in the past week. Respondents were asked about resource use specifically related to having elevated PPG. Negative binomial regression analyses were used to predict healthcare resource use counts. Analyses controlled for demographic characteristics, duration of diabetes and diabetes-related complications. **RESULTS:** Among respondents regularly measuring PPG (n=691), 5.5% reported having been hospitalized overnight in the past 12 months, 15.9% visited their healthcare practitioner (HCP) in the past 6 months and 15.1% called/emailed their HCP in the past 6 months, specifically related to elevated PPG. Respondents who regularly measured PPG experienced elevated PPG an average of 4.4 times (SD, 4.9) per week, and mean average highest PPG in the past week was 11.9 mmol/L (SD, 4.0). On average, holding other variables at means, a one-mmol/L PPG increase was associated with significant increases in predicted rates of healthcare resource use related to elevated PPG: overnight hospitalizations, 14.4% ($p<0.001$); HCP visits, 14.1% ($p<0.001$); and HCP calls/emails, 12.3% ($p<0.001$). **CONCLUSIONS:** Inadequate PPG control is associated with increased healthcare resource utilization, and additional education regarding PPG control may be helpful in efforts to improve diabetes management and reduce healthcare costs.

MEDICAL DEVICE AND DIAGNOSTICS STUDIES

MD1

COST EFFECTIVENESS OF THE LEFT ATRIAL APPENDAGE CLOSURE DEVICE COMPARED WITH ORAL ANTICOAGULANTS IN PATIENTS WITH NONVALVULAR ATRIAL FIBRILLATION

Falk LE[1], Wijeysundera HC[2], Sikich N[1], Dhalla I[1], Ng V[1]
[1]*Health Quality Ontario, Toronto, ON, Canada,* [2]*Sunnybrook Health Sciences Centre, Toronto, ON, Canada*

OBJECTIVES: To determine the cost-effectiveness of the left atrial appendage closure (LAAC) device compared with warfarin or novel oral anticoagulants (apixaban, dabigatran, rivaroxaban) in patients with nonvalvular atrial fibrillation (NVAF) from an Ontario, Canada, public payer perspective. **METHODS:** A microsimulation model was adapted to assess the cost-effectiveness of the LAAC device compared with apixaban, dabigatran, rivaroxaban, and warfarin over a lifetime horizon. Patients' baseline characteristics were obtained from an Ontario new onset atrial fibrillation cohort (n=35,143). The analysis incorporated CHA2DS2VASc and HAS-BLED risk scores to determine baseline risks of thromboembolic and hemorrhagic events. Treatment effects and adverse events for the LAAC device were obtained from the PROTECT AF and PREVAIL trials. Clinical event costs were primarily obtained from Ontario costing studies and adjusted to 2016 Canadian dollars. Monte Carlo simulation was preformed using 1,000 inner loops and 10,000 outer loops to determine the average base case incremental cost, incremental QALYs, and incremental cost-effectiveness ratio of the LAAC device relative to the oral anticoagulant alternatives. Deterministic, probabilistic, and scenario-based sensitivity analyses were performed to examine uncertainty in the results. **RESULTS:** Over a lifetime horizon, the LAAC device was not cost-effective (ICER: $272,216/QALY) relative to warfarin and was dominated (higher costs, lower QALYs) by each apixaban, dabigatran, and rivaroxaban. In the majority of sensitivity analyses the device remained not cost-effective. The device was shown to be cost-effective relative to warfarin and rivaroxaban when a decreased risk of ischemic stroke for LAAC patients was examined. **CONCLUSIONS:** The LAAC device was not cost-effective relative to warfarin or novel oral anticoagulants in patients with NVAF. These value for money results ought to be considered when making funding recommendations concerning the adoption of this technology in the health care system.

MD2

COST EFFECTIVENESS OF PERCUTANEOUS CLOSURE OF A PATENT FORAMEN OVALE TO REDUCE THE RISK OF RECURRENT ISCHEMIC STROKE IN PATIENTS WHO HAVE HAD A CRYPTOGENIC STROKE DUE TO A PRESUMED PARADOXICAL EMBOLISM IN THE UNITED STATES

Tirschwell D[1], Marks D[2], Macdonald L[3], Smalling R[4], Carroll JD[5], Gu NY[6], Koullick M[7], Saver J[8], Thaler D[9]
[1]*Harborview Medical Center, Seattle, WA, USA,* [2]*Medical College of Wisconsin, Milwaukee, WI, USA,* [3]*South Denver Cardiology Associates, P.C., Littleton, CO, USA,* [4]*University of Texas Houston, Houston, TX, USA,* [5]*University of Colorado School of Medicine, Aurora, CO, USA,* [6]*Abbott, Sylmar, CA, USA,* [7]*Abbott, Plymouth, MN, USA,* [8]*UCLA School of Medicine, Los Angeles, CA, USA,* [9]*Tufts Medical Center, Boston, MA, USA*

OBJECTIVES: FDA has recently approved a first percutaneous patent foramen ovale (PFO) occluder indicated for transcatheter closure of a PFO to reduce the risk of recurrent ischemic stroke in patients who have had a cryptogenic stroke due to a presumed paradoxical embolism. The objective of this study was to evaluate the cost-effectiveness of this therapy compared with medical therapy in the US. **METHODS:** A Markov cohort model consisted of 4 health states (stable state, post mild and moderate acute recurrent stroke state, and death) was developed to simulate the projected clinical and economic outcomes based on US payer perspective. Event rates were extracted from a randomized clinical trial (RESPECT) with a median 5.9 years follow-up. Health utilities and direct medical costs were obtained from the published sources. One-way, probabilistic sensitivity and scenario analyses were performed to assess the robustness of the model. Monte Carlo simulations were used to estimate the 95% confidence intervals (CI) of the modeled outcomes. The model took a lifetime horizon, discounted at 3% and reported in 2016 dollars. **RESULTS:** Compared with medical therapy alone and using the commonly accepted willingness-to-pay (WTP) threshold of $50,000, PFO closure reached the cost-effectiveness in less than 3 years (year 2.684). The cost-effectiveness ratios (ICERs) at year 3, 6 (the median trial followup) and 10 were: $44,335 (95%CI: $35,295-$54,803), $20,996 (95%CI: $16,139-$26,487) and $12,110 (95% CI: $8,824-$15,737), respectively, per each quality-adjusted life-year (QALY) gained. Cost-effectiveness acceptability curve indicated 85.3% probability that the ICERs would be lower than the WTP threshold at year 3 and 100% after year 3. Sensitivity analyses showed that the model was robust. **CONCLUSIONS:** In carefully selected young to middle-aged patients with PFO and history of a cryptogenic ischemic stroke, percutaneous PFO closure therapy is cost-effective in the long term compared to medical therapy alone in the context of US healthcare system.

SPINAL CORD STIMULATION INFECTION RATE AND RISK FACTORS: RESULTS FROM A US PAYER DATABASE

Falowski SM[1], Provenzano DA[2], Xia Y[3], Doth AH[3]
[1]*St. Luke's University Health Network, Bethlehem, PA, USA,* [2]*Pain Diagnostics and Interventional Care, Sewickley, PA, USA,* [3]*Medtronic Inc., Minneapolis, MN, USA*

OBJECTIVES: Surgical Site Infections can result in significant negative clinical and economic outcomes. The objectives of this study are to define the infection rate for SCS implants, to identify patient characteristics that increase the risk for SCS

infection. **METHODS:** Data from the Truven MarketScan® Commercial Claims and Medicare Supplemental databases were used to identify patients with a SCS neurostimulator generator implant during the calendar years 2009–2014. Patients were continuously enrolled for at least 12-months before generator implant. Kaplan-Meier curves were conducted to compare the SCS infection rates between the initial implant group and the replacement implant group. COX proportional hazard regression was performed to characterize the risk factors for SCS infection based on patient demographics, common comorbidities, and other clinical characteristics. **RESULTS:** A total of 13,214 patients were identified. The SCS infection rates were 3.15% in the initial group and 2.96% in the replacement group at the end of 1 year after SCS generator implants. The result of log-rank test showed the difference of infection rates between two groups was not statistically significant (p-value=0.7916). Risk factors for SCS infection included a comorbidity of lumbar disk disease (Hazard Ratio (HR), 1.302; 95% CI: 1.015-1.671; p-value=0.0381) as well as a history of prior all-cause infection (HR, 1.770; 95% CI: 1.342-2.336; p-value <0.0001). In addition, elderly patients were less likely to have a SCS infection (HR, 0.974; 95% CI: 0.962-0.986; p-value <0.0001). **CONCLUSIONS:** The approximate 3% device-related infection rate within 12-months of SCS implant determined from a large administrative database further emphasizes the need for improvement in SCS infection control practices. Based on these results, research is warranted on methods to limit SCS infection rates in patients with a lumbar disk disease or a history of prior all-cause infection. Further research is needed to evaluate these patient factors in a prospective manner for SCS.

MD4

COMPARISON OF ECONOMIC AND CLINICAL OUTCOMES BETWEEN THE DERMABOND® PRINEO® SKIN CLOSURE SYSTEM AND SKIN STAPLES IN PATIENTS UNDERGOING KNEE REPLACEMENT IN REAL WORLD CLINICAL PRACTICE

Johnston SS[1], Sutton N[2]
[1]Johnson & Johnson Co., New Brunswick, NJ, USA, [2]Ethicon Inc., Somerville, NJ, USA

OBJECTIVES: To compare economic and clinical outcomes between patients undergoing knee replacement with use of the DERMABOND® PRINEO® Skin Closure System vs. skin staples. **METHODS:** Retrospective, observational study using the Premier Hospital Database. Patients (aged ≥18 years) selected for study had an elective hospital admission, with discharge occurring between 1/1/2012-9/1/2015, carrying primary ICD-9-CM procedure and diagnosis codes for knee replacement and osteoarthritis (first qualifying=index admission). Patients were classified into two mutually-exclusive groups based on billing records during the index admission: those with billing record(s) for use of PRINEO (PRINEO group); those with billing record(s) for skin staples (staple group). Primary outcomes were index admission's length of stay (LOS), total hospital costs, and discharge status (skilled nursing facility [SNF]/other vs. home/home health care); exploratory outcomes included operating room time (ORT) during index admission and 30, 60, and 90-day readmissions. The PRINEO and staple groups were propensity score matched (1:1/nearest neighbor/caliper=0.10) on patient, hospital, and provider characteristics. Multivariable regressions accounting for hospital-level clustering after matching were used to compare outcomes between study groups. **RESULTS:** Each group comprised 971 patients (1,942 total patients; mean age=65.3y; % females=63.5%). The groups were generally well-balanced on matching covariates: mean standardized difference calculated across 49 covariates=0.049. Compared to the staple group, the PRINEO group had statistically significant: shorter LOS (2.8d vs. 3.2d, P=0.002), lower probability of discharge to SNF/other vs. home/home healthcare (26.4% vs. 38.5%, P=0.011), and lower probability of 30, 60, and 90-day readmissions (30-day, 1.8% vs. 4.4%, P=0.006; 60-day, 3.0% vs. 5.4%, P<0.001; 90-day, 5.4% vs. 7.4%, P=0.016). Differences between the groups for other outcomes were not statistically significant. **CONCLUSIONS:** Among patients undergoing knee replacement in real world clinical practice, use of PRINEO vs. skin staples was associated with shorter LOS, less resource intensive discharge status, and lower probability of readmission.

COST-EFFECTIVENESS STUDIES

CE1

COMPARATIVE COST-EFFECTIVENESS OF EARLY-STAGE BREAST CANCER TREATMENTS IN THE ELDERLY

Ali AA[1], Xiao H[2], Tawk RH[3], Campbell ES[4], Semykina A[5], Montero AJ[6], Diaby V[1]
[1]Florida A & M University, Tallahassee, FL, USA, [2]University of Florida, Gainesville, FL, USA, [3]Florida A&M University, Tallahassee, FL, USA, [4]Florida A&M University, Tallahasse, FL, USA, [5]Florida State University, Tallahassee, FL, USA, [6]Cleveland Clinic, Cleveland, OH, USA

OBJECTIVES: The aim of this study was to assess the comparative cost-effectiveness of breast-conserving surgery plus hormonal therapy with or without radiotherapy in the United States (US). **METHODS:** The study was conducted according to a US Centers for Medicare and Medicaid Services (CMS) perspective and an eight-year time horizon. Cost data were expressed in 2015 US dollars while clinical benefits were expressed in terms of quality-adjusted life years (QALYs). Both costs and QALYs were obtained from retrospective studies using the Surveillance, Epidemiology, and End Results linked with Medicare (SEER-Medicare) and Medicare Health Outcomes Survey (SEER-MHOS) as data sources respectively. The incremental cost-effectiveness ratio (ICER) of the addition of radiotherapy to hormonal therapy versus hormonal therapy alone, after breast conserving surgery (BCS), was estimated. Willingness-to-pay (WTP) thresholds were used to establish the cost-effectiveness of these treatments. Sensitivity analyses were conducted through the application of the bootstrapping method to calculate confidence intervals around the ICER estimate. **RESULTS:** The results of our analysis indicated that the addition of radiotherapy to hormonal therapy after BCS yielded the highest clinical benefits (3.88 QALYs) and costs ($25,246.06) compared to its hormonal therapy alone after BCS (3.52 QALYS; $9,345.92). As a consequence, the ICER was estimated to be $44,167.06 per QALY gained. Sensitivity analyses did not change the direction of the findings of this study. **CONCLUSIONS:** The results of our study has an important implication that a WTP threshold of at least $44,167.06 needs to be adopted for the combination of radiotherapy and hormonal therapy to be cost-effective in the US.

CE2

LOCAL ANAESTHETIC WOUND INFILTRATION IN ADDITION TO STANDARD ANAESTHETIC REGIMEN IN TOTAL HIP AND KNEE REPLACEMENT: LONG-TERM COST-EFFECTIVENESS ANALYSES ALONGSIDE THE APEX RANDOMISED CONTROLLED TRIALS

Marques EM, Blom AW, Lenguerrand E, Wylde V, Noble S
University of Bristol, Bristol, UK

OBJECTIVES: The Arthroplasty Pain Experience (APEX) studies are two randomised controlled trials in primary total hip (THR) and total knee replacement (TKR) at a large UK orthopaedics centre (ISRCTN96095682, 29/04/2010). APEX investigated the effect of local anaesthetic wound infiltration (LAI), administered before wound closure, in addition to standard analgesia, on pain severity at 12 months. This article reports results of the within-trial economic evaluations. **METHODS:** Cost-effectiveness was assessed from the health and social care payer perspective in relation to quality adjusted life years (QALYs). Resource use was collected from hospital records and patient-completed postal questionnaires, and valued using unit cost estimates from local NHS Trust finance department and national tariffs. Missing data were addressed using multiple imputation chained equations. Costs and outcomes were compared per trial arm and plotted in cost-effectiveness planes. The economic results were bootstrapped incremental net monetary benefit statistics (INMB) and cost-effectiveness acceptability curves. One-way deterministic sensitivity analyses explored any methodological uncertainty. **RESULTS:** In both the THR and TKR trials, LAI was the dominant treatment: cost-saving and more effective than standard care. Using the £20,000 per QALY threshold, in THR, the INMB was £1,125 (95%BCI, £183 to £2,067) and the probability of being cost-effective was over 98%. In TKR, the INMB was £264 (95%BCI, -£710 to £1,238), with only 62% probability of being cost-effective. Considering an NHS perspective only, LAI was no longer dominant in THR, but still highly cost-effective, with an INMB of £961 (95%BCI, £50 to £1,873). **CONCLUSIONS:** Administering LAI is a cost-effective treatment option in THR and TKR surgeries. The evidence, because of larger QALY gain, is stronger for THR. In TKR, there is more uncertainty around the economic result, and smaller QALY gains. Results, however, point to LAI being cheaper than standard analgesia, which includes a femoral nerve block.

CE3

LONG-TERM COST-EFFECTIVENESS OF ADHERENCE TO ASPIRIN FOR SECONDARY PREVENTION OF CARDIOVASCULAR EVENTS

Djatche L[1], Varga S[1], Liebertal R[2]
[1]Thomas Jefferson University, Philadelphia, PA, USA, [2]University of Tennessee, Knoxville, TN, USA

OBJECTIVES: Adherence to antiplatelet medications for secondary prevention of cardiovascular (CV) events remains suboptimal. The aim of this study is to determine the clinical and economic implications of aspirin non-adherence in patients with prior primary CV events. **METHODS:** We developed a Markov model to estimate the cost-effectiveness of aspirin adherence from a payer perspective over five-year time horizon. The costs and rates of non-fatal events including adverse events, peripheral arterial disease-related amputation, myocardial infarction (MI) and stroke were gathered from published literature to populate the model. We applied the model separately to a low risk population with no comorbidities (low-risk model) and a high risk population with type II diabetes (high-risk model). The outcome was incremental cost-effectiveness ratio (ICER) measured as cost ($) per quality adjusted life year (QALY). A one-way sensitivity analysis was done to determine the stability of our results, and a tornado diagram was used to determine parameters that will highly affect our results. **RESULTS:** Adherent patients lived 0.25 and 0.36 QALY longer than non-adherent patients in the low-risk model and high-risk model, respectively. Adherence to aspirin had an ICER of $25 per QALY in the low risk population, while adherence to aspirin saved $2,303 in the high risk population. Our results were more sensitive to alteration of parameters in the low-risk model compared to the high-risk model. The two models were highly sensitive to the rates of non-fatal events in non-adherent and adherent patients. A higher event rate in the non-adherent population significantly impacted the models. **CONCLUSIONS:** This analysis demonstrates that aspirin adherence is a cost-effective strategy for promoting CV health, potentially cost saving outcomes for patients with comorbid conditions. While additional research is needed to validate these results in a clinical setting, payers may need to increase the use of strategies to promote adherence.

CE4

HEALTH ECONOMIC IMPACT OF A 17-GENE PANEL PREDICTING AGGRESSIVE DISEASE IN MEN WITH NEWLY DIAGNOSED PROSTATE CANCER

Sarle R[1], Kirsh G[2], Kassabian V[3], Lu R[4], Mega M[4], Shindel AW[4], Febbo P[4], Kemeter M[4], Westerman C[2], Lowentritt B[5]
[1]Michigan Institute of Urology, Dearborn, MI, USA, [2]The Urology Group, Cincinnati, OH, USA, [3]Georgia Urology, Atlanta, GA, USA, [4]Genomic Health Inc, Redwood City, CA, USA, [5]Chesapeake Urology, Towson, MD, USA

OBJECTIVES: Active Surveillance (AS) is increasingly recommended as a viable management option for many patients with clinically low risk prostate cancer (PCa). Genomic testing assesses tumor biology, provides an independent and

individualized risk assessment, and has the potential to optimize care. Here, we assessed the economic impact of genomic testing by assessing the influence of a 17-gene panel (Oncotype DX® Genomic Prostate Score™, GPS) on treatment selection and healthcare costs in patients with NCCN Very Low, Low, and Intermediate risk PCa. **METHODS:** We conducted a chart based analysis for 1087 men with NCCN Very Low, Low, and Intermediate risk PCa managed in four large urology practices (LUP). Shared treatment decisions, with GPS testing, were captured through electronic health records from May 2014 through July 2016. Active Surveillance (AS) was defined as documented AS or lack of treatment documentation within six months of prostate cancer diagnosis. We estimated economic outcomes using peer-reviewed and published cost numbers from baseline (untested) and tested patients from a fifth LUP. **RESULTS:** Baseline (untested) practice patterns in the LUP from which cost data was available included 32% of men following AS, 37% receiving Radical Prostatectomy (RP) and 29% Radiation Therapy (IMRT). In the 5 LUPs with GPS testing, AS, RP and RT were utilized by 59%, 20% and 9% of patients, respectively. In these practices, utilization of GPS was calculated to result in a total savings of $5.574M ($5,128 per-patient) over the first 180 days post-diagnosis, including GPS list price. We estimate that a 2M member commercial payer that tests all appropriate localized PCa patients with GPS would result in approximately $4.5M in savings. **CONCLUSIONS:** In this economic assessment, using real-world cost data and GPS guided treatment selection, we project that GPS utilization would decrease direct healthcare spend through appropriate treatment selection for clinically low-risk PCa patients.

CARDIOVASCULAR STUDIES

BIOLOGICAL AND PSYCHOSOCIAL RISK FACTORS OF STROKE IN AFRICAN AMERICANS ENROLLED IN THE JACKSON HEART STUDY

Nunna S[1], Yang Y[1], Banahan III B[2], Carithers T[1], Khanna R[3]
[1]*University of Mississippi, University, MS, USA,* [2]*Center for Pharmaceutical Marketing and Management, University of Mississippi, University, MS, USA,* [3]*Johnson & Johnson Co., New Brunswick, NJ, USA*

OBJECTIVES: To examine the impact of biological, psychosocial and other socio-economic risk factors on incident stroke and to estimate the population attributable risk (PAR) of factors associated with stroke in African Americans enrolled in the Jackson Heart Study (JHS). **METHODS:** This is a nested case-control study of a cohort of African Americans enrolled in the JHS. Cases were patients with incident stroke during a 10 Year follow up period. Five controls were selected for each case using incidence density sampling and matched with cases on person-years spent in the cohort. Odds ratios (OR) and PARs were calculated to understand the impact of different risk factors on incident stroke. **RESULTS:** From a cohort of 5,302 patients, 129 cases of incident stroke and 590 controls were identified. Hypertension and diabetes were found to be the two strongest risk factors of stroke, with an OR of 1.8 (95% CI 1.1 - 3.1) for hypertension and 1.7 (95% CI 1.1 - 2.7) for diabetes, followed by the Framingham stroke risk score, where the risk of stroke increased by 4% for every 1% increase in the Framingham stroke risk score (OR 1.04, 95% CI 1.01 - 1.08). Psychosocial risk factors including depression (OR 0.7, 95% CI 0.4-1.2), stress (OR 0.9, 95% CI 0.9-1.0), and major life events (OR 1.0, 95% CI 0.9-1.1), were not significantly associated with incident stroke in this population. The overall PAR for biological and psychosocial risk factors combined accounted for 77.5% of incident stroke. **CONCLUSIONS:** African Americans with hypertension and diabetes were at a higher risk of developing stroke. However, findings on the association between depression and stroke were somewhat inconsistent with previous JHS studies due to the way depression was measured.

CV2

ECONOMIC EVALUATION OF ALTERNATIVE ANTICOAGULANT DRUGS FOR THE PREVENTION OF STROKE AMONG 65-YEAR OLD ATRIAL FIBRILLATION PATIENTS IN TAIWAN

Liao C, Lee M
Chimei medical center, Tainan, Taiwan

OBJECTIVES: Atrial fibrillation (AFib) patients have a higher risk of ischemic stroke and anticoagulants are widely used in stroke prevention. Recently, three new oral anticoagulant drugs (NOACs) have been made available in Taiwan (Apixaban, Dabigatran, and Rivaroxaban). This study aims to calculate the cost-effectiveness of them, comparing to Warfarin, in 65-year old patients with AFib from a perspective of Taiwan national healthcare insurance (NHI). **METHODS:** A Markov model, Monte Carlo simulation, and sensitivity analyses were used to assess the costs and quality-adjusted life years (QALYs) of the three NOACs and Warfarin in a Taiwanese setting. All parameters populated were obtained from the literature review and NHI database. The thresholds of the willingness to pay (WTP) at 1 and 3 times GDP per capita ($22,288 and $66,864) were used to assess the cost-effectiveness. **RESULTS:** In a base-case analysis, Rivaroxaban produced the most QALYs at 10.32, followed by Apixaban (9.97), Dabigatran (9.26), and Warfarin (8.91). Warfarin had the fewest costs at $30,251; Rivaroxaban cost the most at $65,665, followed by Dabigatran ($52,991) and Apixaban ($48,223). The costs per QALY gained for each NOAC (Apixaban, Dabigatran, and Rivaroxaban) versus Warfarin were $16,954, $64,931, and $25,116. Dabigatran was dominated by Apixaban and the ICER (Rivaroxaban versus Apixaban) was $49,834. In a Monte Carlo probabilistic sensitivity analysis, Apixaban, Dabigatran, and Rivaroxaban were cost-effective in 36.8%, 13.4%, 36.2% of $22,288, and 31.3%, 15.2%, 48.1% of $66,864. **CONCLUSIONS:** From a Taiwan NHI perspective, if affordable, and the WTP threshold is at least 1 x GDP per capita ($22,288) per QALY gained, Apixaban would be preferred to Warfarin. However, if decision-makers are willing to pay up to 2.25 x GDP per capita ($50,000) per QALY gained, then Rivaroxaban would be the optimal replacement for Warfarin in the Taiwanese setting.

CV3

A HIGH PERCENTAGE OF NEWLY INITIATED DIRECT ORAL ANTICOAGULANT USERS SWITCH BACK TO TRADITIONAL THERAPY

Manzoor BS[1], Lee TA[1], Sharp L[1], Galanter WL[1], Walton SM[2], Nutescu EA[1]
[1]*University of Illinois at Chicago, Chicago, IL, USA,* [2]*University of Illinois at Chicago, Chicago, MA, USA*

OBJECTIVES: The objective of this study is to evaluate patterns of prescription switching in atrial fibrillation (AF) patients initiated on a direct oral anticoagulant (DOAC) and previously naïve to anticoagulation (AC) therapy. **METHODS:** Data was obtained from Truven Health MarketScan® Commercial and Medicare Supplemental Databases from January 1, 2009 to December 31, 2013. AC naïve (those without prior anticoagulant use) AF patients initiated on a DOAC, with 6 months of continuous health plan enrollment before and after index date and maintained on continuous therapy for a minimum of 6 months were included. **RESULTS:** A total of 34,022 AC naïve AF patients initiating a DOAC were included. Of these, 6,613 (19.4%) patients switched from an index DOAC prescription to an alternate anticoagulant and 27,409 (80.6%) remained on the DOAC (age: 68.5±11.7 vs. 67.1±12.7 years, $p<0.001$; males: 3,781 (57.2%) vs. 17,160 (62.6%), $p<0.001$, respectively). A majority of patients received dabigatran as their index DOAC (N=23,521; 69.1%), followed by rivaroxaban (N=9,875; 29.0%) and apixaban (N=626; 1.8%). Amongst those that switched their medication, 3,196 (48.3%) did so within the first 6 months of therapy and 4,574 (69.2%) within the first 12 months. Overall, 2,945 (44.5%) patients switched to warfarin, 2,912 (44.1%) switched to another DOAC and 756 (11.4%) switched to an injectable anticoagulant. The highest proportion of patients switched from dabigatran to warfarin (N=2,320; 35.1%) or rivaroxaban (N=2,252; 34.1%). The median time to switch to another DOAC was 309.5 days vs. 128.0 days ($p<0.001$) to switch to warfarin. **CONCLUSIONS:** In AF patients newly initiated on DOAC therapy, one in five patients switch to an alternate anticoagulant and one of every two patients do so within the first six months of therapy. Switching from an initial DOAC prescription to traditional anticoagulants occurs as frequently as switching to an alternate DOAC. Further investigation is warranted to assess the potential causes of switching.

CV4

WHY HAVE WE BEEN DYING LESS FROM CORONARY HEART DISEASE IN THE UNITED STATES?

Guo H[1], Cutler D[2], Gaziano T[2], Weinstein M[2], Pandya A[2]
[1]*University of Chicago, Chicago, IL, USA,* [2]*Harvard University, Boston, MA, USA*

OBJECTIVES: To replicate a widely cited Ford et al. study (NEJM 2007) that concluded that the decline in CHD mortality in the U.S. between 1980-2000 could be equally attributed to: (1) medical therapies; and (2) changes in CHD risk factors outside of medical therapies. Our replication corrected for one element that could affect (2) above: changes in CHD-related medication rates from 1980-2000. **METHODS:** Ford et al. used average changes in blood pressure and cholesterol in untreated populations to estimate the total deaths prevented or postponed (DPP) from these risk factor reductions outside of medical therapy. However, treatment rates increased from 1980-2000, so it is possible that reductions in average blood pressure or cholesterol among untreated individuals were (at least partially) an artifact of this methodological approach. We adjusted for changing treatment rates by adding back systolic blood pressure (18.8 mmHg) and LDL cholesterol (1.09 mmol/L) to some (for blood pressure) or all (for cholesterol) treated individuals (treatment rates of 18.3% and 7.7%, for blood pressure and cholesterol, respectively) in 2000 to approximate treatment rates in 1980 (6.0% and 0%, respectively). Otherwise, we used the same methods and data sources, such as individual-level data from the National Health and Nutrition Examination Study, as Ford et al. **RESULTS:** In our replication, we estimated total DPP of 236,728 between 1980-2000, with 159,330 (66.3%) attributable to medical therapies and 81,092 (33.7%) from risk factor changes outside of medical therapies. Results were sensitive to assumptions around the levels of blood pressure and cholesterol added back to treated individuals in 2000. **CONCLUSIONS:** After correcting for changes in treatment rates, approximately two thirds of the decline CHD mortality in the U.S. from 1980-2000 could be attributed to medical therapies, with changes in risk factors outside of medical therapies accounting for one third of the CHD mortality decline.

MEDICATION ADHERENCE STUDIES

AD1

EXPLORING LENGTH OF THERAPY AND FACTORS ASSOCIATED WITH HIV PRE-EXPOSURE PROPHYLAXIS MEDICATION ADHERENCE USING PHARMACY CLAIMS DATA

Hazen R, Hou JG, Kirkham H, Pietrandoni G, Delpino A
Walgreen Co. Member of Walgreens Boots Alliance, Deerfield, IL, USA

OBJECTIVES: To characterize use of once-daily emtricitabine and tenofovir disoproxil fumurate for HIV pre-exposure prophylaxis (PrEP) by examining length of therapy, gaps in therapy, and adherence using real-world pharmacy claims data. To examine factors associated with PrEP adherence, including demographic variables and use of Walgreens HIV specialized pharmacies (HIV-sp), which support adherence through personalized medication adherence counseling. **METHODS:** We

conducted a retrospective cohort study using Walgreens prescription pharmacy claims data. A random sample of PrEP users from calendar years 2013 to 2016 were included if they filled a PrEP prescription for >=90 days in the index year. Patients were excluded if they had evidence of combined ARV therapy during the study period. Average length of therapy and the proportion of patients with gaps in therapy were calculated. Medication adherence, measured as proportion of days covered (PDC), was calculated and analyzed by demographic variables and use of HIV-sp. **RESULTS:** On average, patients used PrEP for 157 days consecutively without gaps; 55.6% of users had a >7 day gap in consecutive days of PrEP coverage during the index year. The mean PDC was .88 and 64.0% of users achieved high adherence (PDC>=90%). HIV-sp users were more likely than non-HIV-sp users to be highly adherent (OR=1.39, 95% CI: 1.27–1.52, p<.0001). Those 50 or older were 2.70 times more likely to be highly adherent than those 18-24 years old (CI: 2.34-3.14, p<.0001). Women were less likely to be highly adherent than men (OR=0.67, CI: 0.56-0.80, p<.0001) as were urban vs. rural PrEP users (OR=0.86, CI: 0.77-0.95, p=.0052). **CONCLUSIONS:** PrEP adherence was significantly associated with age, gender, store type, and urban-rural MSA. These results highlight the importance of adherence counseling among specific populations and illustrate differences in adherence by service setting. Future research should investigate improved methods for calculating adherence and length of therapy for PrEP.

AD2

FREE MEDICATIONS: A SYSTEMATIC REVIEW OF THE EFFECT OF ZERO COST SHARING ON ADHERENCE TO THERAPY

Moran KM, Jun D, Lai T, Petrosius P, Takouam D, Touchette DR
University of Illinois at Chicago, Chicago, IL, USA

OBJECTIVES: Behavioral economic studies have suggested that people may place lower value on free goods, an argument used to justify copayments or coinsurance by insurers. The purpose of this study was to examine the effect of zero cost sharing compared to usual cost sharing on medication adherence or persistence. **METHODS:** A systematic literature review was performed using Medline, EMBASE, CINAHL, IPA, Cochrane Library, Scopus, Web of Knowledge, PsychINFO, and Clinicaltrials.gov. Included original articles were English language comparative studies with cost as the main exposure. Each article was assessed by two independent reviewers; disagreements were resolved by consensus. Data on study design, population, intervention, adherence/persistence outcomes, and study quality were abstracted. **RESULTS:** The search identified 1941 unique records meeting preliminary inclusion; 19 articles met full inclusion criteria representing 16 independent studies. Two studies were randomized controlled trials (RCTs) with superior methodological quality. Most studies were conducted in the United States and involved a payer-based program or intervention. Among studies using self-reported measures, zero cost sharing significantly decreased cost-related non-adherence, but only had a small negative effect on overall non-adherence. In observational studies, zero cost sharing was associated with sustained or small increases in adherence. Among the RCTs, zero cost sharing had a positive effect on adherence in one study with an insurance policy change, and no effect in one study with an incentive-based program. Overall, few studies evaluated the effect of zero cost sharing on adherence with high methodological quality. Increases in adherence were small and may be related to the program design and population demographics. **CONCLUSIONS:** No important differential zero price effect could be identified in this literature. Insurers should carefully consider that cost sharing may have a small negative impact on medication adherence, potentially impacting those with cost-related non-adherence most.

AD3

IMPACT OF MEDICATION ADHERENCE ON TOTAL MEDICAL COSTS

Panchal JM, Sathyanarayanan S, Dowling MG, Arvesen M
Cigna Health and Life Insurance Company, Bloomfiled, CT, USA

BACKGROUND: Existing literature suggests that medication adherence leads to lower health care utilization and reduced medical costs despite increased drug spending. While the impact of adherence on total medical costs is more pronounced in some conditions than in others, the consensus is that optimal adherence will reduce health care costs as well as improve health outcomes. **OBJECTIVES:** To estimate the impact of medication adherence on the total annual medical costs for chronic conditions in commercial health plan beneficiaries. **METHODS:** We examined the pharmacy and medical claims for beneficiaries who were continuously eligible in 2015 and with at least two prescriptions for at least one of the following conditions – Diabetes, Hypertension, Depression and Hyperlipidemia. Adherence was calculated using the interval-based Proportion of Days Covered (PDC) method. Generalized linear model with gamma distribution was utilized to examine the association between adherence and total medical costs while adjusting for the factors such as comorbid conditions, demographic, and socioeconomic characteristics. **RESULTS:** The study sample consisted of approximately 121,781 antidiabetic beneficiaries, 378,511 antihypertensive beneficiaries, 375,442 antidepressant beneficiaries and 307,650 antihyperlipidemics beneficiaries included after applying inclusion/exclusion criteria. On average, non-adherent beneficiaries have their average PDC in the 52%-55% range, while adherent beneficiaries have their average PDC around 92%-94%. For antidiabetics, antihypertensive and antidepressants classes, the average cost for non-adherent group was significantly higher than those in the adherent group (p<0.001) after controlling for demographic variables and comorbid conditions. On average there is a $100 - $150 PMPY TMC saving as adherence increases in antidepressants and antihypertensive drug classes. **CONCLUSIONS:** Improvement in adherence leads to cost savings in some therapeutic classes, and the savings vary depending on the demographic characteristics and comorbid conditions. Increasing adherence in cases where the medication costs are higher than the resulting visit rate at a hospital or emergency room may not save costs.

AD4

ADHERENCE TO DRUG THERAPY IN THE PATIENTS WITH CHRONIC KIDNEY DISEASE: A SYSTEMATIC REVIEW AND META-ANALYSIS OF OBSERVATIONAL STUDIES

Ahlawat R[1], D'Cruz S[2], Tiwari P[3]
[1]*National Institute of Pharmaceutical Education and Research (NIPER), S.A.S. Nagar, Punjab, India,* [2]*Government Medical College & Hospital (GMCH), Chandigarh, India,* [3]*National Institute of Pharmaceutical Education and Research (NIPER), S.A.S. NAGAR, Punjab, India*

OBJECTIVES: Medication non-adherence can lead to treatment failure; increased hospitalization, morbidity, and cost of care; and decrease patients' quality of life. The evidence on the medication adherence in the patients with chronic kidney disease (CKD) is lacking. The aim of the present systematic review is to evaluate the medication adherence in the patients with CKD. **METHODS:** Published literature was searched via PubMed, Cochrane library databases, Elsevier ScienceDirect, and Google scholar (from 1990 to Dec 2016). Further, relevant studies were found out by using reference list. Patients of all ages, gender, and diagnosed with CKD and/or on hemodialysis were included. Adherence was defined according to the questionnaires/scales/methods used in different studies. A funnel plot was used to assess the publication bias. Heterogeneity was assessed by using Cochrane Q an I2 statistics. Random effect model was used. **RESULTS:** A total of fifteen studies (prospective-5, retrospective-1, and cross-sectional-9) were included. Pill count (PC) was the most common used method followed by Morisky medication adherence scale (MMAS), self-reported questionnaire (SRQ), and others (5, 4, 3, and 3, respectively). Others include serum phosphate level, interdialytic weight gain, and simplified medication adherence questionnaire. The pooled prevalence of medication adherence was found to be 50.1% (95% Confidence Interval 41.6-59.9). Adherence in patients on 'medications' and 'medication with dialysis' was found to be 49.8% (95% CI37.9-61.8) and 52.5% (95% CI39.0-65.6), respectively. Medication adherence reported using PC was 48.7% (95% CI29.7-68.1); MMAS was 33.4% (95% CI14.6-59.6); SRQ was 67.4% (95% CI49.2-81.6); and others was 59.4% (95% CI28.2-84.5). **CONCLUSIONS:** This systematic review demonstrated a poor medication adherence in the patients with CKD on 'medications' and 'medications with dialysis'. The 'pill count' was found to me most commonly utilized method. Steps to improve the medication adherence could be helpful in decreasing hospitalization, morbidity, and cost of care; and improving patients' quality of life.

PATIENT PREFERENCE STUDIES

PP1

COMPARISON OF PATIENT, ONCOLOGIST, AND ONCOLOGY NURSE PREFERENCES FOR ATTRIBUTES OF DRUG THERAPY IN ADVANCED MELANOMA

Liu FX[1], Witt EA[2], Ebbinghaus S[1], DiBonaventura Beyer G[2], Basurto E[2], Joseph RW[3]
[1]*Merck & Co., Inc., North Wales, PA, USA,* [2]*Kantar Health, Princeton, NJ, USA,* [3]*Mayo Clinic, Jacksonville, FL, USA*

OBJECTIVES: New treatments options are available for patients with advanced melanoma, which can vary in their efficacy, safety and dosing schedules. The objective of this study was to compare different stakeholder perspectives (patients, oncologists, and oncology nurses) on the importance of drug treatment attributes in advanced melanoma. **METHODS:** Online panels were used to conduct a series of discrete choice experiments (DCEs) in US-based patients, oncologists and oncology nurses. In a series of scenarios, respondents were asked to choose between two hypothetical treatments, each with 7 attributes: mode of administration, dosing schedule, duration of therapy (3, 8, and 12 months), objective response rate (ORR) (15%, 33% and 65% chance of response), progression free survival (PFS) (3, 5, and 11.5 months), overall survival (OS) (45, 55, and 75% survival to 12 months), and grade 3/4 toxicities/adverse events (AEs) (10%, 32%, and 55% likelihood). Each attribute had 3 levels except dosing schedule (8 levels). Bayesian logistic regression models were used to estimate preference weights. **RESULTS:** Participants included 200 patients with advanced melanoma, 226 practicing oncologists, and 150 oncology nurses. The relative importance estimates of attributes by oncologists, patients and nurses were, respectively, as follows: OS (34%, 33%, 28%), AEs (49%, 29%, 26%), ORR (12%, 25%, 27%), PFS (3%, 12%, 15%), dosing schedule (3%, 2%, 3%), median duration of therapy (0%, 0%, 0%), and mode of administration (0%, 0%, 0%). Oncologists significantly differed from nurses and patients in the weights assigned to ORR, PFS and AEs (p-values<0.001). **CONCLUSIONS:** Patients and nurses have similar views on the relative importance of treatment attributes for advanced melanoma, while oncologists assigned greater importance to AEs, and less importance to ORR and PFS. Future research could seek to qualify how these differences impact treatment selection.

PP2

CARER SOCIAL CARE-RELATED QUALITY OF LIFE OUTCOMES: ESTABLISHING PREFERENCE WEIGHTS FOR THE ADULT SOCIAL CARE OUTCOMES TOOLKIT FOR CARERS

Batchelder L[1], Saloniki E[1], Malley J[2], Burge P[3], Lu H[3], Forder J[1]
[1]*University of Kent, Canterbury, UK,* [2]*London School of Economics and Political Science, London, UK,* [3]*RAND Europe, Cambridge, UK*

OBJECTIVES: There is an increasing interest in how well informal carers are supported within their caring role. When assessing support, it is important to consider informal carer's quality of life. The Adult Social Care Outcomes Toolkit for Carers (ASCOT-C) was developed and validated to capture the effect of social care on the quality of life (QoL) of informal carers. One objective when developing the ASCOT was that it could be preference weighted for use in economic evaluation. Currently there is no set of preference weights established for the

ASCOT-C. The aim of this study was to generate a set of preference weights for the ASCOT-C. **METHODS:** An online survey was developed, which included the Best-Worst Scaling task (BWS) to elicit preferences for ASCOT-C QoL states. The BWS task was based on a fractional-factorial design, consisting of 32 tasks, which were blocked into four segments. The online survey was administered to a representative sample of the general adult population in England (N = 1,000). Participants were asked to put themselves into the hypothetical state of being a carer and indicated which QoL situation they thought was the best and worst. Multinomial logistic regression was used to analyse the data. **RESULTS:** Results showed that participants rated having 'no control over their daily life' as the worst domain level of all those presented. The second lowest rated domain level was 'I don't do anything I value or enjoy' from the occupation domain. The most valued aspect by participants was the occupation domain at its highest level closely followed by the top level of control. Findings also showed that the position of the domains influenced participants' best and worst choices. **CONCLUSIONS:** This study has established a set of preference weights for the ASCOT-C. We reflect on the value of these weights for policy and practice.

PP3

PATIENTS' PREFERENCES OVER TREATMENT SIDE-EFFECTS REFLECT A LATENT "OPTIMISM" CHARACTERISTIC

Mukamel DB[1], Wenzel L[1], Ladd H[1], Osann K[1], Sparks L[2], Havrilesky L[3], Wright AA[4], Walker J[5], Robison K[6], Alvarez R[7], Van Le L[8], Wakabayashi M[9], Randall L[10], Wahi A[1], Hsieh S[11], Lipscomb J[12], Cohn D[13]

[1]*University of California, Irvine, Irvine, CA, USA,* [2]*Chapman University, Orange, CA, USA,* [3]*Duke University, Durham, NC, USA,* [4]*Dana-Farber Cancer Institute, Boston, MA, USA,* [5]*Stephenson Cancer Center, Oklahoma City, OK, USA,* [6]*Brown University, Providence, RI, USA,* [7]*Vanderbilt University, Nashville, TN, USA,* [8]*University of North Carolina, Chapel Hill, NC, USA,* [9]*City of Hope, Duarte, CA, USA,* [10]*University of California, Irvine, Orange, CA, USA,* [11]*VA Health Care Systems, Livermore, CA, USA,* [12]*Emory University, Atlanta, GA, USA,* [13]*The Ohio State University, Columbus, OH, USA*

OBJECTIVES: To identify a quantifiable, latent patient characteristic associated with a propensity to view the side-effects of chemotherapy treatment as minimally bothersome and to investigate its properties with respect to patient reported quality-of-life (QoL) and satisfaction with treatment choice. **METHODS:** 64 women diagnosed with stage 3 or 4 ovarian cancer (a rare cancer) were given access to a web-based decision-aid, which includes educational modules and a preference elicitation exercise, and is designed to help patients choose between routes of chemotherapy administration. Patients provided QoL data and preferences about side-effects before starting treatment. Preferences were measured using a visual analog scale for 4 side effects, each with 3 possible severity levels, for a total of 12 side-effect/severity dyads. Following chemotherapy choice, satisfaction with treatment choice was measured. Item response theory (IRT) was used to identify a latent "optimism" characteristic of patients based on their tendency to rank all side-effects/severities as likely to be either of little bother or a lot. Regression techniques were used to test the relationships between QoL, its component subscales, "optimism", and satisfaction with the treatment choice. **RESULTS:** Lower scores assigned by the IRT analysis indicate the patient's higher propensity to rank all side-effects/severities as of little concern. Sensitivity analysis suggested a score of 0.2 as the cut-off between "optimistic" and "non-optimistic" patients. Patients who had a higher QoL at baseline were found to be more "optimistic" (OR=1.06 $p<0.05$). "Optimism" had a large effect size (of about 0.75 standard deviation $p<0.001$) on being satisfied with the chemotherapy treatment choice. **CONCLUSIONS:** This study found that ovarian cancer patients exhibited consistent preferences over 12 side-effects/severities and that these are associated with other attitudes towards the disease. Further studies to evaluate this phenomenon for other cancer patients and with respect to other attitudes which may affect care, is indicated.

PP4

VALIDATION OF A QUESTIONNAIRE TO ASSESS PATIENT PERCEPTIONS OF INJECTION DEVICES FOR TYPE 2 DIABETES

Matza LS[1], Stewart KD[1], Paczkowski R[2], Currie BM[1], Yu R[1], Coyne KS[1], Boye KS[2]

[1]*Evidera, Bethesda, MD, USA,* [2]*Eli Lilly and Company, Indianapolis, IN, USA*

OBJECTIVES: Characteristics of injection devices used for administering medication for type 2 diabetes (T2D) could impact patient preference. Previous research has examined patient perceptions of insulin injection devices. However, a range of injectable medications other than insulin are now used to treat T2D. No patient-reported outcome (PRO) instruments have been developed taking into account the perceptions of patients using newer injection devices, which are often different from those used in the past. Therefore, the purpose of this study was to validate a new PRO instrument focusing on patients' experiences with injection devices, including those used for newer treatments such as GLP-1 receptor agonists. **METHODS:** Patients with T2D treated with non-insulin injectable medications were recruited via advertisements and six clinical sites in the US and completed the draft 20-item Diabetes Injection Device - Experience Questionnaire (DID-EQ) and additional measures administered for validity assessment. Analyses focused on item reduction (item performance, factor analysis, IRT), reliability, and validity. **RESULTS:** 142 patients (mean age = 63.0y; 56.3% female) participated. Item reduction yielded a 10-item version of the DID-EQ, including a 7-item device characteristics subscale and three global items assessing satisfaction, ease of use, and convenience of the injection device. The DID-EQ demonstrated good internal consistency reliability (Cronbach's alpha of device characteristics subscale = 0.80) and 7-day test-retest reliability (ICCs: 0.92 for device characteristics subscale; 0.65 to 0.91 for the three global items). Construct validity was demonstrated via correlations with previously validated instruments (e.g., correlations with the DTSQ treatment satisfaction subscale ranged from 0.56 to 0.60, all $p < 0.0001$; correlations with the TRIM-D Device ranged from 0.63 to 0.77, all $p < 0.0001$). **CONCLUSIONS:** This psychometric validation study supports the reliability and validity of the DID-EQ. This questionnaire may be useful in clinical trials and observational research assessing and comparing patient perceptions of injection devices.

THE POTENTIAL ECONOMIC VALUE OF DISEASE-MODIFYING TREATMENTS IN ALZHEIMER'S DISEASE: PATIENT-LEVEL SIMULATION OF PREDEMENTIA SYMPTOM TRAJECTORIES

Herring W[1], Keenan A[2], Mauskopf J[1], Michael T[3], Wiegand F[2]

[1]*RTI Health Solutions, Research Triangle Park, NC, USA,* [2]*Janssen R&D US, Raritan, NJ, USA,* [3]*Janssen Biotech, Inc., Horsham, PA, USA*

OBJECTIVES: Development efforts for disease-modifying treatments (DMTs) in Alzheimer's disease (AD) are increasingly focused on the predementia stages of the disease, where efficacy endpoints are less established and may include a combination of biomarker levels and more sensitive cognitive scales than are used in clinical practice. Demonstrating the economic value of DMTs indicated for the predementia stages of AD requires a modeling approach that translates these sensitive endpoints to long-term disease progression and AD dementia onset. **METHODS:** A natural history microsimulation model of AD was developed to generate lifetime patient-level trajectories for cognitive, behavioral, and functional symptoms for patients who are asymptomatic, at-risk for developing Alzheimer's dementia (ARAD), defined by elevated beta-amyloid levels but not yet meeting mild cognitive impairment due to AD criteria. A targeted literature review was conducted to estimate trajectories prior to AD dementia onset, after which published AD dementia trajectories were used. The natural history model was validated against published epidemiological studies and used to estimate the potential impact of DMTs for ARAD patients on clinical outcomes that drive costs in AD. **RESULTS:** Compared with natural history, a DMT for ARAD that reduces the rate of progression by 20-50% decreases the lifetime likelihood of AD dementia (29-38% vs. 43%) and AD-related institutionalization (11-17% vs. 21%). A DMT that halts progression for 5 years reduces the lifetime likelihood of AD dementia to 27% (12% institutionalization), with a further reduction to 17-23% (6-9% institutionalization) if the halt in progression is followed by a 20-50% reduction in progression rate. **CONCLUSIONS:** DMTs for ARAD have the potential to reduce progression to AD dementia and institutionalization and thus to reduce AD-related costs. Studies relating biomarker and sensitive cognitive endpoints to long-term progression patterns are essential, as the specific form of these relationships significantly influences the economic value of DMTs for ARAD.

MH2

HEALTH CARE UTLIZATION AND EXPENDITURES AMONG ADULTS WITH BIPOLAR DISORDER IN THE UNITED STATES

Sakharkar P[1], Senthil Kumar N[2], Chandewar A[3]

[1]*Roosevelt University College of Pharmacy, Schaumburg, IL, USA,* [2]*JKKMMRF College of Pharmacy, Komarapalayam, India,* [3]*P Wadhwani College of Pharmacy, Yavatmal, India*

OBJECTIVES: Bipolar disorder (BD) is a manic depressive illness that affects more than 5.7 million of the US adult population. The economic burden of BD in the US was estimated to be $45 billion in 1991. Increasing availability of novel and more expensive therapy for BD suggests a need of assessing healthcare utilization and treatment costs in current environment. The objective of this study was to estimate the healthcare utilization and total healthcare expenditures including inpatient healthcare cost, prescription drug cost, emergency room visit and outpatient cost among US adults with BD. **METHODS:** The Medical Expenditure Panel Survey (MEPS) data of 2008-2012 was used to identify patients with BD using International Classification of Diseases (ICD9-CM) codes. Adults aged 21 years or older were included in the analysis. Data were analyzed using STATA14 for descriptive statistics and differences using the Student t-test and Chi-square test. Regression analysis was performed to predict associations between demographic characteristics; healthcare utilization and healthcare expenditures. Expenditures were adjusted to 2016 US dollars using Consumer Price Index (CPI). **RESULTS:** The final sample consisted of 1729 adults with a mean age was 43.7 yrs. Majority of adults were non-Hispanic white (77%) and were female (67%). Patients had average 23 days of hospital inpatient stay, 1597 medical provider visits, 83 outpatient visits and 15 emergency room visits per year. The total annual healthcare expenditure was estimated to be $11839, which included $3238 of inpatient health care cost, $4026 of prescription drug cost, $473 of emergency room visit and $709 of outpatient cost. Gender and age was good predictor of high healthcare expenditures, prescription drug and outpatient costs ($p<0.05$). **CONCLUSIONS:** Treatment of bipolar disorder poses significant economic burden. Cost effective delivery of medical and psychiatric care is vital for patients with BD to reduce its economic burden on healthcare system and the society.

MH3

HOW WELL DO THE EQ-5D-3L AND 5L PERFORM IN ASSESSING CHANGES IN MENTAL HEALTH?

Crick K, Al Sayah F, Ohinmaa A, Johnson JA

School of Public Health, University of Alberta, Edmonton, AB, Canada

OBJECTIVES: To examine the performance of the anxiety/depression (A/D) dimension of the EQ-5D-3L and 5L in assessing changes (improvement vs.

deterioration) in mental health. **METHODS:** Data from two patient populations were used: 495 adults post-discharge from general internal medicine ward (EQ-5D-3L), and 225 type 2 diabetes patients who screened positive for depressive symptoms (EQ-5D-5L). Anchor-based approach along with effect sizes (ES) and ROC analysis were used. Anchors included Patient Health Questionnaire 9-items "PHQ9" and Generalized Anxiety Disorder 2-item questionnaire "GAD2" for EQ-5D-3L, and PHQ9 and SF-12 physical and mental composite summary scores (PCS, MCS) for EQ-5D-5L. A/D change was quantified as the difference between follow-up and baseline levels. **RESULTS:** For the EQ-5D-3L, ES of PHQ9 and GAD2 changes were larger for symptom improvement vs. deterioration (e.g., ES of PHQ9 worsening on A/D 2 levels =1.8 and for 2 level improvement=0.2). The A/D was useful in detecting changes in worsening depressive symptoms with an optimal cut-off point of 1 (C-index=0.61), but not for improving depressive symptoms or any change in anxiety. For the EQ-5D-5L, ES of PHQ9, PCS and MCS changes were larger for symptom improvement vs. deterioration (e.g., ES of PHQ9 worsening on A/D 2 levels =3.3 and for 2 level improvement =1.3). The A/D was useful in detecting changes in improving depressive symptoms with an optimal cut-off point of 1 (C-index=0.64), in worsening MCS with an optimal cut-off point of 1 (C-index=0.74), but not for worsening depressive symptoms, improving MCS, or any change in PCS. **CONCLUSIONS:** Although the A/D of both EQ-5D-3L and 5L was limited in capturing changes in mental health in these populations, the 5L was more responsive than the 3L. While the performance was better for depressive symptoms than anxiety, it varied by the direction of change. Further evidence in other populations using other measures of mental health is warranted.

MH4

DEPRESSION SCREENING AMONG OLDER ADULTS WITHOUT DEPRESSION IN AMBULATORY SETTINGS IN UNITED STATES

Bhattacharjee S[1], Goldstone L[1], Lee JK[2], Burke WJ[3]
[1]*The University of Arizona, Tucson, AZ, USA,* [2]*University of Arizona, tucson, AZ, USA,* [3]*Banner Alzheimer's Institute, Phoenix, AZ, USA*

OBJECTIVES: Objectives of this study were to examine national patterns and predictors of depression screening among older adults without a diagnosis of depression in the United States (US). **METHODS:** This study used a cross-sectional design utilizing pooled data from National Ambulatory Medical Care Survey (NAMCS, 2005-2013). The study sample consisted of ambulatory visits among older adults (age ≥ 65 years) without a depression diagnosis. Visits were excluded if they listed depression diagnosis using ICD-9-CM codes of 296.2-296.36, 300.4 or 311, or if the answer to the question "Regardless of the diagnoses written-does the patient now have: depression?" was "yes." Depression screening (yes/no) was the dependent variable for this study. Depression screening was identified by the variable "DEPRESS", which represented depression screening exam, from the NAMCS data. All analyses were adjusted for the complex survey design of NAMCS. Weighted percentages of visit estimates were reported in terms of descriptive statistics. Multivariable logistic regression analyses were conducted to examine predictors of depression screening among older adults without a depression diagnosis adjusting for predisposing, enabling and need factors. **RESULTS:** National depression screening rate was only 0.86% [95% Confidence Interval (CI), 0.7%-1.05%] of all ambulatory visits by older adults without depression. Physician specialty, metropolitan status, geographic region, and time spent with physician were significantly associated with depression screening. For example, receipt of depression screening was four times more likely during a psychiatrist visit [Odds Ratio=4.04; 95% CI, 1.60-10.23] and 50% less likely during a neurologist visit (OR=0.50, 95% CI, 0.26-0.97) compared to visits to other physician specialties. **CONCLUSIONS:** Depression screening remains low in ambulatory care settings for older adults without prior diagnosis of depression in the US. Given the high benefit of treatment and little to no harm of screening, healthcare providers should routinely screen older adults for depression.

RESEARCH ON METHODS STUDIES

RM1

LESSONS LEARNED IN IDENTIFYING RELAPSING-REMITTING MULTIPLE SCLEROSIS IN US INTEGRATED DELIVERY NETWORK HEALTH CARE CLAIMS AND ELECTRONIC HEALTH RECORD DATA

Le HV[1], Truong CT[2], Kamauu AW[3], Holmen JR[4], Fillmore CL[4], Sabidó-Espin M[5], Wong SL[6]
[1]*PAREXEL INTERNATIONAL, DURHAM, NC, USA,* [2]*MedCodeWorld, Mississauga, ON, Canada,* [3]*Anolinx LLC, Salt Lake City, UT, USA,* [4]*Intermountain Healthcare, Murray, UT, USA,* [5]*Merck KGaA, Darmstadt, Germany,* [6]*EMD Serono, Inc., Billerica, MA, USA*

OBJECTIVES: To develop and validate operational EHR- and claims-based algorithms for RRMS patient identification in a US Integrated Delivery Network (IDN) healthcare system. **METHODS:** IDN data (2010-2014) were queried for the study inclusion criteria: MS diagnosis, age ≥ 18 years, ≥ 1 year baseline history, and no other demyelinating diseases. The EHR-based algorithm used natural language processing (NLP). The claims-based algorithms were developed using (1) combinations of: MS diagnosis, specific symptoms during a neurology visit, disease modifying therapies (DMT), brain/spinal MRI; and (2) rule out progressive MS (P-MS) through: (option A) medications for P-MS; (option B) MS severity/progression from adapted Kurtzke Functional Systems Scores; and (option C) P-MS defined by Gilden, 2011. Random samples of NLP-based medical chart reviews were the "gold standard" for algorithm validation and positive predictive value (PPV) calculations. **RESULTS:** Of 3,111 MS patients identified, 2,960 (95%) were by claims-based, 990 (32%) by EHR-based, and 839 (27%) by both algorithms. RRMS was established in 2,213 (71%) patients overall. Of 2,960 claims-based, the three algorithm options identified 2,271 (77%) RRMS patients. Of 990 EHR-based patients, RRMS was identified in 837 (85%). An average 19.3 documents per patient were included for NLP-based chart review. The combined claims- and EHR-based algorithms had a PPV (95% CI) of 93% (82%-98%). The claims-based algorithms to identify RRMS had PPV (95% CI) of 88% (78%-94%), 89% (76%-95%), and 89% (79%-95%) for options A, B and C, respectively. **CONCLUSIONS:** Both the combined claims- and EHR-based and the claims-based algorithms had excellent PPV for identifying RRMS among patients with documented MS subtypes. Traditional medical chart reviews will support the NLP-based chart reviews, particularly for patients without clinical notes of MS subtypes. The claims- and EHR-based algorithms to identify RRMS and NLP-based chart reviews are promising methods for future research.

RM2

THE PSYCHOMETRIC EVALUATION OF THE CHINESE VERSION HEARTQOL QUESTIONNAIRE AMONG PATIENTS WITH ISCHEMIC HEART DISEASE IN CHINA

Luan L[1], Hu H[1], Oldridge N[2], Li SC[1]
[1]*University of Newcastle, Callaghan, NSW, Australia,* [2]*University of Wisconsin-Milwaukee, Milwaukee, WI, USA*

OBJECTIVES: This study evaluated the psychometric properties of the Chinese Mandarin HeartQoL Questionnaire (C-HeartQoL), an ischemic heart disease (IHD) specific health-related quality of life instrument, among Mainland Chinese patients with angina, myocardial infarction (MI) and heart failure (HF). **METHODS:** The English version HeartQoL questionnaire was translated into Chinese using the forward-backward translation approach. A cross-sectional study was then conducted in patients with angina, MI and HF using C-HeartQoL, SF-12, and HADS. Internal consistency reliability was evaluated. Convergent validity was assessed with Pearson correlations. Divergent validity was determined using age, gender, SF-12 general health status, HADS anxiety and depression, and functional status as predictor variables. **RESULTS:** In total, 406 IHD patients (angina=111; MI=150; and HF=145) were enrolled in China. Patients with MI (2.04 ± 0.72) had higher HeartQoL scores than patients with angina (1.99 ± 0.75) or heart failure HF (1.27 ± 0.83). Cronbach's α internal consistency reliability was ≥0.90. The correlations between the physical subscales and the emotional subscales in C-HeartQoL and SF-12 were strong ranged from 0.52 to 0.82. Higher HeartQoL scores were reported by younger than older patients and by male than female patients. Higher HeartQoL scores were observed consistently in patients reporting 'Excellent/very good' health status than by those reporting 'Good/fair' or 'Poor' status and by patients reporting 'Good/fair' health status than by patients with 'Poor' status and by patients without anxiety or depression than patients with anxiety or depression. Patients with functional class 'I/II' angina or heart failure had higher HeartQoL scores than patients classified as functional class 'III/IV'. **CONCLUSIONS:** The C-HeartQoL demonstrates good internal consistency reliability and construct validity in patients with IHD and in each diagnostic subgroup. The data support the use of the Chinese HeartQoL by researchers and clinicians to assess and compare health-related quality of life in Chinese patients with IHD.

RM3

USE OF MULTIPLE SURROGATE ENDPOINTS IN ADVANCED COLORECTAL CANCER

Elia E[1], Städler N[2], Ciani O[3], Taylor R[3], Bujkiewicz S[1]
[1]*University of Leicester, Leicester, UK,* [2]*F. Hoffmann-La Roche Ltd, Basel, Switzerland,* [3]*University of Exeter, Exeter, UK*

OBJECTIVES: Regulatory and reimbursement agencies increasingly base their decisions on surrogate outcomes especially if they can be measured early compared to the final clinical endpoint. Progression free survival (PFS) has been investigated as a surrogate endpoint for overall survival (OS) in advanced/metastatic colorectal cancer, however the outcome of these investigations has not been conclusive. In recent years, meta-analytic methods allowing for use of multiple surrogate endpoints jointly have been proposed. The aim of this research was to assess if PFS and response to treatment used jointly as surrogate endpoints to OS improve their predictive value. **METHODS:** Data were obtained from a systematic review of randomised control trials in advanced/metastatic colorectal cancer on effectiveness of pharmacological therapies (systemic chemotherapy (SC), anti-EGFR and antiangiogenic). Multivariate meta-analysis was used to model the association between treatment effect on both surrogate (PFS and response) and final (OS) endpoints, on all data and in subgroups of subclass therapy. **RESULTS:** Bivariate meta-analysis showed significant association between treatment effects on PFS and OS, which was only minimally improved in the trivariate analysis modelling the effect on two surrogate outcomes jointly. For subclass therapies, there was a moderate improvement in the association for SC, with increased precision by 9% of the regression coefficient between effects on OS and PFS, but not for the other two subclasses. Predicted treatment effects on OS were obtained with higher precision only for SC and antiangiogenics (reduction in uncertainty on average 1.7% and 2.4% respectively) when using both surrogates jointly. **CONCLUSIONS:** Joint use of two surrogate endpoints did not lead to much improvement in the association between treatment effects on surrogate and final endpoint but in some subclasses led to improved precision of the predicted effects on OS, likely due to the more accurate estimation of PFS when both surrogates were modelled jointly.

RM4

IDENTIFICATION OF PATIENTS WITH HIGH CARE CONTINUITY TO IMPROVE VALIDITY OF COMPARATIVE EFFECTIVENESS AND SAFETY RESEARCH USING ELECTRONIC HEALTH RECORDS

Lin KJ[1], Singer DE[2], Glynn RJ[1], Schneeweiss S[1]
[1]*Brigham and Women's Hospital and Harvard Medical School, Boston, MA, USA,* [2]*Massachusetts General Hospital and Harvard Medical School, Boston, MA, USA*

OBJECTIVES: Electronic health records (EHR) have been widely used for comparative effectiveness research. Care-discontinuity (i.e., receiving care outside of an

EHR system) was associated with substantial information bias when using EHR as the sole data source. We aimed to develop and validate a prediction score for having high care-continuity to reduce such bias. **METHODS:** Study cohort comprised all patients ≥ 65 in EHR from two large US provider networks linked with Medicare insurance claims data from 2007/1/1 to 2014/12/31. Based on the linked EHR-claims data, we measured care-continuity by the **M**ean **P**roportion of **E**ncounters **C**aptured (MPEC) by the EHR system. With predictors available in EHR, we built a prediction model for MPEC by Lasso regression, using the two EHR systems as training and validation set, respectively. Within deciles of predicted continuity, we quantified misclassification by **M**ean **S**tandardized **D**ifferences between the proportions of 40 key variables based on EHR alone vs. linked claims-EHR data (MSD_40_variables, <0.1 was used to indicate satisfactory variable classification). We compared patient characteristics in those with high vs. low predicted EHR continuity. **RESULTS:** Based on 104,403 patients in the training and 79,336 in the validation set, we developed a prediction score that was highly correlated with the measured care-continuity in both training and validation sets (Spearman correlation=0.81, 0.83, respectively). In the training set, MSD_40_variables (misclassification based on EHR alone) in the worst predicted continuity decile was 7.8 (95% confidence intervals 6.8-9.1) fold greater than that in the best predicted continuity decile. Those with top 20% predicted continuity were found to have satisfactory variable classification (MSD_40_variables<0.1) and comparable patient characteristics, compared to the rest of population. We found similar results in the validation set. **CONCLUSIONS:** Restriction to patients with high predicted care-continuity may reduce misclassification of key characteristics and improve validity of drug research relying exclusively on EHR.

HEALTH CARE USE & POLICY STUDIES

HEALTH CARE USE & POLICY STUDIES – Consumer Role in Health Care

PHP1

A GLOBAL ASSESSMENT OF THE ALIGNMENT OF VALUE BASED HEALTHCARE IN ORTHOPAEDICS USING DATA FROM THE ECONOMIST INTELLIGENCE UNIT

Tavare A, Jayakumar P
Oxford University, Oxford, UK

OBJECTIVES: Value-based healthcare (VBHC) is a patient-centric framework to improve performance in healthcare systems. Value is commonly defined as the health outcomes benefiting the patient over cost. The field of orthopaedics is well placed to introduce VBHC principles into practice given the high volume of discrete conditions and procedures. The aim of this study was to assess the alignment of VBHC in orthopaedics globally. **METHODS:** Data from the Economist Intelligence Unit (EIU) was used. EIU researched, assessed and scored 25 countries across a set of 17 original qualitative indicators (scored on an integer basis). These span four domains: enabling context, policy and institutions for value in healthcare; measuring outcomes and costs; integrated and patient focused care; and outcome based payment approached. **RESULTS:** (1) Most developed countries have moderate alignment with VBHC. Only Sweden emerges with very high alignment and the UK is the only country with high alignment. (2) Whilst India and China generally have similar results, they diverge strongly on health coverage: just 18% of India's population covered by some form of health insurance while in China more than 95% of the population is covered by public health insurance. (3) Strong policy support is generally found in wealthier countries, which helps the transition towards VBHC. (4) The advantage of bundled payments for co-ordinating care and focusing on the patient is increasingly being recognised. In six of the 25 countries assessed, one or more payers are implementing bundled payments. (5) Moving from fragmented single-provider-based care to co-ordinated, team-based care remains challenging. Many countries lack coordinated care pathways, which are not nationally standardised. **CONCLUSIONS:** Some countries are coming closer to aligning their health systems to the VBHC model, but the majority are still in the early stages. Often lower income countries have other priorities such as increasing access to basic health service and improving quality.

TRENDS IN PRESCRIPTION OPIOID MEDICATIONS: EMPIRICAL ANALYSIS OF MILLIGRAM MORPHINE EQUIVALENT PER DAY

Nguyen A, Doctor J
University of Southern California, Los Angeles, CA, USA

OBJECTIVES: Prescription opioids(POs) are often prescribed to those suffering pain. The United States is facing an epidemic, with an increasing number of overdose deaths each year1. This study looks at recent trends in POs, particularly milligram-morphine-equivalent-per-day(MME/day) prescribed and price elasticity of demand(PED) for MME/day. **METHODS:** Data from the Medical Expenditure Panel Survey(MEPS) was analyzed to examine recent trends in POs. This study looks at the last five years of available data(2010-2014) from the Prescribed Medicines files of MEPS. MME/day is calculated using the Centers for Medicare and Medicaid Services provided conversion factors. The length a patient has taken a medication(LPTM) is calculated from the survey round and panel data. PED for MME/day is estimated using self-reported out-of-pocket-pay (OOP). **RESULTS:** Throughout 2010-2014, there is an average of 59.1 MME/day for prescriptions, decreasing on average by -3.19 MME/day per year. Only 67.17% of patients receive prescriptions within the 50 MME/day threshold recommended by the Centers for Disease Control and Prevention(CDC)1. There was a similar proportion of prescriptions between 50 and 100 MME/day(16.35%) and greater than 100 MME/day(16.48%) found across all five years. Similarly, on average, there is almost no correlation between MME/day and LPTM(0.00048), however, there is an increasing trend in the correlation for every year (0.031 each year). There is a small but significant correlation between MME/day and OOP(0.087). The PED for MME/day is approximately 0.102 with a slight 0.013 average increase in elasticity each year. **CONCLUSIONS:** Many patients receive prescriptions well above the CDC threshold. As expected, POs are significantly inelastic. Despite the small upward trend in elasticity, OOP is unlikely to have an effect on demand for MME/day. This study shows that while there is progress in reducing the average MME/day, using OOP and LPTM may not be effective as methods to decrease the proportion of patients receiving POs over the CDC threshold. 1https://www.cdc.gov/drugoverdose/pdf/calculating_total_daily_dose-a.pdf

PHP3

OVER-THE-COUNTER MEDICATION USE AND DECISION-MAKING AMONG RESIDENTS OF SENIOR LIVING COMMUNITIES: A QUALITATIVE STUDY

Paliwal Y, Slattum P, Jones RM, Moczygemba L, Gendron T, Nadpara PA
Virginia Commonwealth University, Richmond, VA, USA

OBJECTIVES: Older adults are regular consumers of over-the-counter (OTC) medications. OTC medications are generally considered safe, and convenient to use without requiring a prescription. However, the safety of an OTC medication and the final health outcome depends in part upon consumers' perceptions and beliefs, and how they make decisions about OTC use. The primary objective of this study was to explore the knowledge, attitudes, beliefs and experiences about OTC medications among older adult residents of senior living communities. The secondary objective was to elicit the OTC decision-making process in this population. **METHODS:** Focus groups (N=10) were conducted at two senior living facilities in Richmond, Virginia. Overall, 80 people participated (7-8/group) in the 90-minute group discussion. A set of open-ended questions were asked to facilitate a rich discussion about OTC medication use and decision-making. All focus groups were recorded, transcribed verbatim, and analyzed qualitatively using NVivo software. **RESULTS:** Most participants considered OTC medications safe and effective to use, if following the drug-label instructions appropriately. Age and chronic health conditions were considered two important factors that might influence the safety and efficacy of OTC medications. Two major patterns of decision making about OTC purchase and use were identified: (1) Consumers actively look for different OTC options, compare them, and buy them to self-treat, or (2) Consumers, either base their decision on their previous experience or their physician's suggestion, buy the same OTC medications and use them consistently. Participants also reported using OTCs inappropriately and experiencing side effects. Aspirin was observed as the most abused OTC medication in this population. **CONCLUSIONS:** Older adult residents of senior living communities feel positive and satisfied with their OTC use, in general. Considering the self-reported abuse, and experiences of facing side effects, education focused toward older adults should be encouraged to aid in safe and responsible decision-making for self-medication with OTCs.

PHP4

ASSESSMENT OF SELF MEDICATION PRACTICES AMONG URBAN SRI LANKAN ADULTS

Ekanayake U, Silva N
International Institute of Health Sciences, Welisara, Sri Lanka

OBJECTIVES: To access the self-medication practices among urban Sri Lankan adults and their perception regarding self-medication. **METHODS:** A descriptive cross sectional study was done on 227 Sri Lankan Urban adults, who are over 20 years of age using convenient sampling using an online data collection form based on a questionnaire. **RESULTS:** Self-medication practices were reported by 69% of the surveyed respondents (n=227).Analgesics was reported as the most commonly used drug for self-medication (80.8%). Significant relationship between the educational level and the use of self-medication was observed (p=0.001). The relation between status of employment and the use of self-medication was significant (p=0.001). Majority of the respondents (68.6%) used the previous prescriptions given by a doctor to obtain drugs on their own, for a subsequent illness. The most commonly reported reason for self-medication practices was the insignificant nature of minor illnesses (59%).Inability to understand the instructions provided in the package insert of the drugs was reported by 67.1% of the respondents .35.5% of the respondents affirmed the efficacy of 'self-medication drugs' by marking 5 on a scale of 1-5, 5 being most positive. **CONCLUSIONS:** It was revealed that self-medication is a common practice among the Urban Sri Lankan population and a range of drugs are being used for this purpose. But the capability of the individuals to practice "responsible self-medication" was unsatisfactory so it is crucial to enforce the required regulations and strategies related to drug use and to raise awareness regarding potential implications of the same among the public.

PHP5

ATTITUDE TOWARDS BLOOD DONATION IN HUNGARY

Pakai A[1], Székelyné Farkas R[1], Csákvári T[1], Ferenczy M[2], Karácsony I[2], Brantmüller É[3], Boncz I[4], Endrei D[4], Oláh A[4]
[1]*University of Pécs, Zalaegerszeg, Hungary,* [2]*University of Pécs, Szombathely, Hungary,* [3]*University of Pécs, Kaposvár, Hungary,* [4]*University of Pécs, Pécs, Hungary*

OBJECTIVES: The willingness to donate blood in Hungary decreased gradually in the last decades. The aim of the study is to assess the practice, knowledge and attitude of donors' towards blood donation. **METHODS:** A cross-sectional, quantitative study with non-probability, convenience sampling was performed in Kecskemét between 2016. 07. 01 – 2016. 09. 31. All responders were between 18-65 years, and had a residence in Bács-Kiskun county (N=200). Responders who filled out less than 70% of the questionnaire ware excluded. The questionnaire

used in the study had questions about socio-demographic data; health status; locations, amount, frequency of blood donations; knowledge and attitude towards blood donations. For analysis we used SPSS 22.0. Besides descriptive statistics (mean, median, mode, standard deviation, frequency) we calculated Spearman correlation, Kruskall-Wallis test, Mann-Whitney U test, linear regsression, χ^2-test and ANOVA ($p<0,05$). SPSS 22.0 was used for calculation. **RESULTS:** Mean age of donors was 41.43 years (SD=11.27, min=18 years, max=65 years). Mean score of the knowledge test was 14.44±1.58 points (min=11, max=19). Socio-demographic data do not have an affect on knowledge, nor regularity of blood donations ($p>0.05$). Fear of needle, pain and infection shows a negative correlation with the number of donations. Low haemoglobin level is the most frequent reason to be excluded from donation. There is no connection between knowledge level and attitude towards blood donation ($p>0.05$). **CONCLUSIONS:** Based on our results we conclude the following: good cooperation with the donors are important; interests of young people must be increased; opportunity of donation on weekends and afternoons (after morning shift schedules) must be given; maintain people's motivation and expand knowledge about blood donation is necessary.

PHP6

NAVIGATING ACCOUNTABLE CARE AND OTHER PAYER-PROVIDER ORGANIZATIONS: AN ASSESSMENT OF EMERGING INSTITUTIONAL STAKEHOLDERS BEHIND VALUE-BASED HEALTHCARE TRANSFORMATION

Capuano C[1], Curran K[1], Yampolsky D[1], Bower D[1], Suponcic S[2]
[1]Navigant Life Sciences, Boston, MA, USA, [2]Navigant Life Sciences, Lawrenceville, NJ, USA

OBJECTIVES: Payers are increasingly tying payment for healthcare to quality and value. Within this context, providers are committing to and pursuing systematic solutions to become value-based organizations. This transformation is driving changes in the leadership and organizational structures of hospitals and health systems. This research examines emerging institutional stakeholders behind value-based healthcare transformation; the scope of their responsibilities; and implications for manufacturers seeking to engage accountable care and other payer-provider organizations to drive market access. **METHODS:** A survey of 64 administrators and executives of integrated networks (27%) and hospital systems (73%) was conducted. Represented systems included on average 29 acute care hospitals and 83% were Accountable Care Organizations. Respondents included C-Suite/President (17%), Vice President (28%) and Director (55%) titles. The survey assessed institutional priorities related to value-based healthcare transformation; and leadership and organizational structure related to these priorities. **RESULTS:** Many domains of value-based healthcare transformation were considered, and each was widely reported to be a priority for represented institutions today. Furthermore, dedicated roles have been or will be established with focus primarily or exclusively on each: 68% of organizations have an executive function focused on Payment Transformation; 74% on Population Health Care Coordination and/or Clinical Integration; 75% on Quality; and 76% on Customer Experience. These functions operate at the enterprise (system) level in nearly half of organizations and at the affiliate level in others. **CONCLUSIONS:** As institutions have taken on a greater role in defining and assessing value and in operationalizing value-based decision making in healthcare, there has been a proliferation of relevant stakeholders involved in carrying out these responsibilities. Manufacturers seeking to demonstrate the value of their product within these settings must be prepared to target these emerging customers; including a tailored value proposition which considers the specific scope of their responsibilities.

PHP7

LANDSCAPE OF PATIENT-ENGAGEMENT ACTIVITIES ACROSS THIRTEEN VALUE-ASSESSMENT BODIES

Oehrlein EM[1], Harris J[2], Labkoff N[2], Perfetto EM[2], Boutin M[2]
[1]University of Maryland, School of Pharmacy, Baltimore, MD, USA, [2]National Health Council, Washington, DC, USA

OBJECTIVES: Understanding the current landscape of patient-engagement activities among value-assessment bodies (VABs) is an important step toward establishing "best practices" in patient-centric value assessments. The objective of this study was to identify and compare patient-engagement practices across VABs. **METHODS:** A sample of North American and European organizations involved in developing clinical and/or economic value assessment was chosen for representativeness. The sample included national health technology assessment bodies (HTA's; n=6), professional organizations (PO; n=4), and collaborations/independent organizations (CO; n=3). Information was gathered between September-October 2016 through a targeted web search and soliciting information from the organizations directly. Data collected included: (1) terms and definitions used to describe patient engagement; (2) types of patient-engagement opportunities offered; (3) evidence that opportunities offered are employed and impact decision-making. **RESULTS:** Tremendous variation exists in terms, processes, and impact of patient engagement across sampled organizations. Seventeen different terms were identified for describing patient engagement activities (e.g., patient input, patient-group submitted information). Opportunities vary widely and include: patient questionnaires (HTA=2); comment periods (HTA=1; CO=1); participation on committees (HTA=3; PO=3); ability to propose topics (HTA=1); draft guidance (HTA=1); general stakeholder forum (CO=1). While many organizations describe engagement opportunities in their documents, only two organizations had clear evidence of engagement impacting decision-making or being consistently incorporated. There is also wide variation in the types of individuals or groups allowed to contribute the patient voice. **CONCLUSIONS:** There is substantial heterogeneity in what is considered patient engagement across VABs. While some seek out patients directly by advertising patient-specific opportunities via social media, others refer to comment periods open to any stakeholder as patient engagement. Completed value assessments also depict wide variation in impact of the approaches, from descriptions of how patient engagement was directly incorporated into decision-making to no mention of any patient participation.

PHP8

INFLUENCING FACTORS OF YOUNG ADULT ROMANTIC RELATIONSHIPS

Ipolyi D[1], Oláh A[2], Pakai A[3], Karácsony I[4], Gelencsér E[1], Boncz I[2], Stromájer-Rácz T[2], Brantmüller É[1]
[1]University of Pécs, Kaposvár, Hungary, [2]University of Pécs, Pécs, Hungary, [3]University of Pécs, Zalaegerszeg, Hungary, [4]University of Pécs, Szombathely, Hungary

OBJECTIVES: Many conflicts can be observed in relationships, the poor management of which can cause the relationships to end. The objective of our study is to examine young adult romantic relationships and to explore what factors affect them. **METHODS:** The participants were full-time BSc students at Hungarian universities (University of Pécs, Semmelweis University, Pázmány Péter Catholic University) and their age ranged between 18 and 26 years (N=362). They were chosen for the quantitative, cross-sectional, descriptive research by convenience sampling. The anonym, self-completion questionnaire was delivered to participants via Internet. For data analysis SPSS v 13 was used. Besides descriptive statistics (average, variability, frequency), mathematical statistics (χ2 test, Fisher's Exact Test) were also used ($p<0.05$). **RESULTS:** 55.24% of the students had 1 to 4 one-night stands, 30.93% had 5 or more and only 13.81% have never had one-night stands. Those who meet their partner every day judge the quality of their relationship to be better ($p<0.01$). Couples that are having a shared view of their future think of breaking up more rarely ($p<0.01$). Those who met their partner in a club have had more one-night stands than the others ($p<0.01$). Couples with poor conflict resolution skills think of ending their relationship more often than those who apply proper conflict resolution techniques ($p<0.01$). In case of relationship problems, those couples who try to resolve them together are more successful than those who rely on external help ($p<0.01$). **CONCLUSIONS:** It is a message for parents and also for health visitors that young adults frequently switch their partners; therefore more emphasis should be put on sexual education, especially on its affective side. It is not enough to focus only on the somatic factors. It is necessary to extend the topics of school health education with that of successful conflict resolution techniques.

DRG BASED EVALUATION OF TERTIARY LEVEL INPATIENT CARE IN HUNGARY

Gazsó T, Boncz I, Molics B, Ágoston I, Horváth L, Endrei D
University of Pécs, Pécs, Hungary

OBJECTIVES: Our objective is to determine the tendencies of the capacity for active inpatient care (the number of beds) and determining the DRG based performance volume limit (TVK) based on nationwide data on the one side and regarding the active inpatient care at tertiary level University Medical Centers on the other part. **METHODS:** The data derive from the DRG based financial database of the National Health Insurance Fund Administration, the only health care financing agency in Hungary. We examined the output volume capacity data of active inpatient care expressed in numbers (DRG cost-weight) and the data of capacity expressed in the number of beds for the period of 2013 and 2017. The financial ceiling of hospitals resulted from the performance volume limit/number of beds indicator has been determined. **RESULTS:** Regarding the number of active beds, the number of beds at Universities (in the period under review fell by -3.4%, -224 beds) and the others hospitals in the country (fell by -2.2%, -721 beds) continuous decline is observed with respect to the universities greater frequency. The performance volume limit -determined by the National Health Insurance Fund Administration- shows different trends. Universities experienced -4.4% decline in their financial budget. The others hospitals in Hungary realized an increase (+ 2.9%), but in the last year the volume decline to the 2013 level (-0.2% decrease). The performance volume limit calculated to one hospital bed decreased by 1.1% at University Medical Centers, from 64.4 to 63.7. **CONCLUSIONS:** Determining the performance volume limit is partly independent of the current capacities and the demand, since there are different trends in the data and getting the appropriate theraphy often takes a lot of time because of the long waiting lists. Supervising the performance volume limit based on needs and adjusting the capacities are required.

GENE THERAPIES DEVELOPMENT: SLOW PROGRESS AND PROMISING PROSPECT

Hanna E[1], Rémuzat C[2], Auquier P[3], Toumi M[1]
[1]Aix-Marseille University, Marseille, France, [2]Creativ-Ceutical, Paris, France, [3]Faculté de Médecine, Laboratoire de Santé Publique, Aix-Marseille Université, Marseille, France

OBJECTIVES: In 1989, the concept of human gene therapies has emerged with the first approved human gene therapy trial of Rosenberg et al. Gene therapies are considered as promising therapies applicable to a broad range of diseases. The objective of this study was to review the descriptive data on gene therapy clinical trials conducted worldwide between 1989 and 2015, and to discuss potential success rates of these trials over time and anticipated market launch in the upcoming years. **METHODS:** A publicly available database, 'Gene Therapy Clinical Trials Worldwide', was used to extract descriptive data on gene therapy clinical trials: (1) number of trials per year between 1989 and 2015; (2) countries; (3)

diseases targeted by gene therapies; (4) vectors used for gene delivery; (5) trials status; (6) phases of development. **RESULTS:** Between 1989 and 2015, 2,335 gene therapy clinical trials have been completed, were ongoing or approved (but not started) worldwide. The number of clinical trials did not increase steadily over time; it reached its highest peak in 2015 (163 trials). Almost 95% of the trials were in early phases of development and 72% were ongoing. The United States undertook 67% of gene therapy clinical trials. The majority of gene therapies clinical trials identified targeted cancer diseases. **CONCLUSIONS:** The first gene therapy was approved in the European Union in 2012, after two decades of dashed expectations. This approval boosted the investment in developing gene therapies. Regulators are creating a specific path for rapid access of those new therapies, providing hope for manufacturers, healthcare professionals, and patients. However, payers are increasingly scrutinizing the additional benefits of the new therapies. The potential budget impact may become the actual hurdle for gene therapies, leading to restricted access and lost opportunities for many patients.

PHP11

HOW THE PURCHASE AND USE OF A FDA PRIORITY REVIEW VOUCHER AFFECT PRODUCT UPTAKE AND VALUE CONVERSION

Wang A, Chowdhury C
CBPartners, New York, NY, USA

OBJECTIVES: To understand the commercial, evidence generation, and health technology assessment implications of using an FDA Priority Review Voucher (PRV) to shorten the pre-market authorisation timeline **METHODS:** The study employed a literature review, including academic journals, pharmaceutical industry news sources, FDA data, and manufacturer press releases to assess the use and transfer of priority review vouchers, as well as their impact on timing to market authorisation, associated effects on evidence generation, and the eventual effect on health technology assessment. **RESULTS:** There have been 12 PRVs that have been granted by the FDA for the development of a treatment for either a neglected tropical disease or a rare pediatric disease. Of the 12 vouchers, four have been transferred for a price $68 million - $350 million. Economic models predict the value of an expedited review process could be worth $50 million -$300 million depending on a variety of factors, including the treatment algorithm in effect, the competitive environment, and stakeholder perception of unmet need. The first manufacturer to employ a priority review voucher received a decision within six months; however, the application was denied due to insufficient safety data. Only two of the transferred vouchers have been successfully used to achieve both an expedited review and FDA approval. For alicorumab, the voucher provided a competitive advantage to advance its launch date and beat its main PCSK9 competitor to market. However, this advanced timeline also affected the maturation of long-term safety data, and also the approach to reviewing the clinical and economic attributes of the two PCSK9s. The PCSK9 case shines a light on the advantages and disadvantages from evidence generation and appraisal standpoints. **CONCLUSIONS:** While the acquisition of the voucher provides the product with some degree of competitive advantage with regard to timing, the longer-term effect on evidence and health technology appraisal counter-balance these benefits.

PHP12

CHALLENGES OF INTEGRATED PALLIATIVE CARE IN THE HEALTH CARE SYSTEM

Lukács M[1], Oláh A[1], Szabó L[1], Boncz I[1], Szunomár S[1], Fusz K[1], Máté O[1], Endrei D[1], Pakai A[2]
[1]*University of Pécs, Pécs, Hungary,* [2]*University of Pécs, Zalaegerszeg, Hungary*

OBJECTIVES: The aim of our study was to estimate the relationship of the chances of dying in hospital or at home, based on demographic data, social support, healthcare categories and additional service needed in palliative care provided by multidisciplinar teams. **METHODS:** The study is a retrospective, quantitative analysis. Through a purposive sampling we analyzed records of tumor- and terminal stage patients who were involved in the service of the Pécs-Baranya County Hospice Foundation and met enroll criteria. (N=1389). Descriptive (absolute- and reltive frequency, variance,mean, modus, and mathematical statistics (correlation, chi-square test, variance-analysis (ANOVA), T-test) were done on the sample ($p < 0,05$) using MS Excel and SPSS 22.0. **RESULTS:** Men are more likely to die in hospice care unit (OR = 1.369) compared with those who die at home. The county town living (69.10%, OR = 0.625), however, are less likely to die in hospice care. The number of days spent in care of 30.5% of a maximum of six days, and average length of stay in home care was 23.84 days (SD = 29.98) and 46.1% of patients die in home care. We found significant positive correlation between the role of the healthcare scene and social support (p=0.024), while the tumor disease type, deterioration of general status of the patient is significantly rise the chance of the integration into the intramural than home care (p=0.002). The team providing complementary homecare tasks increase the outcome of optimal hospice-palliative care, chance of dying at the patient's home and the length of survival time (p=0.027). **CONCLUSIONS:** Providing an optimal hospice-palliative care needs a complex, holistic, integrated model of care to be implemented.

TWO TRANSPARENT METHODS FOR ESTIMATING DRUG RESEARCH AND DEVELOPMENT COSTS

Ballreich J, Hsu M, Thaver A, Bai G, Anderson G
Johns Hopkins University, Baltimore, MD, USA

OBJECTIVES: Current estimates on the cost of developing a new drug are largely based on proprietary data limiting other researchers from validating or testing underlying assumptions. This study presents two transparent methods for estimating the cost of developing a new drug using publicly available data. **METHODS:** The first approach is a micro approach that utilizes drug company specific levels of research and development expenditures, sales, and drugs on the market. A series of calculations uses this input data and estimates the cost per marketed drug for each company. The second approach is a macro approach and utilizes industry aggregate research and development expenditures and recent approved drugs from the Food Drug Administration (FDA). This data is inputted into a quasi-Markov model of a drug's pre-approval life cycle and calculates the cost per FDA approved drug. A cost of capital is estimated for both approaches using an amortization model. The rates for the cost of capital were either the weighted average cost of capital rate or the rate as suggested by the Congressional Budget Office. **RESULTS:** The micro approach yields a direct cost of $1.65 billion, and the cost was similar across the three large pharmaceutical companies. The macro approach yields $1.43 billion. Using a 3% cost of capital rate, the indirect cost is another $.31 billion and $.26 billion for the micro and macro approach respectively. Using the industry weighted average cost of capital rate, 7.72%, increases the indirect cost to $.57 billion using the micro approach and $.62 billion using the macro approach. **CONCLUSIONS:** Our results were similar to previously reported cost estimates for developing a new drug with one caveat-we had much lower cost of capital. Understanding the level of investment necessary to develop a drug is critical for policymakers who attempt to balance innovation with price regulation.

PHP14

APPROVALS AND DISCONTINUATIONS OF NEW MOLECULAR ENTITIES AND THERAPEUTIC BIOLOGIC LICENSE APPLICATIONS IN THE UNITED STATES (1986–2015)

Turkistani F[1], Seoane-Vazquez E[2], Rodriguez-Monguio R[3], Bin Sawad A[4]
[1]*MCPHS University, Boston, MA, USA,* [2]*Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA,* [3]*University of Massachusetts Amherst, Amherst, MA, USA,* [4]*Umm Al-Qura University, Makkah, Saudi Arabia*

OBJECTIVES: The objective of this study was to describe trends in approvals and discontinuations of new molecular entities (NME) and therapeutic biologic license applications (BLA) during the period 1986-2015. **METHODS:** Data for all FDA-approved NME and BLA marketed in the US during the study period were collected from the Drugs@FDA database, and each NME or BLA discontinued was evaluated to determine whether discontinuation was associated with a safety issue. Descriptive statistics and chi-squared tests were used in the analysis. **RESULTS:** The FDA approved 1,017 drugs during the study period, including 903 NME and 114 BLA. Among the total number of new drugs approved, the percentage of BLA increased from 3.6% the period of 1986-1989 to 8.0% in the 1990s, 15.9% in the 2000s, and 19.4% during the period of 2010-2015. Anti-neoplastic and immunomodulating agents represented 53.5% of all the BLA approved during the study period. The rate of market discontinuation was higher for NME (n=181, 20.0%) than for BLA (n=12, 10.5%) (p= 0.01). As of August 15, 2015, a total of 84 (8.3%) new drugs, including 6 (5.3%) BLA and 78 (8.6%) NME (p=0.22) were withdrawn from the market for safety reasons. **CONCLUSIONS:** The number of BLA and their proportion among the total number of new drugs approved by the FDA increased over time. BLA were concentrated in certain therapeutic categories, especially anti-neoplastic and immunomodulating agents. The majority of the drugs approved in the US remained in the market. NME were more likely to be discontinued. Drugs withdrawn from the market for safety reasons affected one in twelve drugs approved during the study period.

PHP15

PAYERS' ACCEPTANCE OF SURROGATE AND PATIENT-RELEVANT END POINTS IN OUTCOMES-BASED MARKET ACCESS AGREEMENTS

Toumi M[1], Jaroslawski S[1], Jadot G[2], Rémuzat C[3], Kornfeld Å[3]
[1]*Aix-Marseille University, Marseille, France,* [2]*Lyon 1 University, Villeurbanne, France,* [3]*Creativ-Ceutical, Paris, France*

OBJECTIVES: Costly drugs are often not reimbursed by health care payers via the regular pathway but can be subject specific arrangements called Market Access Agreements (MAAs). MAAs are financial (Commercial Agreements) or outcomes-based (Payment-for-Performance Agreements or Coverage-with-Evidence-Development Agreements). Outcomes in outcomes-based MAAs are assessed through changes in surrogate end points (EPs) or patient-relevant EPs. **METHODS:** We reviewed published and grey literature on MAAs between manufacturers and payers from all geographies in May 2015. We classified the schemes by MAA type. Outcomes-based MAAs were further categorized by the EP used. **RESULTS:** We identified 143 MAAs. 56 (39,2%) were pure Commercial Agreements, 53 (37,1%) were Coverage-with-Evidence-Development Agreements and 34 (23,8%) were Payment-for-Performance Agreements. Among Coverage-with-Evidence-Development Agreements, 49 were patient-relevant EP Coverage-with-Evidence-Development Agreements and four were surrogate EP Coverage-with-Evidence-Development Agreements. In 34 Payment-for-Performance Agreements, there were 29 surrogate EP Payment-for-Performance Agreements for 30 drugs and five patient-relevant EP Payment-for-Performance Agreements for at least six drugs. Among 87 outcomes-based MAAs (Coverage-with-Evidence-Development Agreements + Payment-for-Performance Agreements), patient-relevant EP Coverage-with-Evidence-Development Agreements were the most common (56,3%), followed by surrogate EP Payment-for-Performance Agreements (34,1%). **CONCLUSIONS:** Payers have high acceptance for surrogate EPs when used in Payment-for-Performance Agreements. In contrast, patient-relevant EPs are predominantly accepted for use in Coverage-with-Evidence-Development Agreements. Therefore, Payment-for-Performance Agreements are not used by payers to reduce uncertainty about real-life effectiveness. They can constitute an outcome guarantee for payers if they are based on patient-relevant EPs or validated surrogate EPs. In contrast, Coverage-with-Evidence-Development Agreements employ patient-relevant EPs and can be used by payers to reduce uncertainty about a drug's clinical outcomes or real-life use. They can enable payers to align a product's price with its value.

PHP16
CHANGES OF YOUNG ADULTS' DISABILITY DAYS AFTER THE AFFORDABLE CARE ACT EXTENDED DEPENDENT COVERAGE
Kanchanasuwan S, Young HN, Cobran EK
University of Georgia, Athens, GA, USA
OBJECTIVES: This study aimed to evaluate changes in disability days among young adults after the implementation of the extended dependent coverage under the Affordable Care Act (ACA) in September 2010. **METHODS:** A retrospective study was conducted by using the 2008-2012 Medical Expenditure Panel Survey. Rate of disability days from January 2008 to December 2012 were analyzed using interrupted time series Poisson regression models. Adjustment for over-dispersion and seasonality were also used in the analysis. Young adults were identified as respondents aged 19 to 25 years old. Disability days were defined as the numbers of times the person lost at least a half of day from work or school and the additional days the person spent in bed because of a health problem. **RESULTS:** A total of 56,291 disability days occurred in young adults during the study period. The preliminary model showed a reduction in disability days following the policy, with a decrease of 33% [relative risk 0.713; 95% confidence interval (CI) 0.689-0.737; $P < 0.01$]. Adjusted model for seasonality and over-dispersion showed a 25 % reduction in disability days following the policy [relative risk 0.776; 95% confidence interval (CI) 0.610-0.988; $P < 0.04$]. **CONCLUSIONS:** The extended dependent coverage under the Affordable Care Act was associated with a reduction in the number of disability days in young adults. These findings suggest an improvement in health outcomes for young adults after the implementation of the policy.

PHP17
ROLE OF INFORMATION ANXIETY AND LOAD ON THE PROCESSING OF PRESCRIPTION DRUG INFORMATION LEAFLETS
Bapat SS, Patel H, Sansgiry SS
College of Pharmacy, University of Houston, Houston, TX, USA
OBJECTIVES: In this study we evaluate the role of information anxiety and information load on intention to read information from prescription drug information leaflets (PILs). These PILs were developed based on principals of information load and consumer information processing. **METHODS:** This was an experimental prospective repeated measures study where University students were recruited. PILs included a single page information material developed for three drugs namely, Celebrex® (celecoxib), Ventolin HFA® (albuterol) and Prezista® (Darunavir). Information anxiety was measured as anxiety experienced by the individual when encountering information using a 5-point likert scale. To operationalize information load, adults (≥18 years) in a university setting answered the survey questionnaire after reading a scenario followed by viewing three product information sources categorized as existing current practice, pre-existing one-page text only leaflets, and one-page PILs. The outcome variable considered was intention to read which was defined as the likelihood that the patient will read the information. Objectives were analyzed by performing a repeated measures MANOVA using SAS version 9.3. **RESULTS:** A total of 360 consumers participated with a 62% response rate. The mean age was 23(±6.04) years and 72.50% were taking a prescription medication. Compared to pre-existing and text only leaflets, PILs had significantly lower scores on information anxiety ($p<0.001$) and information load ($p<0.001$). The intentions to read scores were highest and significantly different ($p<0.001$) for PILs as compared to existing current practice or text only leaflets. Information anxiety and load significantly impacted intention to read ($p<0.001$). **CONCLUSIONS:** There is a need to balance the amount of prescription information presented to patients in order for them to process it appropriately. Newly developed PILs increased patient's intention to read by decreasing information anxiety and information overload. Several implications of the study are important for researchers of consumer information programs and the US FDA.

PHP18
PHARMACEUTICAL PRICES IN THE UNITED STATES VERSUS EUROPE: HOW DO DIFFERENT TYPES OF US PRICES COMPARE?
Reinaud F[1], Ando G[1], Lockwood C[2]
[1]*IHS Markit Life Sciences, Paris, France,* [2]*IHS Markit Life Sciences, Santa Clara, CA, USA*
OBJECTIVES: Against the background of recent pharmaceutical pricing controversies in the United States, this analysis seeks to provide a more comprehensive and nuanced comparison of prices in the US with those in Europe, including how they evolve over time and how list prices compare to negotiated prices. **METHODS:** Two samples were used: 30 innovative pharmaceuticals approved between 2012 and 2016 by the FDA, and available in each of the EU Top 5 countries. Indices derived from manufacturer prices per pack and unit of strength in January 2017 were compared. Price changes from time of launch to January 2017 were analysed. 20 pharmaceuticals approved earlier, from 2006, to compare different price levels in January 2017 (ASP, FSS, Big4). **RESULTS:** List prices were higher in the United States by an average of 67% over those in the EU Top 5. In the US, manufacturer prices increased by 23% over the period examined. Prices increased for 76.7% of the sample. In the EU top 5, prices of these same pharmaceuticals decreased from 1% in Spain down to 17.8% in Germany. Negotiated pharmaceutical prices are slightly lower than manufacturer prices. Interestingly, the price premium in the United States over Europe was higher in the second sample (of older pharmaceuticals) than in the first sample, although prices tend to increase over time in the US (and decrease in Europe). **CONCLUSIONS:** Price comparisons between the US and Europe often paint a skewed picture in the absence of non-estimated data on net and discounted prices. Pharmaceutical prices across the full spectrum of available prices in the US are still higher than in Europe and continue to increase over time. The trend in Europe is opposite: prices are lower and tend to decrease. The difference is less pronounced among pharmaceutical prices that are negotiated in the United States.

PHP19
IRP IS DEAD, LONG LIVE IRP: AN ANALYSIS OF RECENT IRP REFORMS AROUND THE WORLD
Lockwood C[1], Chui C[2], Genane C[3], Rodrigues T[2], Ando G[2]
[1]*IHS Markit, Santa Clara, CA, USA,* [2]*IHS Markit, London, UK,* [3]*IHS Markit, Paris, France*
OBJECTIVES: International reference pricing (IRP) has been used extensively to regulate pharmaceutical prices. It has been debated whether this policy sows the seeds of its own demise by incentivizing industry and payers to negotiate confidential concessions, prompting scholars to ask whether we will soon face the "end" of IRP. Within this context, the present study updates a 2014 analysis examining IRP policy changes around the world in order to ascertain whether there is any evidence that IRP is becoming less influential. **METHODS:** The study draws upon the same set of 38 countries in which in-depth qualitative interviews were completed with 50 stakeholders (37 payers/policymakers and 13 industry representatives) in 2014. It also expands that list to include 14 additional countries. A qualitative and semi-quantitative analysis of policy changes made throughout 2015 and 2016 was undertaken to identify trends in how IRP policy frameworks have evolved in recent years. **RESULTS:** A total of 12 discrete policy changes were observed across eight of the countries having introduced IRP before the end of 2014 (16%). Of these eight, six belong to the 22 countries (75%) making one or more such changes from time of IRP introduction through end of 2014. The most frequent changes involved modifications to the composition of the reference basket (71%) and frequency with which referencing is performed (43%). Changes to basket composition did not appear motivated by availability of net prices but rather of lower list prices. Three countries were found to have implemented IRP since the end of 2014. **CONCLUSIONS:** Despite recent debates over the end of IRP, it continues to represent a popular tool for regulation of drug prices, and there is currently no evidence of a declining influence - quite the opposite. Policymakers continue to adapt regulations to cope with some of the challenges engendered by this very policy framework.

PHP20
PATENT LINKAGE AND ACCESS TO GENERIC DRUGS IN SOUTH KOREA
Lee T, Son K
Seoul National University, Seoul, South Korea
OBJECTIVES: As a result of Korea-US Free Trade Agreement, patent linkage (PL) of pharmaceuticals was newly implemented in South Korea on March 15, 2012. PL incorporates such components as registration of patents, notification of application for marketing approval of generics, and patentees' prohibition of generic marketing. This study aimed to explore the effect of PL on access to generic drugs and drug expenditures in South Korea. **METHODS:** Delay of access to generic drugs was measured by extended market exclusivity period, defined as the period between the date of conditional market approval of generics and expiry of marketing prohibition, during which generic drugs were not allowed to be sold. Changes in drug expenditures were measured by comparing actual and hypothetical market share of generic drugs, the latter of which meant what the market share of generics had been like if marketing prohibition had not been implemented. The market share of generics was estimated by using a logistic function based on monthly utilization of 856 drugs obtained from National Health Insurance claims database. **RESULTS:** In the cases of two brand-name drugs where marketing prohibition of their generics was put to an end, it appeared that extended effective market exclusivity period was 1.4 month, compared to a maximum of 9 months regulation. This meant that, due to the extended market exclusivity, market entry of 19 generic drugs was delayed for 1.4 month and drug expenditures increased by $150,000~$290,000 in the short run. **CONCLUSIONS:** Though it is too early to generalize what effect PL had on access to generic drugs and drug expenditures, it appeared that not only PL itself but also many other factors including drug pricing, generic substitution, and patent litigation played a key role in influencing access to generic drugs and drug expenditures.

PHP21
NAIVE AND EXPERT PATIENTS' KNOWLEDGE, ATTITUDES AND BELIEFS ABOUT BIOSIMILARS
Wong-Rieger D
Canadian Organization for Rare Disorders, Toronto, ON, Canada
OBJECTIVES: Biosimilars are being approved and included in drug plans. In some countries, clinicians are being asked or mandated to start patients exclusively on biosimilars and even to switch from the originator biologic, citing economic reasons and "no evidence of harm." Given that biologic medicines require patient engagement to use appropriately, this research sought to learn how naïve and "informed" patients feel about biosimilar usage. **METHODS:** A questionnaire, sent to 2000 patients in Canada representing multiple diseases, asked about biosimilar knowledge, attitudes and beliefs. The survey also provided some basic education. About 200 patients who had exposure to biologics were probed further about how biosimilars should be used in routine care. **RESULTS:** More than 40% reported no previous knowledge about biosimilars. Only 20% said they were very familiar. Based on information provided, 68% said they expected different efficacy and 84% expected different adverse effects. While 57% agreed that unexposed patients could be prescribed biosimilars, 78% objected to switching with most opposition from naïve patients. Oncology patients objected most to approval based on extrapolation. **CONCLUSIONS:** Patients are not receiving education about biosimilars and are reluctant to switch with implications for adherence to and confidence in their use.

PHP22

REDUCING PRESCRIPTION DRUG SPENDING: A REVIEW OF POLICY OPTIONS

Alexander GC[1], Ballreich J[2], Socal M[3], Karmarkar T[3], Trujillo A[3], Greene J[4], Sharfstein J[3], Anderson G[2]

[1]Johns Hopkins Bloomberg School of Public Health, Center for Drug Safety and Effectiveness, Baltimore, MD, USA, [2]Johns Hopkins University, Baltimore, MD, USA, [3]Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, USA, [4]Johns Hopkins School of Medicine, Baltimore, MD, USA

OBJECTIVES: High prices for pharmaceuticals have restricted access to branded drugs because some public programs are rationing care and many private insurers, including Medicare drug plans, are placing specialty drugs on high cost sharing tiers. Ongoing concerns over high prices and limited access to pharmaceuticals have generated a wide range of proposed solutions. **METHODS:** We convened a small group of experts in the field and had them identify policy options that are available to reduce either branded drug costs or spending. Their discussion identified seminal articles. Based on these seminal articles, we constructed a preliminary list of policy options and key words that served as a format for conducting a structured literature review to identify additional policy options. **RESULTS:** We identified forty-one solutions in the peer reviewed literature that can be classified into five broad categories: revising the patent system; encouraging research to increase development of new drugs; altering pharmaceutical regulation; decreasing market demand; and developing innovative pricing strategies. We discuss the rationale for these five approaches and summarize the proposed solutions. We also discuss four unresolved empirical issues are particularly important in any discussion of policy options. **CONCLUSIONS:** Many have argued that the high levels of spending for branded prescription drugs are unsustainable. Others are more concerned about the problems many people have accessing the drugs they need or the impact on the health status of the population. Given the interest in the topic, it is likely that one or more of the policy proposals will be implemented in the coming months and years. However, it is likely that no single policy alternative will be a clear "winner". Resolution of specific empirical issues that we identify may assist policymakers to select policies that are most likely to achieve their stated aims while minimizing the likelihood of unintended consequences.

PHP23

MARKET ACCESS OF CELLULAR AND GENE THERAPY PRODUCTS IN THE US AND EU5

Mycka J[1], Dellamano R[2], Lobb W[1], Pereira E[1], Dalal N[1], Dellamano L[3], Liguori G[3], Poliakoff K[1]

[1]Medical Marketing Economics LLC (MME), Montclair, NJ, USA, [2]MME Europe & ValueVector (Value Added Business Strategies), Milan, Italy, [3]ValueVector, Milan, Italy

OBJECTIVES: Examine current market access landscape for cellular and gene therapies in the US and EU5 as well as future implications. **METHODS:** Assessed market access path for all cellular and gene therapies with FDA and EMA approval as of December 31, 2016. Analyzed HTA assessments and funding mechanisms of these therapies in the EU5. **RESULTS:** In the US, cellular and gene therapy products are regulated by the FDA's Center for Biologics Evaluation and Research (CBER) whose Office of Cellular, Tissue and Gene Therapies (OCTGT) has approved 16 cellular therapies and 0 gene therapies for marketing. 50% of all approved cellular therapies are based on Hematopoietic Progenitor Cells (HPC) from cord blood. In Europe, cellular and gene therapy products are assessed by the EMA's Committee for Advanced Therapies (CAT) to confirm whether specific criteria are met by the products to be defined as advanced therapy medicinal products (ATMP). So far, the EMA has approved for marketing 8 ATMPs: 2 gene therapies (alipogene tiparvovec; autologous CD34+ cells transduced to express ADA) and 6 cellular therapies. Of all approved therapies, one was suspended and another two withdrawn. In comparing cellular and gene therapy products approved by FDA and EMA, only the cell therapy talimogene laherparepvec is currently marketed in both US and Europe, while sipuleucel-t and porcine collagen membrane are available in the US but have been withdrawn in Europe. Analysis of HTA assessments and funding mechanisms of these therapies in the EU5 countries showed market access and reimbursement challenges related to uncertain clinical evidence and high costs. **CONCLUSIONS:** Cellular and gene therapy products situation is still in "early days" and constantly evolving. The expected increase in the approved number of these therapies could benefit both patients and pharmaceutical companies, but these expectations will depend on solid clinical evidence and access to them.

PHP24

FUNDING OF GENE THERAPIES IN EUROPE & THE UNITED STATES

Hanna E[1], Rémuzat C[2], Jadot G[3], Auquier P[4], Toumi M[1]

[1]Aix-Marseille University, Marseille, France, [2]Creativ-Ceutical, Paris, France, [3]Lyon 1 University, Villeurbanne, France, [4]Faculté de Médecine, Laboratoire de Santé Publique, Aix-Marseille Université, Marseille, France

OBJECTIVES: Gene therapies (GT) are promising treatments able to potentially cure chronic and disabling diseases after single or short-course administration. Such products deliver long-term benefits after administration. The short-course administration associated to long-term high value lead to high upfront costs that challenge the sustainability of national health insurance systems. As an important number of gene therapies are expected to reach the market, finding a sustainable funding model for GT is needed. The aim of this study is to identify potential funding models for gene therapies in the large 5 EU countries: Germany, United Kingdom, France, Italy, and Spain as well as US. **METHODS:** A literature review was conducted in PubMed, congress abstracts, Health Technology Assessment bodies' websites and grey literature. **RESULTS:** There is no specific path for GT pricing and reimbursement. However, several methodologies have been proposed to set GT price. Four funding models were proposed: "technology leasing reimbursement strategy", high-cost drug mortgages, high-cost drugs reinsurance, and high-cost drug patient rebates. Some authors suggested that this may jeopardize the future health insurance resources and cannot constitute a generalizable model; they proposed discounts according to the turnover. Other authors proposed constraint optimization models for GT pricing, while others considered those models inapplicable to US as patients change health plan regularly thus disconnecting initial investment and future value. **CONCLUSIONS:** Current pricing models based on unit price are too one-dimensional for the future needs of the market assuming GT successful arrival to the market. Performance driven managed entry agreements are unlikely to address the short course treatment and long-term value. Many proposed models may be inadequate; they may be too costly on long term or lead to inappropriate return on investment. While GT started reaching the market, no clear research enlightens payers on optimal funding models.

PHP25

IMPACT OF HEALTH INSURANCE BENEFIT DESIGN ON GENERIC DRUG USE IN THE UNITED STATES: A SYSTEMATIC REVIEW

Mishuk AU[1], Qian J[2], Garza KB[2], Hansen RA[1]

[1]Harrison School of Pharmacy, Department of Health Outcomes Research and Policy, Auburn University, Auburn, AL, USA, [2]Auburn University Harrison School of Pharmacy, Auburn, AL, USA

OBJECTIVES: Use of generic drugs can reduce the growing spending on prescription drugs. In 2014 $227 billion was saved because of generic drugs in the United States. Appropriate policies are imperative to promote the use of generics. This study aimed to understand the influence of health insurance benefit design (copayment, coinsurance, and deductible) on generic drug use. **METHODS:** We systematically searched the literature between January 2006 and September 2016 using PubMed and Business Source Premier for potentially relevant studies. The search was limited to articles written in English, with human subjects, and conducted in the United States. The PRISMA guideline was used for reporting of evidence. **RESULTS:** 125 articles were identified and 11 articles were included in the qualitative analysis. Overall, a majority of studies showed lower cost sharing improved the use of generics and reduced non-adherence to treatment. Adherence improves by 2.7-3.4% when copays for generics are eliminated and copays for brands are reduced, corresponding to an estimated $5.7 million reduction in total non-medication expenditures. Charging a copay decreases the probability of using a generic by about 13% while with lower or no copays, there is an 11% increase in generic dispensing rates. Tiered copay systems increase generic filling by 20%, and a change from a single or 2-tier formulary to a 3-tier formulary corresponds with a 5-15% decrease in drug spending. While evidence supports the role of copayment design and copayment amount on generic use, other drug benefit design approaches such as coinsurance or deductibles need further investigation. **CONCLUSIONS:** Use of generics can be improved through health insurance policies such as low cost-sharing. Eliminating or having very low generic cost-sharing can reduce total healthcare spending and non-adherence to treatment. However, further study is needed to identify the optimal design structure to maximize generic use.

PHP26

THE ASSOCIATION BETWEEN PATIENT SOCIODEMOGRAPHIC CHARACTERISTICS AND GENERIC DRUG USE – A SYSTEMATIC REVIEW AND META-ANALYSIS

Mishuk AU[1], Qian J[2], Howard J[3], Harris I[3], Frank G[3], Kiptanui Z[3], Hansen RA[1]

[1]Harrison School of Pharmacy, Department of Health Outcomes Research and Policy, Auburn University, Auburn, AL, USA, [2]Auburn University Harrison School of Pharmacy, Auburn, AL, USA, [3]IMPAQ International, Columbia, MD, USA

OBJECTIVES: Generic drugs are bioequivalent and cost effective alternatives to brand name drugs. In 2014, $227 billion was saved because of generic drugs in the U.S. To inform the development of educational outreach for improving generic drug use among patients, we sought to critically assess evidence on the association between patient characteristics and generic drug use. **METHODS:** We systematically searched the literature between January 2005 and December 2015 using PubMed, Web of Science, OVID-Medline, Google Scholar, and EBSCO IRA-Medline for potentially relevant studies. The titles and abstracts of identified articles were assessed independently by two reviewers. Titles and abstracts that were not written in English, published prior to 2005, not empirical, did not contain sociodemographic data, or were not policy or methodologically relevant to generic drug use were excluded. Data were pooled in meta-analysis using Rstudio software to assess the association of patient-related factors with generic drug use. **RESULTS:** Our searches resulted in 11 articles on patient-level factors, and 6 of these articles had sufficient information to conduct meta-analyses in the domains of patient sex, age, race/ethnicity, and income. Quantitative analysis indicated no differences in generic drug use existed between subgroups of patients defined by sex, age, or race/ethnicity. However, patients with lower income (i.e., $<200\%$ federal poverty level (FPL)) were more likely to use generic drugs than those with higher income ($\geq 200\%$ FPL) (pooled odds ratio (OR) = 1.32, 95% confidence interval (CI) = 1.15–1.52). Heterogeneity was high ($I2 > 75\%$) for all analyses but income. **CONCLUSIONS:** Patients with lower income were more likely to use generic drugs, whereas we don't have adequate evidence to draw conclusion on the association of generic use with sex, age, or race/ethnicity. Educational outreach targeting patients with higher incomes to understand their perspectives in generic drugs might help improve generic drug use.

PHP27

MONOCLONAL ANTIBODIES BIOSIMILARS IN THE US: WHAT LESSONS CAN BE DRAWN FROM THE RECENT EUROPEAN, SOUTH KOREAN AND JAPANESE EXPERIENCE?

Bocquet F[1], Loubiere A[1], Paubel P[2]

[1]Faculté of pharmacy, Paris Descartes University, Sorbonne Paris Cité, Paris, France; Health Law Institute, Inserm, UMR S 1145, Paris Descartes Université, Sorbonne Paris Cité, Paris, France, Paris, France, [2]General Agency of Equipment and Health Products (AGEPS), Assistance

Publique-Hôpitaux de Paris (AP-HP); Faculté of pharmacy, Paris Descartes University, Sorbonne Paris Cité, Paris, France, Paris, France

OBJECTIVES: This study aims to assess the level of competition between the first monoclonal antibodies (mAbs) biosimilars, i.e. infliximab biosimilars (BIOSIM-INFLIX) and their originator (Remicade/infliximab, J&J/Merck) (ORIGIN-INFLIX) by analyzing the key global infliximab markets and the drivers of the BIOSIM-INFLIX uptakes. **METHODS:** Data on medicine volumes, values and ex-manufacturing prices for BIOSIM-INFLIX and ORIGIN-INFLIX in the EU, in South Korea and in Japan from January 2016 to June 2016 were provided by IMS Health. Volumes were calculated in DDD (Defined Daily Doses) and Weighted Average Price (WAP) in Euros/DDD. **RESULTS:** In the first half of 2016, the highest BIOSIM-INFLIX uptake was found in Denmark (96.4%), while the lowest was reported in Japan (1.7%). In EU countries where BIOSIM-INFLIX were marketed in 2015, their uptakes are between 10% and 30% (e.g. France, Germany, Spain, Italy and the UK with respectively 11.5%, 16.9%, 20.8%, 25.5% and 25.6%), in the same way as for countries where BIOSIM-INFLIX have been marketed since 2013 (e.g., Czech Republic and Portugal with respectively 24.9% and 23.0% uptakes), except Finland (66.4%) and Norway (86.7%). All countries have dominant hospital distributions for infliximab except Germany, Japan and Czech Republic, which have mixed retail/hospital distributions. Germany is the country where BIOSIM-INFLIX is the most expensive (WAP=€21.8/DDD) and Norway the country where it is the cheapest (WAP=€4.8/DDD with a 66.2% discount versus ORIGIN-INFLIX). However, the relative price of BIOSIM-INFLIX versus ORIGIN-INFLIX does not always seem correlated to BIOSIM-INFLIX uptakes (e.g. in South Korea, the BIOSIM-INFLIX uptake was 28.6%, whereas the WAP difference between BIOSIM-INFLIX and ORIGIN-INFLIX was of -4.3%; in Japan, the BIOSIM-INFLIX uptake was 1.7% whereas this difference amounts to -33.5%). **CONCLUSIONS:** Infliximab markets have proven to be highly country-specific. Today, the competition between BIOSIM-INFLIX and ORIGIN-INFLIX does not seem to be mainly based on prices, but on local decision-making and purchasing process.

PHP28

BIOSIMILAR INFLIXIMAB: FEEDBACK AFTER A ONE-YEAR USE IN 37 PARIS PUBLIC HOSPITALS

Bocquet F[1], Degrassat-Théas A[1], Cordonnier A[2], Lawruk A[2], Poisson N[2], Parent de Curzon O[2], Fusier I[2], Paubel P[1]

[1]*General Agency of Equipment and Health Products (AGEPS), Assistance Publique-Hôpitaux de Paris (AP-HP); Faculté of pharmacy, Paris Descartes University, Sorbonne Paris Cité, Paris, France, Paris, France,* [2]*AP-HP, AGEPS, Paris, France*

OBJECTIVES: In 2015, the Committee on Medicinal Products of the 37 Paris Publics Hospitals (AP-HP, the largest hospital group in Europe – €1 billion of drug expenditures and 7 million patients hospitalized annually) authorized the tender between two infliximab biosimilars (BIOSIM-INFLIX) and their originator (ORIGIN-INFLIX) only for naive-patients, as the current French law did not allow the switch from originator biologics to biosimilars for pretreated-patients. A BIOSIM-INFLIX won the tender and the ORIGIN-INFLIX has been listed in the AP-HP hospital drug formulary (HDF) since September 2015 for pretreated-patients. This study analyzes the spread of BIOSIM-INFLIX and of ORIGIN-INFLIX in AP-HP one year after the tender. **METHODS:** Infliximab consumption and expenses data were analyzed over the 2015-2016 period to retrospectively assessed BIOSIM-INFLIX and ORIGIN-INFLIX market shares within the 37 hospitals. **RESULTS:** Infliximab expenses in AP-HP in 2016 were down 13.5% compared to 2015 (€34.8 vs. €39.5 million), while infliximab consumption in volume globally increased by 8.8%. The rise in infliximab consumption was offset by a negative price effect due to the competition of BIOSIM-INFLIX (-45% and -34.5% price discounts for BIOSIM-INFLIX and for ORIGIN-INFLIX respectively). In 2016, infliximab products were used in 20 AP-HP hospitals and the average of BIOSIM-INFLIX uptakes in volume reached 28.4% in AP-HP (vs. 11.5% in France). However, BIOSIM-INFLIX uptakes are heterogeneous among AP-HP hospitals: [80%-90%] (n=2), [60%-40%] (n=2), [30%-10%] (n=9), <10% (n=7). The 3 pediatric AP-HP hospitals decided to list only the ORIGIN-INFLIX in their local HDF. No correlation was found between hospitals' infliximab consumption and BIOSIM-INFLIX uptakes. **CONCLUSIONS:** Until a new law governing the substitution for patients receiving biologics in France develops, the BIOSIM-INFLIX uptakes today depend on the will of hospital physicians to switch from biosimilars to originators. The therapeutic indications in which BIOSIM-INFLIX and ORIGIN-INFLIX are used and the naive/pretreated status of patients must now be explored.

PHP29

ASSESSMENT OF KNOWLEDGE, ATTITUDE AND PRACTICE OF PHARMACY PROFESSIONALS TOWARDS GENERIC MEDICINES: A CROSS SECTIONAL STUDY

Belay YB

Mekelle University, Mekelle, Ethiopia

OBJECTIVES: To assess knowledge, Attitude and practice of pharmacy professionals toward generic products **METHODS:** The study was conducted in all medicine retail outlets in Mekelle city, from April 10, 2016-May 12, 2016. Facility based cross -sectional study was used and the data collection tool were self-administered questionnaire. Statistical test binary logistic regression has been done to determine predictors of knowledge and attitude toward generic medicines. **RESULTS:** From the current study more than half of the respondents 52.9% (agree=32.2%, 20.7% strongly agree) claimed that they have had knowledge on the concept of generic medicine. Pharmacy professionals with experience of from 2 to 5 years (AOR= 25.620 [1.954-335.896]) and those with more than 5 years (AOR= 106.543 [2.375-4779.542) were more likely to have positive attitude toward generic medicines compared to those with work experience of up to 2 years. **CONCLUSIONS:** More than half of the study participants have had knowledge on the concept of generic medicine and their right to perform generic substitution. The professionals with more experience in the sector could have better view on generic product.

PHP30

INAPPROPRIATE MEDICATION USE AMONG THE ELDERLY POPULATION IN PUNJAB, PAKISTAN

Saqib A[1], Rehan Sarwar M[1], Hussain M[2], Younas W[2], Ashraf S[2], Asghar K[2], Ambreen S[2], Muhammad Y[2], Gulzar A[2], Iqbal S[2]

[1]*The Islamia University of Bahawalpur, Bahawalpur, Pakistan,* [2]*Akhtar Saeed College of Pharmaceutical Sciences, Lahore, Pakistan*

OBJECTIVES: To estimate the inappropriate medication use among the elderly hospitalized patients in Punjab, Pakistan. **METHODS:** A descriptive, non-experimental, cross-sectional study was carried out from December 2015 to March 2016 in six tertiary-care hospitals of the Punjab province of Pakistan. The population under study was patients aged ≥60 years and being hospitalized in the selected tertiary-care hospitals. In this study, data was collected from 600 elderly patients (100 patients per hospital). All medicines prescribed in each in-patient chart were noted on a pre-designed performa and were evaluated according to the 2015 American Geriatrics Society Beers Criteria. Statistical Package for Social Sciences (SPSS) was used to analyze the data. **RESULTS:** In 600 hospitalized in-patient (male 52.7% and female 47.3%) charts, 3,179 medicines were prescribed. The most commonly prescribed drug classes were: alimentary tract and metabolism 80%, nervous system 66.3%, anti-infectives for systemic use 62.2% and cardiovascular system 48.3%. The most commonly prescribed inappropriate medications were: omeprazole 51.3%, metoclopramide 14.3%, aspirin 9%, diphenhydramine 7.7%, ibuprofen 4%, famotidine 3.3% and chlorpheniramine 1.8%. **CONCLUSIONS:** The rational use of medicines is of utmost importance, most particularly in the elderly population. It is highly recommended that more consideration should be given to the elderly patients.

PHP31

COMPARING HTA OUTCOMES FOR CENTRALLY AUTHORISED MEDICINAL PRODUCTS IN GREAT BRITAIN 2011-2015

Maignen FM, Zamora B, O'Neill P, Garau M, Lorgelly P

Office of Health Economics, London, UK

OBJECTIVES: Marketing authorisation is the first step in making new medicines available in national health systems. Most new substances are approved in the European Union via the centralised procedure (coordinated by the European Medicines Agency), which was designed to facilitate access to new and efficacious therapies. Many health care systems in Europe then evaluate new technologies according to their effectiveness and cost effectiveness. We compared the outcomes of HTA evaluations for centrally authorised products (CAPs) in Great Britain. **METHODS:** The Medicine Tracker is a proprietary database of products, which includes detailed and structured information on CAPs, e.g. indications (initial and extensions), regulatory and HTA outcomes and dates of decisions. We analysed and compared the outcomes of evaluations conducted by the National Institute for Health and Care Excellence (NICE), the All Wales Medicines Strategy Group (AWMSG) and the Scottish Medicines Consortium (SMC) for all the CAPs which received an authorisation (initial or extension) between 01/01/2011 and 31/12/2015. **RESULTS:** 416 authorisations (excluding generics, hybrids, biosimilars) were granted between 2011 and 2015 (including 67 orphan medicinal products). 171 (30%) are for anti-cancer medicines. 50% of the 416 CAPs were referred to NICE including 60% (103) of the anti-cancer medicines. 75% of NICE appraised CAPs received a positive recommendation and only 21 products (13%) were rejected. Anti-cancer medicines were disproportionally affected by NICE negative recommendations (OR of receiving a negative recommendation compared with other products 4.19 [2.26, 7.75]). The odds of receiving a positive recommendation from the SMC was significantly lower for orphans compared with non-orphan medicinal products; OR 0.42 [0.21, 0.83]. 25 products were appraised in all 3 countries, there was low agreement in terms of recommendations, Kappa 0.479, $p \leq 0.001$. **CONCLUSIONS:** Despite the centralised procedure increasing the availability of new medicines, this does not systematically translate into wider access in Great Britain.

PHP32

REVIEW OF ECONOMIC EVIDENCE ON THE IMPACT OF SUBSTANDARD AND FALSIFIED MEDICINES IN LOW AND MIDDLE INCOME COUNTRIES

Ozawa S, Bessias S, Haynie D, Yemeke T, Herrington J

University of North Carolina at Chapel Hill, Chapel hill, NC, USA

OBJECTIVES: To examine the extent of substandard and falsified medicines in low and middle income countries (LMIC) and assess evidence of their economic impact. **METHODS:** Five databases were searched for articles containing data on prevalence and/or economic impact of substandard and falsified medicines in LMICs: PubMed, EconLit, Global Health, EMBASE, and SCOPUS. The search used variations of two keywords: "substandard and falsified medicines" and "low- and middle-income country." Additional gray literature sources were incorporated through reference mining. Studies that did not seek to quantify either prevalence or economic impact of substandard and falsified medicines, or that pertained only to high income countries, were excluded. Two reviewers independently assessed articles for inclusion. Data describing the setting, medicine, disease target, prevalence, and economic impact were extracted from selected articles. **RESULTS:** While the final article count is still underway, we identified more than one hundred articles describing the prevalence of substandard and falsified medicines in LMICs. Results from country studies suggest considerable variation across regions, specific medicines and facilities (hospitals vs. pharmacies), as well as in the source of the evidence (active vs. passive surveillance). In comparison, very few articles described the economic impact of substandard and falsified medicines in LMICs. The economic impact presented often did not clearly describe the methodology, or used a limited scope focusing on immediate impacts. The

final counts and full results of the review will be presented at the ISPOR conference. **CONCLUSIONS:** This review documents current evidence showing the prevalence of substandard and falsified medicines is a substantial problem in LMICs. It further highlights key gaps in the available literature at estimating the economic impact of substandard and falsified medicines, what further studies are needed to evaluate the broader economic impact of poor medicines in LMICs, and makes a case for investing in evidence-based solutions to address this problem.

PHP33

THE BEST WAY TO HTA? QUEBEC VERSUS THE REST OF CANADA

Macaulay R, Hugon M, Griffiths EA
PAREXEL, London, UK

OBJECTIVES: The Canadian Agency for Drugs and Technologies in Health (CADTH) makes reimbursement recommendations to provincial public drug plans to help guide drug funding decisions. The exception is Quebec, where the Institut National d'Excellence en Santé et en Services Sociaux (INESSS) conducts separate assessments. This research compares drug recommendations between CADTH and INESSS. **METHODS:** Publically available CADTH (including both Common Drug Review [CDR] and pan-Canadian Oncology Drug Review [pCODR] processes) and INESSS reports on drug assessments were identified between 01/31/2015 and 11/30/2016, and key data were extracted and compared. **RESULTS:** 144 appraisals were conducted by CADTH (104 under CDR and 40 pCODR) compared with 337 by INESSS. 83% CADTH appraisals resulted in positive decisions (defined as a full [4%] or restricted recommendation [79%]) with 17% not recommended. Recommendation rates were similar under CDR versus pCODR processes. 48% INESSS appraisals resulted in positive decisions (including restrictions and those from re-assessments) with 37% not recommended and 14% other. 44% INESSS oncology drug appraisals were positive decisions. 96 drugs had been assessed by both CADTH and INESSS in the same indication. Only 55% were concordant (kappa=0.17); however, this is a higher rate than expected by chance (24%). **CONCLUSIONS:** INESSS has appraised many more technologies than CADTH over the past 2 years but issued less frequent positive decisions. Concordance in decisions between agencies is low (kappa=0.17), largely due to the higher recommendation rate for CADTH. Although CADTH offers a single pan-Canadian assessment of the clinical and economic impact of a new drug, their very high rate of positive recommendations that are non-binding (and hence need subsequent provincial assessments) may question their effectiveness in supporting efficient and consistent provincial drug reimbursement. However, these positive recommendations are typically conditional on demonstrating acceptable cost-effectiveness, and unlike INESSS, CADTH conducts horizon scanning, potentially filtering out technologies unlikely to be recommended.

PHP34

UNDERMINING THE GOLD STANDARD? THE ROLE OF NON-COMPARATIVE EVIDENCE IN HEALTH TECHNOLOGY ASSESSMENT

Griffiths EA[1], Vadlamudi NK[2], Macaulay R[3], Uddin J[1], Samuels ER[1]
[1]*PAREXEL, London, UK,* [2]*University of British Columbia, Vancouver, BC, Canada,* [3]*PAREXEL International, London, UK*

OBJECTIVES: Many health technology assessment (HTA) agencies express a preference for 'gold standard' randomized controlled trial (RCT) evidence against a relevant comparator when appraising new health technologies; however, it is not always feasible to design and conduct a clinical trial that meets these criteria. The objective of this study was to assess the current role of non-comparative evidence in HTA decision-making. **METHODS:** The websites of three HTA agencies: NICE (UK), CADTH (Canada), and IQWiG (Germany) were searched for single HTA reports published between January 2010 and December 2015. The product, indication, outcome, and clinical evidence presented (comparative vs non-comparative) were double-extracted, with any discrepancies reconciled. Multiple technology appraisals, medical devices, vaccination programmes, and requests for advice were excluded. A 'non-comparative' study was defined as any study not presenting results against another treatment (including placebo or best-supportive care), regardless of Phase or setting, including dose-ranging studies. **RESULTS:** 549 appraisals were extracted. Non-comparative evidence was considered in 38% (45/118) NICE submissions, 13% (34/262) CADTH appraisals, and 12% (20/169) IQWiG appraisals. Evidence packages based exclusively on non-comparative evidence were presented in only 4% (5/118) NICE appraisals, 6% CADTH appraisals (16/262), and 4% (6/169) IQWiG appraisals. The majority of drugs appraised solely on the basis of non-comparative evidence were indicated for cancer or hepatitis C. Positive outcome rates (encompassing recommended/restricted/added benefit decisions) for submissions presenting only non-comparative evidence were similar to overall recommendation rates for NICE (84% vs 80%, respectively) and CADTH (68% vs 69%), but were notably (though not statistically) lower for IQWiG (38% vs 22%) ($p > 0.05$ for all). **CONCLUSIONS:** The role of non-comparative evidence in HTA is currently limited. Non-comparative studies can be viewed as acceptable clinical evidence by NICE and CADTH when these study designs are justifiable and when treatment effect can be convincingly demonstrated using these methods; IQWiG will rarely consider non-comparative studies.

PHP35

IMMEDIATE DISCOUNTS VERSUS DELAYED REBATES: A SURVEY OF U.S. PAYERS

Mezzio D, Kiselica AM, Nguyen V, O'Day K
Xcenda, LLC, Palm Harbor, FL, USA

OBJECTIVES: Delay discounting describes the tendency to prefer an immediate reward, even when a delayed reward is greater. This phenomenon has been consistently demonstrated in several studies across a variety of populations. This study aimed to assess whether the delay discounting model is applicable among U.S. healthcare payers. **METHODS:** An online survey was conducted with U.S. pharmacy and medical directors who worked at managed care organizations (MCOs) and served as active members of pharmacy and therapeutics committees. Participants were given 27 different scenarios based on the Monetary Choice Questionnaire. Each scenario offered two options from a fictional drug manufacturer wishing to contract with an MCO. Participants chose between a smaller immediate discount off invoice and a larger delayed rebate. The cost savings and length of delay varied in each of the scenarios. A published scoring tool was used to calculate the individual and overall rates at which the subjective value of the delayed reward decreased over time (k). A delay discounting curve plotted the relative subjective value of the delayed reward versus the length of delay. **RESULTS:** The overall median k value across all 54 participants was 0.00254, yielding a shallow hyperbolic delay discounting curve. Subgroup analyses revealed equivalent median overall k values between pharmacy and medical directors. Overall, 54% of all decisions were in favor of a delayed rebate. A magnitude effect was observed, where increases in rebate amounts from small to large coincided with increased favorability towards delayed rebates (50% to 59%, respectively). **CONCLUSIONS:** While payers in this study displayed an expected pattern of discounting delayed rewards, discounting appears to be minimal compared to previously published discounting rates of non-payer populations. Results suggest payers in general are willing to wait for larger, delayed rebates over smaller, immediate discounts when engaging in contracting opportunities.

PHP36

ASSOCIATION BETWEEN EXTERNAL REFERENCE PRICING AND PER CAPITA SPENDING ON PHARMACEUTICALS IN EUROPE

Krahenbuhl J, Page MJ
Medpace, Cincinnati, OH, USA

OBJECTIVES: External reference pricing (ERP) is a cost-containment tool employed by many European countries to manage pharmaceutical prices. The study objective was to explore the association of ERP and related factors with per capita pharmaceutical spending in 28 European countries. **METHODS:** The outcome variable was annual per capita spending on prescription and over-the-counter (OTC) pharmaceuticals. Potential explanatory variables included the number of countries contained in each country's "basket" of countries referenced when establishing price; number of times each country was referenced in other countries' baskets; price type referenced (manufacturer or purchasing power parity); frequency of re-referencing; Eurozone membership; country population and life expectancy, and gross domestic product (GDP) per capita. All analyses were conducted with SAS v9.3. Explanatory variables were assessed for correlation with the outcome variable, normality, and multicollinearity. Linear regression with backwards elimination was performed to delineate the factors with greatest impact on pharmaceutical spending. **RESULTS:** Mean per capita pharmaceutical spending was €367. While the average number of countries in a given country's basket was 13.2, the average number of times a country itself is referenced in another's basket is 12.0. The number of times each country was referenced and life expectancy were statistically significantly associated with pharmaceutical spending. As the times a country is referenced increases by one, per capita pharmaceutical spending increases by €8.37. As life expectancy increases by one year, pharmaceutical spending per capita increases by approximately €21.90. **CONCLUSIONS:** This study showed that the number of times a country is referenced by other countries is significantly associated with per capita pharmaceutical spending in the referenced country, indicating that countries with higher per capita spending impact pricing in other countries. Logically, life expectancy is positively correlated with per capita pharmaceutical spending – the longer a person lives, the more he or she will spend on pharmaceuticals in a given year.

GENERIC COMPETITION IN THE US (1980-2016)

Al-Mutairi R[1], Rodriguez-Monguio R[2], Szeinbach SL[3], Eguale T[1], Tyrrell B[1], Seoane-Vazquez E[4]
[1]*MCPHS University, Boston, MA, USA,* [2]*University of Massachusetts Amherst, Amherst, MA, USA,* [3]*The Ohio State University, Columbus, OH, USA,* [4]*Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA*

OBJECTIVES: This study assessed trends in generic drugs approved by the US FDA in the period 1980-2016. **METHODS:** Study data were derived from the FDA webpage. We assessed the first generic entry for new molecular entities (NMEs) and new therapeutic biologic license applications (BLAs) approved during the study period. We estimated the time from BLA/NME approval to biosimilar/generic approval. Descriptive analysis, t-test and Chi-Square where used in the analysis. Stata 13.1 was used for the analysis. **RESULTS:** The FDA approved 1033 new drugs in the period 1980-2016 including 914 NMEs and 119 BLAs. Nine BLAs and 137 NMEs were discontinued from the market as of December 31, 2016. There were 4 BLAs that experienced biosimilar competition. There were 156 (15.1%) NMEs discontinued from the market and 249 (23.5%) that had patent or exclusivity listed by the FDA, resulting in 528 NMEs that candidates to generic competition of which 392 (74.2%) experienced generic competition during the period of analysis. There were 312 (78.0%) non-orphan NMEs and 91 (49.5%) of orphan NMEs with generic competition. The BLAs with biosimilar competition had a period of single source of 18.3±4.26 years. The NMEs with generic competition had a period of single source of 13.3±4.3 years. The single source period of NMEs was 13.5 years in 1980-1984, 13.8 years in 1985-1989, 12.3 years in 1990-1994, and 11.9 in 1995-1999. Data for the period 2000-2016 is right censored as drugs are expected to experience generic competition in the future. **CONCLUSIONS:** Only a small number of BLA experienced biosimilar competition due to the recent implementation of a pathway for biosimilar approval. A significant number of drugs, especially orphan drugs did not experience generic competition in spite of having not patent or exclusivity protection. The single source period of NMEs declined over time.

PHP38

THE MANAGEMENT OF THE HUNGARIAN HEALTH INSURANCE PHARMACEUTICAL BUDGET BETWEEN 2006-2015

Boncz I, Répásy B, Sebestyén A, Molics B, Vajda R, Ágoston I, Endrei D
University of Pécs, Pécs, Hungary

OBJECTIVES: At the end of 2006, there was an important reform in the Hungarian pharmaceutical market, including serious changes in the health insurance reimbursement of medicines. In 2008, the world economic crisis significantly affected the public expenditures in many countries. The aim of our study is to analyze the changes in the Hungarian health insurance pharmaceutical budget between 2006-2015. **METHODS:** Data were derived from the nationwide administrative dataset of the National Health Insurance Fund Administration (OEP), the only health care financing agency in Hungary. We analyzed the changes of the pharmaceutical budget between 2006-2015. Results are given in Hungarian Forint (HUF) and US dollars (USD). The annual average currency exchange rates were applied according to the data of the Central Bank of Hungary. **RESULTS:** In the first year, the Hungarian pharmaceutical budget decreased from 388.7 billion HUF (2006) to 323.6 billion HUF (2007) by 65.1 billion HUF (16.7 %). This decrease was a bit moderate in USD dollar (0.1 billion USD, 4.7 %) due to the stronger Hungarian currency. For 2011, the pharmaceutical budget slightly increased compared to 2007 up to 376.9 billion HUF (1.88 billion USD). The increase was moderate in USD due to the weakening Hungarian currency. Between 2012-2015. the pharma budget remained in the range of 296-326 billion HUF (1.17-1.3 billion USD). **CONCLUSIONS:** Due to the reform of the whole Hungarian pharmaceutical market and as the effect of economic crisis, the Hungarian health insurance pharmaceutical budget significantly decreased between 2006-2015. Between 2006-2009 this decline became higher as the Hungarian currency weakened compared USD during the world economic crisis. Between 2012-2015. the pharma budget have been stabilized.

PHP39

THE EXCHANGE OF HEALTHCARE ECONOMIC INFORMATION IN THE US: PAYER AND MANUFACTURER EXPERIENCES WITH FDAMA 114 AND FUTURE DIRECTIONS

Duhig A[1], Jackson J[1], Sarnes M[1], Kaufman S[1], Popelar B[1], Carden MJ[2], Saha S[2]
[1]*Xcenda, LLC, Palm Harbor, FL, USA,* [2]*Academy of Managed Care Pharmacy, Alexandria, VA, USA*

OBJECTIVES: To understand US payer and manufacturer experiences with Section 114 of the Food and Drug Administration (FDA) Modernization Act of 1997 (FDAMA 114) and how this experience could influence implementation of new legal provisions and FDA guidance on healthcare economic information (HCEI). **METHODS:** Payers and manufacturers completed surveys assessing the importance of HCEI and application of FDAMA 114 prior to changes resulting from implementation of 21st Century Cures and recent draft FDA guidance. **RESULTS:** Payers (N=59) were largely from managed care organizations (75%) and most (64%) were voting Pharmacy and Therapeutics Committee members. Manufacturers (N=81) represented small- to large-sized companies, with representation primarily from Health Economics and Outcomes Research functions (35%). Most payers (54%) had a person/group responsible for HCEI, with 46% conducting in-house HCEI evaluations. Nearly half (49%) reported that formulary decision-making was at least somewhat limited by the amount and type of HCEI shared by manufacturers; 56% reported receiving HCEI only sometimes or rarely and 29% agreed very much or completely that conservative action by manufacturers limits HCEI access. Some payers (42%) noted variation among manufacturers with respect to proactive sharing of HCEI. Similarly, most manufacturers (53%) rated FDAMA 114 decisions within a brand/therapeutic area as only somewhat consistent. Approximately half of payers rated real world observational studies comparing adherence rates (47%) and retrospective studies assessing quality measure achievement (58%) as very or extremely useful for informing formulary or medical policy decisions. However, manufacturers reported that it is very or extremely difficult to gain approval for proactive dissemination of these studies (38% and 32%, respectively). **CONCLUSIONS:** Despite its utility in payer decision-making, availability and communication of HCEI by manufacturers is varied and limited. Recent approval of 21st Century Cures and draft FDA guidance may improve the effective exchange of HCEI. This research may help to influence implementation of these changes.

PHP40

PAYING FOR INNOVATION: PRIVATE PAYER COVERAGE OF BREAKTHROUGH THERAPIES

Chenoweth MD[1], Boumil M[2], Beninger P[2]
[1]*Tufts University, Medford, MA, USA,* [2]*Tufts University School of Medicine, Boston, MA, USA*

OBJECTIVES: The Breakthrough Therapy Designation provides an expedited Food and Drug Administration (FDA) review pathway for novel pharmaceuticals that treat serious or life-threatening disease and show preliminary clinical evidence of substantial improvement over existing therapies. The aim of this research is to determine whether that clinical data is sufficient for US payer coverage and reimbursement. **METHODS:** We compared characteristics of all novel pharmaceuticals approved with and without a breakthrough therapy designation using publicly available information provided by Drugs@FDA. Benefits documents and coverage policies were extracted from the 20 largest US private insurance companies. Coverage status and prior authorization criteria were then compared to FDA approval. **RESULTS:** Between 11/1/2013 and 12/31/2015, FDA CDER approved 90 novel pharmaceuticals; 22 new molecular entities/new biological products that received Breakthrough Therapy Designation and 68 novel pharmaceuticals that did not receive Breakthrough Therapy Designation. We identified 684 coverage policies issued by private payers for the included new drugs. Almost no payers denied access to any of the included novel drugs; 96.78% of all coverage policies provided at least some degree of patient access. Breakthrough therapies were universally covered by all payers. Private payer coverage of breakthrough therapies was equivalent to the corresponding FDA label in 79.17% of cases, more restrictive in 8.33%, less restrictive in 10.19%, and varied in 2.31%. All 'less restrictive' or 'varied' breakthrough therapies were cancer drugs. Breakthrough therapies were significantly more likely to be equivalent to corresponding FDA approval than other novel pharmaceuticals (79.17% vs. 56.4%). Novel pharmaceuticals that did not receive breakthrough therapy designation were significantly more likely to have additional restrictions applied. **CONCLUSIONS:** Although the Breakthrough Therapy Designation leads to faster regulatory approval, payer coverage remains a significant hurdle for drug manufacturers as they bring novel pharmaceuticals to market. For patients, coverage inconsistencies can mean variable access to breakthrough therapies.

PHP41

DYNAMIC REIMBURSEMENT WORKING IN PRACTICE? CANCER DRUGS FUND REFORMS IN THE UK

Walsh SC, Davé K, Macaulay R
PAREXEL, London, UK

OBJECTIVES: Expedited regulatory pathways increasingly grant marketing authorization for treatments at earlier stages of clinical development. In contrast, payers in Europe, Canada, and Australia are increasingly demanding more robust data to justify reimbursement. Dynamic reimbursement, defined as varying the price as further evidence emerges, provides one route for reimbursement where considerable uncertainty exists. However, in practice, attempts to remove coverage/reduce the price of already reimbursed treatments have been challenging (e.g. Conditional Financing in the Netherlands). Reforms to the Cancer Drugs Fund (CDF) in England have effectively created a dynamic reimbursement scheme whereby drugs reimbursed under the CDF (originally set up in 2011 with free-pricing for qualifying drugs) will only maintain reimbursement if they achieve positive NICE guidance. This research aims to evaluate how these CDF reforms have impacted drug coverage and pricing. **METHODS:** Drugs covered under the CDF (as of 07/29/2016) were identified from the NHS England website. Corresponding subsequent NICE appraisal guidance was screened up to 01/13/2017. **RESULTS:** Thirty-three drug-indication pairings were covered under the CDF; 10 have subsequently received final NICE guidance (100% positive); all recommendations were associated with a PAS (all simple discount schemes). 7 drug-indication pairings were approved through rapid re-appraisals and 3 were approved through full NICE submissions. 18 submissions are undergoing NICE appraisals, of which 7 have draft guidance (2 positive, 4 negative, and 1 recommended for inclusion in the reformed CDF). 3 drug-indication pairings were deferred to the CDF 'off-label process', 1 was withdrawn by the manufacturer, and 1 has unknown status. **CONCLUSIONS:** Under the recent CDF reforms, the NHS has arguably successfully implemented a form of dynamic reimbursement whereby manufacturers have had to reduce their prices or lose reimbursement. However, this is not an ongoing scheme but a one-off set of changes that were a consequence of broader oncology reimbursement reforms.

PHP42

DO PAYERS COVER CANCER AND NON-CANCER DRUGS DIFFERENTLY?

Pope EF[1], Wilkinson C[1], Chambers J[2]
[1]*Center for the Evaluation of Value and Risk in Health, Institute for Clinical Research and Health Policy Studies,Tufts Medical Center, Boston, MA, USA,* [2]*Tufts Medical Center, Boston, MA, USA*

OBJECTIVES: Evidence suggests that health technology assessment agencies across the globe may use different assessment criteria for cancer and non-cancer drugs. Our objective was to compare coverage decisions for cancer and non-cancer drugs issued by US private health care payers to determine if cancer drugs are subject to fewer coverage restrictions. **METHODS:** We identified coverage decisions for cancer and non-cancer drugs from the Tufts Medical Center Coverage Determination database which includes 3,432 coverage decisions issued by 17 of the largest commercial payers (in terms of covered lives). We compared each payer's coverage decision for each drug against the drug's corresponding FDA label. We categorized each coverage decision as: (a) more restrictive than the FDA label (the payer placed conditions on coverage beyond the FDA label); (b) consistent with the FDA label; (c) less restrictive than the FDA label (the payer covered the drug for a broader patient population than the FDA label); or (d) mixed (the payer's coverage decision was more restrictive than the FDA approval in one way but was less restrictive in another). We compared the restrictiveness of coverage of cancer and non-cancer drugs using a chi-squared test. **RESULTS:** The database contains 2,507 coverage decisions for non-cancer drugs, and 925 coverage decisions for cancer drugs. For non-cancer drugs, coverage was more restrictive on 35% (n=877) occasions, consistent on 53% (n=1,324) occasions, less restrictive on 4% (n=109) occasions, and mixed on 2% (n=51) occasions. For cancer drugs, coverage was more restrictive on 5.3% (n=49) occasions, consistent on 70.7% (n=650) occasions, less restrictive on 21.9% (n=201) occasions, and mixed on 1.2% (n=11) occasions. We found a statistically significant ($p<0.05$) difference between the restrictiveness of coverage of cancer and non-cancer drugs. **CONCLUSIONS:** Our study suggests that payer coverage of cancer drugs is less restrictive than coverage of non-cancer drugs.

PHP43

RATES OF PRESCRIPTIONS FOR HIGH OPIOID DAILY DOSES ACROSS MULTIPLE EMPLOYER GROUP PLANS IN EASTERN TENNESSEE

Singer D[1], Crawford AG[1], Fortner G[2], Goldfarb NI[3]
[1]*Thomas Jefferson University, Philadelphia, PA, USA,* [2]*HealthCare 21 Business Coalition, Knoxville, TN, USA,* [3]*Greater Philadelphia Business Coalition on Health, Philadelphia, PA, USA*

OBJECTIVES: CDC has released guidelines for providers on appropriate opioid use which identify potentially unsafe opioid daily doses (≥50 morphine milligram

equivalents (MME) and ≥90 MMEs). This study used a multi-employer dataset in eastern Tennessee to identify the proportion of opioid prescriptions that exceeded these thresholds. **METHODS:** Prescription and medical claims data were obtained from the data warehouse of HealthCare 21, the employer coalition in eastern Tennessee. A cross-sectional analysis was conducted including beneficiaries with continuous eligibility from July 2014 to June 2015 who were ages 18-64. Individuals with a cancer diagnosis were excluded. Filled opioid prescriptions were identified and daily doses in MMEs were calculated. Daily doses of ≥50 MMEs and ≥90 MMEs were identified as these were thresholds described in CDC guidelines. **RESULTS:** The final sample included 63,648 beneficiaries. The median age was 44 and 58% were female. Of these beneficiaries, 14,115 (22%) filled at least one opioid prescription. A total of 47,508 opioid prescriptions were filled. Among the population who filled at least one opioid prescription, the median number of prescriptions was 1, the mean was 3.4, and the maximum was 45. The median daily dose for all opioid prescriptions was 32 MMEs, the mean was 51 MMEs while the 90th and 95thpercentiles were 90 and 135 MMEs, respectively. Nearly one third of opioid prescriptions were for daily doses ≥50 MMEs (30%) and 12% were for daily doses ≥90 MMEs. **CONCLUSIONS:** Despite CDC recommendations against the use of high daily doses of opioids, nearly one in three opioid prescriptions in this study were found to be for daily doses ≥50 MMEs. Further research is warranted to better understand factors contributing to the prevalence of high dose opioid prescriptions and how exposure to these potentially dangerous doses can be reduced.

PHP44

MEDICATION ADHERENCE AND DISCONTINUATION IN MEDICAID PATIENTS WITH DUAL DIAGNOSES OF SCHIZOPHRENIA AND BIPOLAR WHO INITIATED LONG ACTING INJECTABLE ANTIPSYCHOTIC VERSUS THOSE WHO CHANGED ORAL ANTIPSYCHOTICS

Greene M[1], Yan T[2], Chang E[2], Hartry A[3], Broder MS[2]
[1]*Otsuka Pharmaceutical Development & Commercialization Inc., Princeton, NJ, USA,* [2]*Partnership for Health Analytic Research, LLC, Beverly Hills, CA, USA,* [3]*Lundbeck Pharmaceuticals Services, LLC, Deerfield, IL, USA*

OBJECTIVES: To compare medication adherence and discontinuation between patients with dual diagnoses of schizophrenia and bipolar disorder (BPD) who initiated a long-acting injectable antipsychotic (LAI) and those who changed to a different oral antipsychotic monotherapy. **METHODS:** This retrospective cohort analysis used the Truven Health Analytics MarketScan® Medicaid claims database. Of the identified schizophrenia patients (≥18 years) with co-morbid BPD (dual diagnoses), two mutually exclusive cohorts were created: "LAI", patients initiating LAI therapy between 01/01/2013 and 06/30/2014 (the identification period); and "oral", patients who changed to a different oral antipsychotic monotherapy during the same period. The first day of initiating LAI or new oral was the index date. Primary outcome measures were medication adherence [proportion of days covered (PDC)] during the 1-year follow-up and medication discontinuation (continuous medication gap ≥ 60 days) during entire follow-up. General linear regression and Cox regression models were used to estimate adjusted medication adherence rate and risk of discontinuation, respectively, adjusting for patient demographic and clinical characteristics, baseline medication, and baseline emergency department visits or hospitalizations. **RESULTS:** The study sample consisted of 1,028 (45.1%) LAI initiators and 1,250 (54.9%) oral monotherapy users. Compared with oral users, LAI initiators had better medication adherence (adjusted mean of PDC: 0.52 vs. 0.48; p=0.023). LAI initiators also had a significantly longer time to medication discontinuation than the oral cohort. Median time to discontinuation of index LAI was 38 days, compared with 30 days in the oral cohort (p=0.025). Adjusting for covariates, the risk of discontinuing index treatment in the oral cohort was higher than in the LAI cohort (hazard ratio: 1.14; p=0.01). **CONCLUSIONS:** This real-world study suggests that among patients with dual diagnoses of schizophrenia and BPD, use of LAI was associated with slightly better medication adherence and lower discontinuation risk compared with use of oral antipsychotic monotherapy.

PHP45

RELATIVE RISK OF ANTI-PSYCHOTIC USE IN FOSTER CHILDREN BENEFICIARIES ENROLLED IN THE MISSISSIPPI DIVISION OF MEDICAID (DOM)

Gangan N, Banahan III B
Center for Pharmaceutical Marketing and Management, University of Mississippi, University, MS, USA

OBJECTIVES: Increasing use of antipsychotic medications in children, especially outside of FDA approved uses has become a topic of national concern. Higher utilization of antipsychotic medications in foster children has raised questions about treatment disparities. This study assesses the relative risk of antipsychotic use in foster children compared to non-foster children in Mississippi Medicaid. **METHODS:** We employed a retrospective observational design. Mississippi DOM pharmacy claims for all children from ages 4-18 years and continuously enrolled for 2015 were analyzed for antipsychotic use. Antipsychotic use was identified by using NDC codes for all first and second-generation antipsychotics. Foster children were identified using eligibility codes, which excluded children who received long-term care or had dual eligibility. Poisson regression with log link was used to assess the unadjusted and adjusted relative risks of antipsychotic use amongst foster versus non-foster care children. **RESULTS:** We identified 4,626 foster children and 274,043 non-foster children continuously enrolled in 2015. Foster children had higher rates of mental disorders such as psychosis, ADHD, conduct disorder, and disruptive behavior disorder. The unadjusted relative risk of antipsychotic use in foster children was 3.6 times higher compared to non-foster children (95% CI, 3.303-4.013, p<0.0001). When adjusting for demographics and mental health disorders, the relative risk of antipsychotic use dropped to 1.4 (95% CI, 1.272-1.603, p<0.0001). **CONCLUSIONS:** The use of antipsychotic medications was significantly higher among foster children. After adjusting for mental health and developmental conditions, the relative risk of use was still significantly higher but much lower. The drop in adjusted relative risk indicates that higher rates of use in foster children might be explained by higher rates of trauma and mental health disorders. Future work examining additional confounding variables may be needed to determine whether a treatment disparity actually exists between foster and non-foster children.

PHP46

ALL-CAUSE INPATIENT HOSPITALIZATIONS IN MEDICAID PATIENTS WITH DUAL DIAGNOSES OF SCHIZOPHRENIA AND BIPOLAR WHO INITIATED LONG ACTING INJECTABLE ANTIPSYCHOTICS

Greene M[1], Yan T[2], Chang E[2], Hartry A[3], Broder MS[2]
[1]*Otsuka Pharmaceutical Development & Commercialization Inc., Princeton, NJ, USA,* [2]*Partnership for Health Analytic Research, LLC, Beverly Hills, CA, USA,* [3]*Lundbeck Pharmaceuticals Services, LLC, Deerfield, IL, USA*

OBJECTIVES: To compare all-cause inpatient hospitalizations among Medicaid patients with dual diagnoses of schizophrenia and bipolar disorder who initiated long-acting injectable antipsychotics (LAIs). **METHODS:** This retrospective cohort analysis used the Truven Health Analytics MarketScan® Medicaid claims database. Schizophrenia patients ≥18 years with comorbid bipolar disorder (dual diagnoses) and having at least one claim for one of the following four LAIs were identified between 01/01/2013 and 06/30/2014: aripiprazole, haloperidol, paliperidone, and risperidone. The first day of initiating LAI was considered the index date. We compared all-cause hospitalization rates during the 1-year follow-up and time to first all-cause hospitalization during the entire follow-up across the four LAI cohorts. Logistic and Cox regression models were used to estimate risks of inpatient hospitalization, adjusting for baseline patient demographic and clinical characteristics, medication use, and emergency department use/hospitalizations. **RESULTS:** Of the identified Medicaid patients with schizophrenia and bipolar dual diagnoses, 935 initiated an LAI: 49.3% received paliperidone, 23.3% haloperidol, 16.4% risperidone, and 11.0% aripiprazole. Controlling for covariates, the adjusted post-index 1-year hospitalization rate in in aripiprazole (36.8%) was lower than in paliperidone (41.9%), haloperidol (45.6%), and risperidone (47.3%). The median time to first hospitalization in aripiprazole was 647 days, vs. 507 days in paliperidone, 426 days in haloperidol, and 419 days in risperidone. With the aripiprazole cohort as the reference group, the risk of having any inpatient hospitalizations during the entire follow-up was higher in haloperidol, paliperidone and risperidone cohorts. However, none of these differences were statistically significant (p>0.05). **CONCLUSIONS:** This is the first study to compare inpatient hospitalizations among Medicaid patients with dual diagnoses of schizophrenia and bipolar who initiated LAIs. Our findings suggest that patients treated with aripiprazole have a numerically lower risk of having any hospitalizations, compared with those treated with haloperidol, paliperidone, and risperidone, although the difference was not statistically significant.

PHP47

PATIENT CHARACTERISTICS RELATED TO SPECIALTY MEDICATION USE

Park T[1], Griggs S[1], Chung PD[2]
[1]*St Louis College of Pharmacy, St Louis, MO, USA,* [2]*Washington University in St Louis, St Louis, MO, USA*

OBJECTIVES: To identify characteristics associated with specialty medication use by employing a large, nationally representative sample of patients using specialty medications for their chronic conditions in the U.S. **METHODS:** This study used Medical Expenditure Panel Survey (MEPS) data from 2000 through 2013. Among the MEPS respondents aged 18 or older who received at least one medication during the years 2000 through 2013, those who used any specialty pharmaceuticals were considered as specialty medication users (SMUs). Accordingly, adults 18 or older who used only pharmaceuticals other than specialty medications were considered traditional medication users (TMUs). Those who used not only specialty medications but also traditional medications concurrently were labeled as both medication users (BMUs). Andersen's Health Services Utilization model was used to identify potential factors related to specialty medication use. Associations between the variables identified by Andersen's model and specialty medication use were analyzed using logistic regression in a hierarchical fashion. Sampling weights were considered and standard errors were adjusted to account for the complex survey design. **RESULTS:** A fully adjusted model suggested that older adults or individuals using mail order services were more likely to use specialty medications regardless of whether they used traditional medications concurrently. Behaviors of using specialty medication(s) were positively associated with married and active working status and negatively associated with middle or high income and having a usual source of care (visiting a doctor's office, clinic, or health center they usually go when sick) when comparing TMUs and SMUs. In addition, when comparing TMUs and BMUs, behaviors of using specialty medication(s) were positively associated with female gender, having drug insurance, worse health state and more comorbidities and negatively associated with other race/ethnicity (not Caucasian/African American). **CONCLUSIONS:** This study identified characteristics of patients using specialty medication(s). Some sociodemographic, economic, and clinical factors were related to specialty medication use among U.S. adults.

PHP48

KNOWLEDGE, ATTITUDE AND PRACTICE: STUDY OF GENERIC MEDICINES AMONG STAKE HOLDERS IN BAHAWALPUR CITY

Masood I, Akhtar N, Gillani SM, Rabbani W, Batool N, Amin J
The Islamia University of Bahawalpur, Bahawalpur, Pakistan

OBJECTIVES: This study aimed to assess public knowledge and attitudes toward generic medicine usage within a government hospital and community setting in

Bahawalpur which could serve as baseline data for future studies. **METHODS:** A cross-sectional survey involving 600 respondents was conducted using a validated questionnaire among the stake holders of Bahawalpur City, Punjab; Pakistan. The data was collected from 150 pharmacists and 150 doctors by using self-administered questionnaire, while 300 patients were questioned verbally. The data was collected using pre-tested semi structured questionnaire. The data was analyzed using SPSS version 15 and the results were tabulated. **RESULTS:** Out of 150 pharmacist, 102 (68%) had knowledge that generic medicines show same effects as branded medicines. Out of 150 doctors, 67 (44.7%) considered that generic medicines were as effective as branded medicines. Out of 300 patients, 277 (93.3%) considered that branded medicines were safer than generic medicines. Patients 268 (89.3%) were not interested to know about cheaper alternative of prescribed medicines. Patients 296 (98.7%) were not asked by doctors or pharmacist to switch from branded to generic medicines. Pharmacists 113 (75.3%) showed positive attitude to have awareness about shops where generic medicines were available while who suggested the patient regarding use of generic medicines were 102 (68%). Doctors 140 (93.3%) needed information about safety and efficacy of generic medicines and 118 (78.1%) doctors said that their prescribing decision was influenced by advertisements of drug companies. **CONCLUSIONS:** It was concluded from current study that there was gap of knowledge among respondents towards generic medicines. Most of the respondents showed negative attitude towards generic medicines and generic substitution.

PHP49

A CROSS-SECTIONAL STUDY TO EVALUATE THE FACTORS INFLUENCING THE PRESCRIBERS TO PRESCRIBE AN EXPENSIVE BRAND IN BAHAWALPUR, PUNJAB, PAKISTAN

Rehman H, Areej S, Iftikhar S, Arif R, Khan A, Asghar A, Ashraf F, Mumtaz N, Ashraf M, Zafar S, Zaffar M

Akhtar Saeed College of Pharmaceutical Sciences, Lahore, Pakistan

OBJECTIVES: To promote economic treatment option in the society by reducing treatment cost and by supporting generic prescribing trends. **METHODS:** A descriptive, cross-sectional and non-experimental study was conducted among the prescribers of Bahawalpur, using a pre-tested questionnaire. Statistical Package for Social Sciences (SPSS) was used to analyze the data. **RESULTS:** A total of 250 of the prescribers were selected for the study including general prescribers (134) and specialists (116). 93.7% of the prescribers agreed the cost difference between generic and branded medicines, 52.1% of the prescribers disagreed that generic and branded drugs were equally effective, 73.1% of the prescribers believed that branded medicines followed more safety standards than the generic medicines and 61.1% of the prescribers agreed that advertisements have great impact on prescribing behavior. **CONCLUSIONS:** This study concluded that poor knowledge about safety, efficacy, quality and cost difference, and advertisements by the pharmaceutical companies are the major factors that force the prescribers to prescribe branded medicines rather economical generic. The study showed that lack of standard guidelines and polices divert the prescribing behavior from generic drugs to branded drugs.

EXPLORING ANTIMICROBIAL DRUG UTILIZATION REVIEW PROGRAMS IN SAUDI HOSPITALS

Alkelya M[1], Alsultan M[2]

[1]*King Abdullah International Medical Research Center (KAIMRC), Ryiadh, Saudi Arabia,* [2]*Imam Abdulrahman Bin Faisal University, Dammam, Saudi Arabia*

OBJECTIVES: Antimicrobial drug utilization review (DUR) is one of the essential tools to optimize the therapy and minimize the risks that are associated with irrational use of this therapeutic group including the Antimicrobial drug resistance. The aim of the study is to explore how Saudi hospitals setup DUR program for Antimicrobial drugs use **METHODS:** A cross-sectional survey targeted mangers at hospital pharmacies in both governmental and private hospitals in Riyadh City in 2014. The survey gathered information about the Pharmacy & Therapeutics Committee (P&TC) activities and adopted therapeutic guidelines by the hospitals. Descriptive statistics and nonparametric techniques were utilized for the analysis. **RESULTS:** Of the 30 hospital pharmacy managers, 23 (76.6%) responded, and only 21(70%) hospital pharmacies met the inclusion criteria, of which 15 governmental and 6 private hospitals. 20(95.2%) hospitals have P&TC, of these 20 hospitals, 16(80%) have subcommittee dedicated for DUR of Antimicrobial medications. 9 (45%) of these subcommittees meet five times or more annually to discuss Antimicrobial DU related issues.17(85%) of the hospitals have Antimicrobial use guidelines. The main P&T committee at 11 (55%) hospitals that have both dedicated subcommittees and Antimicrobial use guidelines conduct at least 12 meetings annually. The governmental hospitals are more likely to dedicate subcommittee to review Antimicrobial use and have higher frequency of meetings than the private hospitals. **CONCLUSIONS:** The adoption and implementation of Antimicrobial use guidelines is still not optimal in the Saudi hospitals which might have negative impact not only on the patient outcomes but also in public health as a result of irrational use of Antimicrobial drugs which eventually will develop Antimicrobial resistance. The effectiveness of the Antimicrobial DUR program has not been tested in this study, therefore, further studies should be conducted to ensure the effectiveness of the DUR programs in Saudi hospitals.

PHP51

A LANDSCAPE ASSESSMENT OF TWO ANESTHETICS (PROPOFOL & ETOMIDATE) IN THE HOSPITAL INPATIENT POPULATION DEMONSTRATES MARKED DIFFERENCES IN PATIENT CHARACTERICS AND COST

Liao N[1], Yang GA[2], Plent S[2], Abraham J[3]

[1]*Windary LLC, Lebanon, NJ, USA,* [2]*The Medicines Company, Parsippany, NJ, USA,* [3]*The Medicines Company, Reading, MA, USA*

OBJECTIVES: In the last decade the population undergoing medical procedures is older and sicker. However, anesthetics (sedatives/hypnotics) administered during these procedures have not changed significantly during that time. This study sought to gain a better understanding of the sedative/hypnotic landscape in inpatient hospital procedures by examining populations receiving some of the more common drugs. **METHODS:** Adult inpatients with a procedure, discharged in 2014 who received etomidate or propofol, alone or in combination with other anesthetic agents were identified in the Premier hospital database. Data from 01/2013 to 09/2015 was used for trend analysis. Descriptive statistics were employed to understand patients' demographics, therapeutic characteristics, resource utilizations and outcomes. Costs were adjusted to 2015 dollars. **RESULTS:** A total of 3,631,719 adult patients underwent a procedure in the hospital setting in 2014. Of which, 120,304 (3.3%) received etomidate and 1,246,093 (22.4%) received propofol. Compared to propofol patients etomidate patients were: older (64.7 vs. 60.2), sicker, with mean Charlson Comorbidity Index (CCI) 2.7 vs. 1.7, with higher percentage of patients in Mortality/Severity of Major or Extreme groups (73.0% vs.26.2% and 78.6% vs. 35.7%). The etomidate population had higher resource utilization (LOS 10.9d vs. 6.0d; total cost $37,685 vs. $20,586); and higher death rate (15.8% vs 3.0%.) For the 3 year period, both populations demonstrated similar trends for mean age, CCI, LOS, Cost, and Mortality/Severity). **CONCLUSIONS:** In this assessment of propofol and etomidate, procedural administration of propofol is the dominant sedative/hypnotic of use but there are marked differences in patient characteristics between the two agents. Etomidate patients are older, sicker, have a longer LOS and use more health care resources. Further research is necessary to understand if these factors may be influenced by technique or concomitant medications.

PHP52

DRUG REVIEW OF CLASS L - ANTINEOPLASIC AND IMMUNOMODULATING FOR TREATMENT OF APLASTIC / HEMOLYTIC ANEMIA AND APLASTIC PURPURA ACQUIRED

Nunes TR[1], Galdino-Pitta MR[2], Leite BF[3], Oliveira PS[1], Viana DC[4], Araujo BC[1], Zanghelini F[5], Rego MJ[5], Pereira MC[1], Oliveira MD[6], Pitta Id[4], Pitta MG[1], Andrade CA[1]

[1]*Universidade Federal de Pernambuco, Recife, Brazil,* [2]*Federal University of Pernambuco, Recife, Brazil,* [3]*Brazilian Ministry of Health, Brasília, Brazil,* [4]*Avenida Professor Moraes Rego, Recife, Brazil,* [5]*UFPE, Recife, Brazil,* [6]*University Federal de Pernambuco, Recife, Brazil*

OBJECTIVES: To evaluate the therapeutic indication of 25 mg, 100 mg and 200 mg injectable lyophilised powder antithymocyte immunoglobulin (rabbit) for the treatment of aplastic anemia. **METHODS:** A literature search was carried out on February 2015 in the following databases: BMJ - Best Practice, Dynamed and UpToDate. The search strategy adopted the vocabulary of structured Descriptors in Health Sciences (DeCS) and Medical Subject Headings (MeSH) to better identify the references of interest. Indexed search terms used were: "Anemia, aplastic" and "Antithymocyte Globulin rabbit". **RESULTS:** According to evidences in BMJ, the use of antithymocyte immunoglobulin is indicated as first-line treatment in patients with aplastic anemia in groups of patients with non-severe, severe or very severe acquired disease over the age of 50 years. According to Dynamed database, the use of antithymocyte immunoglobulin at a dose of 15 mg/kg/day for 5 days with prednisolone and cyclosporine 5 mg/kg/day for 6 months improves the response rate and the free time of blood transfusions. Since the evidence synthesis found in UpToDate base demonstrates that for the treatment of severe or very severe aplastic anemia there should contain a combination of: removing potentially offending agents (for acquired aplastic anemia), additional supportive care (for example, transfusion and antibiotics) and some form of definitive therapy (e.g., transplantation of hematopoietic cells or immunosuppressive regimens). Since 2014, none of the published studies comparing horse and rabbit immunoglobulin showed superiority of the latter. It should only be used when the horse derivative is not available. **CONCLUSIONS:** Because human antithymocyte equine immunoglobulin is not available in Brazil, we recommend the inclusion of rabbit antithymocyte immunoglobulin in dosages of 25 mg, 100 mg and 200 mg, in the form of injectable lyophilized powder in the National List of Essential Medicines of Brazil.

PHP53

EVALUATION OF DRUG-DRUG INTERACTIONS IN THE PRESCRIPTIONS OF HOSPITALIZED PATIENTS IN LAHORE, PUNJAB, PAKISTAN

Waheed I, Sadiq T, Ijaz A, Cheema KA, Khalid S, Javed M, Arooj A, Aslam S, Amjad A, Fareed S, Saleem M

Akhtar Saeed College of Pharmaceutical Sciences, Lahore, Pakistan

OBJECTIVES: To identify the prevalence of potential drug-drug interactions (DDIs) in the prescriptions dispensed in a tertiary-care hospital of Lahore, Punjab, Pakistan. **METHODS:** A retrospective analysis of 600 prescriptions fulfilling inclusion criteria was conducted in a tertiary-care hospital, from November 2015 to March 2016. The collected data contain demographics, medications, diagnosis, comorbid conditions and length of hospital stay. Medscape database was used for the therapeutic and/or pharmacological classification of prescribed drugs. The prescriptions were analyzed for potential DDIs by using the drug interaction checker. The DDIs were also classified on severity basis as major, moderate and minor. For statistical analysis SPSS version 21.0 was used. **RESULTS:** Overall prevalence of DDIs was 71.3%. Out of 600 sample size, approximately 428 prescriptions have potential DDIs. Average of 3 DDIs was found in each prescription. The prevalence rate of major interactions were 14.3%, moderate 50.3% and minor were 28.7%. Maximum number of major interaction in a prescription was 4, moderate 9 and minor was 6. Highest percentage of interactions was found in the prescriptions of cardiology ward (53.1%). The DDIs were significantly associated with increased number of drugs prescribed (P-value 0.000). **CONCLUSIONS:** Potential DDIs occurrence was significant. Patients admitted to cardiology ward and those with large number of prescribed drugs need to be monitored more closely.

PHP54

EFFECT OF CASH PRESCRIPTIONS ON ADHERENCE PERFORMANCE MEASURE ESTIMATES USED IN MEDICARE STAR RATINGS

Thompson JA, Kelton CM, Lin AC, Luder HR, Winstanley EL, Heaton PC
University of Cincinnati, Cincinnati, OH, USA

OBJECTIVES: Medicare Star Ratings evaluate the quality of Medicare Advantage plans with Part-D coverage (MA-PDs) and stand-alone Part-D plans (PDPs) via multiple measures, including adherence metrics developed by the Pharmacy Quality Alliance (PQA). The objective of this study was to assess the impact of missing cash prescriptions on PQA-adherence calculations for statin, angiotensin system antagonists (RASA), and antidiabetic medications. **METHODS:** The Medical Expenditure Panel Survey 2010-2014 was used for this study. Proportion of days covered (PDC) was calculated for all prescriptions, as well as noncash-only prescriptions, when stratified by drug class. Patient adherence was defined as PDC $\geq$80%. Index date was defined as the first noncash prescription fill date or the round-start-date of the first noncash prescription. Patients were included if they had 2 or more noncash claims, were continuously enrolled in a MA-PD or PDP, and were age $\geq$65. Patients with multiple insurance types, not inscope, with a measurement period $<$91 days, with end-stage renal disease, and diabetic patients with any insulin claim, were excluded. **RESULTS:** Of PDP-enrollees taking a statin (N=16,325,696) the proportion considered adherent decreased from 65.2% for all prescriptions to 59.7% when measuring noncash-only claims. MA-PD-enrollees using statins (N=17,407,689) displayed similar results, and the proportion considered adherent decreased from 62.9% to 56.6%. For those on RASA-therapy, the proportion of PDP-enrollees (N=13,224,287) considered adherent decreased from 67.2% to 57.7%, and the proportion of MA-PD-enrollees (N=13,625,655) considered adherent decreased from 63.1% to 56.6%. For patients taking antidiabetics the proportion of PDP-enrollees (N=3,804,912) considered adherent decreased from 72.8% to 62.6%, while the proportion of MA-PD-enrollees (N=4,792,802) considered adherent decreased from 75.0% to 65.1%. On average 1 million MA-PD/PDP enrollees per year were incorrectly classified as nonadherent when using noncash-only claims. **CONCLUSIONS:** Cash-only prescriptions represent a significant source of drug-exposure misclassification bias for adherence calculations in MA-PD/PDP enrollees using statin, RASA, or antidiabetic medications.

PHP55

KEY GROUPS INFLUENCING GENERIC DRUG USE IN THE U.S. AND THE NATURE AND EXTENT OF THEIR INFLUENCE

Harris I[1], Howard J[1], Frank G[1], Kiptanui Z[1], Hansen RA[2], Qian J[3]
[1]*IMPAQ International, Columbia, MD, USA,* [2]*Harrison School of Pharmacy, Department of Health Outcomes Research and Policy, Auburn University, Auburn, AL, USA,* [3]*Auburn University Harrison School of Pharmacy, Auburn, AL, USA*

OBJECTIVES: Research to better understand the key influencers of generic drug use – including their knowledge base and perceptions toward generic drugs – is needed to effectively design and deliver communications to these key groups that impact consumer acceptance and use of generic drugs. In order to address this important regulatory science need, this qualitative study that identifies the informational needs of these key groups regarding generic drugs was conducted. **METHODS:** Key informants in each of the following 6 groups were interviewed between 9/16/2016 and 11/30/2016: 1) patients/caregivers; 2) prescribers; 3) pharmacists; 4) formulary managers; 5) policymakers; and 6) large purchasers of drugs. Participant screeners differed by group. All interview guides focused on the participant's drug prescribing, dispensing, and utilization backgrounds, roles in generic drug use, beliefs about safety and effectiveness of generic drugs, and informational needs related to generic drugs. Trained interviewers conducted 48 phone interviews. Interviews were audio recorded and transcribed. Qualitative data derived from the transcripts were analyzed with the assistance of NVivo 10 software. Initial themes were identified and discussed until all research team members agreed on major themes. **RESULTS:** While participants are likely to prescribe, dispense, or utilize generic medications, many suggested that because generic drug information is dispersed across multiple sources, it may be challenging to obtain generic drug information from one source. Likewise, policymakers, large purchasers, and formulary managers participating in the study believe generic drugs to be as safe and effective as their brand name counterparts, but find information difficult to obtain. Participants provided suggestions to improve accessibility of information, including electronic mailings that include information on drug safety, effectiveness, and approval process. **CONCLUSIONS:** Data collected from these key informant interviews will be used to inform the development of educational materials to address the key groups' knowledge gaps regarding generic drugs.

PHP56

ASSESSMENT OF PAEDIATRIC PHARMACOTHERAPY AT A PRIVATE HEALTHCARE FACILITY

Rawat J[1], Tiwari P[2], Kumar N[3]
[1]*National Institute of Pharmaceutical Education and Research (NIPER), S.A.S. Nagar (Mohali), Punjab, India,* [2]*National Institute of Pharmaceutical Education and Research, Mohali, India,* [3]*Chaitanya Hospital, Chandigarh, India*

OBJECTIVES: This study evaluated the prescription at a private paediatric outpatient setting and estimated the cost of treatment in paediatric patients. **METHODS:** A cross-sectional study was conducted in the outpatient department of private paediatric hospital for a period of six months. Children below 18 years of age were included in the study. The prescribing pattern for 624 patients was analyzed by using WHO recommended prescribing indicators. The cost of the drugs was obtained from current index of medical specialities (CIMS). **RESULTS:** Of 624 patients, 366 were male and 258 were female. Most of the patients were preschoolers and toddlers. The average number of drugs prescribed was 2.78$\pm$0.05; and, only 4.69% of drugs were prescribed by their generic name. In this study, 7.69% of patients were prescribed with antibiotics and the use of injections was minimal. Nearly half of the drugs were prescribed from the National List of Essential Medicines, 2015. The most common dosage form was syrup (40%). Viral infection was the most common diagnosis (26.12% of the patients). Amoxicillin and clavulanic acid fixed dose combination was the most commonly prescribed antibiotics. In this study, the average cost of drug per encounter was found to be INR139.39$\pm$5.20. **CONCLUSIONS:** There is a scope of prescribing medications by their generic name. This, may, help in keeping the cost of drug therapy low and possibly better compliance.

PHP57

UTILIZATION OF PRESCRIPTION MEDICATIONS AND MEDICATIONS LABELLED FOR SUICIDE RISK AMONG VETERANS WITH POST-TRAUMATIC STRESS DISORDER, BIPOLAR AFFECTIVE DISORDER, MAJOR AFFECTIVE DISORDER AND/OR SCHIZOPHRENIA IN A PRAGMATIC RANDOMIZED TRIAL

Lavigne JE[1], Brown T[2], Gutierrez P[3]
[1]*Wegmans School of Pharmacy St John Fisher College, Rochester, NY, USA,* [2]*US Department of Veterans Health Affairs, Canandaigua, NY, USA,* [3]*US Dept of Veterans Health Affairs, Denver, CO, USA*

OBJECTIVES: To describe the prescription drug utilization of 243 Veterans with post-traumatic stress disorder, schizophrenia, bipolar disorder or major affective disorder who both enrolled and completed at least 2 assessments for a pragmatic randomized trial of blister packaging versus dispensing as usual of all prescribed medications in Denver, Colorado between 2012 and 2014. The intervention was designed to improve adherence and reduce suicide risk. **METHODS:** Trial records were linked to VHA Corporate Data Warehouse (CDW) prescription fill records for the study period by unique patient ID. This study was reviewed and approved by the VISNs 2 and 19 Human Subjects Review Boards and the Department of Defense Human Research Protections Office. **RESULTS:** 236 (97.1%) of these Veterans filled at least one prescription for a tablet or capsule drug product at the VA outpatient pharmacy while enrolled in the study. Subjects were enrolled for a mean of 9.4 months during which time they filled a total of 5,939 tablet and capsule prescriptions. The most prevalent drug classes were antidepressants (CN609) (17%) and anticonvulsants (CN400) (12%). The most frequent drug products dispensed were trazodone (6%), sertraline (5%), prazosin (5%), omeprazole (4%), and gabapentin (4%). **CONCLUSIONS:** This pragmatic randomized trial was designed to improve medication adherence among Veterans who may be at elevated risk of suicide or overdose due to schizophrenia or bipolar disorder, for example. Both are associated with increased risk of suicide. The most prevalenet prescription medications in this pragmatic trial were antidepressants and anticonvulsants, all of which are labelled for risk of suicidal ideation and behavior. Further examination of combination prescribing refinement of warning labels for suicide risk may support future adherence and prevention efforts. LIMITATIONS: Prescription fills outside of VA were not observed.

HEALTH CARE USE & POLICY STUDIES – Equity and Access

A WELLNESS PRODUCTION FUNCTION ALLOCATING SCARCE DOLLARS FOR HEALTH OR LEISURE

Simons WR
Global HTA, Normandy Beach, NJ, USA

OBJECTIVES: To assess and quantify a wellness production function that demonstrates the optimal allocation of money to specific illnesses or leisure, an actual quality adjusted dollar spent. **METHODS:** Medical Expenditure Panel Survey (MEPS) 2014 data were used to estimate a Cobb-Douglas production function with the Physcical and Mental Composite Scoress as the dependent variables and medical conditions, log-transformed healthcare expenditures and income among other factors as covariates. **RESULTS:** The MMEPS data contained approximately 33,000 interviewees. The intercepts for PCS and MCS were 36.29 ($P<0.01$) and 38.38 ($P<0.01$). Expenditures for all he3althcare and pharmaceuticals were statistically significant, (All $P<0.01$). Income elasticities were 1.8884 for PCS and 1.60889 (Both $P<0.01$). **CONCLUSIONS:** This analysis is not a drug to drug comparison of value. Rather, it is a multi-disease and wellness measure of producing change in PCS and MCS either by spending on a specific health condition (e.g., cancer) or something other than health that optimizes PCS ans MCS.

PHP59

IMPLEMENTATION OF HOSPITAL-BASED HEALTH TECHNOLOGY ASSESSMENT IN THE REPUBLIC OF KAZAKHSTAN (2 YEARS' EXPERIENCE)

Sharip B[1], Tabarov A[1], Avdeyev A[1], Kaptagayeva A[2], Zhanabekova L[1], Gizatullina A[1]
[1]*Hospital of the Medical Center of the President's Affairs Administration of the Republic of Kazakhstan, Astana, Kazakhstan,* [2]*the Ministry of Healthcare and Social Development of the Republic of Kazakhstan, Astana, Kazakhstan*

OBJECTIVES: to introduce the results of the first experience of Hospital-based Health Technology Assessment (HTA) in Kazakhstan. At the opening of new Hospital of the Medical Center of the President's Affairs Administration of the Republic of Kazakhstan (Hospital) in March 2015, Innovation Management Department (IMD) was established. One of the main functions of IMD is to evaluate clinical effectiveness, safety and economic effectiveness of new (innovative) health technologies, which are planned for implementing in Hospital practice. **METHODS:** IMD staff have the knowledges and skills in the field of HTA, including 1) the use of systematic search strategy; 2) analysis of reliable information from the evidence-based medicine databases; 3) clinical and economic analysis; 4) analysis of diagnosis-related groups. **RESULTS:** During the reporting period, IMD conducted activities such as: 1) Guideline for implementation of new technologies in Hospital

practice and System of staff motivation for implementation of new technologies were developed; 2) During the years 2015-2016 82 mini hospital-based HTA reports were done for opportunity to make informed managerial decisions about viability of implementing and using new health technologies in Hospital practice; 3) A database of health technologies was established for monitoring and analysis of effectiveness of using implemented technologies, and for development and improvement healthcare quality in Hospital; 4) 20 new health technologies were submitted for inclusion in the Guaranteed volume of free medical care formed by the Ministry of Healthcare. **CONCLUSIONS:** 1) Carrying out of Hospital-based HTA was the basis for making informed managerial decisions about viability of implementing and using new health technologies in Hospital practice; 2) Refusal of implementation of clinical and/or economical non effective health technologies is allowed to optimize Hospital's financial expenses and to fund the most clinical and economic effective health technologies; 3) We consider that the first experience of Hospital-based HTA in Kazakhstan is quite successful and effective.

PHP60

DIFFERENCES IN THE HUNGARIAN AND CHINESE HEALTH PROFILES

Kerner Á[1], Hanzel A[1], Csákvári T[2], Endrei D[1], Molics B[1], Betlehem J[1], Boncz I[1]
[1]University of Pécs, Pécs, Hungary, [2]University of Pécs, Zalaegerszeg, Hungary

OBJECTIVES: The aim of our study is to compare Hungary's and China's health profile and to have a full picture about their similarities and differences. **METHODS:** A quantitative descriptive study was carried out with document analysis. Data derived from the database of World Health Organization and from the year 2012-2013. The indicators are the following: (the number of live births/deaths, leading causes of death, health care expenditure, adult risk factors, drinking water supply, sewage rate). **RESULTS:** The proportion of people over 60 years is 24% in Hungary and 14% in China. There is a big difference in the proportion of urban population (HU: 70%, CN: 53%). The number of deaths per year is higher than the number of births per year factor in Hungary (death: 129.100/year, birth: 98.100/year). However there is a natural increase in China (death: 10,044,900, birth: 18,513,700). There is difference in the ratio of causes of deaths among under-five in 2013 - the maternal mortality (HU: 37%; CN: 16%) occurs more than congenital anomalies (HU: 29 %; CN: 13%). In China, the births asphyxia ratio (CN: 15%; HU: 6%) and the acute respiratory infections are higher (CN: 14%; HU: 5%). The frequency of elevated BP (HU:25.6-42.7%; CN: 23.7-29.8%) and obesity (HU: 20.4-26.2%; CN:4.6-6.8%) are more important from adult risk factors than the others in Hungary. The leading cause of death in 2012 was stroke (2,331,300 death) in China and ischemic heart diseases (34,300 deaths) in Hungary. We found difference in the rate of health care spending per capita between China (> 600 USD) and Hungary (> 2000 USD). **CONCLUSIONS:** There are significant differences in the health profile of Hungary and China. However, higher expenditure in health care does not necessarily result in a better health status.

PHP61

REASON FOR CONCERN: GROWTH AND CHANGE IN COMMUNITIES SERVED BY THE 340B PROGRAM

Rowan K
NORC, Bethesda, MD, USA

OBJECTIVES: The rapid growth of the 340B program has led to increased scrutiny by Congress, federal agencies, policy experts, and drug manufacturers, who have questioned the regulation and oversight of the program. A primary concern is how well the program targets medically needy patients, consistent with the intent of the law. Hospitals and their affiliated outpatient sites can charge full price for 340B drugs to commercially insured patients and retain the difference between the charged and discounted acquisition price, without further mandate on how profits are spent. We examine the growth and change in the socioeconomic profile of communities served by DSH, affiliated sites, and Federally Qualified Health Centers (FQHCs) participating in 340B over the last 23 years. **METHODS:** Location data for DSH, child sites, and FQHCs were extracted from the 340B program database and were linked to 2010-2014 socioeconomic data (latest available) from the American Community Survey by ZIP code. We used regression to examine the effect of time on ZIP code-level socioeconomic characteristics for the three facility types. **RESULTS:** About 92% of child sites were registered since 2012, an increase from 1,025 (by the end of 2011) to 15,021 (as of December 2016). Child sites registered since 2012 are in wealthier communities with lower unemployment and higher rates of private insurance, relative to the DSH themselves and communities whose facilities were registered between 1993-2011. Child sites registered since 2012 are also in communities that are significantly more advantaged than communities with FQHCs. **CONCLUSIONS:** Our findings are consistent with concerns cited by prior research and Congress that the growth in the 340B program is largely among facilities that may not be serving the vulnerable population for whom the program is intended to benefit.

PHP62

FACTORS MILITATING AGAINST EFFICIENT SUPPLY CHAIN MANAGEMENT OF MEDICINES FOR IMPROVED MEDICINES ACCESS AND HEALTH OUTCOMES IN NIGERIA

Chukwu OA[1], Ezeanochikwa VN[2], Chibuogwu AP[3], Eya BE[4]
[1]Pharmaceutical Services Department, National Assembly, Abuja, Nigeria, [2]HealthPlus Pharmacy, Abuja, Nigeria, [3]International Committee of the Red Cross, Abuja Delegation, Abuja, Nigeria, [4]GreenLife Pharmaceuticals, Lagos, Nigeria

OBJECTIVES: Access to affordable quality essential medicines in developing countries like Nigeria continues to be a challenge despite interventions by relevant stakeholders. Inadequate management of the medicines supply chain is a major contributing factor. Hence, this study aims at identifying factors that may be militating against efficient supply chain management (SCM) of medicines in Nigeria. **METHODS:** A mixed methods approach was used to obtain data from logistics companies and pharmacists in Nigeria. Structured questionnaires were administered to logistics companies while in-depth interviews were conducted for pharmacists purposively selected to capture a diverse range of experiences, practice areas and opinions. Quantitative and qualitative data were analyzed using descriptive statistics and thematic analysis respectively. **RESULTS:** Logistics companies are not adequately equipped and no monitoring is in place to ensure that standards are set and followed. 84% of logistics companies had no set of standard operating procedures for medicines logistics. 37% are capable of providing cold chain logistics depending on the duration. 47% had no temperature monitoring devices. There was no form of regulation enforcing standards for medicines logistics, with implications for treatment failure. Pharmacists' views suggest that poor logistics and SCM practices, poor health statistics, weak regulation and policy implementation and lack of support for in-country medical logisticians are factors affecting efficient SCM of medicines. **CONCLUSIONS:** Factors militating against effective logistics and SCM of medicines were identified. Hence the need for establishing measures to improve the situation. Such measures may include more political will in implementing policies, financing SCM of medicines, building in-country skills and capacity in SCM of medicines, individualizing and segmenting medicines supply chains, and creating a regulatory body for certifying and professionalizing medical logistics companies, medical logisticians and supply chain managers in Nigeria, amongst others. These may lead to improved patient outcomes through better access to quality and affordable medicines

PHP63

THE DYNAMIC RELATIONSHIPS BETWEEN ECONOMIC INDICATORS AND PHYSICAL HEALTH MEASURES AMONG WORKING-AGE ADULTS IN THE UNITED STATES

Meraya AM[1], Dwibedi N[1], Tan X[2], Innes K[3], Mitra S[4], Sambamoorthi U[1]
[1]West Virginia University, School of Pharmacy, Morgantown, WV, USA, [2]West Virginia University, School of Pharmacy, Morgantown, WV, USA, [3]West Virginia University, Morgantown, WV, USA, [4]Fordham University, Bronx, NY, USA

OBJECTIVES: To examine the dynamic relationships between various measures of economic status and physical health using a sample of working-age adults (18-64 years) in the US. The study examined the effect of positive and negative changes in economic status on health, and improvement and decline in health on economic status. **METHODS:** The study utilized a retrospective observational longitudinal design with repeated measures of economic indicators and health for a period of 14 years using 8 waves of the Panel Study of Income Dynamics: 1999, 2001, 2003, 2005, 2007, 2009, 2011, and 2013. Health measures were self-rated health (SRH) and functional limitations; economic indicators were family income, labor income and net wealth. Four approaches of panel models:1) System-Generalized Method of Moment (system-GMM); 2) first-difference; 3) first-difference with instrumental variables (IV); 4) Lagged fixed effects; and two standard models: 1) ordinary least squares regression (OLS) and 2) IV OLS were used to evaluate the dynamic relationships between economic indicators and health measures. **RESULTS:** Standard models revealed significant positive relationships between all economic indicators and SRH and negative relationships between all economic indicators and functional limitations. System-GMM estimators revealed that SRH was positively associated with family income (ß=0.871, $p < 0.05$), labor income (ß=0.868 $p < 0.001$) and net wealth (ß=0.317, $p < 0.001$). Nevertheless, only labor income (ß=-0.515, $p < 0.001$) and net wealth (ß=-0.142, $p < 0.05$) were negatively associated with functional limitations. SRH declined due to losses in family income; decreases in SRH resulted in losses in family income, labor income and net wealth. **CONCLUSIONS:** Our findings suggest the need for integrating the economic and health policies and programs to prevent the adverse effects on health whenever an individual experiences either a decline in economic status or decline in health.

QUALITY OF PHARMACOLOGIC CARE BY PHYSICIANS, NURSE PRACTITIONERS AND PHYSICIAN ASSISTANTS IN THE UNITED STATES

Jiao S[1], Murimi IB[2], Mojtabai R[1], Stafford R[3], Alexander GC[2],
[1]Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, USA, [2]Johns Hopkins Bloomberg School of Public Health, Center for Drug Safety and Effectiveness, Baltimore, MD, USA, [3]Stanford Center for Research in Disease Prevention, Palo Alto, CA, USA

OBJECTIVES: Nurse practitioners (NPs) and physician assistants (PAs) have increasingly broad prescribing authority in the United States, yet little is known regarding whether they deliver the same quality of pharmacologic care as physicians. We sought to compare the quality of ambulatory pharmacologic care provided by NPs, PAs and physicians. **METHODS:** We used a serial cross-sectional analysis of 2006-2012 National Ambulatory Medical Care Survey (NAMCS) and National Hospital Ambulatory Medical Care Survey (NHAMCS) to examine ambulatory care services in physician offices, hospital emergency departments and outpatient departments. Participants included a nationally representative sample of patient visits to physicians, NPs and PAs and main outcome measures included thirteen validated outpatient quality indicators focused on pharmacological management of chronic diseases and appropriate medication use. **RESULTS:** A total of 701,499 sampled patient visits were included during the study period, which represented an estimated 8.33 billion visits nationwide. Physicians were the primary provider for 96.8% of all outpatient visits examined, while NPs and PAs each accounted for 1.6% of these visits. The proportion of eligible visits where quality standards were met ranged from 34.1% (angiotensin converting enzyme [ACE]-inhibitor use for congestive heart failure) to 89.5% (avoidance of inappropriate medications among elderly). The median

overall performance across all indicators was 58.7%. On unadjusted analyses, there were statistically significant differences in quality of care between non-physicians and physicians for each indicator. After adjustment for potentially confounding patient and provider characteristics, the quality of pharmacologic care delivered by non-physician providers was similar to the care delivered by physicians for ten of the thirteen indicators evaluated, and there was no consistent directional association between provider type and indicator fulfillment for the remaining measures. **CONCLUSIONS:** While there were significant shortfalls in the quality of ambulatory pharmacologic care among these visits, the quality of care delivered by non-physicians and physicians was generally comparable.

HEALTH CARE USE & POLICY STUDIES – Formulary Development

PHP65

THE 2017 US PAYOR LANDSCAPE: TRENDS AND RESULTS FROM SURVEYS OF MEDICAL AND PHARMACY DIRECTORS ON FORMULARY MANAGEMENT

Brook RA[1], Carlisle JA[2], Smeeding JE[3]
[1]*The JeSTARx Group & NPRT, Newfoundland, NJ, USA,* [2]*The Pharmacy Group, Glastonbury, CT, USA,* [3]*The TPG-NPRT & JeSTARx, Glastonbury, CT, USA*

OBJECTIVES: To determine the types of approaches preferred by Medical and Pharmacy Directors (MDs+PDs) of US health plans, insurers, and pharmacy-benefit managers to enhance the P&T decision-making process and understand formulary reviews/coverage and changes from prior surveys. **METHODS:** Online survey sent to 459 US MDs+PDs on: advisor+plan information; formulary coverage and restrictions. **RESULTS:** The survey was completed by 52 MDs+PDs (11.3%): 55.8% were MDs and worked for: health plans/IDNs/PPOs/IPAs=57.7% ; PBMs=9.6%; Government=3.8%; the remainder consultants. Advisors/plans could cover multiple member-types: Commercial (54.2%=FFS; 70.8%=HMO/PPO), Medicaid (Traditional=22.9%;HMO/PPO=62.5%);Medicare (66.7%;Traditional=22.9%; PDP-only=45.8%) and Employer/Self-funded lives=66.7%. Clinician-administered products were always covered under the medical-benefit (55.6%,previously 64.3%), 4.4% (previously 5.4%) exclusively under the pharmacy-benefit, the remaining 35.6% (previously 32.7%) benefit coverage was threshold/plan-design based, changes were: not anticipated (77.8%,previously 70.9%); expected by 12/17=4.4%; by 12/18=13.3%;or by 12/19=4.4%. Parity policies were in place for self-administered and clinician-administered agents for: no plans=33.3%; select-plans=28.2%; all-members=25.6%; members in mandated-states=10.3%; commercial plans=7.7%; Medicaid plans=7.7%.Mental health [MH] products were carved-out by 35.9 of plans (previously 25.9%), conditions with multiple MH-therapies required: generics-first (41.2%,previously 50%), step-therapy (41.2%,previously 31.5%) or psychiatrist/specialist care (17.6%,previously 18.5%). MH parity policies were in place for: All=62.5%;None=10%;Mandated-states=15%; Commercial-plans=15%;Select-plans=10%;Medicaid-plans=7.5%; Never heard of=7.5%. Respondents involved in decisions for: prescription-drugs (All=75.0%, Some=18.2%,None=6.8%) and Medical-devices (All=43.9%,Some=41.5%, None=14.6%). Budget impact models were used in 73.2% of pharmaceutical and 63.2% of medical-device reviews. Biosimilar use is expected for all reference-product indications (59.5%), while 31.0% will restrict biosimilars to approved indications (31.0%). Most respondents were happy with their medical-benefit, the most request change was moving all drugs to the pharmacy-benefit. Top concerns today and in the future included Oncology; Diabetes and Cardiovascular diseases. **CONCLUSIONS:** The managed care P&T Committee decision-making process is undergoing a series of changes. Medical and pharmacy directors, who commonly serve as P&T Committee members, have distinct opinions as to how to alter the process to adapt to these influences.

PHP66

THE MANAGEMENT OF SPECIALTY DRUGS, SPECIALTY PHARMACIES AND BIOSIMILAR DRUGS IN THE UNITED STATES

Brook RA[1], Smeeding JE[2], Carlisle JA[3]
[1]*The JeSTARx Group & NPRT, Newfoundland, NJ, USA,* [2]*The TPG-NPRT & JeSTARx, Glastonbury, CT, USA,* [3]*The Pharmacy Group, Glastonbury, CT, USA*

OBJECTIVES: A better understanding of health-plan management of specialty pharmacy (SP), SP-products and biosimilars of SP-products. **METHODS:** Online survey sent to 459 US medical+pharmacy directors (MDs+PDs) on: advisor+plan information; specialty-pharmacies/pharmaceuticals, expected biosimilar coverage/restrictions/co-pays. **RESULTS:** The survey was completed by 52 MDs+PDs (11.3%): 55.8% were MDs and worked for: health plans/IDNs/PPOs/IPAs=57.7%; PBMs=9.6%; Government=3.8%; the remainder consultants. Plans were National=41.9%;Regional=34.9%;or Local=23.3%. 51% restrict Specialty Providers (SPs). SPs were: PBM-owned 45.7%; 34.8% owned by the healthplan; 17.4% independent; 10.9% hospital/IDN-owned. 65.9% of plans restricted SPs to those under contract; 6.8% only restricted SPs available through multiple SPs; 6.8% allowed any SP handling the agent. Specialty product co-pays continue to move from fixed to percentage with more plans using group+benefit design to determine the co-pay. Plans covered clinician-administered products under the medical-benefit (MB=15.2%, previously 64.3%); under the pharmacy-benefit (PB=67.4%, previously 5.4%); the remainder varied based on price and plan-design and 89.1% do not expect this to change. Biosimilar use is expected for all reference-product indications (59.5%), while 31.0% will restrict to their approved indications (31.0%). Plans expect biosimilar co-pays to be indication-based (9.5%), discounted off the innovator (45.2%); to vary based on the approval timing (33.3%) or be the only product available (21.4%). Member+provider biosimilar education will be provided through: different co-pays=68.3%; prescriber-mailings=63.4%; patient-mailings=53.7%; prescriber-calls=39.0%; and patient-calls=19.5%. Biosimilars savings are expected to be: <10% in 2017 (52.4%); 60.5% expect 10-20% by 2020; and 61.9% expect >20% by 2025. **CONCLUSIONS:** Costs associated with specialty pharmacies/pharmacy products have shifted and are expected to grow and require appropriate coverage. The switch from the medical benefit to the pharmacy benefit for oral biologics and self-injected agents represents a significant change as SP management has grown. Biosimilars are expected to provide some cost growth relief but only over after the introduction of more than 2 competitive Biosimilars.

PHP67

A REVIEW OF PUBLIC COVERAGE OF CDR REVIEWED DRUGS

Bosnic N[1], Landry K[2]
[1]*PMPRB, Ottawa, ON, Canada,* [2]*Patented Medicine Prices Review Board, Ottawa, ON, Canada*

OBJECTIVES: This PMPRB study analyzes the coverage of drugs reviewed by the CDR across Canadian public drug plans, and examines both the number of drugs and the extent of reimbursement. **METHODS:** The drugs reviewed by the CDR from December 2003 through June 2015, along with their listings as of December 2015, were obtained from IMS Brogan's iMAM and public formularies. The sales data for 2015 was retrieved from the IMS Brogan Private Drug Plan and IMS AG MIDAS™ databases. The coverage rates for 10 provincial drug plans and the NIHB were calculated as simple and weighted percentages of all select drugs. The analysis also includes an inter-jurisdictional comparison using simple agreement descriptive statistics. **RESULTS:** The CDR issued positive recommendations for 55% of the analyzed drugs, with provinces following the CDR recommendation in 78% of the cases. With sales weighting, most provinces listed all major drugs. An inter-jurisdictional comparison of all CDR drugs indicates medium to high rates of coverage agreement, ranging from 50% to 86% across all pairs of the public drug plans. When weighted by sales, the percentage of coverage agreements notably increases. **CONCLUSIONS:** The study results suggest a relatively high coverage and inter-jurisdictional agreement of the CDR drugs, and highlights differences across public drug plans. These findings are expected to inform policy discussions around a national formulary.

ESTIMATING THE STATE BURDEN OF MENTAL DISORDERS IN THE US OVER NEXT 15 YEARS USING A MICROSIMULATION MODEL

Chen F, Su W, Dall T
IHS Markit, Washington, DC, USA

OBJECTIVES: Mental disorders have become the most costly health conditions in the United States. The aim of this study is to estimate the health and financial burdens of five major mental disorders to each of 50 US state governments, through 2030, and quantify the potential benefits from improvements in treatment coverage and medical advancements. **METHODS:** We identified three target population cohorts—state employees, Medicaid beneficiaries and state inmates—from a baseline population synthesized from National Health and Nutrition Examination Survey, American Community Survey, Behavioral Risk Factor Surveillance System, and National Nursing Home Survey data. A published Markov-based microsimulation model was used to simulate the prevalence, incidence, progression, and potential treatment effects of depression, bipolar, schizophrenia, anxiety disorder and Alzheimer's disease at the individual level. The baseline scenario assumes current population behavior and treatment states continue into the future, while an 'improvement' scenario assumes higher treatment adherence, timely diagnosis, insurance coverage expansion, better life style plus certain treatment advances. **RESULTS:** The burden to state governments' spending varies depending on the size of its covered cohorts, prevalence of mental disorders and population health profile of each specific state. Using Ohio for illustration, if current trends continue, mental disorders will result in $14 billion in medical expenditures and $371 million of indirect costs annually. Approximately 911,000 people will have at least 1 of the listed mental conditions. By 2030, it will cost each state resident on average $1,200 in health expenditures to treat the target populations. The modeled 'improvement' scenario could reduce mortality by 165,000 and generate $25 billion in medical savings cumulative through 2030. **CONCLUSIONS:** Mental disorders impose substantial financial costs to state governments. Efforts to expand mental health coverage and improve treatment could effectively reduce the future burden of mental disorders.

PHP70

COST ANALYSIS OF HEALTH EXPENDITURES ASSOCIATED WITH DEPRESSION AMONG INDIVIDUALS WITH DIABETES

Pednekar P, Peterson AM
University of the Sciences, Philadelphia, PA, USA

OBJECTIVES: Diabetes is still one of the serious and expensive health problems in the US and often associated with comorbidities. Compared with the general population, individuals diagnosed with diabetes are 60% more likely to be diagnosed with depression. The goal of this study is to conduct cost analysis estimating excess health care expenditures associated with depression among adults with diabetes by comparing them to those with diabetes and without depression. **METHODS:** In this cross-sectional study, the 2013 Medical Expenditure Panel Survey (MEPS) was used to analyze data on 2,771 adults with diabetes. Individuals with depression were identified using ICD-9-CM and clinical classification codes. Adjusted mean direct health care utilization and expenditures

associated with ambulatory visits, emergency department visits and prescription drugs per person in 2013 were estimated using analysis of covariance after adjusting for age, gender, race/ethnicity and number of comorbidities. **RESULTS:** Out of 2,771 individuals with diabetes, approximately 16% (N= 443) had depression. Adjusted mean health care utilization analysis showed that depressed adults with diabetes had more ambulatory visits (10 vs 6) and used more number of prescription medications (47 vs 22) as compared to non-depressed individuals. Unadjusted mean expenditures for diabetic individuals with depression were $11,572 relative to $8,576 for no depression. After controlling for demographic and number of comorbidity covariates, it was found that an individual with diabetes and depression had significantly greater annual mean health care expenditure of $4,192 compared to that of $2,012 for an individual with diabetes but no depression. Expenses related to ambulatory visits ($1,415 vs $1,041) and prescription medications ($2,769 vs $968) found to be major contributing factors in excess health care expenditure associated with comorbid depression. **CONCLUSIONS:** Depression is a significant contributor to the economic burden among individuals with diabetes, such incremental expenditures can be due to increased health care utilization.

PHP71

PREVALENCE AND PREDICTORS OF PRIMARY NONADHERENCE TO CHRONIC DISEASE MEDICATIONS AMONG THE ELDERLY

Franklin JM[1], Krumme A[1], Mahesri M[1], Brill G[1], Black H[2], McKay C[2], McElwee N[2], Choudhry NK[1]

[1]*Brigham and Women's Hospital and Harvard Medical School, Boston, MA, USA,* [2]*Merck & Co., Inc., Kenilworth, NJ, USA*

OBJECTIVES: Previous work on primary nonadherence has used a wide range of follow-up periods from 30 days up to 18 months, making results difficult to compare. We sought to evaluate primary nonadherence by measuring time until filling in a cohort of elderly patients. **METHODS:** Data comes from a linked database of electronic health records (EHR) and claims for patients aged $\geq$65 years enrolled in Medicare Parts A/B/D. From these data, we identified patients receiving a new prescription for a chronic disease medication. We then followed patients for a fill of the index prescription for one year. Cox models were used to assess differences in time until filling across patient and therapeutic characteristics. **RESULTS:** In 28,770 new medication orders, the majority (58%) were filled within 1 day, 81% were filled within 30 days, and 93% were filled by the end of one year. The rate and timing of filling was similar across therapeutic areas except for insulin, where filling rates were much lower. Within therapeutic areas, time until filling was generally similar across medication classes. Prescriptions with supply $>$ 30 days had a 13% (11%-15%) lower rate of filling than prescriptions with supply $<$ 30 days. Patients with increasing numbers of current medications were much more likely to fill their new prescription. Patients with 3-4 medications had a 71% (65%-77%) higher rate of filling than patients with 2 or fewer medications. Patients with 5-7 medications had twice the rate of filling (HR: 2.06 [1.99-2.14]), and patients with more than 7 current medications had 2.4 (2.3-2.5) times the rate of filling. **CONCLUSIONS:** With the exception of insulin, rates of primary nonadherence were low, and the majority of prescriptions were filled quickly. Focusing interventions on patients with few current medications or those initiating specific medications, such as insulin, may be a promising approach to improve medication adherence.

PHP72

ASSESSING TRENDS IN PHARMACY COST IN SUPER-UTILIZERS AND HIGH-COST PATIENTS IN THE U.S. FROM 1996 THROUGH 2013: EVIDENCE FROM MEDICAL EXPENDITURE PANEL SURVEY DATA

Borah BJ[1], Rojas R[2]

[1]*Mayo Clinic College of Medicine, Rochester, MN, USA,* [2]*Mayo Clinic, Rochester, MN, USA*

OBJECTIVES: To analyze trends in pharmacy costs among super-utilizers and very high-cost non-institutionalized U.S. patients. **METHODS:** This was a retrospective analysis using Medical Expenditure Panel Surveys (MEPS) administered by Agency for Healthcare Research and Quality (AHRQ). MEPS data from 1996 through 2013 were used to construct the top 1% of the costliest patient cohorts. Super-utilizers were defined according to AHRQ definition: Medicare or Medicaid patients with four or more hospitalizations per year; or, privately insured patients with three or more hospital admissions per year. Healthcare costs were inflated to 2013 prices. Multivariate quantile regression was used to estimate pharmacy cost for the top 1%, and generalized linear modeling (GLM) was used to estimate mean pharmacy cost for super-utilizers. **RESULTS:** The share of top 1% of the costliest patients steadily grew from 0.73% of the U.S. population to 1.35% ($\sim$4.26 million) during the study period. The average age for these patients varied between 51 and 56 during the study period. Mean pharmacy cost rose from $2,275 in 1996 to a high of $16,831 in 2011, then declined to $11,962 in 2013. Mean out-of-pocket pharmacy cost during this period rose from $676 to a high of $2,122 in 2004, and then declined to $743 in 2013. For super-utilizers, mean pharmacy cost rose from $2,618 to a high of $6,901 in 2007 and then declined to $5279 in 2013. Mean out-of-pocket pharmacy cost for super-utilizers started with $930 in 1996, peaking to $1,720 in 2003 then declined to $677 in 2013. Both quantile regression of pharmacy costs for the top 1% and the GLM regression for super-utilizers confirm these descriptive findings. **CONCLUSIONS:** Mean pharmacy cost increased by 425% for the top 1% of the high-cost patients in the U.S. while it rose by 102% for the super-utilizers during the study period.

PHP73

ECONOMIC BENEFIT OF PROCESS OPTIMIZING IN BLOOD COLLECTION CENTER WITH LEAN SIX SIGMA APPROACH

Guo W[1], Gu M[1], Wang B[1], Jin S[2]

[1]*Zhongshan Hopital, Fudan University, Shanghai, China,* [2]*Becton, Dickinson and Company, Shanghai, China*

OBJECTIVES: Patients at Zhongshang Hospital have complained a lot about the long waiting time and crowed environment of out-patient blood collection center for years. To improve the total efficiency and reduce non-value-added cost, the blood collection center launched a process optimization project with consultancy support from Becton, Dickinson Company during March to July in 2016. **METHODS:** Lean Six Sigma methodologies are used in this project. Process map and spaghetti diagram are used to understand current work flow and patient traveling flow. Data of patient distribution by time, average patient waiting time and per capita blood collection time were collected from LIS (laboratory information system). The cause of prolonged waiting time was analyzed using Ishikawa diagram. The failure mode and effects analysis (FEMA) was applied and 9 root of cause were identified. 5S tools were also used to make an organized environment. Improvement actions were taken in 3 areas: environment and layout, patient education, shift and duty arrangements of staff. The outcome was quantified to evaluate economic impact on the organization. **RESULTS:** With an investment of $58 ($580 in total, 10 years straight-line depreciation), the average patient waiting time dropped from 14.5 to 9 minutes and the per capita blood-collecting time dropped from 1.4 to 1.31 minutes. Due to the work efficiency improvement, we were able to save the workload by 1.5 man-year, which equals to a labor cost saving of $24,710 annually. The rejecting rate of blood samples dropped from 0.0421% to 0.0245%, results in a cost saving of $4,166. In total, the net benefit of the project was $28,876 per year. At the same time, patient satisfaction rating increased from 4.59 to 4.97 as a result of improved waiting environment and shorter waiting time. **CONCLUSIONS:** Hospital can economically benefit from Lean Six Sigma project through efficiency improvement and reduction of unqualified blood samples.

PHP74

COST DRIVERS IN PUBLIC DRUG PLANS IN CANADA, 2015/16 - COMPASSRX

Lungu E, Bosnic N, McComb G

Patented Medicine Prices Review Board (PMPRB), Ottawa, ON, Canada

OBJECTIVES: After several years of low or negative growth, drug expenditures in public drug plans increased sharply by 12.2% in 2015/16. The 3rd edition of the CompassRx provides insight into the factors that contributed to this remarkable growth in cost. **METHODS:** The analysis uses claims-level public drug plan data from the Canadian Institute for Health Information's NPDUIS Database for the 2011/12 to 2015/16 fiscal years. A sophisticated cost-driver model isolates the key factors contributing to changes in drug and dispensing costs: the mix of drugs, drug prices, dispensing fees, the volume of drugs, and changes in the demographic profile of the beneficiaries. **RESULTS:** The striking growth in drug costs in 2015/16 was due to the combined effect of limited generic savings and an increased use of high-cost drugs. The hepatitis C drugs Harvoni, Sovaldi and Holkira alone contributed 7.3% toward this increase in growth, while other high-cost drugs continued to put pressure on costs. The generic drug use and lower prices, which markedly pulled down drug costs in recent years, had a diminished cost saving impact from -9.2% in 2012/13 to -4.1% in 2015/16 and was no longer able to offset the effect of higher-cost drugs. **CONCLUSIONS:** A greater understanding of the forces driving expenditures in Canadian public drug plans will inform policy and stakeholder discussions and aid in anticipating, managing and responding to evolving cost pressures.

PHP75

AN EVALUATION OF INJECTABLE DRUG PRICES DURING TIMES OF SHORTAGE IN THE UNITED STATES

Aguilar A, Campbell P, Malone DC

University of Arizona, Tucson, AZ, USA

OBJECTIVES: To examine trends in drug prices for injectable products listed on the American Society of Health-system Pharmacists (ASHP) drug shortage list. **METHODS:** Medications were identified using the American Society of Health-Systems Pharmacists Current Drug Shortages list and if the shortage limited supply to a large academic medical center in the US. National Drug Codes (NDCs) for affected and available products were retrieved from the ASHP Current Drug Shortages updates pages. Wholesale acquisition cost (WAC) and historical average whole sale prices (AWP) price for each NDC was obtained from Red Book. Price changes were based on the defined daily dose (DDD). A WAC per DDD (or alternate dose) was calculated for each NDC and changes in AWP between January 1, 2015 and March 22, 2016 were identified. **RESULTS:** There were 25 drug products identified with cost data for 454 NDCs. The WAC per DDD ranged from $1.23 to $234.60 for the 207 medications on shortage and from $1.40 to $139.09 for the 247 available products. Seventy-five of 454 NDCs (16.5%) had price changes in 2015 or 2016 (38 products on shortage and 37 products without shortages). Changes in price ranged from decreases of 87.5% to increases of 197.6% with the majority (87%) of products having an increase in AWP. Increases greater than 50% in AWP were observed in 9 drugs on the shortage list but only two products widely available. **CONCLUSIONS:** Injectable medication prices appeared to be unaffected by drug shortage status. Few products experienced decreases in AWP or increases greater than 50% while on the drug shortage list. Further research is needed to identify other factors associated with drug price changes.

PHP76

REDUCING OUT-OF-POCKET COST BARRIERS TO SPECIALTY DRUG USE UNDER MEDICARE PART D: ADDRESSING THE PROBLEM OF "TOO MUCH TOO SOON"

Doshi JA[1], Li P[1], Pettit AR[1], Dougherty JS[2], Flint A[2], Ladage VP[1]
[1]University of Pennsylvania, Philadelphia, PA, USA, [2]PhRMA, Washington, DC, USA

OBJECTIVES: Medicare Part D specialty drug users who do not qualify for low-income subsidies (non-LIS beneficiaries) face high and variable cost sharing during the calendar year. We examined their out-of-pocket (OOP) cost patterns under the existing Part D cost-sharing policies and under proposed changes to these policies. **METHODS:** Using 2012 100% Medicare claims data, we examined mean annual and monthly OOP drug costs for Medicare Part D patients who were full-year users of Part D specialty drugs for rheumatoid arthritis (RA, n=1,063), multiple sclerosis (MS, n=2,256), or chronic myeloid leukemia (CML, n=1,135) under existing policy. Using the same data, we simulated costs under both proposed MedPAC policy recommendations and our own recommendations. **RESULTS:** In 2012, our sample faced mean annual cumulative OOP drug costs (for all medications) of $3,949 (RA), $5,238 (MS), and $6,322 (CML). Mean OOP costs were $977 (RA), $1,613 (MS), and $2,456 (CML) in January alone. A substantial proportion of total annual OOP prescription spending also occurred during the catastrophic coverage phase (RA=$1,229 [31%], MS=$2,456 [47%], CML=$3,546 [56%]. Under proposed MedPAC changes, patients would have faced maximum annual OOP spending of $4,700, but mean OOP costs in January and February would have been higher compared to existing policy. Under our proposed strategy, OOP costs would have been spread evenly over 12 months (≤$392 per month). The potential incremental costs of our proposed strategy would have been $23.55 per non-LIS Part D beneficiary per year. **CONCLUSIONS:** The existing Part D cost-sharing structure creates substantial financial burden for specialty drug users, especially early in the year. Implementing both annual and monthly OOP maximum spending limits would result in lower, more consistent OOP costs, potentially increasing patients' ability to access treatments for life-threatening, chronic, and rare diseases.

PHP77

LATE-TO-REFILL REMINDER CALLS HAVE GREATER IMPACT ON MEDICATION ADHERENCE IN MEDICARE PART D PATIENTS WITH A 90-DAY FILL

Gooptu A[1], Lou Y[1], Mu Y[1], Bowes N[1], Taitel MS[2]
[1]Walgreen Co, Deerfield, IL, USA, [2]Walgreen Co., Deerfield, IL, USA

OBJECTIVES: To study whether late-to-refill reminder calls (LTR) from pharmacists are more effective on medication adherence, in patients with 90-day fill than patients with 30-day fill, within Medicare Part D (Med D) population. **METHODS:** A total of 735,218 Med D patients who were 3 days late for their refills at Walgreens retail pharmacy in January 2015 were randomized into an intervention group to receive LTR reminder calls or a control group. Patients were categorized into two subgroups based on days of supply for prescription that triggered LTR: 30-day (28-34 day supply) subgroup (n=395,560) and 90-day (84-100 day supply) subgroup (n=288,211); patients with other days of supply were excluded. We compared the LTR effect on medication adherence for the 90-day subgroup to the 30-day subgroup. Within each subgroup, the LTR effect is measured as the difference in medication adherence between the intervention and control group. Medication adherence was measured as Proportion Days Covered (PDC) and the percent of patients with optimal adherence (OA) PDC≥ 80% over a 365-day period. Difference-in-difference regressions and t-tests were used to test differences. **RESULTS:** The LTR effect on average PDC is significantly higher by 1.1 percentage points (67.0% vs. 65.9%) for the 90-day subgroup and 0.8 percentage points (49.7% vs. 49.0%) for the 30-day subgroup. The LTR effect on proportion of OA patients is significantly higher by 1.5 percentage points (45.9% vs. 43.4%) for the 90-day subgroup and 0.6 percentage points (28.1% vs. 27.5%) for the 30-day subgroup. The LTR effect on average PDC and proportion of OA patients for the 90-day subgroup was significantly greater than the 30-day subgroup by 0.3 and 0.9 percentage points respectively. **CONCLUSIONS:** Pharmacists initiated late-to-refill reminder calls had a greater impact on adherence in Medicare Part D patients with 90-day fills than 30-day fills.

PHP78

RISK SCORE, COST & UTILIZATION IN THE HEALTH INSURANCE EXCHANGE POPULATION: OPEN ENROLLMENT VS. SPECIAL ENROLLMENT PERIODS

Pulungan Z, Teigland C, McClellan M, Kilgore K
Avalere Health - An Inovalon Company, Bowie, MD, USA

OBJECTIVES: To examine differences in risk scores, cost and utilization between Affordable Care Act (ACA) health insurance exchange plan members enrolled during open enrollment period (OEP) to those who enrolled during a special enrollment period (SEP). **METHODS:** This study used claims data from ACA plans from January-September 2015. Descriptive analyses were conducted to examine differences in risk scores, per member per month cost, and health care utilization between members enrolled during OEP compared to SEP. The sample consisted of 1.7 million enrollees (11% SEP). **RESULTS:** Average risk scores were 20% (1.12 vs. 1.40) lower in SEP versus OEP enrollees. Cost was 5% ($407 vs. $398) higher in SEP. The ratio of cost to risk score (cost-risk ratio) was 31% ($363 vs. $278) higher in SEP enrollees. This pattern was consistent across metal levels, except for Catastrophic. The high cost of SEP enrollees were driven by hospitalizations (45% higher) and emergency room visits (24% higher). Rates of primary care visits and prescription drug fills were lower in SEP enrollees. Discontinued enrollees had a slightly higher cost-risk ratio for both OEP ($282 vs. $277) and SEP ($383 vs. $361) than those with continuous enrollment. Across the OEP (January-March), the cost-risk ratio was 6% lower for members enrolled in February. Cost-risk ratio was steadily increasing from $321 for members enrolled in April to $516 for those enrolled in September. The increase was mainly due to a 46% increase in hospitalizations. **CONCLUSIONS:** Members who enrolled in on-exchange plans during a SEP had higher cost, yet lower risk scores on average compared to those who enrolled during OEP. The difference in cost-risk ratio was driven more by month of enrollment and less influenced by month of disenrollment. During the SEP, cost-risk ratios steadily increased for members who enrolled closer to the end of the benefit year.

PRICE TRAJECTORIES ASSESSMENT FOR INJECTABLE MEDICARE PART B GENERIC DRUGS

Gordon N[1], Ben-Aharon O[2], Goldstein DA[3]
[1]Ben-Gurion University of the Negev, Beer-Sheva, Israel, [2]Bar-Ilan University, Ramat-Gan, Israel, [3]Rabin Medical Center, Petach-Tikva, Israel

OBJECTIVES: To assess price changes with time following launch for Medicare part B injectable, generic drugs and to understand how drug characteristics influence price trajectories. **METHODS:** We included all Medicare part B drugs that were reported in both 2006 and 2016. Vaccines, biologics, oral agents and inhalers were excluded. Patent expiration dates were attached using the Medicare Drug Patent Expiration engine and drugs with a patent expiration date later than 2006 were removed. We used the Anatomical Therapeutic Chemical (ACT) code for each drug to identify an indication. For each drug we extracted the Average Sales Price (ASP) history from October 2006 to October 2016, published by the Center for Medicare and Medicaid services (CMS). US inflation rates were obtained from the United States Department of Labor, and prices were adjusted for inflation. For each drug we calculated the cumulative ASP change during the follow-up period. Data was analyzed using IBM SPSS Statistics software. **RESULTS:** We identified 166 injectable, generic drugs that fulfilled our inclusion and exclusion criteria. During our follow-up period 56 (34%) drugs had increases in price of more than 100% and 13 (8%) had increases of more than 1000%. The most common indications in the group of drugs with price increases were nervous system (25%) and anti-infectives (14%). When analyzing the price trajectory of the top increasing drugs, we found both gradual price increases and price hikes. There was no association between drug indications and price trajectory patterns. **CONCLUSIONS:** Generic drug costs may change substantially throughout time. Gradual price increases or acute price hikes may be due to the lack of generic substitution in the market or competitor substitution shortages due to quality, production and marketing reasons. New regulations may be needed to prevent further increases in generic drug costs.

PHP80

BURDEN OF COST OF ADVERSE DRUG REACTION IN PSYCHIATRIC PATIENT—AN ACTIVE SURVEILLANCE FROM A DEVELOPING COUNTRY

Lucca J, Ramesh M, Ram D
JSS University, Mysore, India

OBJECTIVES: To determine the incidence and estimate the direct cost incurred for the management of adverse drug reaction in ambulatory psychiatric patients **METHODS:** This prospective active surveillance pharmacovigilance study carried out over a period of two year. Patients of any age presented with psychiatric illness receiving at least one psychotropic agent were included. Economic burden associated with the management of ADRs was calculated by considering the cost of medications, medical devices, bed charges, laboratory investigations charges and other relevant charges. **RESULTS:** Of the total 1913 patients observed,763 were identifies with 1058 ADR, which translates to an ADR rate of 39.8%. The average number of ADRs in a patient was 1.3 (range 1 to 8). Majority of ADRs were observed in females [n=456 (59.7%)], patients receiving 3-4 drugs [n=323 (42.3%)], and in patient with co-morbid medical condition [n=386 (50.5%)]. Of the total ADRs, 27.9% of the ADR resulted in economic burden to patients. Total direct cost incurred in the management of 296 ADRs was INR 144731.00 (2,125.00 USD). Average cost incurred per ADR was INR 488.95 (7.17USD) [range: INR 10 (0.14USD) to INR 7846 (115.2 USD)]. Bed charge [INR 75460.00 (1108.11 USD)] and other charges [INR 3430.00 50.36USD] were observed as the highest and Lowest burden of cost to the patient. The average cost incurred in the management of 'mild', 'moderate' and 'severe' reactions were INR 166.6 (2.44 USD), INR 427.47 (6.27USD) and INR 5280(77.54 USD) respectively. **CONCLUSIONS:** Inour study Adverse drug reactions added an economic burden in patients. Educating the patient and the care giver for early detection and management of ADRs may give a more favorable outcome in psychiatrice practice.

PHP81

RETROSPECTIVE DATABASE ANALYSIS OF HOSPITAL LENGTH OF STAY (LOS) AND COST PER HOSPITAL DAY IN PATIENTS UNDERGOING COMMON SURGICAL PROCEDURES IN THE UNITED STATES

Dagenais S[1], Hayflinger DC[2], Kang A[1], Corman SL[3]
[1]Pacira Pharmaceuticals, Inc., Parsippany, NJ, USA, [2]Hayflinger Analytic Services, Wilmington, DE, USA, [3]Pharmerit International, Bethesda, MD, USA

OBJECTIVES: Hospital length of stay (LOS) is an important contributor to healthcare costs in surgical patients, but surgery-specific estimates of daily costs are lacking. We aimed to describe hospital LOS and cost per day in patients undergoing inpatient surgical procedures. **METHODS:** This study evaluated data available via the Premier Perspective® Database which includes administrative data from more than 600 hospitals in the United States. Data on discharges from 10/1/2014 to 9/30/15 with a primary ICD-9 procedure code for one of the 10 most common surgical procedures performed in adults (total knee and hip replacement; laparoscopic cholecystectomy and appendectomy; cervical fusion; open fracture reduction of the femur and tibia/fibula; lumbar/sacral fusion; total abdominal hysterectomy; and excisional wound/burn debridement) were included. Maternal or neonatal hospitalizations and those with any intensive care unit stay were excluded. Outcomes included LOS, total and daily hospitalization costs, and total and daily room and board costs by surgical procedure. All outcomes were summarized descriptively using means and standard

deviations. **RESULTS:** A total of 307,236 hospital discharges of interest occurred during the study period. Of these, one third were total knee replacements, with a mean length of stay of 2.7 days, room and board cost of $677 per day, and total costs of $4808/day. Mean LOS was shortest for cervical fusion (1.9 days) and longest for excisional wound/burn debridement (7.1 days). Cost per hospital day was highest for cervical fusion (room and board $594/day; total $6860/day) and lowest for excisional wound/burn debridement (room and board $793/day; total $1883/day). **CONCLUSIONS:** tal cost per hospital day varied over 3-fold among the 10 most common surgeries performed in US hospitals, likely reflecting the acuity of the patient population and surgery. Shortening LOS by one full day could reduce room and board costs by $594 to $793.

PHP82

COST-UTILITY OF BLISTER VERSUS BULK PACKAGING ALL MEDICATIONS FOR VETERANS WITH POST-TRAUMATIC STRESS DISORDER, BIPOLAR AFFECTIVE DISORDER, MAJOR AFFECTIVE DISORDER OR SCHIZOPHRENIA: RESULTS OF A PRAGMATIC RANDOMIZED TRIAL

Lavigne JE[1], Zhou M[1], Gutierrez P[2]
[1]US Department of Veterans Health Affairs, Canandaigua, NY, USA, [2]University of Colorado School of Medicine, Aurora, CO, USA

OBJECTIVES: To estimate the cost-utility of blister versus bulk packaging of all prescribed medications for 303 Veterans with post-traumatic stress disorder, major affective disorder, bipolar affective disorder, and/or schizophrenia during a 12-month pragmatic randomized trial in Denver, Colorado, 2012-2014 (NCT01118208). **METHODS:** The perspective is that of the US Department of Veterans Health Affairs. Quality adusted life years (QALYs) were calculated as the area under the SF-6D curve as derived from baseline and monthly SF-36 assessments for 243 subjects (80.2%) who completed at least 2 assessments. The intervention was expected to improve adherence to prescriptions for indications beyond the eligibility criteria. Therefore, all VA utilization and costs were extracted from the VA Corporate Data Warehouse for the intervention period and expressed in 2012 dollars. Costs were estimated at $0.46 - $0.52 per blister card per 30 – 90 day prescription and $0.02 per bottle per prescription. Labor to fill blister cards was estimated at 10 – 15% more. The incremental cost effectiveness ratio (ICER) was calculated. **RESULTS:** The ICER point estimate was negative and blister packaging dominant, with both lower mean total costs ($19,170 vs $21,113) and higher mean QALYs (0.59 versus 0.58). Next steps include bootstrap replications and net benefit calculations to ascertain confidence in this point estimate. **CONCLUSIONS:** In this group of 236 Veterans, the point estimate suggests that blister packaging all prescription medications is both less expensive and produces higher quality of life than dispensing in bottles. **LIMITATIONS:** Blister packaging costs are based on cold seal and small-scale production and are likely higher than would be expected with mass production technologies and economics of scale. Medications filled outside of the VA system were not observed.

PHP83

TRENDS IN PRICES OF NEW SYSTEMIC ANTIBIOTICS APPROVED BY THE FDA (1999-2016)

Alqahtani SS[1], Seoane-Vazquez E[2], Rodriguez-Monguio R[3], Eguale T[1], Tyrrell B[1]
[1]MCPHS University, Boston, MA, USA, [2]Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA, [3]University of Massachusetts Amherst, Amherst, MA, USA

OBJECTIVES: Antibiotic resistance is considered a main public health concern. The price of new antibiotics must be sufficient to recover the investment. This study assessed trends in the cost per course of therapy of new systemic antibiotics approved by the FDA in the period 1999-2016. **METHODS:** A list of new antibiotics marketed in the US in the period 1999-2016 was extracted from the FDA webpage. Average wholesale prices (AWP) were extracted from the RedBook (Truven Health). Daily doses and duration of the treatment were extracted from the FDA-approved label. The AWP cost per course of antibiotic drug therapy were calculated. Prices were adjusted by the consumer price index to 2016 dollars. The compound annual growth rate (CAGR) was calculated for each price from market entry to December 31, 2016. Descriptive analysis were done in the study using Excel 2013. **RESULTS:** The FDA approved a total of 19 new systemic antibiotics in the period 1999-2016. The antibiotics had an average±standard deviation of 3.0±2.1 indications (range 1-8). Price information was available for all drugs with the exception of obiltoxaximab (2016). The cost of a course of drug therapy at market entry varied by drug, indication and population subgroup. The median cost per course of drug therapy was $1,305.64. Gatifloxacin had the lowest CPI-adjusted cost per course of drug therapy at market entry ($50.09 in 1999) and avibactam/ceftazidime had the highest cost (range: $1,801.10-$5,043.08 in 2015). The median cost of a course of drug therapy at market entry was $136.41 (range: $50.09-$1,639.74) in the period 1999-2004, and $1,703.81 ($538.75-$5,401.45) in the period 2005-2016. The CPI-adjusted median AWRP CARG was 6.91%. **CONCLUSIONS:** Prices of antibiotics at market entry increased during the study period. The prices of the marketed antibiotics also increased faster than the inflation.

PHP84

DISCHARGE DESTINATION AFTER TOTAL JOINT ARTHROPLASTY AND POST-ACUTE CARE COSTS

Lerner J[1], Chitnis A[2], Bhattacharyya S[1], Holy CE[2]
[1]DePuy Synthes, Inc., Raynham, MA, USA, [2]Johnson & Johnson, New Brunswick, NJ, USA

OBJECTIVES: Post-acute care accounts for substantial amount of 90-day episode costs after joint replacement of the lower extremity. This study evaluated the impact of the first discharge destination on costs within 90-days of hospital discharge after primary total knee arthroplasty (TKA) or total hip arthroplasty (THA). **METHODS:** This retrospective cohort study included health care claims from the Centers for Medicare and Medicaid Services Standard Analytic Files, limited data sets (LDS). Patients aged 65 or older who had an inpatient TKA or THA between January 1, 2012 and October 1, 2014 were included. Patients' discharge status (to home with or without home care versus skilled nursing facility) was the primary exposure variable and post-acute care costs was the outcome of interest. A multivariable linear regression model was used to estimate post-acute costs after adjusting for patient demographic and clinical characteristics, type of surgery (TKA vs THA), and the costs of index surgery. **RESULTS:** A total of 881,197 patients with total joint arthroplasty were identified. Of these, 37.1% were 75 years of age or older, 63.9% were women and 66.4% had TKA. The average Charlson comorbidity index of the population was 0.71. Most patients were in the South (36.7%) followed by Midwest (28.4%), West (18.5%) and Northeast (16.4%) regions. More than half of the patients (57.2%) were discharged home after their index surgery. Total post-acute costs were $9,400 lower ($3,975 vs $13,375, $P<0.0001$) for patients discharged home versus other settings of care. **CONCLUSIONS:** Costs for Medicare patients discharged directly to home (with or without home care) were 70% lower compared to those for patients discharged to other settings. Further work is required to determine the extent to which social, economic, and clinical factors allow for safe discharge home after joint replacement.

PHP85

COST-EFFECTIVENESS OF THE INITIAL TREATMENT OF VENOUS THROMBOEMBOLISM FROM THE BRAZILIAN PRIVATE HEALTHCARE SYSTEM PERSPECTIVE

Alexandre RF[1], Squiassi HB[1], Santana CF[1], Nascimento R[1], Lucchetta R[2], Riveros BS[2], Pedro GO[3], Nita ME[3]
[1]Pfizer, São Paulo, Brazil, [2]Federal University of Parana, Curitiba, Brazil, [3]SolVE, São Paulo, Brazil

OBJECTIVES: To assess the cost-effectiveness of apixaban versus other anticoagulants in the initial treatment of venous thromboembolism (VTE) from the Brazilian Private Healthcare System (PHS) perspective. **METHODS:** An economic evaluation of apixaban versus other anticoagulants (dabigatran, rivaroxaban and standard of care (SOC) – enoxaparin and warfarin) was performed using a Markov-associated decision tree model that accompanied patients with VTE over a 5-year time horizon. For all comparators, a single treatment of 6 months was considered. The clinical and economic outcomes considered were, respectively, life years saved (LY) and medical direct costs. An annual discount rate of 5% was considered for the latter. A probabilistic sensitivity analysis (PSA) was also performed, considering variations in efficacy, risks of long-term events and costs. The cost-effectiveness acceptability curve ranged from BRL 0 to 100,000. **RESULTS:** Total costs of dabigatran, rivaroxaban, apixaban and SOC were, respectively, BRL 2437, BRL 1464, BRL 1427 and BRL 684, with effectiveness of 4.45 LY for all treatments. In the PSA, the efficiency of all treatments had little variation because of the low incidence of thromboembolic events or bleeding. The acceptability curve indicated a 100%, 70% and 0% probability in apixaban to be more cost-effective versus dabigatran, rivaroxaban and SOC, respectively, regardless of willingness to pay. **CONCLUSIONS:** It was possible to observe similar efficacy among all comparators, with apixaban being the treatment with the lowest cost, that is, more efficient compared to dabigatran and rivaroxaban, but not to SOC, in the treatment of VTE in the Brazilian PHS.

CONTRASTING NON-EMERGENT CARE DELIVERED IN EMERGENCY DEPARTMENTS AND URGENT CARE CENTERS TO ARKANSAS MEDICAID AND PRIVATE OPTION ENROLLEES

Kathe NJ[1], Bhandari NR[1], Chopra DA[1], Moore G[1], Li C[1], Goudie A[2], Martin BC[3]
[1]University of Arkansas for Medical Sciences, Little Rock, AR, USA, [2]Arkansas Children's Hospital, Little Rock, AR, USA, [3]University of Arkansas for Medical Sciences College of Pharmacy, Little Rock, AR, USA

OBJECTIVES: Urgent care centers (UCC) are alternatives to care delivered at emergency departments(ED) that might reduce health expenditures for non-emergent care. As part of the Affordable Care Act, Arkansas expanded coverage to poor and near poor individuals by purchasing qualified health plan (QHP) coverage for non-frail persons with incomes between 17-138% of FPL instead of traditional fee for service Medicaid. This study compared the utilization and costs of UCC and ED services in traditional Medicaid FFS and QHP and assesses the geographic variation. **METHODS:** Non-institutionalized newly enrolled individuals 19-64 years of age in 2014 with 180 days or more of continuous enrollment in either Medicaid or commercial plan were analyzed. ED and UCC visits were classified as emergent, non-emergent and unmeasurable using the NYU ED algorithm. The per visit costs and geographical distribution across 7 health insurance regions of the state were analyzed for non-emergent UCC visits and compared with non-emergent ED visits. **RESULTS:** There were a total of 11.35 UCC and 782.25 ED visits per 1000-person years for QHP recipients of which 67.36% and 25.75% were for non-emergent care respectively. There were 1309.64 ED visits per 1000-person years (45.16% for non-emergent care) and virtually no UCC visits for traditional Medicaid recipients. The average costs for non-emergent UCC visits for QHP was $136 compared to $531 for non-emergent care delivered in the ED for QHP compared to $169 for non-emergent ED care in traditional Medicaid. The Central metropolitan region had the highest rate of non-emergent UCC visits (10.91 per 1000 person years) compared to the West Central rural region (0.91 per 1000 person years). **CONCLUSIONS:** There is considerable ED utilization for non-emergent care and significant cost savings could be realized if this care is shifted to UCC. Geographic access may hinder utilization of UCC in rural areas.

PHP87

SHORT-TERM COSTS OF WHOLE GENOME SEQUENCING IN CARDIOLOGY AND PRIMARY CARE: FINDINGS FROM THE MEDSEQ PROJECT

Christensen KD[1], Vassy JL[2], Phillips KA[3], Blout CL[1], Azzariti DR[4], Lu CY[5], Robinson JO[6], Lee KB[6], Douglas MP[3], Yeh JM[7], Machini K[4], Rehm HL[4], McGuire AL[6], Green RC[1], Dukhovny D[8]
[1]Brigham and Women's Hospital, Boston, MA, USA, [2]VA Boston Healthcare System, Jamaica Plain, MA, USA, [3]University of California – San Francisco, San Francisco, CA, USA, [4]Partners HealthCare Personalized Medicine, Cambridge, MA, USA, [5]Harvard University, Hartford, CT, USA, [6]Baylor College of Medicine, Houston, TX, USA, [7]Boston Children's Hospital, Boston, MA, USA, [8]Oregon Health and Science University, Portland, OR, USA

OBJECTIVES: To determine the short-term cost impact of integrating whole genome sequencing (WGS) into cardiology and primary settings. **METHODS:** A cost analysis was conducted alongside a randomized controlled trial. Cardiology patients with diagnoses of hypertrophic or dilated cardiomyopathy (n=100) and ostensibly healthy primary care patients (n=100) were randomized to review family history alone (control arm) or with WGS reports (WGS arm). To estimate the cost of WGS from consent through results disclosure, study staff tracked personnel time and resource use. To estimate the costs of follow-up health care, study staff identified services ordered after disclosure sessions by reviewing medical records and survey data, and then applied cost weights per CMS fee schedules. Costs were assessed in 2015 dollars. **RESULTS:** Per-patient costs through 6 months post-disclosure averaged $13,799 and $10,086 in the WGS and control arms, respectively, in cardiology settings (Δ=3,713, $p<0.001$); and $7,956 and $2,771, respectively, in primary care settings (Δ=5,185, $p<0.001$). Costs in WGS arms included an average of $5,315 for WGS. Among the 49 cardiology randomized to WGS, sequencing identified genetic variants associated with cardiomyopathy diagnoses in 24 patients (49%), secondary monogenic disease risks in 8 patients (8%), and carrier status for autosomal recessive conditions in 41 patients (84%). Among the 50 primary care patients randomized to WGS, sequencing identified monogenic disease risks in 13 patients (26%) and carrier status in 50 patients (100%). All sequenced patients also received pharmacogenomic information about 5 drugs and risk information about 8 cardiometabolic traits. **CONCLUSIONS:** WGS increased short-term costs in both cardiology and primary care settings, but differences were almost due to the costs of sequencing itself. Longer time horizons are needed to understand the impact of WGS on patient health, but early evidence about its cost impact are encouraging given expectations that prices will continue to fall rapidly.

PHP88

HEALTH ECONOMIC IMPLICATIONS AND CONSUMER PREFERENCE DISTORTIONS OF NEGATIVE INTEREST RATE POLICY

Cangelosi MJ
Boston Scientific Corporation, Marlborough, MA, USA

OBJECTIVES: Monetary policy has evolved, in some countries, to the form of a negative interest rate policy (NIRP). The objective of this research is to review the cost-effectiveness literature to identify examples of negative discounting within CEA analyses, and examine the theoretical implications of such discounting on potential care preferences between acute costs – potentially descriptive of one-time procedures – and chronic costs – potentially descriptive of long-term pharmaceutical treatment. **METHODS:** A review of the Tufts CEA Registry, examining the reported discount rate of all CEAs that reported a discount rate. A theoretical model was developed to estimate the value of a 5- and 10-year stream of future, chronic costs, discounted by several scenarios – (0.5%), 0%, and 3% – to examine how these changes in discount rates may alter the evaluate of these chronic costs, relative to a one-time acute cost. **RESULTS:** Zero analyses were identified within the Tufts CEA Registry with a negative interest-/discount-rate. 60% of articles reporting a discount rate utilizing a 3% discount rate; the lowest identified interest rate was 1%. At a NIRP of (0.5%), the economic model suggests indifference between acute costs equal to 5.08-times chronic costs over a 5-year period, or 10.28-times over a 10-year period. At 0%, those multiples become 5x and 10x, respectively. At 3%, those multiples become 4.57x and 8.49x. Thus, the alternation of the discount rate from 3% to (0.5%) potentially allowed acute costs to increase by 11% and 21% compared to a 5-year and 10-year chronic cost, respectively. **CONCLUSIONS:** NIRP is not yet reflected in the cost-effectiveness literature. As NIRP continues and potentially impacts health economic decision makers, there exists potential for preferences to be altered towards acute costs such as procedures over more chronic costs, such as pharmaceutical requiring long-term chronic or even lifetime use.

PHP89

IMPACT OF ARGININE-BASED IMMUNONUTRITION ON INPATIENT TOTAL COSTS AND HOSPITALIZATION OUTCOMES FOR PATIENTS UNDERGOING COLORECTAL SURGERY

Banerjee S[1], Garrison L[2], Danel A[3], Ochoa Gautier JB[4], Flum D[2]
[1]Boston University School of Medicine, Boston, MA, USA, [2]University of Washington, Seattle, WA, USA, [3]Nestle Health Science, Vevey, Switzerland, [4]Nestle Health Science, Florham Park, NJ, USA

OBJECTIVES: We assessed the impact of arginine-based immunonutrition intervention for patients undergoing elective colorectal surgery on post-surgical utilization and cost outcomes. **METHODS:** This analysis is based on data from two Washington State databases: Surgical Care and Outcomes Assessment Program (SCOAP) linked to the Comprehensive Hospital Abstract Reporting System (CHARS). The sample (N=722) comprised adult patients from Washington State hospitals that participated in the Strong for Surgery (S4S) initiative between January 1, 2012 and December 31, 2013. A generalized linear model was used to predict the outcomes, adjusting for demographic characteristics and patient health conditions within a multivariate regression framework. **RESULTS:** Our findings indicate significantly fewer re-admissions (-0.18; $p<0.01$) and hospital days (-1.3; $p<0.10$) for the intervention group during the 180 days following index hospitalization. Clinical benefits included decreased risk of infections ($p<0.05$) and venous thromboembolism ($p<0.01$). There was a similar pattern toward lower total costs (-$4,675; $p\geq 0.10$) in the immunonutrition patients group: however, these were not statistically different compared to the control group at any time point. Savings in the immunonutrition group were substantial—mean total costs per patient less by approximately $2,500 at index hospitalization, $3,500 less through 30 days of follow-up, and $5,300 less over 180 days compared to control group. **CONCLUSIONS:** Among the significant drivers of total costs during the 180-day follow-up period were post-operative complications. Overall, the findings suggest that arginine-based immunonutrition should be thoroughly evaluated for incorporation into clinical practice for elective surgery patients. Moreover, there is a need to assess the impact of the intervention in other hospitals both within and outside Washington.

PHP90

PRICE ANALYSIS OF THERAPEUTIC BIOLOGICS MARKETED IN THE UNITED STATES

Turkistani F[1], Seoane-Vazquez E[2], Rodriguez-Monguio R[3], Bin Sawad A[4]
[1]MCPHS University, Boston, MA, USA, [2]Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA, [3]University of Massachusetts Amherst, Amherst, MA, USA, [4]Umm Al-Qura University, Makkah, Saudi Arabia

OBJECTIVES: The objective of this study was to evaluate trends in manufacturer-listed prices of therapeutic biologics approved by the FDA for chronic use and marketed in the US during the period 1986–2015. **METHODS:** Regulatory information for therapeutic biologics was extracted from the FDA website. The FDA recommended adult defined daily dose (DDD) was collected from the first FDA-approved label of each biologic. The average wholesale price (AWP) history was collected from the RedBook. Prices were adjusted to the first semester of 2016 using the consumer price indec (CPI) US city average, all items. Descriptive statistics and Wilcoxon rank sum tests and t-tests were performed. The significance level was set at 0.05. **RESULTS:** The analytical sample included 58 biologics (representing 51.3% of all FDA- approved therapeutic biologics during the period 1986-2015). The median market entry inflation-adjusted AWP per DDD was $113.10 (n=2, interquartile range [IQR]=47.70) in the 1980s, $64.80 (n=7, IQR=99.70) in the 1990s, $105.90 (n=24, IQR=294.60) in the 2000s, and $213.00 (n=25, IQR=504.10) during the period 2010-2015. The median inflation-adjusted AWP per DDD for therapeutic biologics for chronic use at market entry was higher for FDA-priority rewiew ($389.20, n=34, IQR=636.00) than for standard review ($88.50, n=24, IQR=105.30; $p<0.05$). **CONCLUSIONS:** The FDA approved an increasing number of therapeutic biologics for chronic use during the period 1986-2015. Median AWP prices at market entry increased over time, and the increase in the prices of therapeutic biologics at market entry exceeded the inflation rate.

PHP91

ECONOMIC BURDEN ASSOCIATED WITH TEMPERATURE DYSREGULATION

Corral M[1], Ferko N[2], Andrade A[2], Hollmann S[2]
[1]C.R. Bard Inc., Murray Hill, ON, Canada, [2]Cornerstone Research Group Inc., Burlington, ON, Canada

OBJECTIVES: Thermoregulatory mechanisms are often disrupted in patients with critical neurological injury, leading to increased complications and resource use. Previous studies have found that early initiation of mild-moderate hypothermia (32–34°C) was associated with improved survival and neurologic outcomes. A structured literature review was performed to identify the economic burden associated with temperature dysregulation. The assumed costs associated with temperature dysregulation included potential cooling procedures, hospital length of stay (LOS), rehabilitation, and labor costs. **METHODS:** Review of published studies indexed on Medline was performed in December of 2016 without a date restriction. Only English studies were considered. The search strategy included the key words "temperature management" or "therapeutic hypothermia" plus terms including but not limited to: (1) "fever", "cardiac arrest", "hypoxic-ischemic encephalopathy", "stroke", "intracerebral hemorrhage", "Glasgow coma scale", "cerebral performance category", "traumatic brain injury", "subarachnoid hemorrhage", or "cerebral injury", and (2) "cost", "economic", "nursing care", "reimbursement", "resource", "societal", or "labor", including MeSH terms where appropriate. Additional references were obtained by reviewing bibliographies. **RESULTS:** Over 2000 titles and abstracts were screened, 146 studies were considered potentially relevant (i.e., included clinical and/or economic outcomes), and 29 of these studies focused on costs, resource use, or public health/economic impact. In patients with critical neurological injury, fever indicated poor prognosis, and was often associated with increased LOS, mortality, and costs. However, reported outcomes and costs varied considerably depending on region, definition, perspective, neurological status, and disease state. For example, reported LOS ranged from 2.5 to 35 days. Long-term societal costs associated with rehabilitation and nursing care, as well as specific costs comparing temperature management methods were limited. **CONCLUSIONS:** Studies have evaluated cost of temperature dysregulation in the hospital setting and have suggested some methods for cost savings. Further research quantifying the longer term economic impact of temperature dysregulation and how temperature regulation methods can avert these is warranted.

PHP92

A COMPARISON OF ONCOLOGY AND NON-ONCOLOGY ORPHAN DRUG PRICES IN EUROPE

Young KE[1], Soussi I[2], Toumi M[3]
[1]Creativ-Ceutical, Paris, France, [2]Creativ-Ceutical, Tunis, Tunisia, [3]Aix-Marseille University, Marseille, France

OBJECTIVES: This study aimed to assess price differences of oncology and non-oncology orphan drugs in France, Germany, Italy, Norway, Spain, Sweden, and UK by comparing the annual treatment cost per patient of similarly available drugs. **METHODS:** Orphan drugs granted market authorisation up to June 13, 2016 were extracted from the European Medicines Agency website and divided into oncology and non-oncology. The annual treatment costs per drug were calculated based on the summary of product characteristics (SmPC) using ex-factory prices from IHS POLI and country price databases. The treatment cost in the each country (comparator country) was compared to the UK (reference country) and ratios were analysed for both oncology and non-oncology drugs. The absolute value of the median annual treatment costs of non-oncology and oncology orphan drugs within each country was also analysed. **RESULTS:** 120 orphan drugs were included in the analysis. Compared to the UK, the average annual costs of non-oncology drugs were minimally more expensive in France (averaged ratio 1.03), Germany (1.09), Italy (1.05), similar in Sweden (1.0), and were cheaper in Spain (0.94), and Norway (0.86). The cost differences (ratios) for oncology orphan drugs did not differ greatly with non-oncology (FR 1.04, DE 1.11, IT 1.1, ES 1.01, NO 0.83, SE 0.98). In absolute values, the median annual treatment cost of non-oncology orphan drugs were more expensive than oncology orphan drugs in UK, France, Spain, and Norway, while oncology drugs were more expensive in Germany, Italy and Sweden. The absolute cost differences only amounted from €1,700 to €19,400 per patient per year. **CONCLUSIONS:** In Europe, the price differences of oncology and non-oncology orphan drugs are negligible within and among countries. Moreover, oncology orphan drugs are not generally more expensive than non-oncology orphan drugs.

PHP93

HEALTH CARE USE AND EXPENDITURES AS COMPARED BETWEEN SPECIALTY MEDICATION USERS AND TRADITIONAL MEDICTION USERS

Park T, Griggs S
St Louis College of Pharmacy, St Louis, MO, USA

OBJECTIVES: To investigate health care use and expenditures in specialty medication users compared with traditional medication users. **METHODS:** This was a retrospective cohort study of US adults aged 18 or older using Medical Expenditure Panel Survey (MEPS) data from 2000 through 2013. MEPS respondents aged 18 or older who used any specialty medications were considered specialty medication users (SMUs). Individuals who used pharmaceuticals other than specialty medications were considered traditional medication users (TMUs). Outcomes of health care use included the number of prescription medications as well as the annual number of emergency department visits, hospitalizations, office-based visits, and hospital outpatient visits. Outcomes of health care expenditures included total health care expenses, total prescription medication expenses, out-of-pocket (OOP) expenses for prescription medications as well as spending on emergency department visits, hospitalization, office-based visits, and hospital outpatient visits. For outcomes of health care use, a negative binomial model (or a zero-inflated negative binomial regression model for the outcomes with excessive zeros) was employed. To analyze the outcomes of health care spending, a generalized linear model (GLM) with a log link function and gamma distributed errors (or a two-part model for zero-inflated expenditure data) was used. **RESULTS:** After controlling for the various covariates, SMUs used about 65% fewer prescription medications (incidence rate ratio [IRR] = 0.35, 95% CI = 0.18-0.67) and had 68% fewer hospital outpatient visits (IRR = 0.32, 95% CI = 0.16-0.68) compared with TMUs. However, SMUs spent about $3,600 more on prescription medications while their OOP medication spending was about $100 less than TMUs. **CONCLUSIONS:** Compared with TMUs, SMUs used less prescription medications and had less hospital outpatient visits. Spending on prescription medications was higher by SMUs than TMUs, unlike OOP spending.

PHP94

A MODEL TO EVALUATE THE CLINICAL AND ECONOMIC BURDEN OF INTRAVENOUS COMPOUNDING ERRORS

Erdal EP, Yang W, Pan JJ
Becton Dickinson, Franklin Lakes, NJ, USA

OBJECTIVES: Pharmacies in hospital have adopted volumetric measurement for compounding intravenous (IV) medication for years, which is a multi-step process manually carried out by pharmacists and technicians. Compounding errors in each step can lead to consequences, such as medication wastage and additional time for re-compounding. In addition, compounding errors that go undetected and reach the patient can lead to preventable adverse drug events (pADEs). An Excel model was developed to articulate the clinical and economic burden during the IV compounding process. **METHODS:** A targeted literature review on IV medication errors (ME), medication wastage, and IV compounding labor was conducted using Medline (2003-2015), identifying seven key articles related to the incidence rates of compounding errors during the process for both chemotherapy and non-chemotherapy preparations. A literature review investigating cost of pADEs, medication wastage, and labor was also incorporated. **RESULTS:** A base scenario for a pharmacy with an annual 15 million USD spending on IV medication, and a total of 100,000 manually prepared IV admixtures was evaluated. The model estimated that of 7,100 compounding errors, 5,574 of the errors would be detected by the pharmacy, resulting in the re-compounding of 1,784 IV preparations. The re-compounded preparations are associated with costs of $241,024 in medication wastage and $23,537 in labor. The 1,527 compounding errors not detected by the pharmacy could result in 359 pADEs, with a total cost of $1,369,222. **CONCLUSIONS:** This model demonstrated the substantial impact of IV compounding errors that lead to pADEs, medication wastage, and unnecessary labor. The consequences were estimated to cost more than $1,633,783 per year, which is estimated to be >10% of the total hospital IV medication spending. Process standardization and evaluation of new IV preparations measurement methods, such as gravimetric-based medication workflow solutions, are needed to mitigate compounding errors at pharmacies.

A COST-EFFECTIVENESS ANALYSIS OF SELF-DEBRIEFING VERSUS INSTRUCTOR DEBRIEFING FOR SIMULATED CRISES IN PERIOPERATIVE MEDICINE IN CANADA

Isaranuwatchai W[1], Alam F[2], Hoch JS[3], Boet S[4]
[1]St. Michael's Hospital, Toronto, ON, Canada, [2]Sunnybrook Health Sciences Centre, Toronto, ON, Canada, [3]University of California, Davis, Sacramento, CA, USA, [4]University of Ottawa, Ottawa, ON, Canada

OBJECTIVES: High-fidelity simulation training is effective for learning crisis resource management (CRM) skills, but cost is a major barrier to implementing high-fidelity simulation training into the curriculum. The aim of this study was to examine the cost-effectiveness of self-debriefing and traditional instructor debriefing in CRM training programs and to calculate the minimum willingness-to-pay (WTP) value when one debriefing type becomes more cost-effective than the other. **METHODS:** This study used previous data from a randomized controlled trial involving 50 anesthesiology residents in Canada. Each participant managed a pretest crisis scenario. Participants who were randomized to self-debrief used the video of their pretest scenario with no instructor present during their debriefing. Participants from the control group were debriefed by a trained instructor using the video of their pretest scenario. Participants individually managed a post-test simulated crisis scenario. We compared the cost and effectiveness of self-debriefing versus instructor debriefing using net benefit regression. The cost-effectiveness estimate was reported as the incremental net benefit and the uncertainty was presented using a cost-effectiveness acceptability curve. **RESULTS:** Self-debriefing costs less than instructor debriefing. As the WTP increased, the probability that self-debriefing would be cost-effective decreased. With a WTP ≤Can$200, the self-debriefing program was cost-effective. However, when effectiveness was priced higher than cost-savings and with a WTP >Can $300, instructor debriefing was the preferred alternative. **CONCLUSIONS:** With a lower WTP (≤Can$200), self-debriefing was cost-effective in CRM simulation training when compared to instructor debriefing. This study provides evidence regarding cost-effectiveness that will inform decision-makers and clinical educators in their decision-making process, and may help to optimize resource allocation in education.

PHP96

COSTS OF CONTRACEPTIVE METHODS FOR THE PUBLIC HEALTH SYSTEM

Ruas CM, Santos AS, Garcia MM, Campos FF
Universidade Federal de Minas Gerais, Belo Horizonte, Brazil

OBJECTIVES: Hormonal contraceptive methods are important to effective family planning. They can be used in the form of an oral or injectable drug, vaginal ring, subcutaneous implant and intrauterine device. The aim of this study is to describe the prices of different contraceptive methods available for users of the Brazilian public health system. **METHODS:** Cost data was obtained from the Brazilian Drug Market Regulation Chamber (CMED), through the maximum cost of sale to the government. The efficacy data was taken from the Brazilian Federation of Gynecology and Obstetrics (FEBRASGO) for comparison between different methods. The calculations were conducted for a 5-year time horizon and a discount rate of 5% was applied for costs. Cost data was converted through PPP to 2015 USD using the Campbell and Cochrane Economics Methods Group's Evidence for Policy and Practice Information and Coordination Centre Cost Converter tool (CCEMG-EPPI-Centre Cost Converter). **RESULTS:** The costs associated to pills were ethinylestradiol 0.03mg + levonorgestrel 0.15mg (135.72 USD, 99.7% efficacy); cyproterone + ethinylestradiol (307.97 USD, 99.7% efficacy); norethisterone 0.35mg (143.62 USD, 99.0% efficacy). The costs associated to long-acting formulations were: norethisterone 50mg + estradiol valerate 5mg (350.33 USD, 99.0% efficacy) and medroxyprogesterone 150mg (158.18 USD, 99.7% efficacy); and IUD (264.20 USD, 99.9% efficacy). The transdermal patch was associated with higher costs: norelgestromin 0.06mg + ethinylestradiol 6mg (1525.03, 99.7% efficacy). **CONCLUSIONS:** The decision about which products to offer in a country should not only consider efficacy outcomes, but also the costs associated to the technology. The efficacy of the hormonal contraceptive methods vary between 90 and 99.95% and the cost of different method varied between 135.72 and 1525.03 USD.

PHP97

ANALYSIS OF HOSPITAL COSTS BY DAY OF ADMISSION IN PATIENTS UNDERGOING COMMON SURGICAL PROCEDURES IN THE UNITED STATES

Dagenais S[1], Hayflinger DC[2], Kang A[1], Corman SL[3]
[1]Pacira Pharmaceuticals, Inc., Parsippany, NJ, USA, [2]Hayflinger Analytic Services, Wilmington, DE, USA, [3]Pharmerit International, Bethesda, MD, USA

OBJECTIVES: Shortening length of stay (LOS) following inpatient surgery may reduce hospital costs, but quantifying cost savings requires isolation of the fixed surgery costs typically incurred on hospital Day 1 from variable costs incurred on subsequent days. We aimed to describe cost per day of hospital admission in patients undergoing inpatient surgical procedures. **METHODS:** We evaluated data available via the Premier Perspective® Database which includes administrative data from more than 600 hospitals in the United States. Data on discharges from 10/1/2014 to 9/30/15 with a primary ICD-9 procedure code for one of the 10 most

common surgical procedures performed in adults (total knee and hip replacement; laparoscopic cholecystectomy and appendectomy; cervical fusion; open fracture reduction of the femur and tibia/fibula; lumbar/sacral fusion; total abdominal hysterectomy; and excisional wound/burn debridement) were included. Maternal or neonatal hospitalizations and those with any intensive care unit stay were excluded. The primary outcome was daily total hospital cost, stratified by day of hospital admission and surgical procedure. All outcomes were summarized descriptively using means and standard deviations. **RESULTS:** A total of 307,236 hospital discharges of interest occurred during the study period. Total daily costs in all surgeries were highest on the first day of admission (Day 1) and declined thereafter. The differences in total hospital costs for the first 3 days of hospitalization were most pronounced in lumbar/sacral fusion ($23,749, $1862, and $1359 on Days 1, 2, and 3) and cervical fusion ($13,914, $1174, and $1453). Total costs on Day 3 were less than $1500 for all surgeries except laparoscopic cholecystectomy ($2132) and open fracture reduction of the femur ($2794) and tibia/fibula ($1936). **CONCLUSIONS:** Hospital costs in surgical patients were heavily weighted toward the first day of admission. Shortening LOS by one full day could reduce total hospital costs by up to $2794, depending on the type of surgery.

PHP98

WHEN COST EFFECTIVE INTERVENTIONS ARE UNAFFORDABLE

Bilinski AM[1], Neumann PJ[2], Cohen JT[2], Thorat T[3], McDaniel K[4], Salomon J[5]
[1]Harvard Graduate School of Arts and Sciences, Cambridge, MA, USA, [2]Tufts Medical Center, Boston, MA, USA, [3]Center for the Evaluation of Value and Risk in Health, Institute for Clinical Research and Health Policy Studies,Tufts Medical Center, Boston, MA, USA, [4]University of Edinburgh, Edinburgh, UK, [5]Harvard University, Boston, MA, USA

OBJECTIVES: Interventions deemed cost-effective in academic literature are not always affordable. Specifically, interventions may provide high benefit for low cost, but adopting them may necessitate elimination of other more beneficial expenditures. One tool to assess affordability is budget impact analysis (BIA), which estimates a program's short-term costs and savings from the payer's perspective. We examined how BIA has been employed in the global health cost-effectiveness analysis (CEA) literature and explored how to incorporate affordability information alongside CEA. **ANALYSIS:** We investigated BIA in 384 articles from the Global Health Cost-Effectiveness Analysis (GHCEA) Registry, developed by the Tufts Center for the Evaluation of Risk in Health. Three percent (n/N = 12/384) of articles performed a formal BIA. Most of these (n/N = 9/12) noted that cost-effective interventions might be prohibitively expensive for government budgets. In practice, the conclusions of CEA and BIA can differ because: the CEA willingness to pay threshold may be too high; CEA measures societal costs while BIA measures payer costs; CEA considers a time horizon long enough to accrue all benefits while BIA considers budgeting for 1-5 years; and CEA discounts costs and benefits while BIA does not. We argue that researchers should report both CEA and BIA with information about why the two may diverge in a given context. Policymakers should be wary of binary classifications of cost effectiveness, as high-value programs may require substantial new resources. They might seek support from external funders or lenders to adopt programs that have a favorable incremental cost-effectiveness ratio but high upfront costs. **CONCLUSIONS:** Currently, there is a dearth of budget impact information for proposed global health interventions. Researchers should report both cost-effectiveness and budget impact estimates. Policymakers should interpret information about cost effectiveness in the context of their budget and other available funding sources.

A SYSTEMETIC REVIEW OF COST-OF-ILLNESS STUDIES ON MULTIMORBIDITY

Wang L[1], Si L[1], Palmer AJ[1], Cocker F[2], Sanderson K[3]
[1]University of Tasmania, Hobart, Australia, [2]Monash Centre for Occupational and Environmental Health (MonCOEH), Melbourne, Australia, [3]School of Health Sciences, University of East Anglia, Norwich, UK

OBJECTIVES: To describe the methods of cost-of-illness (COI) studies on multimorbidity; and to summarize the economic outcomes of multimorbidity. **METHODS:** A systematic search for COI studies of multimorbidity published in English from 2000 to 2016 was performed. Inclusion criteria: peer-reviewed cross-sectional, cohort and modeling COI studies of multimorbidity; exclusion criteria: studies focusing on the index disease. Data extracted for each eligible study included definition, measure, prevalence of multimorbidity; number of included health conditions; age range of sample; methodology of COI; proportion of multimorbidity costs and average costs per capita. The adapted British Medical Journal Checklist was used to assess the study quality. Costs were converted to 2016USD using the 2016 exchange rate for each currency, with adjustments over time based on the Consumer Price Inflation. **RESULTS:** 26 articles were included, of which, the definition used in the 14 studies that clearly defined multimorbidity was limited to a simple count of 2 or more conditions. Methodology used to derive costs differed markedly among the studies. Average annual costs per patient of multimorbidity ranged from $49-$252,313; the ratios of multimorbidity over non-multimorbidity costs ranged from 2-16. The highest costs ($252,313) were found in a study of American children. Using a cut-off of 3 or more conditions, average costs were 7%-85% higher than 2 or more conditions within 14 available studies. Among 10 studies providing a breakdown on costs, the largest proportion for multimorbidity was spent on inpatient (95%) or medicines (64%) costs in non-societal perspective studies, while on social care cost from societal perspective (56%). **CONCLUSIONS:** COI studies of multimorbidity are highly heterogeneous. Multimorbidity was associated with considerable economic burden even in children. Costs of different definitions of multimorbidity were limited by the data available. Standardized methods are required for improving accuracy, enhancing interpretation and facilitating comparisons between studies from different perspectives.

PHP100

COST-EFFECTIVENESS OF VENOUS THROMBOEMBOLISM PROPHYLAXIS AFTER TOTAL KNEE AND HIP REPLACEMENT FROM THE BRAZILIAN PRIVATE HEALTHCARE SYSTEM PERSPECTIVE

Alexandre RF[1], Santana CF[1], Squiassi HB[1], Nascimento R[1], Lucchetta R[2], Riveros BS[2], Rosim MP[3], Pedro GO[4], Nita ME[4]
[1]Pfizer, São Paulo, Brazil, [2]Federal University of Parana, Curitiba, Brazil, [3]University of Sao Paulo, Sao Paulo, Brazil, [4]SolVE, São Paulo, Brazil

OBJECTIVES: To access the cost-effectiveness of apixaban versus other anticoagulants in the venous thromboembolism (VTE) prophylaxis after total knee (TKR) and hip (THR) replacement in the Brazilian private healthcare system (PHS). **METHODS:** A cost-effectiveness analysis of apixaban versus other anticoagulants (dabigatran, rivaroxaban, warfarin and enoxaparin) was performed using a Markov-associated decision tree model that followed patients who had undergone TKR and THR (56% of the cohort underwent THR) over a 12-month time horizon. The clinical outcome considered was life years saved (LY). The economic outcome considered was medical direct costs, considering an annual discount rate of 5%. A probabilistic sensitivity analysis (PSA) was also performed, considering variations in efficacy, risks of long-term events and costs. The cost-effectiveness acceptability curve ranged from BRL 0 to 100,000. **RESULTS:** Total costs of enoxaparin, dabigatran, rivaroxaban, apixaban and warfarin were, respectively, BRL 881, BRL 463, BRL 383, BRL 348 e BRL 292, with effectiveness of 1.18 LY for all treatments. In the ASP, the efficiency of all treatments had little variation because of the low incidence of thromboembolic events or bleeding. The acceptability curve indicated a 100% probability in apixaban to be more cost-effective versus all comparators, except for warfarin, regardless of willingness to pay. **CONCLUSIONS:** It was possible to observe similar efficacy among all anticoagulants for VTE prophylaxis after TKR and THR, with apixaban being the treatment with the lowest cost, that is, more efficient compared to all comparators, but not to warfarin, in the Brazilian PHS.

PHP101

ECONOMICS OUTCOMES OF MEDICATION SAFETY PROGRAM AT PUBLIC HOSPITAL IN RIYADH, SAUDI ARABIA

Alomi YA[1], Al-Shubbar NA[2], Lubad NA[2]
[1]Ministry of Health, RIYADH, Saudi Arabia, [2]King Salman Hospital, RIYADH, Saudi Arabia

OBJECTIVES: Medication safety program started at Ministry of Health in 2014. The pharmacist should prevent all drug related problems. The objective of this study to estimate cost-avoidance of Medication Safety program at the public hospital in Riyadh city, Saudi Arabia by using American model. **METHODS:** It is a simulation of a 9-month (Dec 2014-Aug 2015) at 300-bed Public Hospital through preventing and documentation of medication errors in adults and pediatrics of inpatient pharmacy services. The program Led by trained pharmacist and delivered Basic medication safety education to all health professional. The estimated cost calculated by using International Study Model (Ling et al., Am J Health Syst Pharm 2005). It expressed in USD, the cost considered were the expected results of medication errors sequel if not stopped; starting from Physician visit, additional laboratory test, further treatment, hospital admission, Critical care admission to death stage. **RESULTS:** The total number of prevented medication errors were 3,378 in 805 prescriptions and patients inside the hospital. The estimated cost avoidance of preventing medication errors was (98,195.97 USD) for the study period and (10,910.USD) per month. The cost avoidance was (29 USD) per each mistake, and (122 USD) per prescription and patient. The highest cost avoidance (90%) came from adults (18-more than 65) while (10%) from pediatrics. The greatest drug of cost avoidance was from prevented Paracetamol Injection errors (7,108 USD), followed by prevented Omeprazole Injection errors (1,525.85 USD). The estimated cost avoidance of preventing medication errors was (130,927.96 USD). **CONCLUSIONS:** Medication safety program is cost-avoidance at the public hospital. Expanding medication safety overall hospital health care services associated with preventing drug-related problems, and avoiding unnecessary cost

PHP102

THE ECONOMIC CONTRIBUTION OF PHARMACEUTICAL CLINICAL TRIALS TO HEALTH CARE AND HEALTH RESEARCH IN ALBERTA, CANADA

Tran DT[1], Akpinar I[2], Jacobs P[2], Jonsson E[2], Fedorak R[1], Richer L[1]
[1]University of Alberta, Edmonton, AB, Canada, [2]Institute of Health Economics, Edmonton, AB, Canada

OBJECTIVES: Clinical trials are recognized as drivers of economic activity as well as mechanisms of scientific evidence. Industry-sponsored trials alleviate healthcare costs. We sought to examine the economic contribution of industry-sponsored trials in Northern Alberta, Canada. **METHODS:** We selected all phase two and three industry-sponsored trials that started in 2012 in Northern Alberta, Canada. We used trial-specific budget documents to estimate billing costs into three major groups: administration, ethic review and patient costs. We used the trial protocol obtained from the website ClinicalTrials.gov to identify drugs, average dosages and treatment lengths in each trial. Alberta Health Drug Benefit List (ADBL) and the US Department of Veteran Affairs Drug List (VADL) (adjusted for currency differences) were used to obtain drug prices. Price of a close substitute was used if the experimental drug was not listed in either ABDL or VADL. **RESULTS:** There were 40 trials initiated in Northern Alberta in 2012. The mean (standard deviation (SD)) trial length was 29.7 (SD: 14.5) months. 251 patients (75% on experimental arms) were enrolled. Five trials had an open label phase for 28 patients. 55 drugs were evaluated; of which, 15 were biological

products. Total healthcare cost avoidance was Canadian $29 million. Of which, operating costs were $5.2 million, drug costs were $13.5 and $10.3 million during the trial period and the open label phase, respectively. **CONCLUSIONS:** In addition to the medical advancement benefits, industry-sponsored clinical trials in Northern Alberta contribute a significant dollar amount to the Alberta healthcare system. Policy to motivate industry-sponsored trials should be in place to help alleviate health care costs.

PHP104

ASSESSING THE FINANCIAL VALUE OF PATIENT ENGAGEMENT

Levitan B[1], Getz KA[2], Eisenstein EL[3], Goldberg M[4], Harker M[3], Hesterlee SE[5], Patrick-Lake B[6], Roberts J[3], DiMasi JA[2]
[1]*Janssen R&D, Titusville, NJ, USA,* [2]*Tufts University, Boston, MA, USA,* [3]*Duke Clinical Research Institute, Durham, NC, USA,* [4]*Johnson & Johnson, Titusville, NJ, USA,* [5]*Pfizer, Chapel Hill, NC, USA,* [6]*Clinical Trials Transformation Initiative, Durham, NC, USA*

OBJECTIVES: While patient groups, regulators, and sponsors are increasingly considering engaging with patients in the design and conduct of clinical development programs, sponsors are often reluctant to go beyond pilot programs due to uncertainty in the return on investment. The objective of this work was to develop an approach to estimate the financial value of patient engagement. **METHODS:** Expected net present value (ENPV) is a common technique that integrates the key business drivers of cost, time, revenue, and risk into a summary metric for project strategy and portfolio decisions. We describe an approach to assess the impact of patient engagement on ENPV for a medical treatment development program, then apply it to a typical oncology development program entering phase 2 (cost to launch $121MM, NPV $493MM) or phase 3 (cost to launch $114MM, NPV $640MM). **RESULTS:** For a pre-phase 2 project, the cumulative impact of a patient engagement activity that avoids one protocol amendment and improves enrollment, adherence, and retention is an increase in net present value (NPV) of $62MM ($65MM for pre-phase 3) and an increase in ENPV of $35MM ($75MM for pre-phase 3). Compared with an investment of $50,000 in patient engagement, the NPV and ENPV increases exceed 1000-fold the investment. This ENPV increase is the equivalent of accelerating a pre-phase 2 product launch by 2½ years (1½ years for pre-phase 3). **CONCLUSIONS:** Risk-adjusted financial models can assess the impact of patient engagement. A combination of empirical data and subjective parameter estimates shows that engagement activities with the potential to avoid protocol amendments and/or improve enrollment, adherence and retention may add considerable financial value. This approach can help sponsors assess patient engagement investment decisions.

PHP105

PRICES OF TUBERCULOSIS DRUGS MARKETED IN THE US (1973-2016)

Daniels K[1], Hariharan D[1], Seoane-Vazquez E[2]
[1]*MCPHS University, Boston, MA, USA,* [2]*Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA*

OBJECTIVES: This study describes trends in average wholesale prices (AWP) at market entry of drugs and vaccines approved by the FDA for the treatment and prevention of tuberculosis (TB) and marketed in the US in the period 1980-2016. **METHODS:** The AWP information was collected from the Redbook (Truven Health) for the drugs approved by the FDA to treat TB. Defined daily dose information was collected from the World Health Organization. The AWP was collected from the effective date to January 2017, and price at market entry was converted to 2016 USD using the consumer price index (CPI). Descriptive statistics were conducted in the analysis. **RESULTS:** Twenty-six TB drugs and vaccines approved by the FDA were included in the analysis. There were seven products approved by the FDA in the period 1973-1989, 8 in 1990-1999, and 11 in 2000-2016. The market entry Cost Per Treatment was $207.20 for hydrocortisone and $147.73 for Bacillus of Calmette and Guerin (BCG vaccine). The highest TB drug prices for the period 1973-1989 were $58.65 for rifampin (intravenous), $3.29 for hydrocortisone (topical), $1.61 for a combination of isoniazid and rifampin (oral), $1.3 for prednisolone acetate (ophthalmic), $2.08 for tuberculin (intradermal) and, $36.54 for methylprednisolone sodium succinate (intravenous or intramuscular). In 1990-1998, the costs were $147.73 for the BCG vaccine, live, $5.15 for hydrocortisone (topical), $3.74 for aminosalicylic acid (oral), $8.58 for ciprofloxacin (ophthalmic), and $5.51 for streptomycin (intramuscular). Prices in the period and for the 2000-2016 period included $5408.41 for gatifloxacin (ophthalmic), $168.59 for the BCG vaccine, live (intradermal), $175.27 for capreomycin (injection), $214.6 for rifampin (intravenous), and $191.79 for bedaquiline fumarate (oral). **CONCLUSIONS:** The FDA approved a large number of products for treatment and prevention of TB during the study period. Prices of TB drugs at market entry increased during the same period.

PHP106

COST-EFFECTIVENESS ANALYSIS OF THE USE OF SIU-LNG AGAINST LONG- AND SHORT-ACTING CONTRACEPTIVES, AS CONTRACEPTIVE METHODS FOR WOMEN OF FERTILE AGE IN COLOMBIA

Vargas J[1], Alandete J[2], Herran SE[3], Meneses E[3], Marrugo RD[3]
[1]*Econopharma, Mexico City, Mexico,* [2]*Bayer LATAM, Whippany, Mexico,* [3]*Bayer andina, Bogota, Colombia*

OBJECTIVES: To estimate the cost-effectiveness ratios of the use of SIU-LNG against the use of T-copper, Implants, patch injectable, oral contraceptives and vaginal ring as contraceptive use for women of childbearing age. **METHODS:** Markov model was developed to estimate the differences in the main outcomes, as avoided pregnancies and total costs, including first and second lines of contraceptive treatment, as well as costs for the presentation of pregnancies. The horizon utilized was 5 years, under monthly cycles, thus were estimated, abandonments / changes method, failures, presence of adverse events, no use of any method or presentation of pregnancy. Technology costs were estimated with national databases; and insurance costs for events. **RESULTS:** Long-acting methods-LARCS- (T-Copper, Implants and SIU-LNG) are considered dominant over all short-acting methods, that is, more effective in terms of reducing unwanted pregnancies and are less expensive. Compared to LARCs, on average they represent 32.8% more unwanted pregnancies and an over-cost of 51.9% in 5 years. Among LARCs, cost differences are narrow, but in avoided pregnancies, it is estimated that SIU-LNG has the lowest number of pregnancies (19), compared to 49 with T-copper and 37 with implants under a cohort of 100 women. In the temporal horizon, from the second year, the implants shows ICER of dominance over the T-Copper; while the SIU-LNG shows the very first 3 years as a dominant option vs all other technology evaluated but shows versus copper T, a cost-effectiveness ratio for avoided pregnancy of $ 5,845,273 in the second year, in the third year of $ 1,104,713, and from the fourth year, a dominance relationship on T-copper. **CONCLUSIONS:** Long-acting contraceptive methods have a dominance relationship over short-acting methods, because they have high levels of adherence. In general, SIU-LNG is a dominant technology over all competitors evaluated over a five-year horizon.

PHP107

THE PRICE RISE OF GENERIC DRUGS IN US MARKET

Joshi D
MCPHS, Boston, MA, USA

OBJECTIVES: After amendments were made to the law in the favor of generic drug makers, this market saw an influx of new players, which brought generic prices further down. Currently, on average, the cost of a generic drug is **80 to 85 percent lower than the brand name product**. As prices declined, usage of generics picked up rapidly. The main objective is to determine the extent to which generic drug price increases and to determine which drug classes has the most cost in order to discover the challenge and the barriers behind generic drug prices increase. **METHODS:** The difference with generic prices has been obtained by the Medicaid file using National Average Drug Acquisition Cost (NADAC) Weekly reference file. The NADAC for prescription and over-the-counter covered outpatient drugs is reported at the 11-digit National Drug Code level. **RESULTS:** Most extraordinary price increases were between 100 and 200 percent. 48 were 500 % or higher. 15 were 1,000 % or higher. Clomipramine HCL/50mg/capsule/oral, 2,000 % in 1 year, $0.34 per capsule in the first quarter of 2013 to $8.43 per capsule in the first quarter of 2014. 183 out of the 351 extraordinary price increases were less than 200 % Hydrocortisone/20mg/tablet/oral. 160 % in 1 year, $0.16 per tablet in the first quarter of 2012 to $0.41 per tablet in the first quarter of 2013. **CONCLUSIONS:** Based on the analyses conducted to date, a vibrant generic market can exert downward pressure on overall drug prices. Generic drugs account for majority of prescriptions filled in US and represent lower costs to healthcare system.Factors such as drug shortages, the ability to obtain new market exclusivities, the distribution system, small market size, and consolidation in the generic drug industry present potential barriers to ongoing competition in the generic drug market, and will be subject of continued study.

PHP108

PRICES OF BIOSIMILARS IN THE US

Gannu L[1], Daniels K[2], Seoane-Vazquez E[1], Szeinbach SL[3]
[1]*Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA,* [2]*MCPHS University, Boston, MA, USA,* [3]*The Ohio State University, Columbus, OH, USA*

OBJECTIVES: The Affordable Care Act of 2010 defined a pathway for the approval of biosimilar biologic drugs by the FDA. This study assessed trends in prices of biosimilars and biologic drugs in the US as of January 1, 2017. **METHODS:** A list of biosimilars and therapeutic biologics approved in the US was extracted from the FDA webpage. Average wholesale prices (AWP) were extracted from the RedBook (Truven Health). Average sales price (ASP) used for Medicare Part B reimbursement was collected from the CMS. Descriptive statistics were conducted in the study. **RESULTS:** The FDA approved a total of 4 biosimilar drugs for therapeutic biologics as of January 1, 2017. The single source life of the originator biologic drugs from initial approval to first biosimilar approval was 13.7 years for adalimumab, 17.6 infliximab, 17.8 etanercept, and 24.0 filgrastim. Infliximab biosimilar entered the market with an AWP representing 88.3% of the biologic originator. The AWP of the infliximab originator continued to increase, and the biosimilar represented 85.0% of the originator in Jan 1, 2017. The infliximab biosimilar had an ASP price of 122.0% of the originator biologic ASP at market entry. Filgrastim biosimilar entered the market with an AWP representing 85.9% of the originator biologic. The filgrastim biosimilar had an ASP price of 97.0% of the corresponding originator biologic in October 1, 2015, and decrease to 71.0% in January 1, 2017. Prices for adalimumab and etanercept were not available. **CONCLUSIONS:** Biosimilar prices at market entry were equal or higher than the prices of the corresponding biologics. The ASP for the originator filgrastim remained constant after biosimilar entry, while the ASP for the biosimilar declined. Savings from biosimilars could results from lower biosimilar prices at market entry and from lower biologic and biosimilar price increases.

PHP109

COST ANALYSIS OF DELIVERY ADULT MEDICATION THERAPY SERVICES AT MINISTRY OF HEALTH IN SAUDI ARABIA

Alomi YA[1], Alhadab M[2], Alotaibi T[2], Alassadi N[2], Alhaza N[2], Alzahrani S[2], Algamdi E[2]
[1]*Ministry of Health, RIYADH, Saudi Arabia,* [2]*Alyamama Hospital, RIYADH, Saudi Arabia*

OBJECTIVES: To explore the estimation of cost calculations for delivery drug therapy services for adults' population by using American Model with local cost. **METHODS:** It is a cross-sectional 6-months 2016 analysis of drug distribution services for adult patients. It was at 300-Bed Maternity and Pediatrics Hospital in Riyadh, Saudi Arabia. The cost calculated Adults drug therapy management services delivered to 144 beds. The physician prescribed the medications. The pharmacist reviews and prepared drugs and distributed through unit dose system, floor stock distribution, and discharge medications services. The fast moving oral and topical medications

included in the study. The cost Model calculated based on variable expenses including personal cost, material, and supply cost. Fixed cost was including direct cost, non-salary cost, and overhead cost. All cost used of US dollar currency and local prices. **RESULTS:** The estimated cost of delivery of drug therapy services for all total number adults beds per day was (1,191.9 USD). It contained three types; the unit dose system (761.35 USD), drug floor stock distribution system (334.99 USD), and discharge medication system (95.62 USD). The cost of delivery of medicines to single bed per day was (13.99 USD) with highest estimated cost of delivery from discharge medication (6.37 USD), followed by unit dose services (5.29 USD) and floor stock therapy (2.33 USD). The majority of cost came from overhead cost, and material and supply in floor stock services and discharge medication delivery; while the personal cost in unit dose services delivery. The total estimated annual expenditures of drug distribution services were (435,067.15 USD). **CONCLUSIONS:** In this Adults Medication therapy services cost-estimation the first study at MOH in Saudi Arabia. It is an essential basic element of the PharmacoEconomic program and implements Saudi future vision 2030 for drug therapy health care services.

PHP110

GENERIC DRUGS IN CANADA, 2015

Lungu E, Potashnik T
Patented Medicine Prices Review Board, Ottawa, ON, Canada

OBJECTIVES: Generics360 is a PMPRB publication series that compares the price of generic drugs in Canada with those in other industrialized countries. This edition focuses on the 2015 calendar year and includes an analysis of the OECD market. **METHODS:** The analysis compares the manufacturer ex-factory generic prices of a large sample of drugs in Canada with their corresponding international prices. International comparisons focus on the seven countries the PMPRB considers in reviewing the prices of patented drugs (PMPRB7): France, Germany, Italy, Sweden, Switzerland, the UK and the US, as well as select countries in the Organisation for Economic Co-operation and Development (OECD). Data was collected from the IMS AG MIDAS™ Database. **RESULTS:** Generic prices in Canada have been reduced by half over 2010 to 2015, markedly narrowing the gap between Canadian and foreign prices. Both provincial generic pricing policies and the depreciation of the Canadian dollar contributed to the decrease in the difference between foreign and Canadian prices. This gap was wider for molecules with higher sales and those with a greater number of domestic suppliers. **CONCLUSIONS:** While the Canadian provinces markedly reduced the prices of generic drugs for all Canadians through the implementation of generic pricing policies, prices in other countries continue to be lower. This analysis is designed to inform policy discussions related to the Canadian prices of generic drugs.

PHP111

COST-ANALYSIS AND FORECASTING DURING (2016-2020) OF TOTAL PARENTERAL NUTRITION PREPARATIONS IN SAUDI ARABIA

Alomi YA[1], Fallatah AO[2]
[1]*Ministry of Health, RIYADH, Saudi Arabia,* [2]*King Salman Hospital, RIYADH, Saudi Arabia*

OBJECTIVES: The Total Parenteral Nutrition (TPN) preparations cost estimation and forecasting is a part of the pharmacy strategic planning at MOH in Saudi Arabia. The study investigated the cost analysis of TPN preparations and forecasting in 2016-2020. **METHODS:** Simulation of 6-month 2015 cross-sectional of TPN (2 in 1) preparations for neonates, pediatrics, and adults patients. It was at 300-Bed Hospital (King Salman Hospital) in Riyadh, Saudi Arabia. The pharmacist reviews and prepared TPN. TPN developed through sterile 797 standards and automated compounding facilities. The cost drives from Ministry of Health information database. All price used US dollar currency and local prices. **RESULTS:** The total number patients were 112 with 1631 TPN orders. The estimated cost of TPN bag for adult per day was (265.95 USD). The estimated cost of TPN preparations for pediatrics per day was (284.35 USD). The estimated cost of TPN preparations for neonates was (250.64 USD). The average break-even points after establishment TPN room was 4-months only. The forecasting cost with additional 30% revenues. TPN prices for adults was (345.73 USD), pediatrics (369.65 USD), and neonates (325.8 USD). The break-even points after new price occur after 3-months only. The automated TPN compounding system should use for hospital if at least had an average of eight to ten TPN preparations per day. **CONCLUSIONS:** Cost analysis and forecasting of Total Parenteral Nutrition prices is part pharmacoeconomics program and vision future 2030 at MOH in Saudi Arabia. It is an essential tool for TPN strategic plan, forecasting of new TPN services, and cost estimated of TPN-related health care services.

PHP112

COST OF PEDIATRICS DRUG THERAPY SERVICES AT MINISTRY OF HEALTH IN SAUDI ARABIA

Alomi YA[1], Alhadab M[2], Alotaibi T[2], Alhaza N[2], Alassadi N[2], Alzahrani S[2], Alghamdi E[2]
[1]*Ministry of Health, RIYADH, Saudi Arabia,* [2]*Alyamama Hospital, RIYADH, Saudi Arabia*

OBJECTIVES: To explore the estimation of cost calculations for delivery drug therapy services for pediatrics by using American Model with local cost. **METHODS:** It is a cross-sectional 6-months 2016 analysis of drug distribution services for pediatric. It was at 300-Bed Maternity and Pediatrics Hospital in Riyadh, Saudi Arabia. The cost calculated pediatrics drug therapy management services delivered to 144 beds. The physician prescribed the medications. The pharmacist reviews and prepared drugs and distributed through unit dose system, floor stock distribution, and discharge medications services. The medications prepared through ASHP standards and facilities. The fast moving oral and topical medications included in the study. The cost Model calculated based on variable expenses including personal cost, material, and supply cost. Fixed cost was including direct cost, non-salary cost, and overhead cost. All cost used of US dollar currency and local prices. **RESULTS:** The estimated cost of Delivery of drug therapy services for all total number adults beds per day was (1,214.72 USD). It consisted of three types; the unit dose system (771.9 USD), drug floor stock distribution system (350.34 USD), and discharge medication services (92.5 USD). The majority of cost came from overhead cost, and material and supply in floor stock services and discharge medication delivery; while the personal cost in unit dose services delivery. The total estimated annual expenditures of Drug distribution services were (443,371.83 USD). The highest budget expenditures from unit dose services 63.54 % (281,743.01 USD), followed by floor stock medication delivery 28.8 % (127,872.64 USD), and discharge drug therapy 7.6 % (33,756.17 USD). **CONCLUSIONS:** The estimation cost of delivery pediatrics drug therapy is the first study in the Middle East, Gulf countries, and Saudi Arabia. It is basic element of cost calculation of Pediatrics -related health care services.

PHP113

DEVELOPMENT OF THE PUBLIC HEALTH PRODUCT TAX IN HUNGARY BETWEEN 2011-2015

Csákvári T[1], Endrei D[2], Boncz I[2]
[1]*University of Pécs, Zalaegerszeg, Hungary,* [2]*University of Pécs, Pécs, Hungary*

OBJECTIVES: Several countries has been already established taxes placed upon unhealthy foods and beverages, to increase health awareness. Hungary's public health product tax ('fat tax') has been established in 2011, and its entire amount is a revenue source of the National Health Insurance Fund (NHIF). The aim of our study is to introduce Hungary's public health product tax and reviewing the amount of tax received between 2011-2015 grouped according to taxable products. **METHODS:** A quantitative, retrospective study was carried out to assess the products that have public health tax placed on to. Amount of tax bases (units in liter or kilogram) and amount of tax income (USD) was determined between 2011 and 2015. Data derived from the National Tax and Customs Administration of Hungary. **RESULTS:** Both amount of income and number of taxable products increased over the years. Amount of public health tax income increased by 51% since 2012, due to the Act's extension to alcoholic beverages in 2015. Most of all income came from prepacked sweetened products (34.24%, ~34,756,809.8 USD) and alcoholic beverages (28.09%, ~28,512,272.9 USD) in 2015. Prepacked sweetened products (72.49%) and salty snacks (13.31%, 12,288,313.89 USD) were the biggesttax bases (in kilogram). Soft drinks was the main product in tax bases (in liter) (81.04%), although only 15.78% of income can be linked to this item. Alcoholic beverages with 35-45% v/v had the greatest income (49.21% of income from alcoholic beverages, 13.82% of all income, ~14,031,990.27 USD), hovewer this means only 1,66% of all tax bases (in liter). **CONCLUSIONS:** Public health product tax's primary goal was to become a small, but stabile source of revenue for the NHIF. It can also be a significant factor from a public health perspective. It is important to assess its affect on population's health awareness in the future.

PHP114

THE IMPACT OF THE FDA'S UNAPPROVED DRUGS INITIATIVE ON EXPENDITURES FOR ORAL COLCHICINE IN THE UNITED STATES

Saffore CD[1], Bellfi L[2], Edwards SA[1], Walton S[1], Schumock G[1]
[1]*University of Illinois at Chicago College of Pharmacy, Chicago, IL, USA,* [2]*University of Illinois at Chicago, Chicago, IL, USA*

OBJECTIVES: It has been suggested that some recent price increases of older generic medications may be attributed to the FDA Unapproved Drugs Initiative (UDI), a program to improve safety by removing unapproved drugs from the market. Colchicine is a good example of a previously unapproved drug marketed for many years at a low price. In 2009, a New Drug Application (NDA) was approved for colchicine (Colcrys) in accordance with FDA's UDI, and in 2015 a FDA approved branded generic became available. This study assessed the impact of FDA's UDI on expenditures for oral colchicine before and after the NDA by conducting a descriptive analysis of expenditures over time. **METHODS:** Data on drug expenditures, adjusted for inflation using the Consumer Price Index, and units sold from January 1, 2006 to December 31, 2015 were obtained from the IMS Health National Sales Perspective database. Expenditures (in 2015 $), units sold, and expenditures/unit ("price") by year were plotted graphically to observe trends over time. Percentage change of each over time was also examined. **RESULTS:** The most volatile time period observed was 2010 to 2014, during which there was a 437% increase in total expenditures, a 574% increase in total expenditures/unit, and a 20% decline in total units sold (total = unapproved and approved products). During the same period, Colcrys expenditures and units sold exhibited a 1,096% and 941% increase respectively. Meanwhile, unapproved oral colchicine expenditures and units sold declined 100% to zero in 2014 due to market exit prompted by FDA's UDI. Subsequently, in 2015, the branded generic oral colchicine entered the market, which lead to a decline of approximately 60% in expenditures and units sold for Colcrys. **CONCLUSIONS:** Expenditures for oral colchicine rose substantially following FDA approval, driven largely by increased price, suggesting a substantial market impact of FDA's UDI on expenditures.

PHP115

AN INCREASE OVER TIME IN PUBLISHED REAL-WORD/HEALTH-ECONOMIC EVIDENCE IN CLINICAL JOURNALS ACROSS DIFFERENT THERAPY AREAS

Hartog TE, Yoruk B, Huang Y, Costa C, Nuottamo N, Van Lier H
Excerpta Medica, Amsterdam, The Netherlands

OBJECTIVES: Insights from real-world/health-economic (RW/HE) research are becoming increasingly important to clinical decision-making in a number

of therapy areas. This study quantifies the publication of RW/HE evidence in clinical journals over ten years (2005–2015) and across different therapy areas. **METHODS:** Five therapy areas were selected: cardiology, diabetes, neurology, oncology, and nephrology. Within each therapy area, three journals were identified based on impact factor (high) and clinical editorial focus. For these journals, a literature analysis was performed using EMBASE to identify published RW/HE original research articles – as defined by ISPOR – using a search string based on previously published recommendations. We used chi-square tests to compare the proportion of RW/HE articles grouped by therapy area in 2005, 2010, and 2015, and pair-wise tests to compare changes from 2005–2010 and 2010–2015. We also compared the proportion published in society journals versus non-society journals. **RESULTS:** Among all therapy areas, the proportion of RW/HE publications increased over time, but especially during the period 2010–2015. Overall, the proportion of RW/HE publications increased from 6.6% in 2005 to 9.0% in 2010 and 17.1% in 2015 ($p<0.001$). The proportion of RW/HE publications was different between therapy area ($p<0.001$ in all 3 time points), with the highest proportion in 2015 for diabetes (23.3%), cardiology (21.0%), and nephrology (20.1%), and the lowest for neurology (8.4%) and oncology (11.7%). Compared with non-society journals, society journals published a higher proportion of RW/HE publications (5.9% vs 20.1% in 2015; $p<0.001$) and had a stronger increase over time (growth rate 74.3% vs 99.9% for 2010–2015; $p<0.001$). **CONCLUSIONS:** During the period 2005–2015, the proportion of RW/HE articles in top clinical journals increased across all therapeutic areas investigated. These results could suggest an increasing willingness to publish RW/HE evidence for health-care decision-making, with some notable differences between therapy areas.

PHP116

STAKEHOLDER DEMAND FOR INFORMATION RELATED TO PIPELINE PRODUCTS AND UNAPPROVED USES OF APPROVED MEDICINES

Nelson JA[1], Woltemath D[1], Drozd M[2], Vandigo J[2]
[1]*Health Strategies Group, Yardley, PA, USA,* [2]*Pharmaceutical Research and Manufacturers of America (PhRMA), Washington, DC, USA*

OBJECTIVES: This study sought to better describe payer and physician interest, perceptions, and use of information about pipeline products and unapproved uses of approved medicines. **METHODS:** We conducted a series of 15-minute online surveys in November 2016 with specialist physicians (cardiologists, oncologists, endocrinologists, neurologists, psychiatrists, and rheumatologists) and payer executives (representing managed care organizations, pharmacy managers, and large integrated delivery networks). **RESULTS:** 178 specialist physicians and 39 payer executives participated in the study. More than 80% of respondents indicated they would like to receive more information on products in the biopharmaceutical pipeline. Among those interested in pipeline information, 72% of payer executives and 53% of physicians indicated they would like this information at least 6 months pre-approval. The majority of payer executives (82%) and physicians (85%) say they would like to receive more information from biopharmaceutical companies on unapproved uses of approved medicines, provided that the evidence is scientifically sound. Respondents saw the most value in receiving information that underwent peer review and disclosed information about study design and limitations. Respondents also acknowledged the value of FDA approval; 79% of payers agreed that even if companies were able to proactively share more information regarding unapproved uses of a medicine, they would still want to see the manufacturer take steps to have the use approved as an indication on the product labeling. Two-thirds (66%) of physicians thought that if they had more information on unapproved uses they would more often refer patients to clinical trials studying those uses. **CONCLUSIONS:** Payers and specialist physicians are interested in receiving additional information about unapproved uses of medicines from biopharmaceutical companies, provided that the quality of the information is scientifically sound. These stakeholders do not view the sharing of information outside of product labeling as precluding the need for clinical trials, particularly for unapproved uses.

PHP117

IMPACT OF AGING ON THE COLOMBIAN HEALTHCARE SYSTEM

Hernández-Galvis J, Rosselli D
Pontificia Universidad Javeriana, Bogota, Colombia

OBJECTIVES: Our objective was to review, based on the official 2014 Colombian healthcare registry (known as RIPS), the crude figures of resource use (number medical consultations and hospitalizations) by age group. **METHODS:** The RIPS database provides demographic information (of which we used age and gender) of each patient's contacts with the health system, on the number of hospitalizations, and on the length of stay (LOS). Based on DANE (the official Colombian statistics agency) we calculated the proportion of subjects in each age group that contacted the system on that particular year, the average number of contacts, hospitalization rate and average length of stay. **RESULTS:** According to RIPS 25,880,817 subjects (54.3% of Colombian population) contacted the health system in 2014, on average 12.2 times. Coverage was high in the first year of age (96% of population), reached its lowest point in the 10 to 14 year age group, and then rose consistently with age. The number of contacts, the hospitalization rate and the LOS increase with age (average LOS is around 5 days at ages 5 to 25, but then rises progressively, up to 11 days at age 80). An interesting finding was that according to DANE's projections, based on the last census (in 2005) there should be 669,643 Colombians age 80 or more, and according to RIPS 921,727 contacted the health system in 2014. **CONCLUSIONS:** Our results give face validity to our RIPS information system and support its potential use both for research purposes and for decision making. Our health system has to be prepared for dealing with chronic conditions, with more comorbidities and with other characteristics of an older population. Additionally, our results suggest that the aging population process has been underestimated by our official statistics agency.

PHP118

CHANGES IN THE PREFORMANCE INDICATORS OF CHRONIC INPATIENT CARE IN HUNGARY BETWEEN 1990 AND 2015

Ágoston I, Endrei D, Molics B, Szarka E, Gyuró M, Boncz I
University of Pécs, Pécs, Hungary

OBJECTIVES: The aim of our study was to demonstrate the changes in the performance indicators of chronic inpatient care in Hungary between 1990 and 2015. **METHODS:** The study involved the most significant performance indicators of chronic hospital capacities in the period examined, and we used descriptive statistics. The data derived from the financial database National Health Insurance Fund Administration, the single health care financing agency in Hungary. We analysed the period between 1990-2015. **RESULTS:** The number of chronic hospital beds decreased from 30.784 in 1990 to 27.314, in 2015. The lowest number of chronic beds was 19.295, in 2001. Conversely, the number of acute care beds decreased with 31.660 beds. The rate of the active/chronic number of beds changed from 70/30 to 60/40 in the period examined. The internal rates considering chronic beds changed to a great extent. Nursing homes were closed, the number of beds in Pulmonology decreased significantly and that of beds in Psychiatry reduced to a lesser extent. According to new challenges, the number of rehabilitation beds increased by 4.5-fold, to 15.107 beds. Permanent nursing capacities increased by 185%. The increase was not shown in the number of discharged patients, because fewer than 9.696 patients were discharged from chronic beds in the period examined. Despite the decrease in the number of beds, the number of discharged patients from active beds increased by 141.734. This fact shows the development of the technologies in active care. Considering chronic care, slight development could be observed. The number of nursing days decreased to 30.3 days in 15 years. Bed occupancy indicators within chronic care accounted for approximately 84%. **CONCLUSIONS:** According to international trends, the significance of chronic inpatient care capacities increased in Hungary. The internal rates of the number of chronic beds are consistent with the types of disorders; their necessity is supported by the bed occupancy indicators.

PHP119

EXPLORING FACTORS ASSOCIATED WITH MEDICATION SELF-SYNCHRONIZATION

Lou Y[1], Mu Y[1], Taitel MS[2]
[1]*Walgreen Co, Deerfield, IL, USA,* [2]*Walgreen Co., Deerfield, IL, USA*

OBJECTIVES: To explore factors associated with medication self-synchronization. **METHODS:** This observational study includes established Walgreen patients who filled 4 unique maintenance medications in July 2016. Logistic regression is used to evaluate variables associated with medication self-synchronization defined as having just 1 trip (measured as unique prescription sold date) for all maintenance medications in the month. The independent variables include age, gender, payment type, copay amount, total number of prescriptions, maintenance medications indicators, and days supply indicator. **RESULTS:** Out of 613,405 patients in the study, 168,441 (27.46%) are self-synchronized and 444,964 are not (37.86% with 2 trips; 26.77% with 3 trips; and 7.91% with 4 trips). Younger patients are more likely to self-sync than older patients: odds ratios (OR) range from 1.37[1.33, 1.40] to 1.81[1.73, 1.91] compared to patients >65 years old. Patients with low copays are more likely to self-sync than patients with high copays: odds ratios range from 1.09[1.04, 1.14] to 1.61[1.55, 1.66] compared to patients with copays >$80. Patients taking selected maintenance medications are more likely to self-sync than patients who are not: odds ratios are 1.08[1.06, 1.10] for anti-diabetic, 1.34[1.31, 1.36] for anti-hypertensive, and 1.33 [1.30, 1.35] for anti-hyperlipidemic medications. Compared to patients who had both 30-day and 90-day fills, patients who had only 30-day fills or 90-day fills are more likely to self-sync: odds ratios are 1.52[1.49, 1.56] and 2.29[2.21, 2.38] respectively. Finally, patients with more prescriptions are less likely to self-sync (OR= 0.911[0.906, 0.915]). **CONCLUSIONS:** Medication self-synchronization is associated with age, copay amount, selected maintenance medication indicators, day supply indicators, and total number of prescriptions. Understanding the underlying factors of medication synchronization helps pharmacies design and deliver more effective patient support programs.

PHP120

THE PREVALENCE AND TYPE OF POTENTIALLY INAPPROPRIATE PRESCRIBING AMONG HOSPITALIZED GERIATRICS IN MALAYSIA

Akkawi ME, Nik Mohamed MH
International Islamic University Malaysia, Kuantan, Malaysia

OBJECTIVES: To identify the prevalence and types of potentially inappropriate medications (PIMs) and potentially prescribing omissions (PPOs) among community-dwelling geriatrics pre- and post-hospitalization. **METHODS:** A prospective cohort study involving patients ≥ 65 years old, on at least one medication for a minimum of 3 months prior to hospitalization, in a tertiary hospital in Malaysia. Data was collected from patients and their records after a signed consent form has been obtained. Patients were followed up until discharge. Medications at admission and discharge were reviewed to identify PIMs/PPOs using STOPP/START criteria Version 2. **RESULTS:** Of 300 patients, 44.3% (n=133) were females, with a mean age of 72 ± 6 years, length of hospital stay was 5.4 ± 3.7 days with a cumulative number of comorbidities upon admission of 3 ± 1.25 diseases. The prevalence of PIMs at admission was 35.3% (106 patients, 134 PIMs), which reduced at discharge to 31.6% (95 patients, 123 PIMs) (p=0.80). The three most common PIMs at admission and discharge were drugs that increase the risk of falls in patients with persistent postural hypotension, non-steroidal anti-inflammatory drugs (NSAIDs) used in patients with creatinine clearance CrCl < 50 mL/min, and metformin used in patients with CrCl < 30 mL/min. The prevalence of PPOs at admission was 47.6 % (143 patients, 207 PPOs), which increased at discharge to 48% (144 patients, 201 PPOs) (p=0.99). The three most common PPOs at admission and

discharge were the omission of vitamin D supplement in patients with a history of falls, and the omission of angiotensin converting enzyme (ACE) inhibitor and ß-adrenergic blocker in patients with documented coronary artery diseases. **CONCLUSIONS:** PIMs and PPOs are prevalent among community-dwelling geriatrics and hospitalization did not change their prevalence or type significantly.

PHP121

NATIONAL SURVEY OF PHARMACY PRCATICE AT MOH HOSPITALS IN SAUDI ARABIA 2016: DRUG MONITORING AND PATIENT EDUCATION

Alomi YA[1], Alghamdi SJ[1], Alattyh RA[1], Alshahrani AM[2], Shorog EM[2], Alasmary SA[2], Alanazi SA[3], Almutairi AS[1], Almutairi MM[1], Alanazi HH[1]
[1]Ministry of Health, RIYADH, Saudi Arabia, [2]King Khalid University, College of Pharmacy, RIYADH, Saudi Arabia, [3]Aleman Hopsital, RIYADH, Saudi Arabia

OBJECTIVES: To explore the drug monitoring and patient education at Ministry of Health (MOH) hospitals in Saudi Arabia **METHODS:** It is a 4-months cross-sectional national survey of drug monitoring and patient education at MOH hospitals in Saudi Arabia. The study consisted of two-part; a demographic information and the second part contained eighty-five questions divided into six domains drove from American Society of Health-System Pharmacists (ASHP) survey. The parts were pharmacy management and resources, prescribing and medication management, preparation of drugs and dispensing, technology and clinical pharmacy services, drug monitoring and patient education, and pharmacy education and training. The 5-points Likert response scale system closed and ended questions used. An electronic questionnaire distributed to the one hundred eighty-five directors of pharmacies at MOH hospitals, and it analyzed the drug monitoring and patient education section through survey monkey system **RESULTS:** The total responders were seventy hospital pharmacies; the repose rate was (37.73%). The highest estimated number of drug monitoring was a prevented medication error per hospital per year (139,816.79), the drug information inquiries per hospital per year were (69,703.23), the adverse drug reaction was (61,905.16). The average number of patients counseling per hospital per year was (58,643.33), the number of pharmacist intervention per hospital per year (58,628.13). The patient education services existed in 52 (74.3%) hospitals. The patient education services were given through outpatient services 59 (84.3%), and at the bedside during discharge 19 (27.1%). The patient education provides to adults patient followed pediatrics and geriatrics patient at outpatient and inpatient setting. The most hospital pharmacies shared in national diabetic day 45 (64.3%) and national asthma day 23 (32.9%). **CONCLUSIONS:** The pharmacist had the active role in drug therapy monitoring and patient counseling. Expanding those services with regular documentation is recommended to improve the quality of the services and patient health care outcomes.

PHP122

THE IMPACT OF A PHARMACY OPERATIONS MODEL ON IMPROVING MEDICATION ADHERENCE

Pickering M, Nelson M
Pharmacy Quality Alliance, Springfield, VA, USA

OBJECTIVES: Suboptimal medication adherence continues to be a recognized issue. In recent years, one emerging pharmacy operations approach to improving adherence has been the appointment-based medication synchronization model. We evaluated the available literature to summarize the impact of medication synchronization model on relevant outcomes and identify gaps for future research. **METHODS:** A comprehensive literature search was conducted using PubMed and EMBASE since database inception. English studies were included if they were peer-reviewed observational and/or interventional studies that investigated impact of medication synchronization on outcomes. References of included studies were screened to identify additional articles for inclusion. Each study was screened by two independent reviewers. Discrepancies were resolved through a third reviewer. **RESULTS:** The search yielded a total of 271 records. After screening for relevance, inclusion criteria, and duplicates, a total of 9 articles were included for data extraction. The majority of studies (7/9) found a significant improvement in the CMS Medicare Star Ratings measures for adherence to oral anti-hyperglycemics, anti-hypertensives, and anti-hypercholersterolemics. One study assessed patient experience to this synchronization model; finding that patients were highly satisfied. One study concluded that medical savings per additional dollar spent on medications ranged from approximately $1-37, depending on the medication. **CONCLUSIONS:** Medication synchronization has improved adherence across a series of chronic medications. However, even with these positive results, there is a paucity of peer-reviewed evidence evaluating the impact of medication synchronization on healthcare resource utilization (e.g., hospitalizations, ED visits), associated economic outcomes, and adherence to other medications outside of the CMS Star Ratings (e.g., COPD medications). Additionally, most studies were conducted using small sample sizes. Future research is needed that investigates the impact of medication synchronization on other priority conditions (e.g., COPD), other outcomes (e.g., hospitalizations, ED visits, and associated costs), and the overall impact on Star Ratings for Medicare Part D plans.

PHP123

EFFECT OF THE ORDER OF DRAW FOR MULTIPLE BLOOD COLLECTION TUBES ON DIAGNOSTIC PARAMETERS

Oláh A[1], Müller Á[1], Pakai A[2], Szabó L[1], Stromájer-Rácz T[1], Knisz J[1], Boncz I[1], Betlehem J[1], Csonti R[1]
[1]University of Pécs, Pécs, Hungary, [2]University of Pécs, Zalaegerszeg, Hungary

OBJECTIVES: There are numerous international standards and recommendations by pharmaceutical manufacturers for the order of draw to avoid contamination of the sample caused by additives in blood collection tubes. Our goal was to examine whether changing the order of draw results in biases in the analyzed diagnostic parameters. **METHODS:** The quantitative, cross-sectional study was carried out in Karolina Hospital, Mosonmagyaróvár, Hungary between September 1. and November 31, 2016.We used non-randomized, purposive sampling in both experimental and control groups (N1=30, N2=30). In the experimental group, four incorrect orders of draw for phlebotomy tubes were used (Clot-activator, Na-citrate; Li-heparine, Na-citrate; K3 EDTA, native; Na-citrate, native). In the control group, the correct order of draw was followed (Na-cytrate, native, K3 EDTA). The following parameters were examined: prothrombin, INR, Potassium, Calcium, Magnesium, ALP. Data were analyzed using descriptive (absolute and relative frequencies, median with interquartile range [IQR]) and mathematical (χ2-test, Mann- Whitney U tests, linear and logistic regressions) statistics ($p < 0.05$). **RESULTS:** Incorrect order of draw (K3EDTA-serum tube) resulted in significantly decreased calcium levels in the experimental group compared to the control group (2.39 mmol/l [IQR: 2.33-2.46] vs. 2.60 mmol/l [IQR: 2.57-2.63], $p < 0{,}001$) Any other deviation in the order of draw failed to show significant biases. **CONCLUSIONS:** Incorrect order of draw for the sampling tubes during phlebotomy resulted in decreased level of calcium ion, which is a statistically significant difference, however, the value still remained in the normal clinical range.

OUTCOMES ANALYSIS OF A SPECIALTY PHARMACY PROGRAM

Halim L[1], Canes A[2], Aslam S[2], Stambaugh T[2], Shah J[1]
[1]The Cigna Companies, Bloomfield, CT, USA, [2]Cigna, Bloomfield, CT, USA

OBJECTIVES: To evaluate whether, compared with retail services, the use of specialty home delivery pharmacy services embedded in a health plan's operations is associated with improved medication adherence and reduced overall healthcare costs. **METHODS:** A retrospective, matched cohort study using administrative claims data was conducted using pharmacy and medical claims for patients receiving specialty medication from a specialty home delivery pharmacy and those filling at retail. Based on sample size and potential for differences in outcomes, subpopulations taking inflammatory, multiple sclerosis, oncology, HIV and renal transplant medications were selected. Patients were identified based on their first condition-related medication fill in 2014 and followed for one year. The cohorts were matched on confounders including demographics, Charlson comorbidity score and baseline use of pharmaceutical therapy, as well as condition-specific factors. Statistically significant differences were evaluated using T and chi-squared tests. **RESULTS:** The final analysis included 3,910 patients per cohort. The mean medical cost per patient was 10.8% lower in the home delivery group ($11,928 v $10,639; difference = $-1,289; $P = 0.0176$) in the follow-up period. The home delivery group had lower mean inpatient hospital costs ($2,640 v $1,809, difference = $-832; $P < .0001$). Patients in the home delivery group were more adherent to therapy, 62.9% v 72.1% had PDC > 80%, ($P < 0.0001$). Further, patients in the home delivery pharmacy group had higher levels of engagement in case management and other disease management programs 22.2% vs 25.2% (P .0019). **CONCLUSIONS:** After adjusting for measured confounders, individuals who filled their oral and self-injectable specialty medications through mail order pharmacy had higher adherence rates and lower medical cost. This was accompanied by improved engagement in disease/care management programs. These results provide evidence of the effectiveness of patient education, refill management, and clinical management of adverse effects and drug interactions provided by specialty pharmacy services.

PHP125

PERCEPTION OF IRON DEFICIENCY IN MULTIDISCIPLINARY CLINICAL PRACTICES IN ALGERIA IN 2016: SUPFER DZ SURVEY

Benakli M[1], Belkaid R[2], Ramdani N[3], Mahi L[4], Hammoudi-Bendib N[5]
[1]Centre Pierre et Marie Curie, Algiers, Algeria, [2]CHU Beni-Messous, Algiers, Algeria, [3]Laboratoire de Biologie, Algiers, Algeria, [4]Axelys Santé DZ, Algiers, Algeria, [5]EHS Dr.Maouche (CNMS), Algiers, Algeria

OBJECTIVES: The aim of this survey was to assess the diagnostic modalities and the management of iron deficiency (ID) or iron deficiency anemia (IDA) in clinical practices in Algeria. **METHODS:** Physicians were selected from a professional database. They reported, on a self-administered questionnaire, the estimated frequencies of ID and IDA among their patients, the diagnostic modalities and treatments. They have also reported the conditions of use of oral or intravenous (IV) iron and erythropoiesis-stimulating agents (ESA). The survey analysis was performed on 349/400 questionnaires of physicians from different therapeutic areas (anesthesia, intensive care, surgery, n=43; gynecology, obstetrics, n=111; oncology, hematology, n=58; gastroenterology, n=64; cardiology, n=36; internal medicine, n=25; others, n=12). **RESULTS:** Out of 82% (290/349) of physicians reported cases of ID. Among them 20% (75/349) reported a frequency of ID $\geq$ 50%. Physicians were 97% (335/349) to report IDA among their anemic patient. For 71% (250/349) of them, frequency of IDA was > 30%. Physicians were 25% (88/349) to systematically explore ID (57% in gynecology-obstetrics) and 67% only if there is an anemia. Physicians (90%) mainly use oral iron as primary treatment of ID and are 29% who are using IV iron if hemoglobin (Hb) level $\leq$ 8 g/dL (median). Survey responders were 49% (170/349) to report transfusion for severe IDA (48% in the post-partum). In contrast with Hb level (89%), serum ferritin and transferrin saturation, were insufficiently performed: 66% (232/349) and 36% (125/349), respectively. The use of ESA was reported by 25% (60/238) of physicians [72% (42/58) in oncology and hematology]. **CONCLUSIONS:** This survey provides an initial source of information on the frequency of ID and IDA based on the routine clinical practices from a multidisciplinary sample of Algerian physicians. It appears that the monitoring of iron status parameters is advised to better optimize treatment and reduce blood transfusion.

PHP126

COMPARISON OF ADVERSE DRUG REACTIONS BETWEEN OLDER AND YOUNGER PATIENTS IN KOREA: USING ADVERSE EVENT REPORTING SYSTEM DATABASE FOR 2013-2015

Je S, Kim NH, Song SM, Lim SJ, Suh D
Chung-Ang University, Seoul, South Korea

OBJECTIVES: Although older adults appear to be more prone to experience adverse drug reactions(ADR), a comparison of the health consequences of ADR between older(e.g., over 65years of age) and younger(e.g., 65years of age and under) adults has not been performed in the South Korean population. The aim of this study was to identify the characteristics of MEs between older and younger adult patients in South Korea using the Korea Adverse Event Reporting System(KAERS). **METHODS:** The KAERS database contained a total of 754,231ADR reports from 38,974patients with average 1.99reports per patient. KAERS collects ADR reports that include patient demographics, concomitant drugs, patient outcome, reaction severity and the results of causality assessments. We conducted analyses with geriatric ADR reports from the KAERS database covering 2013 to 2015. Reporting odds ratio(ROR) was calculated to examine whether the number and types of ADR reports were statistically different between the two groups:(under vs over 65years old). **RESULTS:** The proportion of ME reports for older adults was 1.38times(95% CI=1.207-1.578) greater than that of the young adults. In the 327geriatric ADR reports examined, 18different types of MEs were identified according to WHO-ARTcode. Of the most frequently reported types of geriatric ADRs, the number of reports of "off label use"(n=166, 50.8%) and "accidental overdose"(n=21, 6.4%) was 1.5times(95%CI=1.14, 1.96) and 2.96times (95%CI=1.48, 5.90) greater, respectively, in the older patients compared to younger adults. In addition, frequently used drugs and underlying diseases in the 327older adults ADR reports were "prucalopride"(n=82, 25.1%) and "unspecified primary hypertension"(n=32, 11.0%), respectively. "Carcinoma in situ of stomach"(n=30,8.3%) was the most frequently reported disease condition for which medicines that caused ME was prescribed. **CONCLUSIONS:** Older adult patients are more likely to experience ADRs because of off label medication use and accidental overdose than younger patients. This finding suggests the need for healthcare professionals to continuously monitor medication use to prevent possible ADRs.

PHP127

MULTIMORBIDITY AND POLYPHARMACY AMONG MEDICAID BENEFICIARIES – A MULTI-STATE ANALYSIS

Feng X[1], Tan X[1], Zheng T[1], Riley B[2], Bias T[3], Sambamoorthi U[1]
[1]West Virginia University, School of Pharmacy, Morgantown, WV, USA, [2]Marshall University, School of Pharmacy, Huntington, WV, USA, [3]West Virginia University, School of Public Health, Morgantown, WV, USA

OBJECTIVES: Multimorbidity is highly prevalent among young adults and these adults often use multiple medication classes known as polypharmacy. Current definitions of polypharmacy are limited because they do not measure daily use of multiple medication classes. To examine the relationship between multimorbidity and polypharmacy. Polypharmacy was estimated with the commonly-used measure and a novel measure. **METHODS:** In this cross-sectional study, data on fee-for-service Medicaid recipients (N = 54,907) were derived from 2010 Medicaid Analytic Extract files of Maryland and West Virginia. Nineteen chronic conditions based on the US Department of Health and Human Services framework were selected. Medication classes were identified using the National Drug Codes. Commonly-used polypharmacy measure was defined as number of drug classes (within an arbitrary 90-day time period) that was 1 standard deviation above the mean. The novel approach integrated the number of drug classes and duration of use to calculate simultaneous daily use medication classes. The simultaneous use of 5 or more different medication classes for a 60-day consecutive period was defined as polypharmacy. The association between multimorbidity and polypharmacy was examined with Chi-square tests and logistic regressions. **RESULTS:** Polypharmacy was estimated at 17.1% under the commonly-used approach and 38.1% under the novel measure. Individuals with multimorbidity had higher rates of polypharmacy under both definitions (33.3% -commonly-used measure vs. 64.5% -novel measure). Adults with multimorbidity were more likely to have polypharmacy for both measures (AOR = 8.6, 95% CI =8.1 -9.2 -commonly-used measure; and AOR = 6.3, 95% CI =6.0 -6.5 -novel measure), compared to those without multimorbidity. **CONCLUSIONS:** Polypharmacy was highly prevalent among adults with multimorbidity regardless of the definition used, although the commonly-used definition may underestimate the rate of polypharmacy.

PHP128

90-DAY INDEX FILLS AT RETAIL PHARMACY CONTRIBUTE TO HIGHER CMS STAR QUALITY MEASURES

Lou Y[1], Gooptu A[2], Mu Y[1], Rozenbaum A[3], Taitel MS[2]
[1]Walgreen Co., Deerfield, IL, USA, [2]Walgreen Co, Deerfield, IL, USA, [3]Walgreens Co, Deerfield, IL, USA

OBJECTIVES: To determine if 90-day fills at retail pharmacy are associated with greater adherence to medications included in the CMS Star quality measures. **METHODS:** This observational cohort study includes new and established Medicare Part D (Med D) patients 18 years or older who had at least one prescription fill for any of the three CMS Star drug classes (diabetes, hypertension, or cholesterol) at Walgreens retail pharmacy in January 2016. Patients who filled their first Star drug prescription (index fill) with a 90-day supply are included in the 90-day group and all others are in the 30-day group. To minimize the differences between groups, we propensity score matched patients in the 90-day group, one-to-one, to patients in the 30-day group on age, gender, copay, comorbidities, and past medication adherence history. We evaluate two measures of medication adherence during the period from the index fill to the end of 2016: proportion of days covered (PDC) and optimal adherence (OA): the percent of patients with PDC≥ 80%. Student's t-tests and Chi-square tests were used to evaluate differences in the 2 adherence measures. **RESULTS:** The study cohorts consist of 41,704 diabetes patients, 90,034 hypertension patients, and 80,164 cholesterol patients. Average PDCs in all 3 Star drug classes were significantly ($p < 0.001$) higher for the 90-day group than the 30-day group: diabetes: 82.44% vs. 75.84%, hypertension: 79.83% vs. 72.74%, and cholesterol: 77.09% vs. 70.45%. Percent of patients with PDC≥ 80% in all 3 Star drug classes were also significantly ($p < 0.001$) higher for the 90-day group than the 30-day group: diabetes: 66.40% vs. 59.99%, hypertension: 60.22% vs. 53.98%, and cholesterol: 60.16% vs. 52.55%. **CONCLUSIONS:** When Med D patients start the calendar year with a Star drug class 90-day prescription at retail pharmacy they have significantly greater adherence measured in CMS Star ratings.

PHP129

CLINICAL AND ECONOMIC OUTCOMES OF CLINICAL PHARMACIST AT ADULTS CRITICAL CARE OF PRIVATE HOSPITAL IN SAUDI ARABIA

Alomi YA[1], El-Bahnasawi M[2], Shaweesh T[2], Kamran M[2], Elgaili SH[2], Elemam AI[2], Antonio EJ[2]
[1]Ministry of Health, RIYADH, Saudi Arabia, [2]Dr. Sulaiman Al-Habib Medical Group, RIYADH, Saudi Arabia

OBJECTIVES: To explore the clinical and economic outcomes of clinical pharmacist at critical care units at private hospital in Riyadh city, Saudi Arabia **METHODS:** It is a 6-months cross-sectional study from January to June 2016 in adults critical care unit at Dr. Alhabib Group Chain Hospitals. It is one of the biggest private chain hospitals in Kingdom of Saudi Arabia. It was a thirty-bed critical care bed consisted of trauma, medical, surgical and maternity critical care cases. The pharmacist monitored all patients through daily medical round and documents any pharmacist intervention. The pharmacist intervention system used an international study model (Kinky et al., Ann Pharmacother 1999), measure level of activity, rational of clinical intervention, recommendation, patient outcome and pharmacoEconomic impact. The estimated cost avoidance of prevents drug-related problems. **RESULTS:** The total number of pharmacist interventions were (1.222). Among pharmacist intervention 956 (78.2%) was Saudi and 266 (21.8%) was non-Saudi. The gender distribution 540 (44.2%) was female, and 682 (55.8%) was male. The majority of them in age 65 or older 459 (37.6%) and age (18-40) 368 (30.1%). The most drug classification had interventions was Anti-infective drug 363 (29.7%) followed by musculoskeletal and joint disease medications 199 (16.3%). The highest interventions were potentially significant 610 (49.9%) and potentially serious 360 (29.5%). The most rationale of intervention was inappropriate dose 245 (20%), and therapeutic duplications (11.3%). The most patient outcome was unknown 539 (44.1%), patient condition improved 408 (33.4%), and therapeutic end point reached 133 (10.9%). The most pharmacoEconomic impact was the reduction in cost drug therapy 884 (72.3%). The estimated cost avoidance (220,882.1 USD), the total annual estimated cost avoidance (441,764.2 USD) **CONCLUSIONS:** The clinical pharmacist at critical care units of the private hospital is crucial and essential. The pharmacist prevent drug-related problems and saving additional cost of pharmacy services and health insurance system

PHP130

NATIONAL SURVEY OF PHARMACY PRACTICE AT MINISTRY OF HEALTH HOSPITALS IN SAUDI ARABIA 2016: PHARMACY MANAGEMENT AND RESOURCES

Alomi YA[1], Alghamdi SJ[1], Alattyh RA[1], Alswayeh YA[1], Alshahrani AM[2], Shorog EM[2], Alasmary SA[2], Alanazi SA[3], Almutairi AS[1], Almutairi MM[1], Alanazi HH[1]
[1]Ministry of Health, RIYADH, Saudi Arabia, [2]King Khalid University, College of Pharmacy, RIYADH, Saudi Arabia, [3]Aleman Hopsital, RIYADH, Saudi Arabia

OBJECTIVES: To explore pharmacy management and resources at Ministry of Health (MOH) hospitals in Saudi Arabia. **METHODS:** It is a 4-months cross-sectional national survey of pharmacy management and resources at MOH hospitals in Saudi Arabia. The study consisted of two-part demographic information, and the second part contained eighty-five questions divided into five domains drove from American Society of Health-System Pharmacists (ASHP) survey. The parts were pharmacy management and resources, prescribing and medication control, preparation of medications and dispensing, technology and clinical pharmacy services, drug monitoring and patients education. The 5-points Likert response scale system closed and ended questions used. An electronic questionnaire distributed to the one hundred eighty-five directors of pharmacies at MOH hospitals, and it analyzed the pharmacy management and resources section through survey monkey system. **RESULTS:** The total number of responders was sixty-five hospital pharmacies; the repose rate was (35.13%). The majority of pharmacy services consisted of outpatient pharmacy 55 (96.5%), pharmacy store 49 (81.67%), inpatient pharmacy 48 (80%) and emergency pharmacy 40 (70.18%). The seldom finding of pharmacy services were satellite pharmacy 4 (8.16%), and clinical pharmacy 7 (13.73%). The total number prescriptions dispensed were (53,125) per day with an average (1,080,45) prescriptions per hospital. The total number of pharmacists were (618), and pharmacy technicians were (818) with a mean (11.14) pharmacists and (14.26) pharmacy technicians per hospital respectively. The majority of hospital pharmacies had job description 45 (73.77%), vision 44 (68.75%), and mission 42 (68.75%). While the tiny percentages found were pharmacy annual plan 23 (38.98%), and pharmacy strategic plan or competency of pharmacy staff 26 (43.33%). **CONCLUSIONS:** Most of the hospital pharmacies missed some an essential of pharmacy practice with emphasis on Human Resources and clinical pharmacy services. Implementing of the MOH pharmacy strategic plan with close monitoring is required for all hospitals in Saudi Arabia.

PHP131

CAUSALITY, SEVERITY AND PREVENTABILITY PROFILING OF ADVERSE DRUG REACTIONS AMONG MEDICINE INPATIENTS IN A TERTIARY CARE PUBLIC TEACHING HOSPITAL, INDIA

Dar MA
National Institute of Pharmaceutical Education and Research (NIPER), S.A.S. Nagar (Mohali), Punjab, India

OBJECTIVES: This study was aimed to characterize the ADRs and to assess their causality, severity and preventability. **METHODS:** This prospective observational study was conducted in the patients admitted to medicine wards of a hospital. Patients either gender admitted in medicine wards were included in this study. The causality of ADRs was assessed using Naranjo's scale and WHO-UMC criteria. Severity and Preventability were assessed using modified Hartwig's severity scale and modified Schumock & Thornton criteria, respectively. **RESULTS:** Over the period of six months, data from 808 patients was collected. Of which 776 were analysed as they met the inclusion criteria. Out of 776 patients with complete documentation, 77 patients (45 male, 32 female) developed 82 ADRs (9.9%). 65.8% ADRs were observed in adults and 34.2% in geriatrics. Maximum number of ADRs were observed in age group of 40-49 years (25.6%). The highest number of ADRs were associated with antimicrobial drugs (24.4%) followed by diuretics (15.80%), opioid analgesics (14.6%), anticoagulants (14.6%) and antidiabetics (13.4%). Among the organs affected, approximately half of the ADRs were associated with GIT (46.3%) followed by metabolic (35.3%), haematological (14.6) and cutaneous (9.7%). Constipation (19.5%) followed by hypokalemia (19.5%), coagulopathy (14.6%), hypoglycaemia (13.4%) and hypersensitivity reactions (9.7%) were most commonly observed ADRs. Causality assessment by Naranjo's scale revealed 13.4% of ADRs were 'definite', 52.4% were 'probable' and 34.2% were 'possible' in nature. WHO-UMC criteria showed 15.8% of ADRs were 'certain', 37.8% were 'probable' and 46.2% were 'possible'. Of the 82 ADRs, 31.7% were 'mild' and 68.3% were 'moderate'. Preventability assessment showed that 34.2% of ADRs were 'definitely preventable', 46.3% were 'probably preventable' and 19.5% were 'not preventable'. **CONCLUSIONS:** ADRs encountered in this study were either 'definitely preventable' or 'probably preventable'. A regular mechanism to monitor the patients may be an option to minimise the ADRs.

PHP132

CLINICAL OUTCOMES OF PHARMACOKINETICS SERVICES MANAGED BY PHARMACIST AT MINISTRY OF HEALTH HOSPITAL IN SAUDI ARABIA

Alomi YA[1], Almudaiheem HY[2]
[1]*Ministry of Health, RIYADH, Saudi Arabia,* [2]*Ministry of Health, Riyadh, Saudi Arabia*

OBJECTIVES: To explore the clinical outcomes of pharmacist-managed Pharmacokinetics services at Ministry of Health Hospital in Saudi Arabia **METHODS:** It is a prospective study of pharmacokinetics services impact managed by a pharmacist over a period of six months at King Saud Medical City (KSMC). The study divided into two phases, each of 3-month duration for data collection and evaluation. The first phase (Phase I) was the Pre-intervention phase; the second was the intervention phase (phase II). Any patient received Gentamicin followed up by trained pharmacist. The pharmacist all pharmacokinetics parameters such as weight, height, culture sensitivity, and any adjustments in dosage, trough and peak levels and duration of administration recorded on a pharmacokinetics form on a regular basis at each phase. **RESULTS:** The total number of patients were 162 in phase I and 136 in phase II, the was no difference in age or gender. In the intervention phase, the adherence of labeled indication increased from 67 (41.4%) to 73 (53.7%) patients while adherences of non-labeled indications decreased from 95 (58.6%) to 63 (46.3%) patients. The sub-therapeutic trough levels of Gentamicin statistically significantly decreased from 22(13.6%) to 12 (8.8) patients ($p<0.5$). The therapeutic level of gentamicin significantly statistically increased from 22 (13.6%) to 63 (46.3%) patients ($p<0.05$). The sub-therapeutic peak levels of Gentamicin statistically significantly decreased from 40 (24.7%) to 18 (13.2%) patients ($p<0.05$), while the therapeutic level of Gentamicin statistically significantly increased from 2 (1.2 %) to 55 (40.4%) patients ($p<0.05$). All patients 136 (100%) were compliance of Gentamicin duration of administration time in the intervention phase. **CONCLUSIONS:** There is a significant impact of the pharmacist in the pharmacokinetics services, more compliance to indication guidelines, and decrease drug-related problems. Expanding the role of the pharmacist in therapeutic drug monitoring services is required at all hospitals in the Kingdom of Saudi Arabia.

PHP133

IMPACT OF CONVERSION IN RECTAL RESECTION FOR NON-RECTAL CANCER PATIENTS

Song C, Liu E
Intuitive Surgical, Sunnyvale, CA, USA

OBJECTIVES: This study aimed to assess the impact of conversion from minimally invasive surgery (MIS) to open surgery in rectal resection for non-rectal cancer patients. **METHODS:** Patients who underwent rectal resection in Premier Hospital Perspective® Database from 2008/01 to 2015/09 were included. Cases with rectal cancer ICD-9 diagnosis codes were excluded. Conversions were identified by ICD-9. Multivariate regressions were used to estimate the impacts of conversion through comparing converted vs. 1)non-converted cases; 2)open cases. Outcome measurements included postoperative complications, length of stay(LOS), operation time, total hospitalization cost. Further stratification analyses by surgeon specialty and teaching status were performed. **RESULTS:** Among 20385 non-rectal cancer patients with rectal resection in the study, 33.8% were done with MIS and 23.5% of those MIS were converted to open procedure. For non-rectal cancer patients, conversion to open surgery had significant higher odds of postoperative complications(OR1.41, 95%CI[1.23-1.62]), longer LOS(0.89days, 95%CI[0.56-1.22]) and operation time (50.70mins, 95%CI[27.04-74.35]), higher total cost($2546.14, 95%CI[1503.10,3589.19]) than non-converted cases. Comparable LOS and total costs were observed among converted and open cases, but converted cases were associated with significantly higher risk of postoperative complications(OR1.13, 95%CI[1.01-1.28]), and longer operation time(71.22mins, 95%CI[48.43-94.02]). Among cases performed by non-colorectal surgeons, odds of having postoperative complications were significantly higher in the converted cases than non-converted cases(OR1.51, 95%CI[1.27, 1.79]) and open cases(OR1.15, 95%CI[1.00, 1.32]). In contrast, the impact of conversion on postoperative complication among colorectal surgeons' cases was insignificant. In community hospitals, total hospitalization cost for converted cases was significantly higher than open cases ($2300.05, 95% CI[1131.05,3470.86]); whereas in teaching hospitals, cost for converted cases were lower yet insignificant than open cases. **CONCLUSIONS:** Conversion of rectal resection among non-rectal cancer patients is associated with higher risk of complication and longer OR time than non-converted cases and open cases. There are variations among surgeon specialties and hospital teaching status.

PHP134

ANTIMICROBIAL DRUG CONSUMPTION IN AMBULATORY CARE CLINICS AND EMERGENCY UNITS AT NORTH WEST (TABUK) REGION HOSPITALS, SAUDI ARABIA

Alomi YA[1], Almasoudi AH[2], Alghamdi GA[3], Alomrani HZ[4], Albelwi AA[5], Almalki MG[6], Sallam Na[7], Albalawi SS[8], Albalawi HS[9], Abdelaziz SY[10], Alenezi AR[11]
[1]*Ministry of Health, RIYADH, Saudi Arabia,* [2]*Maternity Children Hospital, Tabuk Region, Tabuk, Saudi Arabia,* [3]*Tabuk Region Medical Affairs, Tabuk, Saudi Arabia,* [4]*Haql District Hospital, Tabuk, Tabuk, Saudi Arabia,* [5]*Alwajh General Hospital,Tabuk Region, Tabuk, Saudi Arabia,* [6]*Umluj Hospital Tabuk Region, Tabuk, Saudi Arabia,* [7]*Duba general hospital,Tabuk Region, Tabuk, Saudi Arabia,* [8]*King Khalid Hospital,Tabuk Region, Tabuk, Saudi Arabia,* [9]*Pharmaceutical Care Administration Staff Tabuk Region, Tabuk, Saudi Arabia,* [10]*Duba General Hospital,Tabuk Region, Tabuk, Saudi Arabia,* [11]*Pharmaceutical Care Administration Director Tabuk Region, Tabuk, Saudi Arabia*

OBJECTIVES: To explore the Antimicrobial medication use in Ambulatory care clinics and Emergency Units at North West Region Hospitals, Ministry of Health, Saudi Arabia **METHODS:** It is 12-month antimicrobial drug consumption by ambulatory care clinics and Emergency department at North West region hospitals. It included all adults, pediatrics, and neonatal population. The medications selected by Central Antibiotics committee at MOH as part of the National Antimicrobial stewardship program. The consumption-is driven from pharmacy database and calculated base on of stranded unit of antimicrobial per each hospital. The cost of antibiotics consumption calculated by used Ministry of Health National Cost database. All cost used as US currency. **RESULTS:** The total number of Antimicrobial standard units at Ambulatory care clinics and Emergency were (25,116) and (8,687) with average (5,023.2) and (1,737.4) per hospital respectively. The highest drug consumption at Ambulatory care was Azithromycin tablet (10,932), followed by Azithromycin syrup (7,760), and Moxifloxacin tablet, while at Emergency department Azithromycin syrup (4,357) followed by Ceftriaxone injection (805) and Gentamicin 80 mg injection. The total cost of Antimicrobial consumption at Ambulatory care and Emergency were (37,620.13 USD) and (24,822.61) USD) respectively. The highest medication cost at ambulatory care was Levofloxacin injection, Linezolid tablet, and Azithromycin syrup while the Emergency they were Meropenem, Azithromycin syrup, and Moxifloxacin injection. **CONCLUSIONS:** An Ambulatory care clinics and Emergency department had a high consumption of antimicrobial drugs with burden cost. Antimicrobial stewardship program at Ambulatory care clinics and Emergency are necessary to prevent bugs related resistance, improve patient outcome and avoid especially adults Department is a mandate and necessary.

OBJECTIVES: To compare Medicare Advantage beneficiary population health status for patients utilizing provider services solely with narrow networks (NN) which are plans with relatively low copays and premiums, but where provider options are considerably constrained, or with Patient Centered Medical Home (PCMH) providers. **METHODS:** This retrospective cohort study used data from Strenuus, a managed care data aggregator, to identify providers participating in NN and PCMH product. Five insurers were selected based on size and variety of products, and their NN and PCMH product were identified. The patient population of Medicare Advantage (MA) members was extracted from a large nationally representative and statistically de-identified administrative claims database. Members were divided into three groups based on their provider: 1) members receiving services solely within a NN/PCMH ("In"); 2) members receiving services solely outside NN/PCMH ("Out"); and 3) members receiving services both in and outside of NN/PCMH ("Control"). CMS-HCC Risk Scores (version 22) were calculated for each member. The study sample consisted of MA beneficiaries who were continuously enrolled for 12 months within 2014 (N=1.4 million) and in 2015 (N=1.1 million). **RESULTS:** The distribution of members across the groups (In, Out and Control,) was 40%, 10% and 51%, respectively, and was consistent across years. In 2014, mean risk score (and standard deviation) for In, Out and Control, groups respectively were: 0.78 (0.56), .88 (.70), and 1.18 (.98). Similarly, in 2015, these results were 0.88 (0.51), 1.18 (0.70) and 1.44 (0.88). The mean risk scores across the three groups within each year were significantly different ($p < .01$). **CONCLUSIONS:** Data suggest that beneficiaries receiving all of their care

from NN/PCMH providers are healthier than those entirely outside NN/PCMH. Further, beneficiaries receiving a mix of in- and out-network are the least healthy of the three groups.

PHP136

PATIENTS' SATISFACTION OF AMBULATORY CARE PHARMACY SERVICES IN RIYADH CITY, SAUDI ARABIA

Alomi YA[1], Al-Kammash HA[1], Alhamidi A[1], Aboziad W[1], Alhadab M[2], Alotaibi N[3], Al-Shubbar NA[4]
[1]Ministry of Health, RIYADH, Saudi Arabia, [2]Alyamama Hospital, RIYADH, Saudi Arabia, [3]Al-Eman Hospital, RIYADH, Saudi Arabia, [4]King Salman Hospital, RIYADH, Saudi Arabia

OBJECTIVES: To explore the patient's satisfaction with ambulatory care pharmacy services at Riyadh city in Saudi Arabia. **METHODS:** It is 4-months cross-sectional survey of Patients satisfaction of Ambulatory care pharmacy services at Riyadh city in Saudi Arabia. The survey consisted of Forty-Eight questions divided into two-part demographic information and the second part with eleven domains. It included medication availability, patient counseling, pharmacist and patient relationship, medication reconciliation, medication aberrance, pharmacy location. Pharmacy waiting area, pharmacy communications, pharmacy waiting time, overall patient satisfaction of pharmacy services. The 5-points Likert response scale system closed and ended questions used. The survey distributed through three public, pediatrics, and emergency hospitals ambulatory care patient. The authors did the interview with the patient with electronic survey documentation. It analyzed through survey monkey system. **RESULTS:** The total responders were (606) Patients. Of those 509 (84.3%) was Saudi and 95 (15.7%) was non-Saudi. The gender distribution 338 (55.8%) was female, and 268 (44.2%) was male and the majority of them in age (18-44) 65.3%. The scores of medication availability domain were (3.35), patient counseling was (3.2), pharmacist and patient relationship were (3.7), and medication reconciliation was (1.96). The medication adherence was (1.8), pharmacy location was (3.7), pharmacy waiting area was (3.25), pharmacy communications was (2.14), pharmacy waiting time was (3.61), pharmacy recommends to others was (3.54). General evaluation of pharmacy services was very good-excellent with 381 (62.87%) of responders, while 369 (60.9%) advised the pharmacy to his family or friend and 315 (52.5%) of responders prefer to visit pharmacy again. **CONCLUSIONS:** A half of patients satisfied with ambulatory care pharmacy services at Riyadh city. The patients were not happy with medication reconciliation services, medication adherence, and pharmacy communications system. Improving ambulatory care pharmacy services will prevent drug misadventures, avoid additional cost, and raise patient satisfaction of pharmacy services.

PHP137

PHARMACIST INTERVENTION OF PREVENTION MEDICATION ERRORS AT PEDIATRICS, OBSTETRICS, AND GYNECOLOGY HOSPITAL, EAST PROVINCE, SAUDI ARABIA

Alomi YA[1], Alanazi AA[2], Alsallouk SA[3], Almadni O[3], Almaznai MM[3], Mossa K[4], Alhejili B[4], Aldwihi M[3]
[1]Ministry of Health, RIYADH, Saudi Arabia, [2]Maternity Children Hospital Dammam, Dammam, Saudi Arabia, [3]Health Affairs Eastern Province, MOH, RIYADH, Saudi Arabia, [4]Maternity Children Hospital Dammam, RIYADH, Saudi Arabia

OBJECTIVES: The pharmacist intervention system started at East Province of Ministry of Health in 2013. The pharmacist interprets and prevents all drug related problems. The objective of this study was to explore pharmacist intervention and prevented medication errors at Pediatrics, Obstetrics and Gynecology hospital in East province, Saudi Arabia. **METHODS:** It is a cohort study of 12-months, 2015 of pharmacist intervention and prevention medication errors. The system established at 500-bed Pediatrics, Obstetrics and Gynecology Hospital in 2013. This system was a part of medication safety program. The hospital had medication safety officer with medication safety committee. Any intervention should document through medication error form. The structure consisted of patient information, the sources of medication errors, time of mistakes. The type of medication errors, description of errors, causes of errors, recommendation to prevent the errors, and the outcome of medication errors by using National Coordinating Council (NCC) for Medication Error Reporting and Prevention (MERP) system. **RESULTS:** The total number of prevented medication errors were 1654 in 827 prescriptions. The majority of medication errors committed through physicians followed by nurses. The most error stopped with Pediatrics (1-month to 6 years) followed by young adults (18-40 years). The majority type of mistakes was prescriber-related 1216 (73.52%) followed by patient-related errors 426 (25.75%). The outcome of medication errors were near miss 1651 (99.82%). The most medications prevented errors were Paracetamol syrup, Iron tablet, Folic acid tablet, and Calcium tablet. There were three errors of high-risk medications were avoided included Insulin, Enoxaparin, and Heparin. **CONCLUSIONS:** The pharmacist plays a significant role in preventing medication errors, especially in pediatrics populations. The necessity of pharmacist provides basic medication safety education to all health care providers. Expanding pharmacist role in preventing medication errors associated with patient safety and avoid the unnecessary cost.

NATIONAL SURVEY OF DRUG INFORMATION CENTERS PRACTICE IN SAUDI ARABIA: MEDICATIONS-USE EVALUATION SERVICES AT MINISTRY OF HEALTH

Alomi YA[1], Almudaiheem HY[2]
[1]Ministry of Health, RIYADH, Saudi Arabia, [2]Ministry of Health, Riyadh, Saudi Arabia

OBJECTIVES: To explore Drug Information Centers practice in Saudi Arabia: with emphasis on Medication-Use Evaluation services at MOH. **METHODS:** It is a national survey of Drug Information Services at MOH. It consisted of a demographic section and ten domains with 181 questions. The ten areas included; Leadership and Practice Management, Medication Addition and Deletion System, Hospital Formulary System, Medication Safety System, Professional, and Public Education. The Evidence Based Medicine-Therapeutics Guidelines, Medication-Use Evaluation (MUE), Pharmacoeconomics System, Investigational Drug Services (IDS) and Professional Publications Services (PPPS), and Ethical and Legal Issue. It drove from International pharmacy standard and best practice guidelines. The domain of Medication-Use Evaluation explored and analyzed. **RESULTS:** The survey distributed to forty-five of hospitals, the response rate, was 40 (88.88%) hospitals. Of that, 35 % were large hospitals and 37.5 % were medium-sized hospitals. The organizational authority for the MUE process found at 26 (65%) of hospitals and the indicators for comprehensive surveillance of the medications use system existed in 24 (60%) hospitals. The priorities aspects of MUE existed in 24 (60%) hospitals. The informality of health-care professionals objectives and expected benefits of the MUE process exist in 25(62.5%). The Criteria, guidelines, treatments protocols and standards of care for specific medications existed in 26 (65%) hospitals applied 25-100% the elements. Educate health-care professionals to promote the use of criteria, guidelines, treatment protocols, and standards of care existed in 27 (67.5%) hospitals. The implementation plan for improvement of the medications uses exist in 25 (62.5%) hospitals. **CONCLUSIONS:** There was an incomplete implementation of Medication-Use Evaluation in drug information centers practice. Establishing strategic planning of Medication-Use Evaluation system and set up an educational program for drug information pharmacist, will improve Medication-Use Evaluation practice.

NATIONAL SURVEY OF PHARMACY PRCATICE AT MOH HOSPITALS IN SAUDI ARABIA 2016: TECHNOLOGY AND CLINICAL PHARMACY SERVICES

Alomi YA[1], Alghamdi SJ[1], Alattyh RA[1], Alshahrani AM[2], Shorog EM[2], Alasmary SA[2], Alanazi SA[3], Almutairi AS[1], Almutairi MM[1], Alanazi HH[1]
[1]Ministry of Health, RIYADH, Saudi Arabia, [2]King Khalid University, College of Pharmacy, RIYADH, Saudi Arabia, [3]Aleman Hopsital, RIYADH, Saudi Arabia

OBJECTIVES: To explore pharmacy technology and clinical pharmacy services at Ministry of Health (MOH) hospitals in Saudi Arabia. **METHODS:** It is a 4-months cross-sectional national survey of technology and clinical pharmacy services at MOH hospitals in Saudi Arabia. The study consisted of two-part a demographic information, and the second part contained eighty-five questions divided into six domains drove from American Society of Health-System Pharmacists (ASHP) survey. The parts were pharmacy management and resources, prescribing and medication management, preparation of drugs and dispensing, technology and clinical pharmacy services, drug monitoring and patient education, and pharmacy education and training. The 5-points Likert response scale system closed and ended questions used. An electronic questionnaire distributed to the one hundred eighty-five directors of pharmacies at MOH hospitals, and it analyzed the pharmacy technology and clinical pharmacy services section through survey monkey system. **RESULTS:** The total responders were seventy hospital pharmacies; the repose rate was (37.73%). Pharmacy computerized and technology in drug distribution network found in 14 (20%) hospitals only. The computerized physician order entry (CPOE) found at (13.14%) hospital pharmacies and alarming medication system at (10.27%) hospital pharmacies. The majority of hospital pharmacies 60 (85.7%) was not used new technology for drug distribution network. The most clinical pharmacy activities found were medication error preventing and monitoring 59 (89.39%), patient drug counseling 52 (78.79%), and provide drug information services 49 (75.38%). The hospital pharmacies provided clinical activities to adult Emergency section 39 (62.9%), adult medicine and surgery 40 (62.5%) units. The most clinical services measured clinical outcome, and cost avoidance was patient drug counseling 33 (55%), medication errors prevention 32 (52.46%), adverse drug reaction prevention 28 (46.67%), drug information inquiries 26 (44.07 %). **CONCLUSIONS:** Pharmacy computerization and technology seldom implemented at MOH hospitals. The clinical pharmacy services are high demand to all medical and surgical for pediatric, adults, and geriatrics patients.

ANTIMICROBIAL DRUG CONSUMPTION IN INTENSIVE CARE UNITS AT NORTH WEST (TABUK) REGION HOSPITALS, SAUDI ARABIA

Alomi YA[1], Almasoudi AH[2], Alghamdi GA[3], Alomrani HZ[4], Albelwi AA[5], Almalki MG[6], Sallam Na[7], Albalawi SS[8], Abdelaziz SY[9], Albalawi HS[10], Alenezi AR[11]
[1]Ministry of Health, RIYADH, Saudi Arabia, [2]Maternity Children Hospital, Tabuk Region, Tabuk, Saudi Arabia, [3]Tabuk Region Medical Affairs, Tabuk, Saudi Arabia, [4]Haql District Hospital, Tabuk, Tabuk, Saudi Arabia, [5]Alwajh General Hospital,Tabuk Region, Tabuk, Saudi Arabia, [6]Umluj Hospital Tabuk Region, Tabuk, Saudi Arabia, [7]Duba general hospital,Tabuk Region, Tabuk, Saudi Arabia, [8]King Khalid Hospital,Tabuk Region, Tabuk, Saudi Arabia, [9]Duba General Hospital,Tabuk Region, Tabuk, Saudi Arabia, [10]Pharmaceutical Care Administration Staff Tabuk Region, Tabuk, Saudi Arabia, [11]Pharmaceutical Care Administration Director Tabuk Region, Tabuk, Saudi Arabia

OBJECTIVES: To explore the Antimicrobial medication use in Intensive care units at North West Region Hospitals, Ministry of Health, Saudi Arabia. **METHODS:** It is 12-month antimicrobial drug use by Intensive care units at North West region hospitals. It included critical care for adults, pediatrics, and neonates. The medications selected by Central Antibiotics committee at MOH as part of the National Antimicrobial stewardship program. The consumption-driven from pharmacy database and calculated base on of stranded unit of antimicrobial per each hospital. The antimicrobial consisted of antibacterial drugs, antifungal, and antiviral medications. The cost of antimicrobial consumption calculated by used Ministry of Health National Cost database. All cost used as US

currency. **RESULTS:** The total number of Antimicrobial standard units was (14,305) and average (2,861) per hospital. The highest drug consumption was Ceftriaxone 1 gm injection (2724) followed by Imipenem 500 mg injection (1251) and Vancomycin 500 injection (1165). The total cost of Antimicrobial consumption was (53,884.95 USD) and (10,777 USD) per each hospital. The highest cost medication consumption from Adults critical care (39,562.33 USD) followed by pediatrics critical care (9,779.93 USD) and Neonates critical care (4,542.68 USD). The highest medication cost was Imipenem, Meropenem, and Moxifloxacin. It consumed more than 50% of the cost burden. **CONCLUSIONS:** The study is the first in Saudi Arabia, Gulf and Middle East countries. Health system pharmacies leaders are targeting apply antimicrobial stewardship program, and National Drug Utilization Evaluation system to control unnecessary medication expenditures and prevent misuse of medicines.

PHP141

NATIONAL SURVEY OF PHARMACY PRCATICE AT MOH HOSPITALS IN SAUDI ARABIA 2016: PHARMACY EDUCATION AND TRAINING SERVICES

Alomi YA[1], Alghamdi SJ[1], Alattyh RA[1], Alshahrani AM[2], Shorog EM[2], Alasmary SA[2], Alanazi SA[3], Almutairi AS[1], Almutairi MM[1], Alanazi HH[1]
[1]Ministry of Health, RIYADH, Saudi Arabia, [2]King Khalid University, College of Pharmacy, RIYADH, Saudi Arabia, [3]Aleman Hopsital, RIYADH, Saudi Arabia

OBJECTIVES: To explore the pharmacy education and training services at Ministry of Health (MOH) hospitals in Saudi Arabia. **METHODS:** It is a 4-months cross-sectional national survey of pharmacy education and training services at MOH hospitals in Saudi Arabia. The study consisted of two-part; a demographic information and the second part contained eighty-five questions divided into six domains drove from American Society of Health-System Pharmacists (ASHP) survey. The parts were pharmacy management and resources, prescribing and medication management, preparation of drugs and dispensing technology and clinical pharmacy services, drug monitoring and patient education, and pharmacy education and training. The 5-points Likert response scale system closed and ended questions used. An electronic questionnaire distributed to the one hundred eighty-five directors of pharmacies at MOH hospitals, and it analyzed the pharmacy education and training section through survey monkey system. **RESULTS:** The total responders were seventy hospital pharmacies; the repose rate was (37.73%). The most hospital pharmacies had a continuing medical education (CME) required 41 (58.6%), and allowed paid time off continuing education program was 31 (41.3%). The policy of CME existed in 33 (47.1%) only while not lived in 37 (52.9%) hospital pharmacies. The most affiliated training program was the pharmacy technician student training program 40 (57.1%) with a total number of candidates (176) annually, and pharmacy students training program 28 (40%) with a total number of candidates was (189) annually. The most courses delivered to health care providers by pharmacists were basic medication safety, cardiopulmonary resuscitation drugs, and an emergency medicine. **CONCLUSIONS:** The hospital pharmacies had adequate an education and training services for pharmacists and pharmacy technicians while missed of Pharm D student and post-graduated residency programs. Review of strategies for pharmacy education and training is highly recommended.

ANALYSIS OF ANTIMICROBIAL MEDICATION CONSUMPTION IN INPATIENT UNITS AT NORTH WEST (TABUK) HOSPITALS, SAUDI ARABIA

Alomi YA[1], Almasoudi AH[2], Alghamdi GA[3], Alomrani HZ[4], Albelwi AA[5], Almalki MG[6], Sallam Na[7], Abdelaziz SY[8], Albalawi SS[9], Albalawi HS[10], Alenezi AR[11]
[1]Ministry of Health, RIYADH, Saudi Arabia, [2]Maternity Children Hospital, Tabuk Region, Tabuk, Saudi Arabia, [3]Tabuk Region Medical Affairs, Tabuk, Saudi Arabia, [4]Haql District Hospital, Tabuk, Tabuk, Saudi Arabia, [5]Alwajh General Hospital,Tabuk Region, Tabuk, Saudi Arabia, [6]Umluj Hospital Tabuk Region, Tabuk, Saudi Arabia, [7]Duba general hospital,Tabuk Region, Tabuk, Saudi Arabia, [8]Duba General Hospital,Tabuk Region, Tabuk, Saudi Arabia, [9]King Khalid Hospital,Tabuk Region, Tabuk, Saudi Arabia, [10]Pharmaceutical Care Administration Staff Tabuk Region, Tabuk, Saudi Arabia, [11]Pharmaceutical Care Administration Director Tabuk Region, Tabuk, Saudi Arabia

OBJECTIVES: To explore the selected Antimicrobial medication consumption in inpatient units at North West Region Hospitals, Ministry of Health, Saudi Arabia. **METHODS:** It is 12-month antimicrobial drug use by inpatients at North West region hospitals. It included inpatient department for adults, pediatrics, and neonates. The medications selected by Central Antibiotics committee at MOH as part of the National Antimicrobial stewardship program. The consumption-driven from pharmacy database and calculated base on of stranded unit of antimicrobial per each hospital. The antimicrobial consisted of antibacterial drugs, antifungal, and antiviral medications. The cost of antimicrobial consumption calculated by used Ministry of Health National Cost database. All cost used as US currency. **RESULTS:** The total number of Antimicrobial standard units was (25,845) and average (5,169) per hospital. The highest drug consumption was Ceftriaxone 1 gm injection (8,572) followed by Ceftazidime 1 gm mg injection (2,147) and Imipenem 500 mg injection (1,347). The total cost of Antimicrobial consumption was (6,829,003.42 USD) and (1,365,800.68 USD) per each hospital. The highest cost medication consumption from Adults inpatient departments (6,803,229.92 USD) followed by pediatrics inpatient (16,087.6 USD) and Neonatal inpatient departments (9,685.9 USD). The highest medication cost was very broad spectrum antibiotics like Meropenem, Imipenem, and Ceftriaxone. It consumed more than 50% of the cost burden. **CONCLUSIONS:** There was very high consumption of antimicrobial drugs inpatient department with huge cost burden. Urgent application of antimicrobial stewardship program especially adults inpatients departments is a mandate and urgent.

PHP143

NATIONAL SURVEY OF PHARMACY PRCATICE AT MOH HOSPITALS IN SAUDI ARABIA 2016: PREPRATION OF MEDIATIONS AND DISPENSING

Alomi YA[1], Alghamdi SJ[1], Alattyh RA[1], Alshahrani AM[2], Shorog EM[2], Alasmary SA[2], Alanazi SA[3], Almutairi AS[1], Almutairi MM[1], Alanazi HH[1]
[1]Ministry of Health, RIYADH, Saudi Arabia, [2]King Khalid University, College of Pharmacy, RIYADH, Saudi Arabia, [3]Aleman Hopsital, RIYADH, Saudi Arabia

OBJECTIVES: To explore the preparation of medications and dispensing at Ministry of Health (MOH) hospitals in Saudi Arabia. **METHODS:** It is a 4-months cross-sectional national survey of preparation of drugs and dispensing at MOH hospitals in Saudi Arabia. The study consisted of two-part a demographic information, and the second part contained eighty-five questions divided into six domains drove from American Society of Health-System Pharmacists (ASHP) survey. The parts were pharmacy management and resources, prescribing and medication management, preparation of drugs and dispensing, technology and clinical pharmacy services, drug monitoring and patient education, and pharmacy education and training. The 5-points Likert response scale system closed and ended questions used. An electronic questionnaire distributed to the one hundred eighty-five directors of pharmacies at MOH hospitals, and it analyzed the preparation of medications and dispensing section through survey monkey system. **RESULTS:** The total responders were seventy hospital pharmacies; the repose rate was (37.73%). The pharmacy services were the drug distribution unit dose 26 (37.1%), an extemporaneous preparation 14 (20 %), repacking medication 14 (20 %), and Intravenous admixture 6 (8.6%) only. The hospital home infusion therapy provided from 4 (5.7%) hospital pharmacies only. The most outpatient prescriptions dispensed to hospital employees 48 (68.8%), general public 42 (60%), hospital clinic or patients discharged or emergency room 40 (57.1%), and home healthcare services 22 (31.4%). The most pharmaceutical services were decentralized with distributive function 41 (61.4%) and centralized with pharmacist visiting patient care areas 17 (24.3 %). The most system founded to assure the accuracy of preparations and dispensing was one pharmacist checks drug order before dispensing 33 (47.1 %), and two pharmacists review high-risk drugs 17 (24.3%). **CONCLUSIONS:** The essential elements of pharmacy practice were weak at MOH hospitals. Annual survey of pharmacy services with improving drug distribution system prevent drug-related problem and improve patient care at Hospitals in Saudi Arabia.

PHP144

WORKLOAD ANALYSIS OF PHARMACEUTICAL CARE SERVICES AND STAFFING REQUIREMENTS AT MINISTRY OF HEALTH HOSPITALS DURING MASS GATHERING HAJJ-2016 IN SAUDI ARABIA

Alomi YA[1], Khayat NA[2], Bamagaus YA[2], Jumah HM[2], Alkharouby AM[2], Baljoon MJ[2]
[1]Ministry of Health, RIYADH, Saudi Arabia, [2]Makkah Medical Affairs, RIYADH, Saudi Arabia

OBJECTIVES: To explore the pharmaceutical care services workload analysis and staffing needs at Ministry of Health Hospitals during mass gathering (Hajj -2016) in Saudi Arabia. **METHODS:** It is 15-days cross-sectional of Pharmaceutical care services workload analysis during mass gathering Hajj period 2016. The pharmacist and pharmacy technicians provide pharmaceutical care to all patient either Pilgrim or non-pilgrim at Makkah region. It included Mona holy places hospitals; Arafa holy places hospitals, and Makkah city. The workload drives as central pharmacy services, patient specific pharmacy activities, and general administration specific pharmacy activities. **RESULTS:** The total number of hospitals was sixteen hospitals. They located at Mona holy places were four hospitals, Arafa holy places were four hospitals, and Makkah city was eight hospitals. The total number of prescriptions was (156,053). Of those (95,460) were Ambulatory care prescriptions, while (54,903) were Emergency Prescriptions, and (5690) were inpatient orders. The average number of Ambulatory prescription per day (6,364) contained (286,380) medications, the mean number of Emergency orders was (3,660.2) per day included (164,709) medications, and the average of an inpatient order was (379.33) per day provided (17,070) drugs. The average time of dispensing inpatient prescription was 6 minutes; while Ambulatory care and emergency were 4 minutes. The number of pharmacists needed (5.84 FTE) for inpatient services per day, (37.54 FTE) for Emergency services per day, and (65.27 FTE) for Ambulatory care services per day. There were not any central pharmacy activities, and clinical pharmacy services or administrative pharmacy activities. **CONCLUSIONS:** The workload analysis of pharmaceutical care services is a part of total quality indicators tool during mass gathering Hajj. Clinical pharmacy activities missed with emphasis on patient-specific clinical pharmacy. There is a highly demand of pharmacists and clinical pharmacists workforce during mass gathering Hajj period.

PHP145

AMINOGLYCOSIDE THERAPEUTICS MONITORING COMPLIANCE AT MINISTRY OF HEALTH HOSPITAL IN SAUDI ARABIA

Alomi YA[1], Almudaiheem HY[2]
[1]Ministry of Health, RIYADH, Saudi Arabia, [2]Ministry of Health, Riyadh, Saudi Arabia

OBJECTIVES: To explore the adherence of Aminoglycoside (Gentamicin,Tobramycin, Amikacin) with basic pharmacokinetics and therapeutic monitoring guidelines in Saudi Arabia. **METHODS:** It is a prospective cross-sectional of Aminoglycoside (Gentamicin, Tobramycin, Amikacin) basic pharmacokinetics and therapeutic monitoring guidelines adherence. It conducted over a 3-Month at King Saud Medical City (KSMC) surgical wards. The guidelines based on basic pharmacokinetics and therapeutic monitoring guidelines. Any patient received Gentamicin followed up by trained pharmacist and supervised clinical pharmacist. The pharmacist measures the adherence of the following elements including; the USA FDA (Food and Drug Administration) labeled indication, all details such as weight, height, bugs culture sensitivity. Moreover, any adjustments of dosage, trough and peak levels and duration of administration recorded on a therapeutic drug monitoring (TDM) form on a systematic basis. All data gathered were statistically evaluated using SPSS version 22. **RESULTS:** The total number of

patients were 162, which 126 (77.7%) were male and 36 (22.2%) were female and a mean age of 34.34 ± 15.71 (M±SD) years. Of those 22 (13.8%) patients located from general surgery wards and 138 (86.3%) was from orthopedic wards. All patients received Gentamicin only. Ninety-Five (58.6%) non-adherence to FDA labeled indications while 67 (41.4%) adherence to FDA labeled indication. All patients 162 (100%) were non-compliance of Gentamicin duration of infusion administration time. The trough levels of Gentamicin were sub-therapeutic level in 22(13.6%) patients, 3(1.6%) patients' toxic levels, and 115 (71 %) patients have not checked the drug levels. While the peak levels were sub-therapeutic level in 40 (24.7%) patients, 1(0.6%) patients toxic levels, and 119 (73.5%) patients have not checked the drug levels. **CONCLUSIONS:** There was a poor adherence to Gentamicin basic pharmacokinetics and therapeutics monitoring guidelines. For aiming compliance, and the guidance leads to decrease Gentamicin resistance, prevent the Gentamicin-related problem, improve Gentamicin therapeutic outcome, and avoid the unnecessary additional cost.

PHP146

COMMUNICATIONS AND RELATIONSHIP FACTORS ON PHARMACY CAREER SATISFACTION IN SAUDI ARABIA

Alomi YA, Al-Ghuraybi BI, Aloumi BE, Al-Subaie RS
Ministry of Health, RIYADH, Saudi Arabia

OBJECTIVES: To explore the communications and relationships factors of Pharmacist Job satisfaction in Saudi Arabia. **METHODS:** It is a 4-months cross section survey of communication and relationships factors on Pharmacist Job satisfaction in Saudi Arabia. The study consisted of forty-three questions divided into two-part demographic information and the second part was the questions about communication and relationships factors of pharmacy job. It included pharmacy supervisors, relationship with coworkers, and pharmacist interaction with other healthcare providers, the customer interaction, and overall job satisfaction. The 5-points Likert response scale system closed and ended questions used. The survey made as an electronic format, and it analyzed through survey monkey system. **RESULTS:** The total responders were two hundred and forty-two. Of those 214 (91.8 %) was Saudi and 33 (8.2%) was non-Saudi. The gender distribution 169 (70.7%) 55.8%) was male, and 70 (29.3%) was female. The majority of them 202 (84.2%) were in age (20-39). The most educational level of the responders was pharmacy diploma level was 97 (40.6%) and pharmacy bachelor degree 98 (41%). Most of the current position was pharmacy technician 78 (34.1%) and staff pharmacist 78 (34.1%) and worked at inpatient pharmacy 73 (34.9%), and outpatient pharmacy 83 (39.7%). The average satisfaction score of pharmacy supervisors' factors was (2.99) the pharmacist relationship with coworkers was (3.68), pharmacist interaction with other healthcare providers' factors was (3.34), and the customer interaction factors were (3.29). Most of the pharmacist found the challenges at their job were (78%). Some responders wished to change their pharmacy career (43.4%) while (63.4%) liked to stay in the pharmacy field. **CONCLUSIONS:** Most of the pharmacists not satisfied with their job because of the supervisor relationship. The pharmacy supervisors of hospital pharmacies demanded of management tools and communication skills with their colleagues

PHP147

HOW IS HEALTH RESOURCE ALLOCATED IN NIGERIA?

Akor WA[1], Vale L[2], Maniatopoulos G[1]
[1]*Newcastle University, Newcastle Upon Tyne, UK,* [2]*Newcastle University, Newcastle upon Tyne, UK*

OBJECTIVES: To evaluate the methods of priority setting used in Nigeria and how it compares with that used in other Low and middle income countries (LMICs). **METHODS:** A systematic literature review on the process of prioritization in LMICs was carried out at the initial phase of the study. Following the review, a mixed method study comprising of an in-depth interviews of health policy makers (N=22) and the distribution of self-administered questionnaire to health workers (N=77/150) was conducted at the 3 tiers of health care – national, state and local levels. The participants at all levels were sampled purposively for the interviews and the questionnaire distribution to the health-workers at each level. The qualitative data was analysed thematically as an iterative process. The self-administered questionnaires were analysed quantitatively. **RESULTS:** The predominant form of financial resource allocation was through budgeting, guided by needs (21%) and political consideration (23%), as typified by this quote - "…and based on the priorities…that will now go through the process of budgeting and approval by the state executive council and then to the state assembly". Further exploration of the priority setting process revealed a lesser defined process at the state level compared to the federal level. There was a strategic relationship between the states and the federal system through a concurrent listing system. In contrast, the local and institutional level of prioritization was more inclusive of stakeholders and its allocation of financial resources was performance-based and largely influenced by the state level policy makers. In the literature, only 2 studies (one central and one decentralised health system) examined this process at all levels in a LMIC, which differed in context, from the Nigerian health system. **CONCLUSIONS:** Health care prioritization is a highly context specific process, that requires a tailoring of approaches, to suit each organisational level of care.

CALCULATING RETURN-ON-INVESTMENT FOR A MEDICATION THERAPY MANAGEMENT PROGRAM

Hung A[1], Seneviratne V[2], McDonnell D[2], Mostovoy L[2], Dzieweczynski J[2], Yoder D[2]
[1]*University of Maryland, School of Pharmacy, Baltimore, DC, USA,* [2]*BlueCross BlueShield Association Federal Employee Program, Washington, DC, USA*

OBJECTIVES: To calculate the return-on-investment (ROI) for a medication therapy management (MTM) program. **METHODS:** Patients were included if they: i) started a MTM pilot program during Jul 1, 2014 to Sep 1, 2014, and ii) were continuously enrolled six months before and after their index date, defined as the date on which a patient started the MTM program. Using claims data from a commercial payer, mean and median healthcare utilization and cost in the six months before the index date were compared with that in the six months after the index date. A comparison group was randomly selected from eligible candidates for the MTM program who were not contacted. ROI was calculated in two ways: i) by taking the mean pre-post savings, or difference in costs in the six months before versus after the index date, and dividing by program costs, and ii) by taking the difference in pre-post savings between the intervention group and comparison group, and dividing by program costs. **RESULTS:** There were 75 patients in the intervention group and 99 patients in the comparison group. Using the first method, the ROI for the MTM program was calculated as approximately $2.50 savings for every $1 spent. Using the second method, the ROI for the MTM program was calculated as approximately $4 savings for every $1 spent. **CONCLUSIONS:** There are various methods in calculating ROI for MTM programs; one must be careful to understand the strengths and weaknesses of each method.

PHP149

PATIENT AND PRIMARY KNOWLEDGE ABOUT MEDICATIONS IN SAUDI ARABIA

Alomi YA[1], Alaskari DA[1], Almelfi MM[1], Badawi DA[1], Alshihri AM[2]
[1]*Ministry of Health, RIYADH, Saudi Arabia,* [2]*Assir Region Medical Affairs, RIYADH, Saudi Arabia*

OBJECTIVES: To explore the patients and basic understanding of medicines in Saudi Arabia. **METHODS:** It is a 4-months cross-sectional survey of patient and basic knowledge of medicines. The questionnaire consisted of two-part demographic information, and second part forty-nine questions divided into four domains. It included basic information about medication, patient information about the drug related problem, patient information about drug-related cost, and patient perception of medications. MedlinePlus and DailyMed health information used. The 5-points Likert response scale system used. The survey distributed through social media and at 500-bed pediatrics and maternity hospital in Asir region, at ambulatory care pharmacy. The survey made an electronic format, and it analyzed domain one through survey monkey system. **RESULTS:** The total responders were (614) Saudi patients. The gender distribution 523 (86.7%) was female, and 91(13.3%) was male. The majority of them in age (18-44) 78.3% and located at Asir region 325 (115%) and Riyadh region 163 (46.9%). The most type of medications used was anti-diabetic and anti-hypertension medicines, Skin medications, and drugs for Respiratory diseases. The responders showed poor knowledge either they do not know or weak information about the generic name of Medicines 300 (54.8%), the trade name 146 (46.8%), drug strength 182 (34.2%). The responder showed adequate knowledge about medications with complete information about drug indication 333 (56.8%), how to use medications 419 (71.6%), the administration time 419 (72%), the potential to adhere medication 325 (55.7%), and the time to stop drugs 293 (50%). The majority of responders used health care providers 346 (57%), drug bulletin 341 (56.2%), and Internet 221 (36.4%) as sources of drug information. **CONCLUSIONS:** The finding showed indigent essential drug information knowledge. Targeting of public awareness of basic information about their medications and patient counseling system will prevent drug misadventures and drug-related morbidity and mortality in Saudi Arabia.

PHP150

PATIENTS AND HEALTHCARE PROVIDERS' ATTITUDES AND PERCEPTIONS ON DRUG -RELATED PROBLEMS IN SAUDI ARABIA

Alomi YA, Al-Shaibani AS, Alfaisal G, Alasmi NM
Ministry of Health, RIYADH, Saudi Arabia

OBJECTIVES: To explore the patients and healthcare providers' attitudes and perceptions on drug-related problems in Saudi Arabia. **METHODS:** It is a 4-months cross-sectional survey of drug related problem information in Saudi Arabia. The study consisted of two-part a demographic data, and second part contained the questions about the knowledge of drug-related problems, the frequent occurrence, the type of medication-induced those problems, and the resources information used about drug related problem. American Society of Health-System Pharmacist definitions of drug-related problems were used. The 5-points Likert response scale system used. The survey distributed through social media. The questionnaire made of an electronic format, and it analyzed through survey monkey system. **RESULTS:** The total responders were two hundred and one. The gender distribution was female 180 (89.6%), and male was 21 (10.4%). The majority of them in age (18-44) 88%. Of those 44 (22.1 %) were health care providers. The majority of responders showed good knowledge about medication non-compliance 150 (75.76%), and medication without indication 147 (73.1%), while an adequate revealed information of adverse drug reaction 128 (64%), and an indication without medication 124 (62%). The poor information found about drug interaction 75 (37.5%) and drug poisoning 89 (44.5%). The most frequent drug-related problems occurred with the patient last year at least once; it was drug noncompliance 142 (71.4%), indications without medication 100 (50%), and adverse medication events 80 (40%). The most type of medications induced the problems were Antibiotics, the drugs for pain, and dermatology drugs. The most resources information of drug-related problems used were the internet, medicine leaflet, and health care practitioners. **CONCLUSIONS:** Drug-related problems occurred at a high rate in Saudi patients. The knowledge of drug-related problems is not adequate. It is very demanding and comprehensive public education about medication and urgent implementation of the patient medications counseling program in Saudi Arabia.

PHP151

ECONOMICS OUTCOMES OF PHARMACIST MANAGED NEONATAL TOTAL PARENTERAL NUTRITION SERVICES AT MINISTERY OF HEALTH IN SAUDI ARABIA

Alomi YA[1], Fallatah AO[2]
[1]Ministry of Health, RIYADH, Saudi Arabia, [2]King Salman Hospital, RIYADH, Saudi Arabia

OBJECTIVES: The National Total Parenteral Nutrition Program started in 2013 at General Administration of Pharmaceutical Care in Saudi Arabia. The pharmacist-managed Neonates Total Parenteral nutrition (TPN) services. The study objective was stimulation of estimated cost avoidance of pharmacist-managed neonates TPN services by used American Model with local cost. **METHODS:** Simulation of 17-hospitals had Neonates TPN services. A 300-Bed Hospital with 6-month TPN services for infants in 2015. The cost of TPN services estimated by variable expenses including personal cost, material and supply cost. Fixed costs including overhead cost and non-salary cost. The cost derived from Ministry of Health information database. TPN services started from prescribing, preparation, dispensing, administration, and follow-up, and discounted the TPN order. Cost avoidance stimulation of pharmacist running neonates TPN services at seventeen hospitals in Saudi Arabia calculated of all TPN stages. All cost calculation used by US dollar currency. **RESULTS:** The total number of TPN prescription was (176 per day) and (74,240 TPN orders per year) for a total seventeen hospitals. The total estimated cost of TPN services managed by a physician was (863.74 USD) per day; while the cost of (786.75 USD) per day if the TPN services run by the pharmacist. The total estimated expenditures of TPN services by a physician (64,124,057.6 USD) annually. The total estimated costs of TPN services managed by the pharmacist (58,408,320 USD) annually. The estimated cost avoidance was (5,715,737.6 USD) annually and (13,550.24 USD) per day. The estimated cost saved was (76.99 USD) per each TPN prescription. **CONCLUSIONS:** In this Neonatal Total Parenteral Nutrition cost-Avoidance simulation for Saudi Arabia, it is with cost savings per each prescribing TPN order. Expanding of pharmacist-managed TPN services for neonates associated cost avoidance simulation for healthcare services.

PHP152

CLINICAL OUTCOMES OF VANCOMYCIN THERAPEUTIC MONITORING SERVICES AT MINISTRY OF HEALTH HOSPITAL IN SAUDI ARABIA

Alomi YA[1], Almudaiheem HY[2]
[1]Ministry of Health, RIYADH, Saudi Arabia, [2]Ministry of Health, Riyadh, Saudi Arabia

OBJECTIVES: To explore the clinical outcome of Vancomycin therapeutic monitoring services at Ministry of Health Hospital in Saudi Arabia. **METHODS:** It is a cross-sectional clinical outcome of Vancomycin therapeutic monitoring over a period of 9-months at King Saud Medical City (KSMC). The study divided into three phases, each of 3-month duration for data collection and evaluation. The first phase (Phase I) was the Pre-intervention phase; the second was the intervention phase (phase II), the third phase Post-intervention phase (Phase III) without any pharmacist. Any patient received Vancomycin followed up by trained pharmacist. The pharmacist followed a labeled indication, all pharmacokinetics parameters such as weight, height, bug culture sensitivity, and any adjustments in dosage, drug level and duration of administration recorded on a therapeutic drug monitoring form on a regular basis at each phase. **RESULTS:** The total number of patients 53 in phase I, 22 in phase II, and 31 in phase III respectively. The labeled indication adherences increased significantly from phase I to phase II 24 (45.3%) to 19 (86.4%) respectively while significantly decreased in 21 (67.7%) patients in phase III ($p<0.05$). The non-labeled indications adherences decreased from phase I to phase II 29 (54.7 %) to 3 (13.6%) patients respectively. The levels of Vancomycin as sub-therapeutic level significantly decreased from 23 (43.4%) to 0 (0.0%)in patients ($p<0.5$), the therapeutic Vancomycin level significantly increased from 11 (20.8%) to 20 (90.9%) in patients ($p<0.05$). The wrong sampling time significantly decreased from 22 (41.5%) to 7 (31.8%) in patients ($p<0.05$). **CONCLUSIONS:** There is a significant adherence to Vancomycin therapeutic guidelines. Targeting to expanding the role of the pharmacist in Vancomycin therapeutic monitoring is required to improve patient outcome and prevent Vancomycin drug-related problems, and avoid the unnecessary additional cost.

PHP153

NATIONAL SURVEY OF PHARMACY PRCATICE AT MOH HOSPITALS IN SAUDI ARABIA 2016: PRESCRIBING AND MEDICATION MANAGMENT

Alomi YA[1], Alghamdi SJ[1], Alattyh RA[1], Alswayeh YA[1], Alshahrani AM[2], Shorog EM[2], Alasmary SA[2], Alanazi SA[3], Almutairi AS[1], Almutairi MM[1], Alanazi HH[1]
[1]Ministry of Health, RIYADH, Saudi Arabia, [2]King Khalid University, College of Pharmacy, RIYADH, Saudi Arabia, [3]Aleman Hopsital, RIYADH, Saudi Arabia

OBJECTIVES: To explore the prescribing and medication management practice at Ministry of Health (MOH) hospitals in Saudi Arabia. **METHODS:** It is a 4-months cross-sectional national survey of prescribing and medication management at MOH hospitals in Saudi Arabia. The study consisted of two-part a demographic information, and the second part contained eighty-five questions divided into six domains drove from American Society of Health-System Pharmacists (ASHP) survey. The parts were pharmacy management and resources, prescribing and medication management, preparation of medicines and dispensing, technology and clinical pharmacy services, drug monitoring and patient education, and pharmacy education and training. The 5-points Likert response scale system closed and ended questions used. An electronic questionnaire distributed to the one hundred eighty-five directors of pharmacies at MOH hospitals, and it analyzed the prescribing and medication management section through survey monkey system. **RESULTS:** The total responders were seventy hospital pharmacies; the repose rate was (37.73%). The highest score of committee shared by the hospital pharmacy was the pharmacy and therapeutic committee (4.32), quality management committee (4.21), and patient or medication safety committee (4.03). Also, the hospital pharmacies actively participated in the antibiotics team (3.19) and pain management team (2.07). The most therapeutic guideline available in the hospital pharmacies were antibiotics guidelines (2.93) and infection control guidelines (2.81). The majority formulary management method used was restricted prescribing 23 (32.9%), and review of non-formulary drugs prior approval 13 (18.6%). The pharmacist had the privilege to write medication orders were 14 (20%) only. The pharmacist commonly prescribed over the counter medications 14 (58.3%) and antibiotics 13 (50%) through the prescription consigned by physicians 38 (54.3%) and drug prescribing protocol 28 (40%). **CONCLUSIONS:** The pharmacist seldom participated in the therapeutic committees or teams although he had an excellent role of providing medication information. Expanding pharmacy activities will improve the prescribing system, patient clinical outcomes, and prevent drug misadventures.

PHP154

DETERMINANTS OF THE MEDICAL SALARY LEVEL IN THE PUBLIC HEALTH SECTOR: EVIDENCE FOR ARGENTINA

Maceira D, Palacios A
Center for the Study of State and Society (CEDES), Buenos Aires, Argentina

OBJECTIVES: To contribute to the informed debate about the determinants of medical salaries in the public health sector in a middle-income country under a decentralized health system context. **METHODS:** A multiple response questionnaire was developed for 631 physicians in 25 public health institutions in 5 Argentine cities: Buenos Aires City, Salta, La Rioja, Chaco and Neuquén, in the year 2014. By means of the estimation of a ordered multinomial logit model we identified the personal, union and institutional determinants, among others, that explain the salary levels perceived by the doctors surveyed. **RESULTS:** The length of the working day, the presence of a medical specialty and the years of experience in the institution by the physician show positive signs, and are statistically significant, when explaining the salary levels perceived. Having a labor contract with contributions and working at the Hospital Materno Infantil de Salta (private management) are associated in a positive and statistically significant way, while the gender of the physician does not seem to be associated with the remunerative level. On the other hand, the union action variables show a positive sign and are statistically significant in the income level of medical professionals. **CONCLUSIONS:** A salary scheme that is aligned with the technical knowledge, effort and motivation of medical professionals in the public health sector is of great importance in order to achieve an equitable and efficient health system. The results obtained here contribute to the informed debate on wage policy in health in a context of middle-income countries, although more research is needed.

PHP155

FINANCIAL IMPACT OF ALTERNATIVE PRICING BENCHMARKS FOR PHYSICIAN DISPENSED SIMPLE PRESCRIPTION AND ADMINISTERED DRUGS IN CALIFORNIA WORKERS' COMPENSATION SYSTEM

Tran DM, Lin T, Huang W, Wilson L
University of California, San Francisco, San Francisco, CA, USA

OBJECTIVES: Determine financial impact and liability of implementing an alternative price benchmark for the reimbursement of physician dispensed drugs (PDD) and physician administered drugs (PAD) drugs in California Workers' Compensation System (CWCS). **METHODS:** A retrospective large database analysis using physician dispensed and administered billing information from CWCS to re-price drug component of claims processed from 2011 to 2013. To price claims under alternative benchmarks, the billed drug was matched to benchmark unit prices and multiplied by the billed quantity to generate an alternative claim payment. Price benchmarks were acquired from both commercially and publicly available sources. Reimbursement methodology implemented by other states' workers' compensation systems were identified and applied to CWCS claims to project the financial impact of adopting a new reimbursement mechanism. **RESULTS:** To maintain drug spend on PDD claims, implementation of Federal Upper Limit (FUL), National Average Drug Acquisition Cost (NADAC), Wholesale Acquisition Cost (WAC), and Average Wholesale Price (AWP) would require an adjustment factor of 2.66, 1.97, 1.27, and 0.49, respectively. FUL, NADAC, WAC, and AWP provides a price for 78.9%, 86.1%, 80.0%, 99.9% of drugs among PDD claims, respectively. To maintain drug spend on PAD claims, implementation of NADAC, WAC, Direct Price (DP), and AWP would require an adjustment factor of 0.92, 0.68, 0.72, and 0.52, respectively. NADAC, WAC, DP, and AWP provides a price for 66.3%, 99.5%, 78.6%, and 89.5% of drugs among PAD claims, respectively. **CONCLUSIONS:** To ensure CWCS continues to be a prudent payer for drugs, a combination of two reimbursement methods may be the best to maintain costs and patient access for CWCS.

PHP156

THE EXPERIENCE AND IMPACT OF BUNDLED PAYMENT IN ORTHOPAEDIC SURGERY: A SYSTEMATIC REVIEW

Tavare A, Jayakumar P
Oxford University, Oxford, UK

OBJECTIVES: Bundled payment is a per-capita, per-episode of care reimbursement system, which aims to incentivise the delivery of high-quality, coordinated care at the lowest possible cost. We systematically reviewed the literature to assess the impact and experiences of bundled payment systems in the field of orthopaedic surgery. **METHODS:** A systematic search of the electronic databases, including PubMed, Web of Science and the Cochrane Library was performed. Results were grouped into specific outcomes of bundle payment systems: costs of episode of care; length of stay; readmission rates; and qualitative experiences. **RESULTS:** A total of 74 articles were retrieved with our search of which 19 studies were included in our analysis. The following outcomes were extracted: (1) The total episode of care costs of primary total joint arthoplasty (TJA) (both knee and hip) was reduced following introduction of bundled payment systems, but there was

no significant difference for those undergoing revision surgery. (2) Average length of stay decreased significantly for primary and revision TJA in bundled payment systems. (3) There was a small and non-immediate decrease in the readmission rate after TJA under a bundled payment system, but there was no significant difference for those undergoing revision TJA. (4) Qualitative survey analysis suggests bundled payment strategies are perceived positively by doctors, and may be sufficient to alter physician behaviour, but concerns included disincentives to operate on high-risk patients and uncertainty about revenue sharing. **CONCLUSIONS:** Bundled payments appear to be effective in reducing costs, length of stay and readmission rates for primary joint arthoplasty. This systematic review is limited by the paucity of studies in the literature and the restriction of all current studies to the US healthcare system. This study warrants more thorough analysis on the specific outcomes of bundled payment systems across multiple geographies and for different procedure types.

PHP157

DO FRENCH HEALTH ECONOMICS AND CLINICAL HTA COMMITTEES HAVE COHERENT APPRAISALS OF CLINICAL TRIALS?

Hanna E[1], Rémuzat C[2], Jadot G[3], Toumi M[1]
[1]Aix-Marseille University, Marseille, France, [2]Creativ-Ceutical, Paris, France, [3]Lyon 1 University, Villeurbanne, France

OBJECTIVES: In France, the Economic and Public Health Assessment Committee (CEESP) and the transparency committee (TC) are 2 independent committees affiliated to the French health authority (Haute Autorité de Santé: HAS). TC assesses medicinal products clinical evidences and provides recommendations on reimbursement for public authorities whereas CEESP provides recommendations on health economics evaluations. These 2 committees operate in parallel without any coordination or communication of information which constitutes a specificity of the French system. The aim of this study was to evaluate the consistency in evaluating clinical trials between CEESP and TC. **METHODS:** All available CEESP published opinions were searched in HAS website, then the TC opinions for the same products were downloaded. Major comments on clinical trials were extracted from both reports by two different analysts. Comments were classified as limited number of included patients (<50), non-comparative trials, and insufficient data based on CEESP opinion and then compared to TC opinion. **RESULTS:** Twenty published CEESP opinions were identified. Aside health economics comments, CEESP had no comments on clinical trials in 11 reports, while TC identified limitations in 8 reports. In 2 CEESP reports insufficient data was claimed, 4 had a limited number of included patients and 3 non-comparative trials. Out of the 9 comments reported by CEESP, 8 were mentioned also on TC opinions. However, TC presented more detailed evaluation and discussion of all the product clinical trials. **CONCLUSIONS:** A strong coherence in the assessment of clinical trials can obviously be concluded from this comparison. These results raise the issue of effort and work duplication due to the parallel and independent work between the 2 committees. On the other hand, this coherence reveals the homogeneity of the HAS assessment culture.

PHP158

THE EFFECT OF THE PAN-CANADIAN PHARMACEUTICAL ALLIANCE ON PROVINCIAL LISTING TIMES AND UNIFORMITY

Mills F
Wyatt Health Management, Oakville, ON, Canada

OBJECTIVES: Analyze the impact of the collective negoiating body, the pan-Canadian Pharmaceutical Alliance (pCPA), on important metrics of relevance for manufacturers and patients, including the delays to reimbursement and level of concordance between three of the largest provincial public drug plans in Canada. Considerable variability exists in provincial listing decisions and time to reimbursement, and the explicit goals of the pCPA are to create greater consistency and improved access to drugs. This analysis sought to quantify the effect of the pCPA on the public drug plans of Ontario, Alberta and British Columbia. **METHODS:** We extracted multiple data points from publicly-available reimbursement recommendations, provincial listing decisions and health technology assessment reports. This data was then analyzed to estimate the time to provincial listing (i.e. reimbursement), before and after the development of the pCPA in 2011. The average post-HTA duration for the 5-year period before 2011 was compared with the period after the introduction of the pCPA using Student's-ttests for each province. We further analyzed the level of agreement between the provinces in a pair-wise fashion, using kappa coefficients as a measure of concordance. The drug plans of Ontario, Alberta and BC were selected both for the sizes of their populations and the transparency and suitability of their reporting processes, which eliminate certain confounding effects seen in other provinces. **RESULTS:** The pCPA appears to had a beneficial effect on the length of time between HTA recommendations and drug plan listing decisions, improving the absolute duration of delays and also harmonizing the time for each of the 3 provinces examined ($p<0.05$). The level of agreement between the provinces also improved significantly after the introduction of the pCPA. **CONCLUSIONS:** The pCPA is achieving its desired effect of improving access to new drugs and creating greater consistency between the public plans.

PHP159

REIMBURSEMENT LAG OF INNOVATIVE NEW DRUGS UNDER TAIWAN'S NATIONAL HEALTH INSURANCE SYSTEM

Shih Y[1], Wang C[2], Wen Y[3], Chen Y[1], Lin F[1], Hsiao F[1]
[1]Graduate Institute of Clinical Pharmacy, College of Medicine, National Taiwan University, Taipei, Taiwan, [2]School of Pharmacy, College of Medicine, National Taiwan University, Taipei, Taiwan, [3]Health Data Research Center, National Taiwan University, Taipei, Taiwan

OBJECTIVES: Reimbursement lag of new drugs is a crucial barrier for patients to fulfill their unmet medical needs. The objectives of this study are to investigate the reimbursement lag under Taiwan's National Health Insurance (NHI) system and to examine factors associated with the reimbursement lag. **METHODS:** This is a retrospective study using data from the National Health Insurance Administration (NHIA) in Taiwan. Total 193 new drugs reimbursed by NHIA from 2007 to 2014 were included in the analysis. Generalized linear models (GLMs) were adopted to estimate factors associated with the reimbursement lag of new drugs. **RESULTS:** We found that the median reimbursement lags in Taiwan were 378 days [standard deviation (SD)=923] during the "first-generation NHI" period and 458 (SD=529) days during the "second-generation NHI" period, respectively. Adjusted GLMs found that a higher budget impact (drug expenditure) and the introduction of the "second-generation NHI" were associated with a longer reimbursement lag among new drugs in the L group (antineoplastic and immunomodulating agents) of Anatomical Therapeutic Chemical (ATC) classification system. For new drugs in the non-L groups (alimentary tract and metabolism, blood and blood forming organs, nervous system and general anti-infectives for systemic use), we found that the original application price suggested by the pharmaceutical company and the adoption of price-volume agreement were associated with a longer reimbursement lag. Besides, this study demonstrated that the main determinant of reimbursement lag was the waiting time for a new drug to be listed in the Drug Benefit Committee meeting, which could be solved by increasing the human resource. **CONCLUSIONS:** The determinants of reimbursement lag were different for drugs in different ATC categories. For this reason, we suggested building up a specific review process for antineoplastic and immunomodulating drugs to improve the efficiency of their reimbursements.

PHP160

REVISITING ROLE OF PHARMACOECONOMICS IN DRUG PRICING AND REIMBURSEMENT IN CHINA: A GOVERNMENT PERSPECTIVE

HU C, Zhang C, Xu L
Astrazeneca (China), Beijing, China

OBJECTIVES: In China, Pharmacoeconomics has long been a hot academic area, which is also drawing closer and closer attentions from government decision makers. Our study aims to provide updates on the role of pharmacoeconomics in drug pricing and reimbursement in China. **METHODS:** Comprehensive search of related literature or official documents was conducted within "CNKI", "Wanfang data" and government's official websites. In addition, expert interviews were carried out as needed. All published governmental documents or regulations related to pharmacoeconomics for drug pricing and reimbursement were included for further analysis. **RESULTS:** 6 governmental documents were included. Drug pricing: in 2009, "state council's opinions on deepening healthcare reform" released by state council first says "pharmacoeconomic evaluation should be gradually implemented in pricing of new drugs". Then in 2010, NDRC published "administration of drug pricing (exposure draft)", saying "price adjustment can refer to results of pharmacoeconomic evaluation". However, NDRC cancelled regulation of drug ceiling price from Jul 2015. In the end of 2015, NHFPC's "pilot scheme for establishing drug price negotiation system (exposure draft)" pointed out "negotiation team should perform EBM and pharmacoeconomic evaluation and integrate international price information before official negotiation." NRDL review: "working scheme for NRDL review (2009)" by MOHRSS says" for inclusion of drug, pharmacoeconomic principle should be used to compare price and efficacy; for exclusion, drugs demonstrated to be not cost-effective should be excluded". then in 2016, "working scheme for NRDL review (2016)" by MOHRSS also emphasized the importance of pharmacoeconomics. NEDL review: "administration methods on NEDL (2015)" by NHFPC says "advisory expert group must conduct technology assessment on included drugs following EBM and pharmacoeconomic principles". **CONCLUSIONS:** Pharmacoeconomics has not been mandatory in drug pricing and reimbursement in China, however, government have realized the great importance of scientific decision making. Pharmacoeconomics is expected to play an important role in pricing and reimbursement in the future.

PHP161

TEN YEAR REVIEW OF THE FINANCIAL PERFORMANCE OF ONTARIO'S SMALL AND RURAL HOSPITALS AND FACTORS FOR PATIENT-BASED FUNDING METHODS

Daniel I
Ontario Hospital Association, Toronto, ON, Canada

OBJECTIVES: Ontario has 55 small and rural hospitals funded through global bugets. Total annual operating budget of $750M with an annual increase of approximately 1% in the last 3 years. Ontario's 18 billion dollar hospital system has undergone a funding transformation with the introduction of patient-based funding methodology for 85 large community and academic hospitals. This research investigates the financial performance of Ontario's small hospitals from 2005/06 to 2015/16 and explore factors affecting the cost structure to consider for developing a funding formula. **METHODS:** Financial and operational indicators including Total Margin, Current Ratio, Working Capital, Sick Time, Overtime, Debt to Equity, Unit Cost Efficiency measure and operational indicators were developed and trended for all hospitals in Ontario. Using descriptive statistics and financial benchmarks, a peer group analysis was performed comparing small hospitals to large community and academic hospitals. Utilization patterns and factors such as rurality or isolation, health services for aboriginal populations and the cost structure for administrative and operational support services were investigated. Using an advisory panel of hospital CEOs and CFO, cost drivers affecting the actual costs, efficiency and productivity were identified. **RESULTS:** The financial performance of small hospitals have been deteriorating at a faster rate than other hospitals with liquidity declining at a rate which forecasts a current ratio less than 1.0 in 2017/18. 17 hospital were in deficits in 2015/16 of $3.97M Administrative and support expenses as a percent of total expenses are significantly higher in small

hospitals. Small hospitals have higher overtime and staffing costs associated with transportation of patients. Small hospitals provide 24/7 emergency services, acute in-patient services and laboratory/diagnostic services. Additional services at some sites include dialysis, obstetrics and surgery. A conceptual funded model for funding was developed using the cost drivers identified. **CONCLUSIONS:** A patient-based funding model must take into consideration some of the unique cost structure and utilization patterns of these hospitals.

PHP162

MECHANISMS TO MITIGATE HEALTHCARE COSTS IN THE US – AN INTERNATIONAL COMPARATIVE ANALYSIS OF THE EVOLVING ROLES OF HTA

Patel P[1], Bathija S[2], Jameel A[1], Macaulay R[3], Anastasaki E[3]
[1]PAREXEL International, Chandigarh, India, [2]PAREXEL International, Horsham, PA, USA, [3]PAREXEL International, London, UK

OBJECTIVES: Due to increasing health care cost containment pressures in the United States, various evidence-based evaluations are in development that can be used to influence reimbursement coverage decisions. Since a wide range of different models exist for pricing and reimbursement (P&R) evaluation of drugs internationally, we aimed to compare clinical evidence-based ratings (CEBR) and cost-effectiveness ratios (CER) between the Institute for Clinical and Economic Review (ICER) in the United States (US) and key systems in the ex-US markets. **METHODS:** A targeted literature review was conducted using six published ICER reports as a reference document to extract corresponding forty-nine HTA reports in France, Germany, Australia, Canada, and the United Kingdom (UK) in diabetic macular edema (DME), heart failure, hepatitis-C, hypercholesterolemia, multiple myeloma, and non-small cell lung cancer (NSCLC). **RESULTS:** For CEBR analysis, similar ratings were seen for drugs evaluated in NSCLC **(high: immuno-oncology drugs, low: non immuno-oncology drugs)**, hypercholesterolemia **(low)** and DME **(low)**, whereas variations were seen in CEBR between countries for remaining drugs in heart failure, hepatitis-C, and multiple myeloma. For economic comparisons, ICER reports CER for 22% (2/9) drugs below a threshold of $100k/quality-adjusted life year (QALY) and 56% (5/9) below a threshold of $150k/QALY. For the same indications evaluated by ex-US HTA agencies, there was a high variation in terms of overall final positive recommendations [Australia: 67% (4/6), Canada: 63% (5/8), and the UK:100% (8/8)]. Similar observations were made for assessments where the CER was below/equal to literature-based threshold [Australia (AUD 45k-75k /QALY): 83%, Canada (CAD 50k/QALY): 25% and the UK (£30k-£50k/QALY): 37%]. **CONCLUSIONS:** Many ex-US markets continue to use a structured approach to influence P&R decisions at a national level. Although ICER uses value-based approach by conducting clinical and economic assessments to evaluate drugs, their decisions are currently non-binding and their role in informally/formally influencing reimbursement coverage requires further research.

PHP163

RELATION BETWEEN POLISH HTA RECOMMENDATIONS AND REIMBURSEMENT DECISIONS

Kawalec P[1], Malinowski K[1], Stawowczyk E[2]
[1]Jagiellonian University Medical College Institute of Public Health, Kraków, Poland, [2]Statsoft Poland Sp z o.o., Kraków, Poland

OBJECTIVES: The aim of the study was to assess the influence of public advisory bodies (the Transparency Council, the President of the AOTMiT; The Polish Agency for Health Technology Assessment and Tarff System) involved in the process on final reimbursement decisions performed by the Ministry of Health. **METHODS:** We have analyzed all statements, recommendations and final reimbursement decisions in Poland for the period of two years: 2014 and 2015. For each recommendation we collected data on decisions as well as potential additional requirements regarding the reimbursement; data was presented for the whole analyzed period and separately for each year, to assess the general tendencies in the reimbursement decision-making in Poland. The tau Kendall measurement of agreement was used to assess the compliance between statements, recommendations and reimbursement decisions. **RESULTS:** We collected 187 records, including 183 Transparency Board statements and 186 recommendations by the President of the AOTMiT, of which 74% and 79%, respectively in the year 2014 and 55% and 42%, respectively in the year 2015, were positive. The President of the AOTMiT was compliant with the statement of the Transparency Board in 95% of cases in the year 2014 and in 76% of cases in the year 2015. Of all drugs, 44% have already gained a positive reimbursement decision (53% in 2014 and 33% in 2015). Agreement between the recommendation and reimbursement status was 0.3188, which represents only moderate agreement. 24% of drugs with negative recommendation obtained positive final reimbursement decision. **CONCLUSIONS:** We observed that final reimbursement decisions did not reflect statements and recommendations issued by the advisory boards. Positive recommendations issued by the AOTMiT did not guarantee positive reimbursement status, and negative recommendations in some cases did not result in the lack of reimbursement.

PHP164

RELATION OF POLISH HTA RECOMMENDATIONS AND DECISIONS ISSUED BY SELECTED NATIONAL HTA AGENCIES

Kawalec P, Malinowski K
Jagiellonian University Medical College Institute of Public Health, Kraków, Poland

OBJECTIVES: The aim of this research was to assess the agreement between recommendations issued by the Polish HTA Agency (AOTMiT) and recommendations published by other national HTA agencies chosen for reference by the Polish HTA Agency. **METHODS:** All recommendations produced by the AOTMiT for years 2013–2015 were collected and scanned for references to corresponding recommendations issued by selected national HTA agencies. The agreement in type of recommendation between the AOTMiT and other HTA agencies was measured using Kappa coefficient. Odds for positive recommendations of the AOTMiT assuming positive recommendations of other national HTA agencies were estimated using logistic regression. **RESULTS:** In total 265 recommendations by the AOTMiT were analysed of which 174 were positive (and suggest reimbursement). Six national agencies were considered (NICE, CADTH, SMC, PBAC, HAS, AWMSG) of which significant agreement was observed only for: CADTH (kappa of 0.2393 (95%CI: 0.0111 - 0.4675)) and PBAC (kappa of 0.2319 (95%CI: 0.0615 - 0.4022)). Significant odds for positive recommendations by the AOTMiT for drugs with positive recommendation by other agency were revealed just for the same national HTA agencies: CADTH (3.09 (95%CI: 1.06 - 9.45)) and PBAC (3.55 (95%CI: 1.46 - 8.89)). **CONCLUSIONS:** Agreement between AOTMiT and other agencies was significant only for CADTH and PBAC. The regression analysis showed that in all cases positive recommendation by the national HTA agency outside Poland was associated with the grater odds for the positive recommendation by the AOTMiT, however only in case of CADTH and PBAC the statistical significance was revealed.

REGULATORY, PRICING AND REIMBURSEMENT LANDSCAPE OF BIOSIMILARS IN AUSTRALIA

Patel P, Tripathi S, Chauhan E, Jain A
PAREXEL International, Chandigarh, India

OBJECTIVES: To understand the dynamics of regulatory approval, pricing, and reimbursement of biosimilars in Australia **METHODS:** Publically available documentation of biosimilar appraisals by the Therapeutic Goods administration (TGA) and Pharmaceutical Benefits Advisory Committee (PBAC) were reviewed to obtain data on the following variables: indication extrapolation, time taken for reimbursement after TGA approval, economic analysis in PBAC submission, and interchangeability at physician/pharmacy level of biosimilars. **RESULTS:** The literature search identified 13 biosimilars approved by TGA. Of which, three biosimilars were not considered relevant for the review due to non-availability of data. Out of 10 biosimilars, 8 got approval for multiple indications corresponding to the reference biologics based on their comparable clinical results in a subset of the approved indications. However, etanercept received approval only in four of six indications. Additionally, one remaining biosimilar (insulin glargine) got approval in line with its reference biologic (there was no need for indication extrapolation). 7 of 10 biosimilars were appraised and recommended by PBAC within 6 months of TGA approval except one (somatropin: 20 months). Of these seven, five submitted cost-minimization analysis in PBAC and demonstrated potential net savings at 5th year and/or over 5 years (Australian Dollar: 10-60 million and 100-150 million, respectively). With respect to the adoption of biosimilars at the provider level, only three biosimilars received interchangeable status (2–Prescriber and 1–Pharmacist). Differences in route of administration and dosage strength to the reference biologics were cited as key reasons for non-interchangeability. **CONCLUSIONS:** Biosimilars in Australia go through standard regulatory, pricing and reimbursement appraisal process. Further, the majority of biosimilars have been recommended on the basis of cost-minimization by PBAC, thereby highlighting their role in the reduction of overall health care costs. Additionally, more initiatives would be needed to drive adoption of biosimilars at patient and provider level.

PHP166

WILL THE REVISED HHS RISK ADJUSTMENT METHODOLOGY IMPROVE ACCURACY IN PREDICTING COSTS FOR DISEASES WITH NON-UNIFORM PATIENT USE OF SPECIALTY THERAPUETUICS?

Buelt L[1], Ciarametaro M[2], Dubois RW[2]
[1]The National Pharmaceutical Council, Washington, DC, USA, [2]National Pharmaceutical Council, Washington, DC, USA

OBJECTIVES: To assess the accuracy of the Affordable Care Act's (ACA) Risk Adjustment Program, which will include additional adjustment for prescription drugs for select diseases in the 2018 plan year, in predicting costs for patients with diseases that have significant cost variance due to non-uniform use of specialty therapeutics. **METHODS:** This study compares actual patient costs, as reported by 2015 claims data in the Truven Marketscan database, to estimated disease-related costs as predicted by the ACA Risk Adjustment Program's revised 2018 methodology, which incorporates additional adjustment for prescription drug users. Errors in estimated costs for specialty therapeutic users and non-specialty therapeutic users (including non-drug users) were determined for Rheumatoid Arthritis (RA), Multiple Sclerosis (MS), and Inflammatory Bowel Disease (IBD). Monte Carlo simulation was used to calculate errors in estimated costs for five plan sizes (1250, 3750, 7500, 37500, 100000). **RESULTS:** Using the 2018 methodology, the median error among RA patients taking a specialty therapeutic is $6,982 and $39,075 for non-specialty drug users. The median error for IBD specialty therapeutic users is $11,226.73 and $50,236.24 for non-specialty users. MS patients have a median error of $7,855.24 among specialty drug users and $13,251.32 for non-specialty therapeutic users. At the plan level, these errors translate to an absolute dollar error ranging from $163,429.03 (1,250 covered lives) to $ 12,212,832.30 (100,000 covered lives) for RA. The average absolute dollar error per plan for IBD and MS range from $60,170.65 to $3,552,171.29 and $23,249.45 to $1,154,468.70 respectively. **CONCLUSIONS:** The Risk Adjustment Program's revised methodology does not take into account differing cost structures for drugs, which may result in the substantial over-estimation of costs for patients taking less expensive therapies. This significant difference in predicted risk could lead to harmful incentives for payers, including limiting access to specialty therapeutics and engaging in adverse selection practices.

DOES PATIENT-PROVIDER COMMUNICATION INFLUENCE PATIENT'S RATINGS OF HEALTH CARE QUALITY?

Kakade A[1], Sam Z[2], Dutta S[3]
[1]Independent Consultant, Hoboken, NJ, USA, [2]Independent Consultant, Fords, NJ, USA, [3]Independent Consultant, Annandale, NJ, USA

OBJECTIVES: Evidence supports that a strong patient-provider interaction and patient engagement in health care decision making improves health outcomes and quality of care. We aimed to explore factors related to patient's rating of quality care in relation to patient-provider communication. **METHODS:** Sociodemographic and patient-provider communication variables were assessed from cycle 4 (4th edition) of Health Information National Trends Survey using a self-administered mailed questionnaire. We analyzed N=3063 subjects with at least one provider visit in the past 12 months from 3,677 records for the year 2015. Univariate logistic regressions were performed followed by multivariate logistic regression. **RESULTS:** In the univariate logistic model, adults with at least one provider visit were more likely to be satisfied with the healthcare quality they received, if they were 50+ years (p=0.0482), had a household income >=50,000 (p=0.0072), had health insurance (p=0.0041), had good general health (p=<.0001) and were more confident about their ability to take care of their own health (p=0.0004). Hispanic adults were less likely to be satisfied with healthcare quality, compared to non-Hispanic Whites (p=0.0014). Patients who had providers involving them in making health-decisions (p=<.0001), had providers who allowed them to ask questions (p=<.0001), and spent enough time (p=<.0001), were more likely to give high quality ratings. In the multivariate logistic model, adults who were over 50+ (OR=2.31; 95%CI 1.16-4.62), had providers involving them in making health-decisions (OR=4.28; 95%CI 1.18-15.56), were allowed to ask questions (OR=5.07; 95%CI 2.26-11.41) and spent enough time with patients (OR=5.32; 95% CI 1.70-16.68) were more likely to give high healthcare quality ratings, after controlling for sociodemographic determinants. **CONCLUSIONS:** These findings suggest that the patient-provider communication positively influences patient's ratings of health care quality and satisfaction. The results confirm importance of patient-provider engagement, patient's involvement in decision making and patient's self-efficacy in health management.

ADJUSTING FOR DIFFERENTIAL ITEM FUNCTIONING IN THE EQ-5D-5L USING EXTERNALLY-COLLECTED VIGNETTES

Longelly P[1], Knott R[2]
[1]Office of Health Economics, London, UK, [2]Monash University, Melbourne, Australia

OBJECTIVES: There is a growing concern that responses to questions on subjective scales will be inaccurate if certain groups of people systematically differ in their interpretation and use of the response categories - known as differential item functioning (DIF). It has been shown that it is possible to correct for DIF by using vignette responses collected externally to the main dataset of interest. We apply this approach to the EQ-5D-5L to demonstrate how this adjustment-method can be used in practice to obtain QALY measures that are comparable across different population groups. **METHODS:** We adjust for DIF in the Multi Instrument Comparison (MIC) study (our main dataset of interest) using vignettes collected in an online survey of Australian respondents (the vignettes sample). We restrict our analysis in both samples to individuals aged 55 years and above (656 respondents in the MIC sample, and 914 in the vignettes sample). To adjust for DIF we use a special case of the HOPIT, where the likelihood functions index two different samples - the vignettes sample and the MIC data - which are linked through common parameters in threshold equations. DIF-adjusted profiles are obtained, and tariffs are applied to calculate DIF-adjusted EQ-5D indices. **RESULTS:** Differences in indices between the lowest and highest educated individuals increased from 0.054 before adjustment to 0.079 post DIF-adjustment, which is above a suggested minimally important difference (MID) of 0.074. The difference between employed individuals and those not employed increased from 0.093 to 0.141 after adjusting for DIF. Differences between married and non-married individuals also increased from 0.065 to 0.096, which is also above the MID. Differences across subgroups in the unadjusted and DIF-adjusted indices were not substantive across subgroups according to gender, migrant status or age group. **CONCLUSIONS:** Ignoring DIF could potentially bias conclusions regarding subgroup comparisons in health-related quality of life if left unadjusted.

PHP169

US PAYER VIEWPOINTS ON, AND USE OF, REAL WORLD EVIDENCE (RWE)

Kelly K[1], Martin M[2], Roberts T[3]
[1]InVentiv Health Consulting, New York, NY, USA, [2]inVentiv Health, London, UK, [3]inVentiv Health Consulting, Morristown, NJ, USA

OBJECTIVES: The term Real-World Evidence (RWE) is frequently used but its interpretation can differ substantially depending on the audience. The objective of this study was to gain a better understanding of what US payers receive with respect to RWE, what evidence is useful, what are key gaps in the evidence provided by industry. **METHODS:** We surveyed twenty US payers, medical directors or pharmacy directors, spread over the US, from national or regional MCOs, representing 172 million lives using a structured interview guide including 17 questions related to their understanding and their use of RWE. **RESULTS:** The survey indicated that payers are familiar with the term RWE and are using RWE to make management decisions. RWE is seen as most influential for diabetes management decisions, while payers are split on how RWE impacts PCSK-9s. RWE is shown to be a key value driver in justifying access in RA, but is shown to be somewhat ineffective in reducing competitive contracting rivalry in categories where there is perceived to be a class effect. The most important benefits of RW data are better understanding cost implications, identification of unexpected AEs and the validation of adherence. As the largest drawbacks of RW data, payers indicated actionability of results, controlling study bias and the fact that often RW study populations are perceived as not reflective of the population in the health plan. Furthermore, payers indicate that RWE is primarily influencing decisions in crowded therapeutic areas such as diabetes and rheumatology. Most payers expected RWE to be more important in the future and expect RWE to be especially valuable for high cost and chronic diseases. **CONCLUSIONS:** RWE is seen as providing important information for decision making by payers in the US amd is expected to be even more important in decision making in the future.

PHP170

METHODOLOGICAL ISSUES IN MCDA FOR TRAINING NEED: ELICITING STAKEHOLDERS' VALUE PREFERENCES IN UKRAINE

Piniazhko O[1], Zalis'ka O[1], Brezden O[2]
[1]Danylo Halytsky Lviv National Medical University, Lviv, Ukraine, [2]Jagellonian University, Krakow, Poland

OBJECTIVES: Currently in Ukraine new National Drug Policy and National list of essential medicines are developing due to the reforming process in health care. The study aimed to elicite values and stakeholders' preferences in the decision making process on financing of medicines for the treatment of cancer and rare diseases in Ukraine. **METHODS:** Multiple criteria decision analysis (MCDA) model was designed adhering to ISPOR MCDA Task Force Reports 1, 2 (Value in Health, 2016). A decision workshop was organized within the training session on MCDA for 24 stakeholders of national level, which were divided into 5 groups in October 2016. Criteria were selected using the structure of "value trees" (Kanavos, Angelis, 2013) and weighing was performed in the deliberative process. The criteria were ranked of their relative importance by allocating a total of 100 weight points between them. The mean values and standard deviations were estimated in MS Excel. **RESULTS:** We ranked the criteria due to their importance comparison and weighing for oncology treatment: therapeutic effect – 33 (SD±6,83), cost of treatment –23,6 (SD±13,59), burden of disease – 17,4 (SD±9,0), safety - 15 (SD±6,45), innovation level –11 (SD±4,47), where weights sum to 100 (∑=100,0). The ranked criteria for rare diseases treatment were identified: therapeutic effect – 37 (SD±17,22), cost of treatment – 30,8 (SD±20,26), safety – 18,8 (SD±7,95), innovation level – 9 (SD±3,42), burden of disease – 4,4 (SD±3,03), where weights sum to 100 (∑=100,0). **CONCLUSIONS:** We found high interest to participate and intention to implement the rational and consistent decisions by stakeholders. It was found that criteria for therapeutic benefits and costs had the highest values for stakeholders for both treatment options. Importantly, there is a necessity to implement international requirements to HTA and MCDA in Ukraine in order to prioritize procurements of medicines, financing by government and reimbursement decisions.

PHP171

ASSESSMENT OF EQ-5D DERIVED POPULATION NORMS OF GENERAL POPULATION OF BALOCHISTAN PROVINCE BY DEMOGRAPHIC CHARACTERISTICS

Nasim A[1], Haq N[1], Rizwan S[2], Riaz S[1], Yasmin R[1], Razzaq G[1], Khan S[1]
[1]University of Balochistan, Quetta, Pakistan, [2]Surgery Unit III, Quetta, Pakistan

OBJECTIVES: This study aimed to measure and analyze EQ-5D derived population norms of general population of balochistan province by demographic characteristics. **METHODS:** A cross-sectional study was conducted in Balochistan. Population sample (n=3892) was collected by using stratified sampling approach from Quetta, Sibi and Loralai. The EQ-5D 3L tool was used to measure health-related quality of life (HRQOL) of healthy population of Balochistan by socio-economic demographic characteristics. The descriptive and inferential statistics have been done by using SPSS version 20. **RESULTS:** Result showed that mean age of respondents was 30.07 years. Maximum respondents 57.1% were male. Majority of respondents 38.1% had no any income. Most of respondents 34.6% were having bachelor education. Occupation wise maximum respondents 22.9% were government employee. Maximum were 88.4% were from urban locality. Sixty-three percent were single and most of respondents 87.4% had their own house. Total of 46 health states reported by the respondents of which most prevailing was having no problems in any domain. EQ-5D descriptive score and EQ-VAS score were 0.80 ± 0.25 and 0.79 ± 0.21 respectively. The percentage of people responding to any problems in the five EQ-5D-3L dimensions increased with age and males have better health as compared to female in all age groups. Comparison of mean score and inferential statistics shown all demographics were significantly associated (P<0.01) with mean EQ5D score and VAS. **CONCLUSIONS:** This study showed Balochistani population HRQOL data measured by the EQ-5D tool. Current study concluded that health status of Balochistan people have same EQ5D trend in which younger age have better health states which reduced as age increasing. Similarly, pain and anxiety is seen more in elderly as compared to earlier ages.

PHP172

PATIENT AND HOSPITAL CHARACTERISTICS RELATED TO LIVER AND KIDNEY DONATIONS IN THE UNITED STATES

Zacherle E[1], Nair AG[2], Noone JM[1], Blanchette CM[1], Zenarosa GL[2], Howden R[2]
[1]Precision Health Economics, Davidson, NC, USA, [2]University of North Carolina at Charlotte, Charlotte, NC, USA

OBJECTIVES: Throughout the past several decades, demand for organ transplantation has largely outweighed organ supply. In 2016, over 76,000 people in the US were active waiting list candidates, but only 33,596 transplants were performed from 15,951 organ donors. While donation rates have slowly risen each year, with kidney and liver being the most common, little is known about the hospitalization characteristics of these donors. The purpose of this study was to evaluate

differences between living and deceased kidney and liver inpatient donors with respect to their demographics and hospitalization characteristics. **METHODS:** The study used data from the 2009-2012 National Inpatient Sample. Hospitalized kidney and liver donors were identified using ICD-9 diagnosis codes V594 and V596, respectively, and grouped into living and deceased cohorts. Both demographics (e.g., age and sex) and hospital factors (e.g., charges, length of stay, and hospital location) were compared using t-tests for means and Wilcoxon Rank Sum tests for medians. **RESULTS:** 3,739 kidney donors were identified, of which 98% were living and 2% were deceased. Among liver donors (n=291), 74% and 26% were living and deceased, respectively. Median age was lower for living kidney donors (41 vs. 48 years; p=0.005) and liver donors (35 vs. 47 years; p<0.001) vs. their deceased counterparts. Average hospital charges were higher for deceased kidney donors ($60,757) vs. living kidney donors ($42,466; p=0.002), but the contrary was seen among liver donors ($48,141 deceased vs. $88,572 living; p<0.001). Living kidney and liver donors had longer lengths of stay (kidney 2.7 days; liver 4.3 days) than their deceased counterparts (kidney 1.4 days; liver 1.2 days; both p<0.001). **CONCLUSIONS:** Inpatient liver donors had higher mortality vs. kidney donors, and living liver donors had greater lengths of stay and hospital charges vs. their deceased counterparts. Additional research is needed to confirm these findings and identify causes of these differences.

PHP173

ASSESSMENT OF HEALTH-RELATED QUALITY OF LIFE (HRQOL) OF GENERAL POPULATION OF SINDH, PAKISTAN

Nasim A[1], Haq N[1], Ahmed A[2], Aziz M[3], Riaz S[1]
[1]University of Balochistan, Quetta, Pakistan, [2]Department of Pharmacy Practice, University of Balochistan, Quetta, Pakistan, [3]University of Sargodha, Sargodha, Pakistan

OBJECTIVES: This study aimed to measure and analyze Health-Related Quality of Life (HRQOL) of general population of Sindh, Pakistan. **METHODS:** A cross-sectional study was conducted in Karachi, Hyderabad and Sukkur. Population sample (n = 3069) was collected by using stratified sampling approach. The EQ-5D 3L tool was used to measure health-related quality of life (HRQOL) of healthy population by socio-economic demographic characteristics. The descriptive and inferential statistics have been done by using SPSS version 20. **RESULTS:** Result showed that mean age of respondents was 29.06 years. Maximum respondents 60.4% were female. Majority of respondents 22.8% had 10k-20k PKR income. Most of respondents 35.1% were having bachelor education. Occupation wise maximum respondents 30.9% were doing private job. Maximum 87.5% were from urban locality. 55.5% were single and most of respondents 75.5% had their own house. Total of 66 health states reported by the respondents of which most prevailing was having no problems in any domain. EQ-5D descriptive score and EQ-VAS score were 0.80 ± 0.27 and 0.80 ± 0.22 respectively. The percentage of people responding to any problems in the five EQ-5D-3L dimensions increased with age and males have better health as compared to female in all age groups. Comparison of mean score and inferential statistics shown all demographics were significantly associated (P<0.01) with mean EQ5D score and VAS. **CONCLUSIONS:** This study showed Sindh population HRQOL data measured by the EQ-5D tool. Current study concluded that health status of Sindh province of Pakistan people has somewhat better EQ5D index score compared to other cities of Pakistan.

PHP174

THE DIRECT MEDICAL COST OF SUCCESSFUL FERTILITY TREATMENT CASES USING THE IN-VITRO FERTILIZATION AT TU DU HOSPITAL IN HO CHI MINH CITY, VIETNAM BETWEEN JUNE 2014 – DECEMBER 2015

Ngoc-Van T[1], Bao-Tran T[2], Nhac-Vu H[2]
[1]Medical College of Quang Nam, Quang Nam, Viet Nam, [2]University of Medicine and Pharmacy, Ho Chi Minh City, Ho Chi Minh, Viet Nam

OBJECTIVES: To describe the direct medical cost of using the in vitro fertilization at Tu Du hospital in Ho Chi Minh city, Vietnam. **METHODS:** A cross-sectional study was carried out on the medical data of the 295 couples having successful fertility treatment by in vitro fertilization from 06/2014 to 12/2015 at Tu Du hospital in Ho Chi Minh city. **RESULTS:** Among 295 couples, mean (±SD) wife and husband ages were 31.0 (±4.3) and 34.4 (±5.5) years old, respectively. The mean infertility duration of the sample was 5.3 (±3.1) years. The proportions of primary and secondary infertility were 70% and 30%. The cycles of treatment noted in this study sample varied from one to four, in which 90% cases had successful treatment after one cycle. The median of the sample's total cost was 2188 USD (range 1292 - 21127 USD). According to the property of the treatment, the procedural steps included ovum preparation, embryos preparation and transferring, and sperm preparation which respectively constituted 59%, 39%, and 2%. The costs were also categorized based on types of service or procedure which consisted of the medicine cost (56%), the procedural and medical services (37%), and the diagnostic tests (7%). **CONCLUSIONS:** This is one of the very first researches studying the direct medical cost of in vitro fertilization in Vietnam. The result shows that the cost of preparing the ovum and the medicine cost were the largest proportions in the direct cost for a fertility treatment case using the in-vitro fertilization at Tu Du hospital in Ho Chi Minh city, Vietnam.

PHP175

THE INFLUENCE OF EXPANDING MEDICAID THROUGH COMMERCIALLY OBTAINED INSURANCE VERSUS TRADITIONAL MEDICAID ON INPATIENT UTILIZATION: A COMPARISON OF ARKANSAS AND KENTUCKY

Shah AB[1], Goudie A[2], Martin BC[1]
[1]University of Arkansas for Medical Sciences College of Pharmacy, Little Rock, AR, USA, [2]Arkansas Children's Hospital, Little Rock, AR, USA

OBJECTIVES: The Affordable Care Act provided financial incentives for states to expand health coverage to all uninsured individuals earning below 138% of the federal poverty level. Kentucky adopted a managed care Medicaid expansion with aggressive outreach efforts, whereas Arkansas used federal funds to purchase commercial insurance through the federal marketplace and prohibited state-funded outreach efforts after June 30, 2014. Our objective was to determine if these alternate methods of Medicaid expansions had a differential impact on all-cause and preventable hospitalizations and racial and ethnic disparities. **METHODS:** The state population was obtained from the census data and stratified into cohorts based on county of residence, age (18-24, 25-34,35-44, 45-54, 55-64), gender and race/ethnicity. We used the State Inpatient Databases for 2013 and 2014 from Arkansas and Kentucky to calculate all-cause and preventable hospitalizations for each county-demographic strata. A difference in difference model was used to estimate the effect of expansion type and a difference in difference in difference model was used to estimate racial and ethnic disparities. **RESULTS:** The rate of change of all-cause and preventable hospitalizations were 2.4% (p=0.017) and 4.4% (p=0.102) higher in Arkansas compared to Kentucky. There was no significant difference in the rate of change of all-cause and preventable hospitalizations amongst blacks (p=0.094;p=0.338) and whites (p=0.117;p=0.351) in Arkansas and Kentucky. However, the rate of change of total and preventable hospitalizations among Hispanics in Arkansas was 160% (p<0.001) and 130% (p=0.015) higher compared to Kentucky. **CONCLUSIONS:** The Kentucky Medicaid expansion appears to be more successful in reducing the rate of increased inpatient hospitalizations which is in part explained by smaller rates of change in preventable hospitalization amongst Hispanics. This may be attributed to their aggressive outreach efforts which may have had more Hispanics acquire coverage through expansion and get care in an outpatient setting to avoid preventable hospitalizations.

PhP176

ASSESSMENT OF HEALTH RELATED QUALITY OF LIFE OF HEALTHY POPULATION OF PAKISTAN

Nasim A[1], Haq N[1], Riaz S[1], Yasmin R[1], Naseer N[2], Burney F[3], Khalid A[4]
[1]University of Balochistan, Quetta, Pakistan, [2]4. Pharm-D, Lahore College of Pharmaceutical Sciences, Lahore, Pakistan, [3]Bolan Medical College Quetta, Quetta, Pakistan, [4]University of Sargodha, Sargodha, Pakistan

OBJECTIVES: This study aimed to measure and analyze EQ-5D derived population norms for Pakistani general population by demographic characteristics. **METHODS:** A cross-sectional nationwide study was conducted. Population sample (n= 16672) was selected from Federal Territory, Punjab, Sindh, Khyber Pakhtunkhwa, Balochistan, Azad Jammu and Kashmir and Gilgit Baltistan by using stratified sampling approach. The EQ-5D tool was used to measure health-related quality of life (HRQOL) of healthy population of Pakistan by socio-economic demographic characteristics. The descriptive and inferential statistics have been done by using SPSS version 20. **RESULTS:** A total of 121 health states reported by the respondents. EQ-5D descriptive score and EQ-VAS score were 0.74 ± 0.32 and 0.75 ± 0.25 respectively. The percentage of people responding to any problems in the five EQ-5D-3L dimensions increased with age and males have better health as compared to female in all age groups. Comparison of mean score and inferential statics shown all demographics were significantly associated (P<0.01) with mean EQ5D score and VAS except residence (p>0.05). Regression model reported Age, City, Gender, Education, Occupation, Residence and House occupancy significantly associated with HRQOL. However, house occupancy (Beta= 1.745) and Age (Beta= 1.1331) were rated as predictors of HRQOL in the current cohort. **CONCLUSIONS:** This study provides Pakistani population HRQOL data measured by the EQ-5D tool, based on a national representative sample. Current study concluded that health status Population norms are useful in making health status of general persons of Pakistan. Socioeconomically deprived groups have inferior health status than more advantaged. The trends detected in high income nations were usually similar to the Pakistan.

PHP177

THE RELATIVE WEIGHT OF INDICATORS OF MULTIDIMENSIONAL POVERTY AND THEIR ASSOCIATION WITH SELF-REPORTED HEALTH: THE CASE OF CHILE

Oyarte M[1], Pedrero V[1], Cabieses B[1], Espinoza MA[2]
[1]Universidad del Desarrollo, Santiago, Chile, [2]Honorary Visiting Fellow, Centre for Health Economics, University of York, York, UK

OBJECTIVES: Chile has included recently the measurement multidimensional poverty (MDP) in population surveys This considers 12 indicators in 4 dimensions measured at the level of household. About 20% of the population is located in MDP. Objective: To explore the i relative weight of each indicators of MDP on self rated health (SRH). **METHODS:** The CASEN survey 2013 estimated distribution of income in Chile. Using data of the population greater of 15 years of CASEN 2013 (n = 85139 equivalent to N = 6.718.477) we estimated multiple models of logistics regressions using as dependent variable the SRH (2 categories: good / bad) and independent each one of them indicators of MDP if only. Each model of regression was alsois adjusted for sex, age, household income and rurality. **RESULTS:** Only 5 of the 12 indicators of MDP was associated with poor health. These were: i) educational absenteeism (OR = 1, 58 CI95%=[1.15-2.17]); (ii) schooling less than that provided for by law (OR = 1, 8 CI95%=[1.54-2,1]); (iii) lack of healthcare attention (OR = 1, 68 CI95%=[1.32-2.13]); (iv) housing in poor condition (OR = 1, 6 CI95%=[1.39-1.85]); (v) lack of basic services (OR = 0 78 CI95%=[0.62-0.97]). The most striking result was that households with at least one member with less than secondary schooling are 69% more chance to present a bad health versus homes without these individuals **CONCLUSIONS:** Live in homes with people with low schooling affects the SRH in greater magnitude than other indicators. This evidence is relevant from a perspective of social determination and health in all policies to raise poverty to many families in Chile and other countries in developing.

PHP178

DETERMINATION OF IMPORTANCE FOR NEW VACCINE ADOPTION: A BEST-WORST SCALING METHOD

Pooripussarakul S[1], Riewpaiboon A[1], Bishai D[2], Bridges JF[2], Tantivess S[3], Muangchana C[4]
[1]Faculty of Pharmacy, Mahidol University, Bangkok, Thailand, [2]Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, USA, [3]Health Intervention and Technology Assessment Program, Nonthaburi, Thailand, [4]National Vaccine Institute, Nonthaburi, Thailand

OBJECTIVES: To determine vaccine attributes importance to various stakeholders in new vaccine adoption in Thailand, using the best–worst scaling (BWS) method. **METHODS:** The vaccine attributes and levels identified from a literature review and semi-structured interviews were categorized into burden of disease, age group, budget impact, fever from vaccine, severity of disease, vaccine effectiveness and cost of vaccine. Main-effects orthogonal design was used to identify 18 best-worst scenarios. A postal survey was conducted among policy makers, healthcare professionals and healthcare administrators during October 2013 and January 2014. Respondents were asked to choose the most important and the least important choices in each scenario. Importance weights were estimated by a conditional logistic regression. Then the relative attribute importance was calculated by the difference between the maximum and minimum coefficient for each attribute divided by the sum of all differences. **RESULTS:** A total of seventy respondents completed the questionnaires. The attribute with highest importance for all groups was severity of disease (35.86%). Fever from vaccine (16.71%), burden of disease (13.48%) and budget impact (12.81%) were not much different importance from each other. For policy makers and healthcare professionals, the attributes with high importance were severity of disease (35.03% and 35.89%), fever from vaccine (22.88% and 16.08%) and burden of disease (14.82% and 15.25%), respectively; whereas the attributes with high importance for healthcare administrators were severity of disease (32.53%), budget impact (15.07%) and fever from vaccine (14.99%), respectively. **CONCLUSIONS:** The BWS method makes it possible to take into account multiple criteria from multiple stakeholders for new vaccine adoption. The results revealed the alignment of a desire for high protection against severe disease in vulnerable groups together with concerns about vaccines with high budget impact and low safety.

PHP179

WHEN WORDS COLLIDE: USE OF THE TERM 'SELECTION BIAS' IN COMPARATIVE DRUG SAFETY AND EFFECTIVENESS RESEARCH

Wahl PM[1], Gagne JJ[2]
[1]Covance Market Access, Gaithersburg, MD, USA, [2]Brigham and Women's Hospital and Harvard Medical School, Boston, MA, USA

OBJECTIVES: In the epidemiologic methods literature, the term 'selection bias' is typically used to describe collider-stratification bias. Yet, many investigators who conduct comparative drug safety and effectiveness research use the term inconsistently when describing other phenomena that lead to bias in, or lack of generalizability of, observational research findings. We surveyed the past five years of comparative drug safety and effectiveness literature to enumerate the various uses of the term 'selection bias' in studies using secondary healthcare databases. **METHODS:** A search of PubMed for observational studies featuring the following terms appearing in the title, abstract, or body was performed for publication dates between 01 January 2011 and 31 December 2015: selection bias AND (comparative effectiveness OR comparative effectiveness research OR comparative safety). Review articles or studies not involving medications, of non-English language, of randomized trials, or involving non-human subjects were excluded. **RESULTS:** The initial search yielded 117 articles, of which 43 met the inclusion criteria. Of the 43 articles reviewed, 34 (79%) used the term 'selection bias' when describing confounding, 2 (5%) to describe generalizability concerns, and 4 (9%) to describe collider-stratification bias. We were unable to categorize use of the term in 3 (7%) articles due to ambiguity regarding the phenomenon to which it referred. Of 4 included articles appearing in health economics and outcomes research or pharmacoepidemiology-focused journals, only 1 (25%) used the term to describe collider-stratification bias. **CONCLUSIONS:** Despite agreement in the epidemiology methods literature that the term 'selection bias' refers to collider-stratification bias, comparative drug safety and effectiveness researchers continue to use the term to describe other phenomena that lead to biased or non-generalizable treatment effect estimates. Inconsistent use of terminology might lead to methodological misunderstandings and conflicting interpretations of research findings.

PHP180

TECHNIQUES FOR TAILORING AN INTERVIEW GUIDE FOR PEDIATRIC CONCEPT ELICITATION AND COGNITIVE DEBRIEFING INTERVIEWS

Krohe M, Morrissey L, Turner-Bowker DM
Adelphi Values, Boston, MA, USA

OBJECTIVES: To provide specific recommendations for improving pediatric interview guides (IGs) used in concept elicitation and cognitive debriefing interviews for clinical outcome assessment (COA) development. **METHODS:** A pediatric concept elicitation IG and a pediatric cognitive debriefing IG were selected from previously conducted studies for review. Prior to being reviewed, both IGs were anonymized in order to remove any information which might disclose the client and/or drug program being evaluated. The IGs were then critically examined in relation to several recent COA best practice publications. Recommendations were made for (1) specific text revisions, (2) adjustments to interviewer instructions, and (3) techniques for supporting continued patient engagement throughout the interview session. Revisions to the IGs are displayed visually in figures to demonstrate clearly where edits were made to the original documents. **RESULTS:** Recommendations for specific text revisions included tailoring the language to the target age group reading level, and refraining from the use of slang/colloquialism. Interview instructions which were added to the IGs included asking children to "visualize" and/or draw their experiences in order to enhance data quality from the concept elicitation process, giving direct instructions to caregivers to sit behind their child during the interview process in order to not influence their child's answers, and reminding caregivers not to interrupt their child. For cognitive debriefing IGs, additional instructions were added and techniques suggested for children to highlight any difficult words when reading a question or set of response options. In order to support continued patient engagement, example rapport-building questions were added to the beginning of and throughout both sets of IGs. **CONCLUSIONS:** Both interview guide and procedural enhancements, in accordance with best measurement practices, can reduce interviewer burden and improve data quality from pediatric interviews.

PHP181

TRENDS IN QUALITY, COST AND PRODUCTIVITY IN SURGICAL CARE

Ning N[1], Haynes A[2], Gawande A[3], Sood N[1], Romley JA[1]
[1]University of Southern California, Los Angeles, CA, USA, [2]Massachusetts General Hospital / Harvard Medical School, Boston, MA, USA, [3]Brigham and Women's Hospital / Harvard Medical School, Boston, MA, USA

OBJECTIVES: U.S. hospitals have improved their productivity in recent years, but the drivers of these gains are unclear. This study investigates the potential contribution of surgical care, documenting trends in quality, cost and productivity and exploring innovation in treatment among Medicare beneficiaries from 2002 through 2013. **METHODS:** We consider 11 classes of surgery, characterized by AHRQ's Clinical Classification System; the surgical classes studied range from tracheostomy to heart valve procedures to colorectal resection to wound debridement. For each surgical class, we assess trends in treatment costs and outcomes among Medicare beneficiaries receiving these procedures during hospital stays. Outcomes include 30-day survival and the avoidance of unplanned readmissions; outcomes and costs are adjusted for patient severity based on demographics, comorbidities, and community context. Productivity is measured by the ratio of the number of high-quality stays (survival without readmissions) to total hospital costs. Surgical innovations are operationalized as clinically distinctive procedures with nonexistent or limited use in 2002, identified using ICD-9 procedure codes. **RESULTS:** Preliminary analysis finds significant and positive productivity growth for 5 surgical classes, tracheostomy 4.96% per year), wound debridement (2.09%), small bowel resection (0.77%), excision of lysis peritoneal adhesions (0.49%), and colorectal resection (0.44%). For each of these surgical classes, the rate of 30-day survival without an unplanned readmission increased from 2002 to 2013, while inflation-adjusted treatment costs decreased. Substantial treatment innovation occurred with respect to surgical procedures utilized for colorectal resection. **CONCLUSIONS:** In 5 out of 11 surgical classes, the quality of surgical care improved while treatment costs declined, thus contributing to improved productivity among U.S. hospitals. However, these trends were associated with measurable innovation in treatment for only 1 surgical class.

PhP182

TRENDS IN UTILITY ELICITATION METHODS: DO ANALYSES ADHERE TO RECOMMENDATIONS?

Pope EF[1], Lavelle T[2]
[1]Center for the Evaluation of Value and Risk in Health, Institute for Clinical Research and Health Policy Studies,Tufts Medical Center, Boston, MA, USA, [2]Tufts Medical Center, Boston, MA, USA

OBJECTIVES: To identify trends and adherence to pharmacoeconomic recommendations in the use of direct and indirect utility elicitation techniques in published cost-effectiveness analyses from seven countries with clear guidelines on a preferred utility method. **METHODS:** We analyzed data extracted from cost-effectiveness analyses (CEAs) included in the Tufts Medical Center CEA Registry, a database with detailed information extracted from CEAs published in peer-reviewed medical and economic journals. Using studies published from 2000-2014 in the US, UK, the Netherlands, Sweden, Italy, Belgium, and France, we analyzed the proportion of utility weights elicited by different methods of direct or indirect elicitation. We excluded utilities that did not have an elicitation method stated in the CEA study (48%; n=5,853), and utilities used in multi-country studies (3.7%; n=475). **RESULTS:** From 2000-2014, the EQ-5D was the lead and trending utility elicitation method cited in CEAs published across all countries, including those that recommended the method in their guidelines (US, UK, Netherlands, Sweden and Belgium) and those that did not (Italy, France). In 2010-2014, most utilities from studies based in countries that recommended the EQ-5D method adhered to guidelines (70.5% in the UK, 83.8% in the Netherlands, 79.9% in Sweden, and 52.5% in Belgium). The US, which recommends a generic instrument, also predominately used EQ-5D (32.3%), followed by time trade-off (19.7%), standard gamble (13%), and the visual analog scale (5.2%). The EQ-5D remained the leading utility elicitation method cited even in CEAs from countries that advocated for use of alternative methods in their guidelines (45% in France and 29.9% in Italy; 2010-2014). **CONCLUSIONS:** The EQ-5D has become the most cited utility elicitation method in published CEAs, despite alternative recommendations in certain countries including Italy and France. This could have important implications for decisions about resource allocation.

PHP183

PATIENT AND KNOWLEDGE ABOUT COST OF MEDICATIONS IN SAUDI ARABIA

Alomi YA[1], Alaskari DA[1], Almelfi MM[1], Badawi DA[1], Alshihri AM[2]
[1]Ministry of Health, RIYADH, Saudi Arabia, [2]Assir Region Medical Affairs, RIYADH, Saudi Arabia

OBJECTIVES: To explore the patients and Knowledge about cost of medicines in Saudi Arabia. **METHODS:** It is a 4-months cross-sectional survey of patient and basic knowledge of medicines. The questionnaire consisted of two-part demographic information, and second part of forty-nine questions divided into four domains. It included basic information about medication, patient information about the drug related problem, patient information about drug-related cost, and patient perception of medications. MedlinePlus and DailyMed health information used. The 5-points Likert response scale system used. The survey distributed through social media and

at 500-bed pediatrics and maternity hospital in Asir region, at ambulatory care pharmacy. The survey made an electronic format, and it analyzed domain three through survey monkey system. **RESULTS:** The total responders were (614) Saudi patient. The gender distribution 523 (86.7%) was female, and 91(13.3%) was male. The majority of them in age (18-44) 78.3%, and located at Asir region 325 (115%) and Riyadh region 163 (46.9%). The type of medications used was for Diabetic and Hypertension, Skin, Respiratory diseases. The responders showed good knowledge about drug storage at room temperature 380 (64.7%) or refrigerator 378 (64.7%), and how to behave with an expired medication 328 (59.85%). The patient had adequate information about drug and light exposure 335 (57.56%) while incomplete information about prescription prices 265 (44.9%). The responders showed that a missing of medication knowledge lead them to visit doctor clinic (20%), visit the pharmacy (32.4%), visit hospital emergency (7.4%), hospital admission (13.9%) or intensive care admission (4.3%). **CONCLUSIONS:** The missing of drug information knowledge is burden cost on health care system. Drug-related prices and medication cost awareness are demanding for Saudi patient to prevent drug-related hospital admission, improve patient clinical outcomes and quality of life.

PHP184

UPDATED CODING ALGORITHMS FOR DEFINING CHARLSON COMORBIDITIES USING LARGE RESTROSPECTIVE HOSPITAL ADMINISTRATIVE DATA

Rosenthal N, Cao Z, Chung J, Magee G, Gundrum J, Dreyfus J, Robinson S, Baumer D, James B
Premier Incorporated, Charlotte, NC, USA

OBJECTIVES: To update Deyo's International Classification of Disease, 9th revision, Clinical Modification (ICD-9) coding algorithm for Charlson Comorbidity Index (CCI) with corresponding ICD-10 codes and assess the concordance between algorithms using a large retrospective hospital administrative database. **METHODS:** Deyo's ICD-9 algorithm for CCI was updated referencing Quan's modified version of Deyo's algorithm and clinical judgment made by the Premier team. The ICD-10 algorithm for CCI was developed using the mapped ICD-10 codes based on the Centers for Medicare and Medicaid Services (CMS) 2016 General Equivalence Mappings, with further adjustment according to the 2016 CMS ICD-10 codes tabular list. The ICD-10 algorithm was validated by a concordance analysis using data from hospitals that submitted both ICD-9 and ICD-10 data to the Premier Healthcare Database during Quarter 4 of 2015. Descriptive analysis was conducted to compare the distribution of CCI scores and prevalence for the individual conditions between the two algorithms. Concordance was assessed by Kappa statistics calculated for each of the CCI comorbidities. **RESULTS:** The analysis included 26,792 inpatient discharges from 79 hospitals that reported both ICD-9 and ICD-10 diagnoses codes between 10/1/2015-12/31/2015. Modification to Deyo's ICD-9 algorithm included: 1) inclusion of 294.1x (dementia in conditions classified elsewhere) and 294.2x (dementia, unspecified) to Dementia codes; 2) removal of 250.7x (Diabetes with peripheral circular disorders) from Diabetes without chronic complication group and inclusion of 250.7x, 250.8x (diabetes with other specified manifestations) and 250.9x (Diabetes with unspecified complication) to Diabetes with chronic complication group. Mean CCI was 1.42 with standard deviation of 2.10 for both algorithms. The Kappa statistics ranged from 0.82 for diabetes with chronic complications category to 0.98 for AIDS, chronic heart failure, dementia, and myocardial infarction. **CONCLUSIONS:** The ICD-10 CCI score had excellent concordance with the ICD-9 algorithm and both algorithms are available for use in outcome studies.

PHP185

HEALTH RELATED QUALITY OF LIFE FOR GENERAL POPULATION IN CHINA BASED ON EQ-5D-3L: A SYSTEMATIC REVIEW

Zhou T[1], Guan HJ[2], Ma AX[1], Liu GG[3]
[1]*China Pharmacuetical University, Nanjing, China,* [2]*School of Pharmaceutical Sciences, Peking University, Beijing, China,* [3]*Peking University, Beijing, China*

OBJECTIVES: Health related quality of life (HRQoL) for Chinese general population is important to decision-maker. The aim of this study was to conduct a systematic review which is based on an EQ-5D-3L questionnaire in China to evaluate HRQoL for general population. **METHODS:** To identify studies related to HRQoL for general population in China, both English and Chinese literatures published from January 1990 to August 2015 were systematically searched by using PubMed, EMbase, the Cochrane Library, VIP WanFang Data and CNKI databases. A descriptive analysis was performed to study health utility, VAS scores, and proportion of people who have problems in five dimensions of EQ-5D-3L. **RESULTS:** In total, 17 studies were identified in this research, all age population and elderly population were included. As for all age population, the health utility ranged from 0.80 to 0.96 while VAS scores ranged from 77 to 86. In the majority studies, the dimension with highest proportion of people having problems was "Pain/discomfort", followed by "Anxiety/Depression", while "Self-Care" dimension was the lowest one. For male, the utility values and VAS scores were higher than female, suggesting a better HRQoL of men. People living in rural areas were with lower health utility than urban residents, but VAS score was on the contrary. As for aged population, the utility values ranged from 0.79 to 0.89. The findings of that dimensions with highest and lowest proportion of people having problems for aged population were the same in all age population. **CONCLUSIONS:** EQ-5D-3L is wildly used in HRQoL studies for Chinese general population. The sample source and the usage of different utility value set might have influence on measurement results.

PHP187

TRANSITIONING TO ICD-10 FROM ICD-9 PROCEDURES FOR RETROSPECTIVE STUDIES IN THE SURGICAL FIELD

Lavin J, Song C, Kreaden U, Liu E
Intuitive Surgical, Sunnyvale, CA, USA

OBJECTIVES: In September 2015, the United States implemented ICD-10 code system which tends to affect large database analyses based on codes. This study explored the code change from ICD-9 to ICD-10 in select surgical procedures and tested the viability of the Centers for Medicare and Medicaid Services (CMS) ICD9 to ICD-10 converter. **METHODS:** We reviewed the Premier® Hospital Discharge Database from 2014 Q1 to 2016 Q2 for a low volume cancer surgical procedure (prostatectomy) and a high volume general surgical procedure (ventral hernia repair). ICD-9 codes for the procedures and their surgical approaches (robotic-assisted vs. non-robotic) were converted into ICD-10 via CMS converter. The quarterly volume trend of the procedures and the proportions by surgical approach were compared before and after the ICD-10 implementation. **RESULTS:** Prostatectomy procedure volume was 3406 in Q1 2014 and 3261 in Q1 2015 using ICD-9, vs. 3733 in Q1 2016 using ICD-10. As a well-established procedure primarily performed robotically, the proportion of robotic-assisted prostatectomy was 82.4% in Q1 2014, 85.1% in Q1 2015 using ICD-9, vs. 61.6% in Q1 2016 using ICD-10. Ventral hernia repair procedure volume was 21,149 in Q1 2014 and 19,723 in Q1 2015 using ICD-9, vs. 9,936 in Q1 2016 using ICD-10. As an emerging robotic-assisted procedure for which the proportion of robotic cases was expected to increase, the proportion of robotic-assisted ventral hernia repair was 2.81% in Q1 2014 and 4.52% in Q1 2015 using ICD-9, vs. 5.2% in Q1 2016 using ICD-10. **CONCLUSIONS:** The study suggests inconsistency of volume trends and proportion of surgical approaches when using the CMS ICD-9 to ICD-10 converter alone. There are challenges of this new coding system that impact large database research. Further collaborations among database researchers, clinicians and billing experts are necessary to understand the challenges and to implement appropriate solutions.

PHP188

MULTIDIMENSIONAL POVERTY, SELF-RATED HEALTH AND BARRIERS TO ACCESS TO HEALTHCARE IN CHILEAN ADULTS

Pedrero V[1], Oyarte M[1], Cabieses B[1], Espinoza MA[2]
[1]*Universidad del Desarrollo, Santiago, Chile,* [2]*Honorary Visiting Fellow, Centre for Health Economics, University of York, York, UK*

OBJECTIVES: Chile has recently included a multidimensional poverty (MDP) index in population surveys. It considers 12 indicators gathered into 4 dimensions for household level MDP. About 20% of the population has multidimensional poverty. We explored the relationship between Self-Rated Health (SRH), MDP and barriers of healthcare access in Chilean adults during 2013. **METHODS:** Using data of >15 years old from the 2013 CASEN survey (n=85139, equivalent to N=6.718.477), we estimated multiple ordinal regression models with partial proportional odds and log complementary link, where SRH (3 categories: good/regular/bad) was the dependent variable; MDP (poor/non-poor) and barriers to access to healthcare (yes/no) were the independent variables. We then adjusted for covariates (sex / age / educational level / immigrant status / ethnicity / occupation / marital status / household income). **RESULTS:** SRH was associated with MDP ([OR=0.86, 95%CI [0.88-0.91]) and with barriers to access to health. Individuals with barriers to access to healthcare were less likely to move from a "poor health" to a "moderate to good health" (OR=0.68, 95%CI [0.66-0.69]). This was even more accentuated when moving from "bad or moderate" to "good health" (OR=0.54, 96%CI [0.52-0.55)]. The association between SRH, MDP and barriers of access was maintained after multivariate adjustment for socio-demographic covariates. **CONCLUSIONS:** Barriers to healthcare showed a strong association with SRH in Chilean adults, even after adjusting for MDP and other socio-demographic covariates. Both MDP and barriers to access are potentially modifiable determinants of SRH that need urgent attention at health policy level in this country.

PHP189

THE ROLE OF PATIENT-POWERED RESEARCH NETWORKS IN COMPARATIVE EFFECTIVENESS RESEARCH AND DECISION-MAKING

O'Brien R[1], Brice C[1], Tarkington A[1], Ciaglia A[2], Buysse B[1], Kim J[3], Thwaites R[4], Garner S[5], Jonsson P[6]
[1]*IMS Health, London, UK,* [2]*International Alliance of Patients' Organizations, London, UK,* [3]*London School of Hygiene and Tropical Medicine, London, UK,* [4]*Takeda, London, UK,* [5]*NICE, London, UK,* [6]*National Institute for Health and Care Excellence (NICE), Manchester, UK*

OBJECTIVES: To elicit views on the potential future role of data collected by patient-powered research networks (PPRNs) and the usefulness, acceptability and future role in comparative effectiveness research (CER) and HTA assessments. **METHODS:** PPRNs are online platforms where patients share their health data with other people or organisations of their choice. Key opinion leaders (KOLs) with interest in PPRNs and decision makers working in regulatory, payer or HTA areas were identified and interviewed by phone. Summary transcription of interviews were analysed in 3 different ways: a) exceptional comments were highlighted; b) answers were coded to and grouped; c) categories were collated and summarised as counts or percentages. **RESULTS:** Invitations were sent to 282 participants. Interviews were conducted in spring 2016 with 21 KOLs and 19 decision makers (overall response rate 14.2%). All KOLs had heard of PPRNs, compared with only 15% of the healthcare decision makers. Most participants (90% of KOLs and 84% of decision makers) thought that PPRNs could be useful for comparative effectiveness research and were able to provide a variety of advantages. Most healthcare decision makers reported that they thought the use of effectiveness evidence from PPRNs was acceptable. However limitations were expressed, such as the burden around ethics and regulations and lack of systematic or standardised data collection and validation of self-reported data. These obstacles need to be addressed in order to make PPRNs more useful for the collection of data for CER. **CONCLUSIONS:** PPRNs are still in their infancy. In the short term, both decision makers and KOLs believe they could be used to better understand the patient point of view. In the longer term, once advancements are made, they could also be used in comparative effectiveness research.

PHP190
MEDICAL NUTRITION TERMINOLOGY AND REGULATIONS IN THE US AND EUROPE: A SCOPING REVIEW
Volger S[1], Freyer K[2], Pitter JG[3], Molsen E[4], Cooblall C[4], Evers S[5], Hiligsmann M[5], Danel A[6], Aggarwal B[7], Seyhun O[8], Ofili T[9], Goates S[10], Partridge J[10], Laplante S[11]
[1]Nestle Nutrition R&D, King of Prussia, PA, USA, [2]Maastricht University, Zoetermeer, The Netherlands, [3]Syreon Research Institute, Budapest, Hungary, [4]ISPOR, Lawrenceville, NJ, USA, [5]Maastricht University, Maastricht, The Netherlands, [6]Nestle Health Science, Vevey, Switzerland, [7]NIOH/ICMR, Gandhinagar, India, [8]Abbott Nutrition International, Istanbul, Turkey, [9]Texas A&M HSC Irma Lerma Rangel College of Pharmacy, College Station, TX, USA, [10]Abbott Nutrition, Columbus, OH, USA, [11]Baxter Healthcare Corporation, Deerfield, IL, USA
BACKGROUND: Medical nutrition (MN) is comprised of parenteral nutrition (regulated in pharmaceutical legislation) and all forms of enteral nutrition that are regulated as "foods for special medical purposes" (FSMP), as defined by the European Commission. Standardized MN terms and definitions are needed to facilitate comparative and cost-effectiveness research of MN in disease management and health outcomes. **OBJECTIVES:** Conduct a scoping review to identify MN terminology, definitions and regulations in the United States and Europe. **METHODS:** The ISPOR Nutrition Economics Special Interest Group's Medical Nutrition Working Group identified 19 MN terms and developed a systematic keyword search and inclusion/exclusion criteria to review relevant literature published from 1/2000 to 8/2015. The following databases were searched: Embase; MEDLINE; Cochrane Clinical Trials Registry; Centre for Reviews and Dissemination; the Cumulative Index to Nursing and Allied Health Literature, as well as pertinent professional and regulatory websites. Two-person teams extracted, reviewed and compared results for accuracy and completeness using a two-step screening process (ie, title/abstract, then full-text review). **RESULTS:** Of the 1,687 titles/abstracts identified, 671 full-text articles were reviewed and 473 articles were included in the final analysis, as well as an additional 222 records from 94 websites. Sixty-five percent of the articles mentioned MN terms, of which less than 35% provided a definition. The most common ICD codes/indications for MN were: symptoms, signs, abnormal clinical/laboratory findings (30%); endocrine, nutritional and metabolic diseases (15%), and digestive system diseases (13%). Less than 5% of the articles referenced a MN regulation, with few (<8%) reporting a health or nutrition economics analysis. **CONCLUSIONS:** MN terminology is not consistently defined and applied in the literature. This lack of clarity makes it challenging to interpret existing research findings and hampers effective assessment of the impact of MN on health outcomes and disease management.

PHP191
FREQUENCY OF AND PERCEPTION TOWARDS CESAREAN SECTION: AN EXPLORATORY ANALYSIS FOCUSING PREGNANT WOMEN ATTENDING PUBLIC HOSPITAL OF QUETTA CITY, PAKISTAN
Ishaq R[1], Iqbal Q[2], Saleem F[1]
[1]University of Baluchistan, Quetta, Pakistan, [2]University of Balochistan, Quetta, Pakistan
OBJECTIVES: The literature reports an increased prevalence of cesarean section (CS) worldwide that is related to various reasons as well as to patients' perception towards. Therefore, the aim of this study was to determine the frequency prevalence of CS (one year retrospective analysis), and explore patient's perception towards CS attending public hospital of Quetta city, Pakistan. **METHODS:** A retrospective, cross sectional study design was adopted. The retrospective study was conducted to assess the frequency of CS over one year time period. The cross sectional study was conducted to evaluate patients' perception towards CS whereby a self administered questionnaire was used for data collection. SPSS v.22 was used for data collection and both descriptive and inferential statistics were used for data analysis. **RESULTS:** For the year 2015, the prevalence rate of CS was 13.03% (3044 CS cases out of 23346 deliveries). From 728, seven hundred and seventeen patients responded to the survey. Although 565 (78.8%) perceived CS as a dangerous procedure [education (p=0.004), locality (p=0.001) and employment status (p<0.001)], 534 (74.5%) patients were in agreement that this is the best manner to save mother's and baby's life. Sixty two percent of the respondents reported that they would like to avoid CS due to the post operative pain and 422 (58.9%) preferred to have a normal delivery. Additionally, significant associations were reported among education (p=<0.001) and locality (p=<0.001), whereby respondents considered normal vaginal delivery as painful. **CONCLUSIONS:** The present study reports that the frequency of CS is almost equal to what is recommended by the World Health Organization. However, when it comes to pcerption towards CS, we conclude that women of the current cohort had less information about CS and there is a need to provide them education during antenatal.

PHP192
PARENT-REPORTED HEALTH STATUS AND ITS ASSOCIATION WITH MULTI-DIMENSIONAL POVERTY AMONGST CHILDREN IN CHILE: A POPULATION-BASED, STRUCTURAL EQUATION MODELLING STUDY
Pedrero V[1], Oyarte M[1], Cabieses B[1], Espinoza MA[2]
[1]Universidad del Desarrollo, Santiago, Chile, [2]Honorary Visiting Fellow, Centre for Health Economics, University of York, York, UK
OBJECTIVES: There are 4,5 million <18 years old living in Chile; about 22% living in multidimensional poverty. The aim was to explore, through structural equation modelling (SEM), the relationship between multidimensional poverty and parent-reported health status; and to explore whether access to health care could mediate this relationship in this population. **METHODS:** We used data from CASEN 2013 national survey (n=56,811, weighted N=4,413,728). SEM Model 1 considered the crude relationship between household multidimensional poverty, parent-reported health status and access to health services (healthcare provision) of the child. SEM Model 2 we adjusted Model 1 by five covariates (sex, age, being an immigrant, household income and rurality). In both cases direct and mediated relations were explored. Both models were assessed using RMSEA<0.05 and CFI>0.95. **RESULTS:** Models 1 and 2 fitted the data appropriately. Model 1: a significant direct effect was observed between multidimensional poverty and parent-reported health status (Bstd=0.04, p-value=0.003). Children living in multidimensional poverty had lower parent-reported health state. Access to healthcare also had a direct and significant effect (Bstd=0.072, p-value<0.001). However, no mediator effect was found for access to healthcare in the relationship between poverty and children's health status (p-value=0.102). Model 2: the direct effect of multidimensional poverty on health of the children was maintained, but the effect of access on children's health disappeared (p-value=0.77). **CONCLUSIONS:** This is the first study in Chile to assess the relationship between multidimensional poverty and parent-reported health status of children. Findings prove the strong relationship between household poverty and health status in children.

PHP193
DO PAYERS VALUE RARITY IN DRUG PRICING OF ONCOLOGY VERSUS NON-ONCOLOGY ORPHAN DRUGS IN EUROPE?
Young KE[1], Soussi I[2], Toumi M[3]
[1]Creativ-Ceutical, Paris, France, [2]Creativ-Ceutical, Tunis, Tunisia, [3]Aix-Marseille University, Marseille, France
OBJECTIVES: To assess if there is a difference on how payers value rarity in drug pricing between oncology and non-oncology orphan drugs in France, Germany, Italy, Norway, Spain, Sweden, UK. **METHODS:** Approved orphan drugs with their respective disease prevalence were extracted from the European Medicines Agency website and were divided into oncology and non-oncology. The annual treatment costs for each drug were computed based on the summary of product characteristics (SmPC) using ex-factory prices from IHS POLI and country price databases. The relationship between the prevalence (rarity) and the annual treatment cost of (price) in each country was analysed using simple regression analysis. The correlation coefficient (r) for oncology and non-oncology drugs were averaged and compared in each country. **RESULTS:** A total of 120 orphan drugs were analysed. For both oncology and non-oncology orphan drugs, results show an inverse correlation between annual treatment cost and disease prevalence in all countries, with the treatment being more expensive the rarer the disease. For non-oncology drugs, statistical significance was reached in all countries except Spain and Sweden (France: r=-0.41, p=0.01; Germany: r=-0.41, p=0.01; Italy: r=-0.38, p=0.01; Spain: r=-0.37, p=0.08; UK: r=-0.40, p=0.002; Sweden: r=-0.47, p=0.06; Norway: r=-0.41, p=0.01). Oncology drugs had a weaker correlation except Spain (France: r=-0.36, Germany: r=-0.18, Italy: r=-0.25, Spain: r=-0.49, UK: r=-0.23, Sweden: r=-0.47, Norway: r=-0.29; all p'0.05 except Spain p=0.03). **CONCLUSIONS:** This study shows an inverse correlation between annual treatment cost and disease prevalence in orphan drugs. A weaker correlation in oncology supports the idea that in this disease area, payers value other drivers aside from rarity which may include severity, the availability of treatment options, the size of clinical benefit, and incremental cost-effectiveness ratio. Pricing is a complex process where different attributes are assessed, however rarity is valued by payers in pricing decisions in all the countries.

PHP194
RELIABILITY AND VALIDITY OF A PATIENT-REPORTED SYNDROME SCALE: PHLEGM SYNDROME (PRS-PS)
Yu L[1], Li Q[2], Zhang HY[1], Chen ZH[2], Wang JH[2], Zhou H[2], Ji KS[1], Yang GL[2]
[1]Affiliated Hospital of Liaoning University of Traditional Chinese Medicine, Shenyang, China, [2]Liaoning university of Traditional Chinese Medicine, Shenyang, China
OBJECTIVES: We have developed a patient-reported syndrome scale: phlegm syndrome (PRS-PS) for efficacy assessment of Traditional Chinese Medicine (TCM). This study was conducted to evaluate the reliability and validity of the scale. **METHODS:** A cross-sectional survey was conducted for the 9-item PRS-ps. The patients with phlegm syndrome which is defined as a viscous, turbid pathological product causing a variety of diseases were recruited. After 24-48h, 30 patients were randomly selected to complete the PRS-PS again for retest reliability. For the patients with hyperlipidemia, triacylglyceride(TG) and total cholesterol (TC) were recorded to evaluate the criterion validity of the PRS-PS. The internal consistency and construct validity were analyzed according to Cronbach's coefficients, Spearman correlation and exploratory factor analysis. **RESULTS:** A sample of 115 patients (average age: 59, 47 males) completed the PRS-PS. The PRS-PS was easy to accept for patients, of which 96.6% completed the scale. The median completion time was 2min, which showed the convenience of the scale. There is no floor and ceiling effect on each item. The retest reliability of the scale was 0.896, of all items range 0.739 from 0.920. Cronbach's coefficient the scale was 0.643, and it declined after deleting any item. The Spearman correlation coefficients of these nine items and the global score were between 0.409-0.722. Exploratory factor analysis identified 3 primary dimensions that were consistent with the conceptual framework construction. TG was positively associated with the item of expectoration (p<0.05), and the correlation coefficient was 0.320. **CONCLUSIONS:** These results suggest that the PRS-PS is a reliable and valid self-rating instrument for efficacy assessment of phlegm syndrome in TCM. Due to the deficiency of a commonly acceptable criterion for phlegm syndrome assessment, the criterion validity of the PRS-PS will be explored in the further research.

PHP196
A CROSS-SECTIONAL STUDY TO EVALUATING KNOWLEDGE, AND ATTITUDE OF FINAL YEAR PHARMACY STUDENTS TOWARDS PHARMACOVIGILANCE IN ABBOTTABAD, PAKISTAN
Syed A[1], Jamshed S[2], Azhar S[1], Raza M[1], Dawood M[1]
[1]Department of Pharmacy, COMSATS Institute of Information Technology, Abbottabad, Pakistan, [2]International Islamic University, Malaysia, Kuantan, Malaysia
OBJECTIVES: To explore the knowledge and attitude of final year pharmacy students towards ADR reporting in Abbottabad, Pakistan. **METHODS:** A cross-sectional study

was conducted in three universities of Abbottabad from April 1 to May 31st 2016. The questionnaire comprised of questions aimed to explore knowledge, attitude and perception of pharmacy students. **RESULTS:** A total of 93 students responded giving the response rate of 83.4%. Among the respondents 67% were females. More than half 60.4% of the respondents indicated that they had read formal topic on Pharmacovigilance concept. The mean knowledge score of Pharmacovigilance and ADR reporting for the final year pharmacy students was 6.26. 60.4% of students do not know how to report an ADR. Surprisingly, 24.2% believe that reporting of ADR makes no significant contribution to the reporting system. Majority of respondents 93.4% believed that ADR reporting should be made compulsory.94% of students thought that proper Pharmacovigilance course should be included in pharmacy curriculum. **CONCLUSIONS:** Although majority of students have positive attitude towards Pharmacovigilance but have insufficient knowledge about Pharmacovigilance concept and adverse drug reactions reporting process. There is need to include course of Pharmacovigilance in pharmacy curriculum.

PHP197

UNDERSTANDING DISEASE BURDEN AND OUTCOMES FROM THE PATIENT'S PERSPECTIVE USING DISEASE-FOCUSED INTERNET FORUM DATA

Thomas M[1], Akhtar A[2], Terkowitz JM[3], Powell GE[4]
[1]*GlaxoSmithKline, Collegeville, PA, USA,* [2]*ZeroChaos, Orlando, FL, USA,* [3]*Inspire, Arlington, VA, USA,* [4]*GSK, RTP, NC, USA*

OBJECTIVES: This research examines what value disease-focused internet forum data offers GSK, including characterizing data elements and whether linked discussion threads provide longitudinal insights into disease and patient perspectives. **METHODS:** This study was a retrospective analysis using deidentified Inspire patient forum data for 2 disease areas: systemic sclerosis ("SS") and rheumatoid arthritis ("RA"). The dataset consisted of English language posts (n=62,806), comprising 5,606 threads, spanning Jan-01-2015 to Nov-30-2015 and representing 6,548 distinct authors. A third party vendor removed PII and discussion threads were programmatically linked by a unique identifier. A random sample of 2,817 threads (50%) consisting of 21,313 posts (34%), representing 3,601 unique authors (55%) was created for curation and analysis. **RESULTS:** Of the 3601 unique authors curated, 870 (24%) indicated they had been diagnosed with SS, 267 (7.4%) indicated they had RA and 54 (1.5%) indicated they had both RA and SS. For 1,975 authors (55%), we were unable to determine a diagnosis. Of the 435 (12%) remaining authors, 203 (5.6%) had other autoimmune disease as diagnosis and 232 (6.4%) were probable RA or probable SS. Patients discussed disease duration in 722 posts, and of those posts 296 (41%) indicated they had the disease for more than 10 years. 26% (n=5541) of posts were made by the patient. 13% gave medication information. 3% discussed non-medical treatments. 5% discussed medical history. 2% provided lab/imaging results. 5% were seeking information. 8% discussed burden of disease. **CONCLUSIONS:** Disease-focused internet forum data provides valuable patient insights and information including: disease burden, duration of disease, medication and non-medication treatments, co-morbidities, and information being sought/provided. Additional research is required to further assess the value of longitudinal data for understanding the patient disease journey and how best to leverage these insights for drug development and safety.

PHP198

THE PATIENT VOICE IN VALUE: REVIEW AND APPLICATIONS OF PATIENT PREFERENCE ELICITATION METHODS

Georgieva M[1], DeBusk K[2]
[1]*Gillings School of Global Public Health, University of North Carolina at Chapel Hill, Chapel Hill, NC, USA,* [2]*Genentech, South San Francisco, CA, USA*

OBJECTIVES: Patient preference elicitation methods can increase the patient-centeredness of medical decision making by measuring benefit and value. Patients' perspectives on treatment benefits and risks can be different from those of regulators and care providers. This study aimed to conduct a comprehensive review and evaluation of methods used to assess patient preferences for different treatments in three therapeutic areas: oncology, immunology, and central nervous system (CNS) diseases. **METHODS:** A search of electronic databases and grey literature identified published articles on patient preference methods and applications. The methods were critically appraised and the literature review was conducted on patient preference studies on pharmaceutical interventions in oncology, immunology, and CNS. **RESULTS:** Discrete choice experiments (DCE) and conjoint analysis (CA) were the most commonly used methods for patient preference elicitation. Heterogeneity of patient preferences and sample size were key in determining the choice of method. Among the 30 studies included in the final literature review, safety, efficacy, and convenience (dosing and route of administration) were used most often in patient preference surveys to differentiate between different treatment options. Cost attributes were also included in patient preference studies in oncology and immunology, while quality-of-life related attributes were used in oncology and CNS preference studies. **CONCLUSIONS:** Quantitative methods to elicit patient preferences such as DCE and multicriteria decision analysis (MCDA) are becoming increasingly acceptable by regulatory and payer bodies as part of benefit-risk assessments and health economic evaluations. Considering patient preferences for efficacy, safety, and convenience can help inform regulators' and payers' value judgments, increase the patient-centeredness of decision-making, and differentiate products in competitive markets.

PHP199

CHANGES IN THE HEADCOUNT OF HEALTH CARE PROFESSIONAL IN HUNGARY

Elmer D[1], Boncz I[1], Molics B[1], Szarka E[1], Kovács G[2], Horváth L[1], Endrei D[1]
[1]*University of Pécs, Pécs, Hungary,* [2]*Széchenyi István University, Győr, Hungary*

OBJECTIVES: After Hungary joined to the European Union in 2004, health care professionals were allowed to enter onto the European labour market. The higher salaries in Western European countries are important motivating factors for Hungarian health care professional to go abroad. The aim of our study was to analyze the changes in the headcount of health care professionals in Hungary. **METHODS:** Data derive from the database of the Hungarian Central Statistical Office. The following health care professional – working in hospitals – were included into the analysis: physicians, dentists, pharmacists, nurses, dieticians, physiotherapists, ambulance men, midwifery, health visitors, and occupational health professionals. We calculated the average headcount between 2003-2012. **RESULTS:** Between 2003-2012 the average increase of the headcount of all health care professionals was 12%. We observed the highest increase in the headcount of nurses (+84%) midwifery (+67 %) and physiotherapists (+61%), while we found the highest decrease in the headcount of occupational health professionals (-76%), dentists (-43%) and pharmacists (-35%). In 2003, we observed the highest headcount for specialist physicians (8109), physicians (3822) and health visitors (3631). We found the highest headcount in 2012 for specialist physicians (7114), health visitors (3830) and physicians (3329). **CONCLUSIONS:** Between 2003-2012 there was a remarkable increase in the the headcount of health care professionals in Hungary. The changes showed significant differences among different professions. In order to prevent well trained health care professionals leaving Hungary for working abroad, futher increase of salaries is needed.

PHP200

AVAILABILITY, PRICE AND AFFORDABILITY OF SELECTED MEDICINES FOR NON-COMMUNICABLE DISEASES IN IRAN; A COMPARISON OF 2007 AND 2014 REPORTS

Heidari E[1], Abdollahiasl A[2]
[1]*Non-communicable Diseases Research Center, Endocrinology and Metabolism Population Science Institute, Tehran University of Medical Sciences, Tehran, Iran, pittsburgh, PA, USA,* [2]*Tehran University of Medical Sciences (TUMS), Tehran, Iran, Tehran, Iran (Islamic Republic of)*

OBJECTIVES: The global and national burden of non-communicable diseases (NCD) continues to rise making access to essential medicines increasingly important. The objective was to compare the results of two national reports conducted in 2007 versus 2014 in Iran in terms of price, availability and affordability. **METHODS:** The data for selected medicines for NCD were collected from public and private sector retail pharmacies and from private pharmacies located in public hospitals in six cities of Iran. The data was collected using standardized methodology developed by the World Health Organization (WHO) and Health Action International (HAI). Medicines that were common in both surveys with the same strength and dosage form were gathered. The outcome measures were percentage availability of drugs, drug price ratios to international reference prices and affordability. Availability of medicines was compared in forms of originator brand (OB) and Lowest Priced Generic (LPG). While affordability was defined as the number of days' wages needed by the lowest-paid unskilled worker to afford one month supply of chronic treatment. The median price ratios didn't alter after adjusting for annual inflation. **RESULTS:** Affordability of essential treatments was reasonable (<1) in both years and there was no significant change in affordability of common treatments between 2007 and 2014. A negligible decrease in affordability of generic Metformin (0.1 to 0.2 wage) and Salbutamol inhaler (0.2 to 0.3 wage) and a little increase in affordability of statins (0.3 to 0.2 wage) can be ignored due to high and variable inflation. Across all three pharmacy settings, the availability of OB has increased while the availability of LPG has decreased. The comparison of the price of surveyed medicines reveals a reduction in median prices of both OB and LPG in all three settings. **CONCLUSIONS:** Although NCD treatments are mostly available and affordable in Iran during past years, more improvements are still needed.

PHP201

PREMIUM-PRICING STRATEGIES AND REPUTATIONAL COSTS FOR MANUFACTURERS: INCENTIVES AND CONSTRAINTS IN THE EVOLVING US PRICING AND REIMBURSEMENT ENVIRONMENT

Enev T
PAREXEL International, Horsham, PA, USA

OBJECTIVES: Manufacturers seeking high prices for new or in-line agents are leveraging incentives that all but guarantee coverage in certain "sensitive" indications. Recent high-profile cases include the launch of Sovaldi (curative benefit), Sarepta (data issues), the price increase of the EpiPen (no competitors), some new oncology therapies. In "sensitive" indications, what are the constraints on "the sky is the limit" pricing incentives? This paper presents a conceptual model that seeks to explain and identify key factors driving manufacturer pricing behavior and payer reactions to it. **METHODS:** Combined deductive / inductive approach; conceptual pricing-strategy model based on small-n qualitative analysis and comparison of salient cases of price-premium strategies. **RESULTS:** Moderately high prices in large population indications (Sovaldi launch), have led to tighter payer scrutiny and stronger public reaction than substantially higher prices in smaller population orphan diseases, or in oncology indications supported by compendia listings. Superior clinical benefits are leveraged by manufacturers to justify high prices, while inferior clinical benefits are leveraged by payers for coverage rejections. As drug pricing has become a salient issue in the US, manufacturers are increasingly considering **"reputational costs"** in their pricing strategies. **CONCLUSIONS:** When seeking high prices in "sensitive" indications, manufacturers face three strategic choices: 1) Maximize price – which potentially maximizes revenue but imposes **reputational & PR costs** and possible payer scrutiny/rejection (data issues-Sarepta); 2) Restrain price – which boosts the company's goodwill, creating **reputational & PR capital**, but has the downside of "leaving money on the table;" 3) Optimize price (to highest level below the payer radar) – which results in capturing significant revenue and maintaining goodwill,

while sacrificing some revenue gain. Reputational costs / benefits are a new factor with significant influence on choice of premium-pricing strategy by manufacturers and a tool for payers and other system actors to indirectly contain costs through PR exposure.

PHP202

ASSESSMENT OF ESSENTIAL DRUGS IN THE MEDICINES FORMULARY HOSPITAL

Lachhab Z, Serragui S, Cherrah Y, Ahid S
Mohammed V University, Rabat, Morocco

OBJECTIVES: Essential medicines are those that satisfy the priority health care needs of the population. Morocco has a national list of essential drugs, which the last revision was carried out at the end of 2011. The pharmaceutical products covered by this list have an annual budget allocated by the Ministry of health (MOH) to ensure their availability in public hospitals. The aim of our study is to assess the part of essential medicine defined by the MOH in the formulary of a Moroccan tertiary hospital. **METHODS:** We have used the medicines formulary Ibn Sina University Hospital Center in Rabat, It was updated on 2016, which includes nine hospitals and contains all the medical specialties; we have analyzed the part of essential medicines according to the WHO list of 2015 and the national list of 2012. **RESULTS:** Of the 818 articles analyzed, we found that essential drugs account for 28.1% according to the WHO list and 37.7% according to the national list. Essential medicines belong mainly to the N, J and B therapeutic classes (ATC classification) according to the WHO list (27.9%, 15.3%, 13.9%) and Moroccan list (25.3%, 17.8% and 9.4%). **CONCLUSIONS:** Our results show that the rate of essential drugs in our hospital is not large enough. In order to adhere to the policy of the Ministry of Health which aims to ensure a harmonious and sustained health development based on the availability of essential medicines, our institution is asked to review the part of these drugs in the hspital formulary.

PHP204

MINING ADVERSE EVENTS IN TWITTER: EXPERIENCES OF ADALIMUMAB USERS

Smith KL[1], Sarker A[2], Nikfarjam A[3], Malone D[4], Gonzalez-Hernandez G[2]
[1]*Regis University, Denver, CO, USA,* [2]*University of Pennysylvania, Perelman School of Medicine, Philadelphia, PA, USA,* [3]*Stanford Unversity School of Medicine, Stanford, CA, USA,* [4]*University of Arizona, Tucson, AZ, USA*

OBJECTIVES: Multiple methods to identify post-marketing adverse events related to medications exist, yet identifying and reporting adverse drug events (ADEs) remains problematic. The advent of social media platforms provides a robust source to mine pharmacovigilance data. The purpose of this study was to automatically identify associations of ADEs and adalimumab from Twitter accounts using natural language processing techniques and compare ADE tweet rates to known ADE sources. **METHODS:** Data were collected from Twitter Public API using keywords Humira, adalimumab, and common misspellings. The Twitter API makes available a sample of all posted tweets. Collected tweets were processed by the information extraction system ADRMine, designed to extract potential ADE mentions. Extracted ADRs were mapped to the standard Unified Medical Language System (UMLS) concepts automatically, using a custom-built lexicon. UMLS concept names were categorized by frequency. Disproportionality analyses were conducted to determine the relation of ADR signals to tweets. Rates of UMLS concept names were compared to ADEs reported in the drug compendia Clinical Pharmacology, Micromedex, and Lexicomp. **RESULTS:** A total of 10,188 tweets mentioned adalimumab; 1382 contained mention of an ADE. Many tweets mentioned medication names but not ADEs. Of ADE tweets, 192 unique UMLS codes were identified. "Pain" (15.5%), "sick" (8.1%), and "tired" (4.6%) were the top three ADE mentions. Pain rates agreed with ADE rates in compendia (6 to 20%) but "sick" and "tired" were not specifically reported as such. Disproportionality analysis resulted in proportional ADR reporting ratio (PRR) of 0.011, 0.013, and 0.011 and lift of 0.012, 0.014, and 0.012 for the top three respectively. **CONCLUSIONS:** ADRMine identified frequently mentioned ADEs and found reporting rates of some UMLS concepts similar to ADEs catalogued in drug compendia. This study suggests that automatically mining social media and resulting disproportionality metrics can yield promising results for further quantification of ADEs.

PHP205

EFFICACY OF INTERNATIONAL APPROACHES TO MEDICINE PRICE REGULATION AND CONTROL: A SCOPING REVIEW

Bashaar M[1], Hassali MA[2], Saleem F[3], Alrasheedy AA[4], Thawani V[5]
[1]*SMART Afghan International Trainings and Consultancy, Kabul, Afghanistan,* [2]*Universiti Sains Malaysia, Penang, Malaysia,* [3]*University of Baluchistan, Quetta, Pakistan,* [4]*Qassim University, Qassim, Saudi Arabia,* [5]*People's College of Medical Sciences & Research Centre, Bhopal -, India*

OBJECTIVES: Polices drafted and being implemented for regulating and containment of medicine prices, but still "access to affordable medicines" is a significant issue for all especially for the world's poor, where the lowest priced medicines are unaffordable for them. Therefore, the aim was to identify and review the literature on international comparative approaches related to medicine price regulation, control, and its effectiveness. **METHODS:** In this scoping review to analyze the strengths and weaknesses of international approaches towards medicine cost containment and price regulation an extensive search was carried out to collect peer-reviewed research and review articles, discussion papers, public documents relating to medicine pricing policies. STARLITE principles were set as an indicator for search strategy. Key search terms used were "medicine prices", "causes of high medicine prices", " approaches towards medicine prices control", "national medicine policies", "international approaches towards medicine price control", "containment policies", and "effects of pricing policy on medicine". **RESULTS:** Multiple methods such as supply-side regulations and demand-side regulations/ incentives, reference-based pricing, equity pricing and WHO recommended policy options for improving medicine affordability and availability, value-based pricing to regulate medicine prices was reviewed. However, inadequate proof of actual policy impact was found that result in affordability, which indicates that access to affordable medicine is a distant goal. These policies or regulations were either less comprehensive, outdated and fell short in implementation especially in low and middle-income countries due to lack of funding, infrastructure or trained professional task force. Overall, none of the policy options was preferred considering its desired outcome. **CONCLUSIONS:** The authors found gaps in the literature and propose that international and national organizations to perform critical evaluation and research. We propose that pro-poor policies should be developed to have a real impact on the lives of the vulnerable population by paying less for, and access to affordable medicines.

PHP206

THE DISCRIMINANT VALIDITY EVALUATION OF A PATIENT-REPORTED SYNDROME SCALE: QI-DEFICIENCY SYNDROME (PRS-QDS) IN PATIENTS WITH QI-DEFICIENCY

Yu L[1], Zhang HY[1], Chen ZH[2], Wu TS[2], Li Q[2], Wang SQ[2], Lv MJ[2], Yang GL[2]
[1]*Affiliated Hospital of Liaoning University of Traditional Chinese Medicine, Shenyang, China,* [2]*Liaoning university of Traditional Chinese Medicine, Shenyang, China*

OBJECTIVES: A patient-reported syndrome scale: Qi-deficiency syndrome (PRS-QDS) had been developed for efficacy assessment in Traditional Chinese Medicine (TCM). This study aimed to evaluate the discriminant validity of the PRS-QDS. **METHODS:** The patients with Qi-deficiency syndrome (QDS) and healthy subjects were recruited. All the subjects were divided into young, middle-aged and aged groups determined by age. Studies have found that there was a correlation between QDS and hemoglobin concentration (Hb), Hb was recorded for patients with anemia to analyse the relationship of QDS and Hb. All the patients with anemia were divided into two subgroups of mild and moderately severe anemia determined by Hb. T test was applied to compare the PRS-QDS scores between healthy subjects and patients with QDS. **RESULTS:** A total of 207 subjects [77 health (age: 51, 30 males) and 130 patients (age: 54, 46 males)] completed the PRS-QDS(ranging from 0-40, high score means less healthy). The total score of healthy people was 7.44±5.16, and the patients with QDS was 19.44±7.30. These total scores of young, middle-aged and aged subgroups for those patients were 19.60±5.86, 19.39±7.36, 19.42±7.67 compared to 8.91±5.15, 7.00±5.82, 4.47±3.12 for those healthy population respectively. The ten item scores of the patients with QDS were obviously higher than those of healthy population($P<0.001$). The total score for the mild anemia subgroups was 14.36±7.89 compared to 23.00±7.07 for those moderately severe anemia. T test results showed that the ten item scores of the patients with mild anemia were clearly lower than those of moderately severe anemia. **CONCLUSIONS:** The results expected differences in the PRS-QDS scores by the degree of anemia and known groups showed a good discriminant validity of the PRS-QDS. The evaluation of efficacy assessment for the PRS-QDS will be needed in the futher research.

PHP207

ANALYSIS OF THE MEDICINES FORMULARY IN A MOROCCAN HOSPITAL CENTER ACCORDING TO THE ATC CLASSIFICATION

Lachhab Z, Serragui S, Cherrah Y, Ahid S
Mohammed V University, Rabat, Morocco

OBJECTIVES: The Anatomical Therapeutic Chemical (ATC) classification system has been recommended by the WHO for several years for studies on the use of drugs. It is currently widely used internationally and the number of its users is increasing gradually. The aim of this study is to analyze the medicines formulary of the University Hospital Center according to this classification. **METHODS:** We carried out an analytical study of the 2016 drugs formulary of the University Hospital Center IBN SINA - RABAT MOROCCO- where the ATC classification was one of the main parameters studied. **RESULTS:** We analyzed 818 drugs; Belonging to 21 classes according to the pharmacological classification and to 14 classes according to the ATC classification. The results showed that cardiology drugs occupy the most important place (14.18%), followed by anti-infectives (13.08%) and anesthesia-ICU drugs (9.16%). The less represented classes were stomatology (0.12%), antispasmodics (0.24%) and gynecological drugs (0.73%). Regarding the ATC classification, the results showed that drugs belonging to class N (nervous system) occupy the first place (21.9 %), followed by class B (blood drug: 13.5%) and Class J (anti-infectives = 12.6%) respectively. The least represented classes were; class G (Genitourinary system and sex hormones: 0.6%) and class P (pesticides, insecticides and revulsives: 0.7%). **CONCLUSIONS:** Drug classification systems provide a useful means of drug description and a uniformity standard for the collection and use of drug use data. The results show a significant difference between the ordinary pharmacological classification and the new ATC classification which appears to be more precise, hence the interest of its adoption in the future referencing of drugs at our establishment.

PHP208

PRACTICAL ISSUES OF DETERMINING WEIGHTS FOR CRITERIA TO BE USED IN AN MCDA FRAMEWORK - BASED ON A CASE-STUDY

Piniazhko O[1], Nemeth B[2]
[1]*Danylo Halytsky Lviv National Medical University, Lviv, Ukraine,* [2]*Syreon Research Institute, Budapest, Hungary*

OBJECTIVES: This study aimed to evaluate the different practical issues with determining the criteria weights of a multiple-criteria decision analysis (MCDA) framework and provide recommendations for the future based on a case-study. **METHODS:** An MCDA workshop was held in Kyiv, Ukraine in October 2016.

The 20 participants with various healthcare-related backgrounds were asked to assign weights to five criteria (Burden of disease, Therapeutic effect, Safety, Innovation, Costs) individually, considering two decision scenarios: assessing pharmaceuticals to treat oncological diseases and rare diseases. The sum of the criteria weights was set to 100. The same participants were later assigned into 5 groups with 4 members each, to have discussions and finally agree on a set of weights that represented the joint opinion of their group. The sets of criteria weights of individuals and groups from this workshop were assessed with descriptive statistical methods. **RESULTS:** The means of the criteria weights of individuals and groups differed noticeably in some cases, e.g. 9.25 and 4.4 were the average values from individuals and from groups in the case of the 'Burden of disease' criterion for oncological drugs. The 'Costs' criterion had the highest standard deviation values in both decision scenarios and both in the case of individual and group-based weighting. Contrary to expectations, the smallest weight assigned a criterion was not always lower in the case of individuals than in the case of groups. Intra-group differences were also significant, e.g. one group assigned the weight of 5 to the 'Therapeutic effect' criterion while another group set this weight to 60. **CONCLUSIONS:** These findings indicate the presence of different value judgements when the same people are put in different situations. It can be recommended to consider the potential behavioural biases and limitations when constructing an MCDA framework in practice.

PHP209

IMPACT OF VERBAL AND PHYSICAL AGGRESSION TOWARDS PARAMEDICS IN HUNGARY

Csákvári T[1], Endre M[1], Németh G[2], Szabó J[3], Boncz I[4]
[1]University of Pécs, Zalaegerszeg, Hungary, [2]Ambulance station of Kaposvár, Kaposvár, Hungary, [3]St. Rafael Hospital, Zalaegerszeg, Hungary, [4]University of Pécs, Pécs, Hungary

OBJECTIVES: Aggressive behavior from patients and relatives is a serious risk factor for health care workers. Verbal and physical aggression has a negative effect on their work, it can even cause inability to work and career changing in extreme cases. The aim of our study was to assess the frequency of verbal and physical agression towards paramedics and their impact. **METHODS:** A quantitative, cross-sectional study was carried out with non-probability convenience sampling. Our sample consists of paramedics working in health care for more than one year (N=100). Demographic data, number of verbal and physical aggression coming from patients or their relatives, assumed cause of agressive behavior and type of help paramedics received was assessed with a self-made questionnaire. SPSS 22.0 was used for calculating descriptive statistics, χ2-test and Mann Whitney U test ($p<0,05$). **RESULTS:** Mean age of responders is 38.57±10.73 years. Large part of the sample has experienced some kind of agressive behavior during their career (verbal: >91%, physical: >49%). Number of conflicts containing verbal aggression is more frequent (from patient: 10.50±10.52; from relative: 9.5±11.06), than physical (from patient: 3.21±4.85; from relative: 1.55±0.50). Paramedics who experienced aggressive behavior are more likely to consider career changing, whether it is verbal (from patient: p=0,016; from relative: p=0,045) or physical (from patient: $p<0,001$; from relative: $p<0,001$). Main causes of agression according to paramedics are physcotropic drugs (72,73%), toxic condition (63,64%) and psychological disorders (30,30%). None of the responders (0%!) received any kind of conflict management training or training for trauma processing, although 60% of them would like to participate. **CONCLUSIONS:** Paramedics are put at a great risk of being confronted by aggressive patients of relatives. It is important to help them at their workplace, training them how to manage conflicts and process trauma.

PHP211

MODERNIZING THE 14-ITEM TREATMENT SATISFACTION QUESTIONNAIRE FOR MEDICATION USING RASCH MEASUREMENT THEORY

Rodriguez AM[1], Gemmen E[2], Fabre A[3], Parmenter L[4]
[1]QuintilesIMS, Madrid, Spain, [2]Quintiles, Inc., Rockville, MD, USA, [3]Quintiles Real-World & Late Phase Research, 92594 Levallois-Perret Cedex, France, [4]Real-World & Late Phase Research, Quintiles, Inc., Reading, UK

OBJECTIVES: The Treatment Satisfaction Questionnaire for Medication (TSQM) Version 1.4's psychometric properties have been demonstrated. The primary objective of this study was to review and to psychometrically evaluate the TSQM using Modern Test Theory Methods. **METHODS:** Patients with Multiple Sclerosis completed the TSQM electronically. Descriptive statistics were used to characterize the participants. Floor and ceiling effects were calculated per item.To evaluate the scaling properties and construct validity of the TSQM, Rasch measurement theory (RMT) was used and the following examined: 1) Fit to the RMT model; 2) Internal reliability; 3) Item category thresholds; 4) Unidimensionality; 5) Response dependency; 6) Differential item functioning (DIF); and 7) Targeting. A partial credit Rasch polytomous model was used. **RESULTS:** 283 patients completed the TSQM. The majority of patients had some college education, were female, and were on average 50 years old. Fit to the RMT model was examined which resulted in rescoring items with disordered thresholds. Item residual and person residual were of 0.0 ± 2.14 and -0.12 ± 1.54 respectively. The Person Separation Index was 0.88. DIF was assessed for gender using analysis of variance and non-uniform DIF was observed for 7 items. Unidimensionality was assessed using independent t-tests between subsets of items identified by a principal component analysis of the residuals, and 12.5% of t-tests were statistically significant (at the recommended alpha level of 5%). Finally, we assessed targeting, and person to items threshold distributions showed a reasonable targeted scale to person thresholds. Items' order from lowest to highest treatment satisfaction was examined. **CONCLUSIONS:** The TSQM has undergone extensive psychometric assessments leading to several versions. An examination of the psychometric properties using mixed methods is granted to improve the scoring and psychometric properties of the measure.

PHP212

ASSESSMENT OF HEALTH-RELATED QUALITY OF LIFE (HRQOL) OF GENERAL POPULATION OF KHYBER-PAKHTUNKHWA (KPK) BY DEMOGRAPHIC CHARACTERISTICS

Nasim A[1], Haq N[1], Abidi SS[2], Jaffri SB[3], Riaz S[1]
[1]University of Balochistan, Quetta, Pakistan, [2]Institute of Pharmacy, Lahore, Pakistan, [3]Muhammad Medical College Mirpurkhas, Mirpurkhas, Pakistan

OBJECTIVES: This study aimed to measure and analyze Health-Related Quality of Life (HRQOL) of general population of Khyber-Pakhtunkhwa (KPK). **METHODS:** A cross-sectional study was conducted in KPK. Population sample (n=1971) was collected from Pehsawar and Sawat by using stratified sampling approach. The EQ-5D 3L tool was used to measure health-related quality of life (HRQOL) of healthy population of KPK by socio-economic demographic characteristics. The descriptive and inferential statistics have been done by using SPSS version 20. **RESULTS:** Result showed that mean age of respondents was 24.15 years. Maximum respondents 59.1% were female. Majority of respondents 53.3% had no any income as most of the respondents 42.8% were students. Maximum 81.4% were from urban locality. Eighty percent were single and most of respondents 85.5% had their own house. Total of 60 health states reported by the respondents of which most prevailing was having no problems in any domain. EQ-5D descriptive score and EQ-VAS score were 0.80 ± 0.24 and 0.78 ± 0.20 respectively. The percentage of people responding to any problems in the five EQ-5D-3L dimensions increased with age and females have better health as compared to male in all age groups. Comparison of mean score and inferential statistics shown all demographics were significantly associated ($P<0.01$) with mean EQ5D score and VAS. **CONCLUSIONS:** This study showed KPK population HRQOL data measured by the EQ-5D tool. Current study concluded that health status of KPK people have same EQ5D trend in which younger age have better health states which reduced as age increasing. Better female health states were observed which showed males are more prone to disease and sickness.

PHP213

WHAT IS BEING MEASURED IN PATIENT-REPORTED OUTCOME MEASURES? SYMPTOM QUESTIONS MAY OFTEN REVEAL IMPACT ANSWERS

Tutuncu A[1], Egan S[1], Evans C[2], Cala ML[2], Ryan A[2], Khurana L[3], Dallabrida SM[3]
[1]Endpoint Outcomes, Long Beach, CA, USA, [2]Endpoint Outcomes, Boston, MA, USA, [3]ERT, Boston, MA, USA

OBJECTIVES: To determine the cognitive retrieval process utilized by patients when asked to describe symptom severity. **METHODS:** 419 subjects with diabetes (n=104), chronic obstructive pulmonary disease (COPD) (n=104), depression (n=107) and osteoarthritis (OA) (n=104) were recruited through Boston media sources; eligible subjects were screened to confirm diagnosis. Subjects were provided a verbal descriptor scale ("none", "mild", "moderate", "severe", "very severe", and "as bad as I can imagine") at the research site and were asked to describe for their most bothersome symptom, in free text, what each response option meant to them. The data was then coded and analyzed using Atlas.ti. **RESULTS:** Subjects with depression, diabetes, COPD and OA most often reported their most bothersome symptom at each severity level in terms of the impact it had on them (62.6%, 39.4%, 28.8% and 32.7% respectively). In contrast, fewer depression, diabetes, COPD and OA subjects indicated the severity descriptors were associated with more traditional symptom descriptors (4.7%, 14.4%, 16.3% and 29.8% respectively). For example, subjects with OA were more likely to assign impact descriptors as: "none"="I feel great", "mild"="walk faster with a cane", "moderate"="take short breaks", "severe"="take more breaks when walking", "very severe"= "stay home and watch TV", "as bad as I can imagine"="stay in bed listen to radio" versus traditional symptom descriptors such as "none"="no pain", "mild"="annoying", "moderate" can deal with it", "severe"= hurt", "very severe"="hurt badly", "as bad as I can imagine"="like dying". **CONCLUSIONS:** In most cases across four disease areas, when subjects were asked to think about the severity of their most bothersome symptom, they considered the impact of their disease rather that symptom severity. Questionnaires that purport to capture information on symptom severity may actually be capturing the impacts of a disease.

PHP214

CONDITIONS WITH LOW MEDICATION ADHERENCE AND ASSOCIATED OUTCOMES: AN ASSESSMENT OF THE UNITED STATES POPULATION

Patel P[1], Annunziata K[1], Le Calve P[2], Apecechea M[3]
[1]Kantar Health, New York, NY, USA, [2]Kantar Health, Paris, France, [3]Kantar Health, München, Germany

OBJECTIVES: Medication nonadherence is a concern to physicians and stakeholders, as it is often associated with poorer health outcomes. The aims of this analysis are to (1) assess which conditions have the lowest rates of medication adherence, (2) compare adherence by age and by number of conditions, (3) assess health outcomes by adherence. **METHODS:** This analysis utilized results from the US National Health and Wellness Survey 2016. A stratified random sampling based on gender, age, and race/ethnicity was used to ensure representativeness to the adult (age 18+) population (based on US Census Bureau). Descriptive analyses were conducted to assess condition prevalence. Adherence to prescription treatments (using the Morisky Medication Adherence Scale, ©MMAS-8)1 was assessed among the more prevalent conditions as well as some lower prevalent conditions. Adherence was analyzed by age group and by number of conditions. Healthcare utilization, costs, and productivity impairment were also assessed by adherence levels. **RESULTS:** Among the conditions profiled, the ones with the lowest rates of adherence included: acne (55%), headache (46%), allergies (44%), dry eye (43%), migraine (41%), asthma (inhalers) (40%), social anxiety disorder (40%), bipolar disorder (40%), generalized anxiety disorder (38%), anxiety (37%) and heartburn (36%). Among the more prevalent conditions, the percentage of low adherence decreases as age increases. In assessing the general

trends by condition, compared to adults with high adherence, adults with lower adherence had: higher rates of emergency room visits, higher rates of hospitalizations, and greater work/activity impairment. **CONCLUSIONS:** Conditions that garner low adherence could suggest there is an unmet need. Since low adherence is associated with greater levels of resource utilization and impairment, understanding which conditions have low adherence could help inform stakeholders which conditions present opportunities for decreasing disease morbidity and improving outcomes. Further, understanding the reasons could also help determine appropriate measures for improving adherence.

PHP215

THE VARIABILITY AND COMPLIANCE OF PRESURGICAL IMMUNE ENHANCING SUPPLEMENTS OF PATIENTS ACROSS FOUR SURGICAL DISCIPLINES - A RETROSPECTIVE STUDY

Smalarz A[1], Ochoa Gautier JB[2], Glembot T[3], Lessar S[3]
[1]Strategic Market Insight, Acton, MA, USA, [2]Nestle Health Science, Florham Park, NJ, USA, [3]Valley Health Metabolic & Bariatric Program, Winchester, VA, USA

OBJECTIVES: Surgical procedures are invasive by nature and trigger a complex neurohumoral stress response which is critical to initiate physiologic recovery and tissue healing. Preoperative nutritional optimization with immune enhancing supplements containing arginine, omega-3 fatty acids and nucleotides modulates the stress response and reduces postoperative complications. Despite overwhelming evidence verifying the importance of preoperative nutritional intervention, preoperative nutrition protocols are not implemented consistently to promote patient compliance. The objective of this study was to evaluate the variability and compliance of surgical patients to their preoperative nutritional regimen. **METHODS:** A database including four surgical disciplines (major spine, bariatrics, total hip and knee replacement, and gastrointestinal malignancy) was developed to track variability and compliance with the nutritional supplementation. All patients were prescribed a five (5) day preoperative oral immunonutrition protocol. Patients undergoing bariatric or total joint replacement surgery were given a separate pre-operative class. On the day of surgery, the patient self-reported the number of cartons consumed. Using SAS, these records were analyzed to evaluate patient variability and compliance. **RESULTS:** 2,283 patients records were included in this analysis. Compliance varied among the disciplines. Patients undergoing total joint replacement (n=982) or bariatric surgery (n=267) had the highest compliance rate of 52% and 48% respectively. The lowest compliance rate was seen in those having major spine (n=833, 28.9%) or GI malignancy (n=201, 12.9%) surgery. **CONCLUSIONS:** Patient compliance did vary among the surgical disciplines. In addition, those patients who received a separate pre-operative class had higher compliance rates. Future research is needed regarding the source of the variability of compliance, including the impact of preoperative education, as well as the impact of compliance with preoperative nutritional regimens on outcomes.

PHP216

AVAILABILITY OF ECONOMIC DATA FOR THERAPEUTIC BIOLOGIC DRUGS IN THE US

Turkistani F[1], Seoane-Vazquez E[2], Rodriguez-Monguio R[3], Bin Sawad A[4]
[1]MCPHS University, Boston, MA, USA, [2]Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA, [3]University of Massachusetts Amherst, Amherst, MA, USA, [4]Umm Al-Qura University, Makkah, Saudi Arabia

OBJECTIVES: 1) to evaluate changes in product package inserts (PPIs) labeling and indications, 2) to evaluate the availability of economic evaluations assessing indications of biologics license applications (BLAs) marketed in the US in the period 1986-2015. **METHODS:** The FDA website was used to obtain information regarding the history of FDA approvals and labeling changes for BLAs in the study period. The labeling changes represent alterations of any section on a PPI including: indications, precautions, warnings, and adverse events. A search using FDA approved label and Micromedex was performed to identify changes in BLAs uses. For the economic evaluations, electronic search was done on Medline and Embase (1986 through August 15, 2016) for CEAs and CUAs studies assessing therapeutic biologics in the US. Key words included BLAs generic and branded names and "cost." Descriptive statistics were estimated using Microsoft Excel 2013. **RESULTS:** A total of 177 economic evaluations published in the period 1989-2015. The FDA approved 114 BLAs in the study period. The BLAs had an average of 4.3±6.0 indications, with an average 2.4±2.0 FDA-approved indications and 2.0±4.7 off-label indications. An estimated 39% of the therapeutic biologics, 29% of the FDA-approved indications and 8% of the off-label indications had at least one economic evaluation published in an indexed journal. There were a total of 882 labeling changes for BLAs in the study period, representing an average of 0.68±0.95 labeling changes for every year a BLA was available on the market. The most common FDA approval label changes for BLAs were supplements (59.64%) followed by labeling revisions (28.57%), and efficacy supplement with clinical data (8.96%). **CONCLUSIONS:** The economic information available for BLAs is limited and no economic evaluation was conducted for more than half of the BLAs marketed in the US. More BLAs economic evaluations are required for use by decision-makers.

PHP217

HEALTHCARE NEEDS OF INTERNATIONAL MIGRANTS IN RELATION TO NATURAL DISASTERS: THE CASE OF CHILE

Bernales M[1], McIntyre AM[1], Cabieses B[1], Repetto P[1], Espinoza MA[2]
[1]Universidad del Desarrollo, Santiago, Chile, [2]Honorary Visiting Fellow, Centre for Health Economics, University of York, York, UK

OBJECTIVES: Chile is Latin American country prone to natural disasters (NDs). Despite efforts to improve knowledge and effective strategies for prevention and control of NDs in this population, little has been explored related to international migrants (2.5% total population, N=550.000). We explored healthcare related needs of international migrants towards NDs in Chile. **METHODS:** Qualitative case study of the city of Valparaíso, one of the immigrant-densest cities in Chile and with one of the highest rates of NDs. We conducted 23 individual semi-structured interviews (12 women/11 men), until data saturation was reached. We transcribed interviews verbatim and conducted thematic analysis in NVivo Software. Ethical approve from UDD Ethics-Committee. **RESULTS:** We found two types of participants, those who had not had a NDs experience before (immigrants from bordering countries) and those who did (Central American/Caribbean countries). In both cases there was little knowledge around this topic. Healthcare needs towards NDs were: being trained on how to safely evacuate, how to cope with owns and relative's distress, understand the location of safe zones, and what the exact role of the healthcare system is, especially given that the largest response comes from unprepared community members and not experts/authorities. They request for official communication channels with authorities/healthcare experts at all times. **CONCLUSIONS:** International migrants have clear and urgent healthcare related needs in relation to NDs in Chile. This data should be integrated with ongoing strategies in the country, in order to protect the life and health of all residents in the country, including immigrants.

PHP218

PATIENT REPORTED OUTCOMES WITHIN THE FDA COA QUALIFICATION PROGRAM

Champion A
Healthcare Research Insights, Inc, Lake Forest, IL, USA

OBJECTIVES: Patient-reported outcomes (PROs) are increasingly important in drug development, HTA and patient care. FDA guidance on PROs was issued in 2009 and PROs were included in the FDA January 2016 Pilot Clinical Outcome Assessment (COA) Compendium. The objective of this analysis was to characterize the PROs in the Compendium to add to our understanding of which PROs are more likely to achieve regulatory acceptance. **METHODS:** The Compendium reports outcomes by FDA review division from COA Qualification Program submissions and approved NME labeling from 2003 to 2014; including outcome of interest, outcome assessment(s) and assessment type [PRO, observer-reported (ORO), clinician-reported (CRO), and performance (PO)]. The Compendium was reviewed to characterize PROs in the context of all outcomes within the review division and in aggregate. Frequency of outcome assessment type was determined. PRO outcome assessment tools were identified and characterized by "level" (e.g. generic, disease specific), type of data and collection method. **RESULTS:** Approximately 1/4 of Compendium outcomes had COA submissions, implying the majority of outcomes were from label claims. Outcome assessments were most frequently PROs (48%) or CROs (39%); POs (11%) and OROs (3%) were infrequent. All OROs were parent observations in pediatric studies. The number of PRO assessments was greatest in Pulmonary, Allergy & Rheumatology (22) and Gastroenterology & Inborn Error (21). As a percent of total outcome assessments, PROs were least frequent in Dermatology & Dental (13%) and Psychiatry (10%). Most PRO assessments measured signs and symptoms of disease. Pain and less frequently fatigue were measured in multiple disease states. Patient satisfaction with treatment was reported once, as was the SF-36. **CONCLUSIONS:** Within the FDA Pilot Clinical Outcome Assessment Compendium, patient-reported outcome assessments were frequent; however they were generally disease specific. A health-related quality of life instrument that could be used to compare outcomes across disease states was only listed once.

PHP219

EVALUATION OF IMPACT OF EDUCATIONAL INTERVENTION ON ADVERSE DRUG REACTION REPORTING BEHAVIOUR OF COMMUNITY PHARMACISTS IN SOUTH INDIA

Srikanth MS, Ramesh A
JSS University, Mysuru, India

OBJECTIVES: To assess the impact of educational intervention on ADR reporting behaviour of the community pharmacists in selected practice settings of south India. **METHODS:** A cross sectional study was conducted after educational program to assess impact of intervention on knowledge, attitude and practice of community pharmacists towards ADR reporting. A series of training programs were conducted to improve the awareness and to provide education to community pharmacists on ADR detection and reporting. Training program included basic concepts of ADRs, importance and application of ADR reporting, safety reporting methods, ADR reporting and documentation process as per national requirements, management of common ADRs, possible barriers in reporting. The impact of educational intervention was measured by reviewing number and quality of ADRs reported. Quality of ADR was assessed using prepared checklist. Barrier Assessment Questionnaire (BAQ) was administered to assess the barriers if any in ADR reporting. **RESULTS:** About 68 community pharmacists with mean age of 39.69 ± 8.65 years, with a practicing experience of 15± 2.5 years had participated in this study. During the 6 month regular follow–up, 82 ADR reports received from 23 (28%) trained pharmacists. Quality of ADRs were satisfactorily only for 68% of reports. However, remaining reports were not of satisfactory quality. Major barriers identified for under reporting were lack of time (83%), forgetfulness (68%), and shortage of time from patients (46%). **CONCLUSIONS:** The study findings suggest that educational intervention improved the ADR reporting culture among community pharmacists. However, quality of reported cases should be routinely reviewed to further strengthen reporting culture.

PHP220

PERCEPTION OF YOUNG ADULTS TOWARDS PREMARITAL MEDICAL SCREENING IN QUETTA CITY, PAKISTAN

Ahmed A[1], Anwer A[1], Haider S[1], Iqbal Q[1], Saleem F[2]
[1]University of Balochistan, Quetta, Pakistan, [2]University of Baluchistan, Quetta, Pakistan

OBJECTIVES: The aim of this study was to investigate the perception of young adults toward premarital medical screening in Quetta city,

Pakistan. **METHODS:** A cross sectional, descriptive study design was adopted. Perception of young adults towards premarital medical screening was assessed through a pre-validated questionnaire. The questionnaire was distributed to 1260 respondents of both genders. Descriptive and inferential statistics were used for data analysis. All analyses were performed by SPSS v. 20 and $p<0.05$ was taken as significant. **RESULTS:** Twelve hundred and sixty young adults participated in study with a response rate of 99.4%. Seven hundred and eighteen (57.0%) respondents were males and 924 (73.3%) belonged to age group of 18-23 years. Nine hundred and sixty four (76.5%) had no family history of heredity diseases. Although 1074 (85.2%) of the respondents had information about genetic diseases, 65% had little idea about premarital blood screening. Interestingly, while premarital screening was perceived as a good practice (996, 79.0%) and a method to save generations from genetic diseases (1152, 91.4%), 927 (73.6%) of the respondents still reported that they will not opt for premarital blood screening before their marriages. However, 828 (65.7%) were in favor of premarital screening only if a law is approved by the healthcare authorities. The Chi square test was used for cross tabulation and no significant association was reported among study questions and demographic variables ($p>0.05$). **CONCLUSIONS:** The current study concluded that majority of the participants had little idea about premarital blood screening. Additionally, premarital screening was not perceived as an important procedure before marriages. This reflects the lack of information towards premarital screening and the need of providing health education in order to improve the perception towards premarital screening among young adults in Quetta city, Pakistan.

PHP221

WILLINGNESS TO PAY FOR HEALTH CARE IN THE US: WHOSE PERSPECTIVE IS IT ANYWAY?

Treadwell S, Lu CY
Harvard Medical School and Harvard Pilgrim Health Care Institute, Boston, MA, USA

OBJECTIVES: There is substantial attention on value in health care. The value of a health technology may vary depending on the perspective used. We reviewed and analyzed willingness to pay (WTP) studies to understand the perspectives used for eliciting the value of health care. **METHODS:** We searched PubMed for English-language articles related to WTP for health technologies in the US published from 2006 through 2016. We extracted key features of studies, including the type of health technologies, disease category, and importantly, methodological differences including perspectives, elicitation methods, and mode of administration. **RESULTS:** Of 4,810 articles identified by our search, 104 relevant WTP studies were included. Thirty-three focused on a drug or treatment, 18 investigated diagnostics, and 53 investigated others including technologies, vaccines, and health programs/policies. Seventeen looked at infectious diseases, 16 focused on oncology, and 71 investigated other conditions including neurology and musculoskeletal diseases. Fifty-two studies surveyed patients, 13 included family members, and 25 studies used the general population to assess WTP out-of-pocket for a health intervention from an individual perspective. Seventeen studies used payment card method, 11 used discrete choice, and 14 used bidding game approach. Ninety-five studies estimated WTP from the individual perspective and nine from the societal perspective. **CONCLUSIONS:** There has been substantial variation in studies with respect to the type of technologies and diseases assessed and respondent characteristics. Almost all studies assessed technologies from the individual perspective. As perspectives influence the perceived value of the technologies, it is important to conduct WTP from both the societal and the individual perspectives.

PHP222

IS REDDIT A USEFUL SOCIAL MEDIA DATA SOURCE FOR DRUG OVERDOSE DISCUSSIONS AND OUTCOMES?

Thomas M[1], Anderson LS[2], Akhtar A[3], Rogg L[4], Schifano L[2], Powell GE[2]
[1]*GlaxoSmithKline, Collegeville, PA, USA,* [2]*GSK, RTP, NC, USA,* [3]*ZeroChaos, Orlando, FL, USA,* [4]*GSK, Research Triangle Park, NC, USA*

OBJECTIVES: To identify the strengths and limitations of Social Media for toxicovigilance, and to establish the extent to which relevant overdose discussions can provide safety-related outcomes. **METHODS:** This study was a retrospective analysis, conducted using English language Reddit posts (n=3579) spanning a 1 year period. Noise was removed from the data via key words, natural language processing, and crowd sourcing via Amazon Turk, to identify in-scope posts prior to making posts available for manual curation. **RESULTS:** Of the 3579 total posts evaluated, 60.7% (2172) were discussing events other than overdose (e.g. drug abuse, illicit drug use); 39.3% (1406) contained overdose discussions- 16% (573) of the posts were determined to be intentional overdoses, 6.6% (236) were unintentional/accidental overdoses and 16.7% (597) were unknown. 61% (858) of the 1406 posts were posted by the patient; 38% (534) were unknown/other and 0.9% (13) was posted by Healthcare Providers. Overdose symptoms were discussed in posts 58% of the time (815), co-morbidities 8% of the time (112) and dose information was provided 4% of the time (56). 27% (390) posts mentioned overdose help and the action taken as a result of the overdose included going to the hospital 20% (78), calling healthcare provider 8% (31) and other 45% (175). 210 (15%) overdose posts contained various overdose treatments. 271 posts (19%) mentioned overdose outcomes and included death in 10% of the cases (27), 11% recovering/resolving (30), 10% not recovered/resolved (27) and 69% of cases (187) recovered/resolved. The 3 most commonly discussed drugs were: Amphetamine and dextroamphetamine (156), Acetaminophen (89) and Diphenhydramine (60). **CONCLUSIONS:** Social media (Reddit) data provides relevant, data rich discussions on drug overdose including: overdose symptoms, drugs involved, comorbidities, treatments and patient outcomes. Additional research is required to further assess the value of this data for various toxicovigilance activities.

PHP223

DIGITAL TRACKERS SHOW THAT HIGH INTENSITY EXERCISING AND CONSISTENT SLEEP PATTERNS ARE ASSOCIATED WITH POSITIVE SELF-REPORTED HEALTH STATUS

Kumar S, Quisel T, Foschini L, Juusola J
Evidation Health, San Mateo, CA, USA

OBJECTIVES: Behavioral data (e.g., steps and sleep patterns) from activity trackers can provide valuable insights into an individual's overall health and wellness. However, the relationship between behavioral characteristics and perceived health and quality of life (QoL) in the general population has not been quantified. In this analysis, we examined the association between behavioral traits inferred from passive trackers and self-reported overall health, physical health, mental health and QoL. **METHODS:** Members of an online health community were invited to participate in a survey that included ratings of perceived overall health status, physical health, mental health and QoL on a 5-point Likert scale, as well as characteristics such as age and gender. We used their activity information recorded from health trackers and apps over the past five months to compute per-patient daily mean and standard deviation of step and sleep metrics such as step count, sleep duration, maximum steps taken in a continuous 30-minute interval per day, and sleep efficiency. Weight was also collected from connected scales. For 7,261 individuals, we used the various computed behavioral characteristics as explanatory variables in standard regression models to predict perceived overall health, physical health, mental health and QoL while controlling for age and gender. **RESULTS:** On average, the study population took 10,588 steps per day and slept 6.6 hours per night. Weight was negatively associated with perceived overall health status, physical health and QoL. High intensity exercise and consistent sleep length had statistically significant associations with positive perception of overall health, physical health and mental health, and high self-reported QoL. **CONCLUSIONS:** Our results indicate that individuals who frequently engage in rigorous exercising and sleep a consistent amount nightly also have positive perceptions of their health, wellness and QoL. Further research should be conducted to determine if these relationships hold true among disease-specific populations.

PHP224

PATIENTS CONSIDER TRAINING A NECESSARY PART OF CLINICAL TRIALS, PREFERRING READILY-ACCESSIBLE INTERACTIVE ELECTRONIC TRAINING

Ly JJ, Durand EM, Gary ST, Tuller JM, Dallabrida SM
ERT, Boston, MA, USA

OBJECTIVES: As patient-reported outcomes (PROs) are often primary or secondary endpoints in clinical trials, regulatory PRO guidance recommend patient training to improve data quality and reduce variability. This study explored patients' views on the importance of training and their preferred mode for training. **METHODS:** 437 Participants reported on an online survey their opinions regarding 1) the necessity of training during clinical trials, 2) preferred training material format, and 3) accessibility of materials for the duration of the trial. Participants were also asked how they would handle questions that may arise when completing questionnaires. Demographic information, including age, education level, and household income were recorded. **RESULTS:** 95.4% of participants indicated that educational materials and training were "definitely needed" (75.5%) or "somewhat needed" (19.9%). With modes of training, 71.6% of participants reported they preferred completing interactive training on mobile electronic devices or the internet as opposed to 27% who preferred paper guides to take home. 89.9% of respondent considered accessibility to the training to refresh on the information during the trial "definitely needed" (58.2%) or "somewhat needed" (31.7%). Should they have questions completing a questionnaire, 46.2% stated they would ask the trial doctor, 40.5% would look up information online or in reference materials, and 12.6% would try to pick the best answer. **CONCLUSIONS:** Our study found that the vast majority of participants considered educational materials and training a necessary part of clinical trial participation. Moreover, most participants preferred electronic modes of training and the ability to refresh on training materials. Less than half of the respondent would ask site staff to clarify questions, which may introduce inconsistency in PRO measures unless training is used to provide standardize instructions and key definitions. Our findings are consistent with regulatory PRO guidance and suggest that electronic interactive training could be used as an approach to improve data quality.

PHP225

ASSESSMENT OF PATIENT SATISFACTION AND PERCEPTION TOWARDS PHARMACIST AND PHARMACY SERVICES IN TERTIARY CARE HOSPITALS QUETTA, BALOCHISTAN

Ahmed A[1], Mustafa G[1], Haq N[2], Nasim A[2]
[1]*Department of Pharmacy Practice, University of Balochistan, Quetta, Pakistan,* [2]*University of Balochistan, Quetta, Pakistan*

OBJECTIVES: The Study aimed to assess patient satisfaction and perception towards pharmacist and pharmacy services in tertiary care hospitals Quetta, Balochistan. **METHODS:** Cross sectional study was conducted in tertiary care hospitals of Quetta to assess patient satisfaction and perception towards pharmacist and pharmacy services. The research instrument is designed and validated by Pakistan Institute of Medical Sciences and translated into Urdu by using standard translating procedure, comprises of 19 questions. Data collected from 1013 patients from January to September 2016. All analyses were done by using SPSSv20. **RESULTS:** Result showed that mean age of respondents were 43.95 years. 1013 respondents do not know about pharmacist. Majority of respondents (n=556, 54.9%) were male. Majority of respondents (n=179, 17.7%) matric as education. Most

of respondents (n=637, 62.9%) were have no income. Majority of respondents (n=837, 82.6%) were married. Majority were (n=647, 63.9) lived in their own house and from urban locality. Majority of respondents (n=290, 28.6%) were prescribed 6 medicines and large number of respondents (n=188, 18.6%) were dispensed 2 medicines. Maximum patients (n=693, 68.4%) showed poor satisfaction towards Pharmacists and pharmacy services provided to them. Comparison of mean score with demographics showed that there is no statistical significant difference found among demographics. **CONCLUSIONS:** Study concluded that patients were not satisfied with Pharmacy services provided to them and ultimately it results in patients show poor satisfaction, perception and appreciation of the pharmacists' role in the health care team. Pharmacists need to be able to reach out to patient, evaluate their reluctances and promptly offer explanation which was valued by the patients.

PHP226

EXPLORATION OF FEMALE WORKFORCE AND THEIR JOB SATISFACTION IN PUBLIC SECTOR HOSPITALS IN QUETTA, PAKISTAN

Noureen N, Haq N, Nasim A, Riaz S
University of Balochistan, Quetta, Pakistan

OBJECTIVES: To assess the female workforce and their job satisfaction in government hospitals in Quetta, Pakistan. **METHODS:** Mixed method Prospective and Retrospective study conducted on total of 579 female healthcare professionals in Government hospitals of Balochistan, Quetta from July-2015 to April-2016. All the female health care professionals (medical doctors, pharmacists, nurses) working in government hospitals targeted for the study. Study tool consists of Questionnaire for job satisfaction consists of domains i.e. Authority, Promotion, relation with patient, Relation with other health care provider, Pay and Professional development along with socio-demographic variables. All female employees present on their duties on time who agree to participate in study were included. Descriptive and inferential statistics have been done by using SPSS version 20. **RESULTS:** Majority of participants (n= 304, 52.5%) were nurses. having majority (n=155, 51.0) ranges between 25 - 30 years. Majority of them were married (n=184, 60.5%). Maximum respondents 97 (31.9%) were have experience of 1 – 5 years. Overall satisfaction score demonstrated that maximum respondents (n=500, 86.4%) were satisfied, association of mean satisfaction score with demographics was performed, none of demographics was significantly associated with overall satisfaction (i.e. $p>0.05$) except to job place (p=0.001) and Department (p=0.019). **CONCLUSIONS:** It is concluded that overall satisfaction was found to be satisfied, however it is showed that early career level in respondents were more satisfied, as the age level was increased there is low gradient of satisfaction with job.

PHP227

THE ASSOCIATIONS OF MULTIMORBIDITY ON HEALTH-RELATED LOST PRODUCTIVITY TIME IN A LARGE AND DIVERSE AUSTRALIAN PUBLIC SECTOR WORKFORCE: A CROSS-SECTIONAL SURVEY FROM AN EMPLOYEE PERSPECTIVE

Wang L[1], Cocker F[2], Kilpatrick M[1], Otahal P[1], Si L[1], Palmer AJ[1], Sanderson K[3]
[1]*University of Tasmania, Hobart, Australia,* [2]*Monash Centre for Occupational and Environmental Health (MonCOEH), Melbourne, Australia,* [3]*School of Health Sciences, University of East Anglia, Norwich, UK*

OBJECTIVES: Multimorbidity adversely affects health-related productivity loss. Sex may influence this relationship. This study aims to evaluate absenteeism, presenteeism and total lost productive time (LPT) due to multimorbidity from an employee perspective. **METHODS:** A 2013 Partnering Healthy@Work survey of state government employees in Tasmania, Australia (N=3,228, mean age 47 years, 71.9% women) was conducted as part of an evaluation of workplace health and wellbeing programs. Multimorbidity was defined as the co-occurrence of 2+ chronic conditions out of a pre-specified list of 20. Measures of absenteeism, presenteeism and LPT were obtained from employees' self-reported data over a 28-day period. Analyses were stratified by sex, and two-part models were used to estimate the associations between multimorbidity and productivity loss. **RESULTS:** This study included 3,086 respondents. The mean age of the sample was 47 years (SD=10). The majority of the respondents were female (71.7%). The average number of health-related total LPT was 0.8 (SD=2.3) and 1.0 (SD=2.7) days for men and women with multimorbidity, respectively. Both women and men with multimorbidity had greater odds of productivity loss due to absenteeism or presenteeism compared to those without, but women with multimorbidity had 40% and 30% more LPT due to absenteeism (RR=1.4, 95%CI 1.1-1.8) and presenteeism (RR=1.3, 95%CI 1.0-1.6), respectively, in women with day lost. However, there was no significant difference in men with day lost. **CONCLUSIONS:** This study identified the negative influence of multimorbidity on LPT and significant differences in LPT between men and women reporting multimorbidity. Female employees with multimorbidity were less likely to engage in their work due to presenteeism and absenteeism, and thus may require more attention in regards to planning preventive health care intervention strategies in a diverse, public sector workforce, particularly in female dominated occupations.

PHP228

AN ANALYSIS OF THE EVOLVING USE OF RWE BY IDNS TO INFORM CLINICAL DECISION MAKING

Powers E[1], Horowicz-Mehler N[1], Morris J[1], Denysyk L[1]
[1]*QuintilesIMS, New York, NY, USA,* [2]*QuintilesIMS, Durham, NC, USA*

OBJECTIVES: Availability of robust real world data (RWD) is quickly evolving; simultaneously, incentives driving use of RWD and RWE are changing clinical decision making. This study assesses what data IDNs are using to generate RWE and how they are using RWE. **METHODS:** A quantitative survey of 70 US IDNs and payers about RWD sources and uses of RWE. We assessed the type of evidence generated, therapeutic areas of greatest interest, analytic approaches used to generate RWE, and willingness to partner with different healthcare stakeholders. **RESULTS:** Despite having improved sources of RWD (95% have some integrated EMRs), only 18% of IDNs use these data in clinical decision making. Key challenges include the expense of generating and applying the evidence and lack of skills to generate the evidence. The IDNs surveyed indicated that they would like more guidance on how to generate RWE cost effectively. About a third of the surveyed IDNs indicated they would partner with pharma to achieve this. The TAs for which they use RWE most frequently are anti-infectives, cardiovascular / metabolic, critical care, inflammation, and oncology. In the future, IDNs indicated future use to include neurology, women's health and nephrology. **CONCLUSIONS:** IDNs make little use of RWE in their decision making, but their needs for RWE to manage clinical decisions effectively grows. IDNs' ability to generate and leverage RWE lags the increasing availability of RWD. They would like to use more RWE, but more cost-effectively than the current model. Because a meaningful number are open to collaborating with third parties including pharma, pharma has an opportunity to engage with IDNs to accelerate their evidence generation and make more efficient.

PHP229

ICER'S GENERALIZED BUDGET IMPACT MODELLING METHODOLOGY IS CONTRARY TO ISPOR TASK FORCE GUIDELINES AND THE METHODS OF OTHER HTA AGENCIES

Jaksa A, Liden D, Pontynen A
Context Matters, New York, NY, USA

OBJECTIVES: Budget Impact Analysis (BIA) is an important tool used in pharmaceutical pricing and reimbursement. We compared the BIA methods of the Institute for Clinical and Economic Review (ICER) to those of influential Health Technology Assessment (HTA) agencies. The aim was to determine whether they share similar BIA methods and goals and whether ICER is aligned with ISPOR's 2012 BIA recommendations. **METHODS:** We examined BIA methods guidelines of NICE, SMC, G-BA/IQWiG, PBAC, HAS, and CADTH, comparing them to each other and to ICER's methodology framework. We used ISPOR's 2012 BIA report on good practices as a benchmark for comparison. We assessed each set of HTA guidelines and methodologies to determine who conducts the BIA, the perspective of the BIA, and how the analysis is used. **RESULTS:** HTA agencies and ISPOR's guidance are consistent in their BIA approach, requiring assessments which address specific payers and policymakers and using real-world costs and populations. ICER uses a generic perspective, generally assuming wholesale acquisition costs, an unmanaged healthcare system (excluding cost-offsets or other resource considerations), with populations and uptake patterns that lack the specificity and applicability of those used by HTA agencies. ICER also uses a uniform budget cap in its analysis, potentially creating a bias towards lower cost drugs, regardless of effectiveness. ICER uses BIA and cost-effectiveness to determine whether the drug is affordable and provides good value to the healthcare system, and whether discounts are needed for the product-price to be "value based." HTA agencies primarily use BIA to aid in implementing their decisions. **CONCLUSIONS:** HTA agencies are more consistent with ISPOR BIA guidance than ICER. ICER's generic perspective and broad assumptions call into question the validity and usefulness of their BIA analyses, especially when used by ICER to make determinations about value and not, like most HTA agencies, solely to guide implementation.

PHP230

DEVELOPMENT OF A CONCEPTUAL FRAMEWORK OF "GOOD HEALTHCARE" FROM THE PATIENT'S PERSPECTIVE

McCaffrey S, Chan C, Hoole M, Chiauzzi E
PatientsLikeMe, Cambridge, MA, USA

OBJECTIVES: Research is lacking on the most important aspects of care and clinician performance from the patient's perspective. Utilizing concept mapping (CM), a mixed method (qualitative and quantitative), the primary objective of this study was to conceptualize "good healthcare" and aspects of healthcare that matter most to patients. Secondary objectives evaluated differences in prioritizing aspects of healthcare among (1) various patient populations and (2) patients and stakeholders. **METHODS:** This study consisted of two phases, (1) statement generation, and (2) CM. Statements about what constitutes "good healthcare" were generated from literature review, stakeholder interviews (clinicians, researchers, purchasers, measure developers, health IT) and survey of patients (n=157) and stakeholders (n=17), via the online Open Research Exchange platform of PatientsLikeMe (a social network for patients with life-changing medical conditions). The majority of patients in phase I self-identified as female (71%), White (85%), and Non-Hispanic (92%) with a mean age of 56 years, and reported 68 different primary diagnoses. The statement pool (n=1300) was reduced to 79 statements for CM. In the second phase, using ConceptSystems software, stakeholders (n=15) and patients (n=172) rated these statements on importance and sorted the statements into meaningful categories. The majority of patients in phase II self-identified as female (64%), White (82%), Non-Hispanic (86%) with a mean age of 57 years, and reported 51 different primary diagnoses. **RESULTS:** Preliminary results produced an 8-factor solution: (1) Doctor-Patient Communication, (2) Doctor Characteristics and Behavior, (3) Appropriate Care, (4) Outcomes, (5) Patient as an Active and Informed Participant in Their Care, (6) Office Attributes, (7) Team Communication, and (8) Insurance Limitations. Pattern matching (cluster ratings of importance) across various demographic/clinical variables (e.g., gender) revealed similar results across groups. **CONCLUSIONS:** The conceptual model generated from this study is the first step towards developing patient-reported performance measures, and may also have public policy implications.

PHP231
CURRENT SITUATION AND PROSPECT OF PRIVATE HOSPITAL IN CHINA
SHI H[1], Huang L[2], Xu L[2]
[1]Astrazeneca(China), Beijing, China, [2]Astrazeneca (China), Beijing, China
OBJECTIVES: To provide advices and future development directions for Chinese private capital invested medical institutions by analyzing the development of health resources from 2011 to 2015 in China. **METHODS:** The data of health resources were collected from National Health and Family Planning Commission of China. The data were divided into group public hospital (groupPub) and group private hospital (groupPvt). Descriptive analysis was applied by Excel. **RESULTS:** There were 27.587 thousand hospitals, 5.33 million beds and 5.071 million medical personnel in china in 2015. The number of groupPub institution is 13.069 thousand and accounted for nearly half (47.4%) in 2015. But groupPub accounted more than 60% of institutions in 2011. The groupPub is decreasing while the groupPvt is increasing from 2011 to 2015. The groupPvt increase around 15%. The number of beds in hospital is still increasing in both groups. The groupPub-bed was 4 times (4.3 : 1.03) as groupPvt-bed in 2015 and in 2011 even reached 7 times (3.24 : 0.46). The growth rate of groupPub-bed is around 6%. The growth rate of groupPvt-bed is still remained at 23%. From 2011 to 2015, the number of medical personnel increased fast in both groups. The groupPub-PPL was 5 times (4.28 : 0.79) as many as groupPvt-PPL in 2015 and reached 8 times (3.28 : 0.42) in 2011. The growth rate of groupPub-PPL is 7% and the rate of groupPvt-PPL is still remained at 17%. **CONCLUSIONS:** Private hospital has a significant gap from results than public hospital in China. Although government has been raising private capital invested medical institutions, but because of condition and the health environment, the development of private hospitals is still difficult. But private capital can coordinate with tired medical service of health care reform policy and transition into a specialist hospital. Private hospital will be occupied a place in the future medical environment.

PHP232
DISCRIMINANT VALIDITY OF A PATIENT-REPORTED SYNDROME SCALE: PHLEGM SYNDROME (PRS-PS) IN PATIENTS WITH PHLEGM SYNDROME
Yu L[1], Li Q[2], Zhang HY[1], Chen ZH[2], Zhou H[2], Yang GL[2]
[1]Affiliated Hospital of Liaoning University of Traditional Chinese Medicine, Shenyang, China, [2]Liaoning university of Traditional Chinese Medicine, Shenyang, China
OBJECTIVES: The study was conducted to compare the scores of a patient-reported syndrome scale: phlegm syndrome (PRS-PS) in patients categorized by baseline disease species, with a priori assumption that the primary phlegm symptoms of patients in different diseases were diverse from each other. **METHODS:**Healthy volunteers and patients with phlegm syndrome which mainly manifest as poor appetite, abdominal distension, greasy mouth, expectoration, heaviness in the body and sticky greasy coating, were enrolled. All the subjects were divided into young, middle-aged and aged subgroups determined by age. Patients with phlegm were separated into different groups accoring to baseline diseases. PRS-PS scores were compared between healthy subjects and patients and in different diseases. **RESULTS:**A total of 201 participants [86 health (age: 55, 40 males) and 115 patients (age: 59, 47 males)] completed the PRS-PS (ranging from 0-36, high score means less healthy). There were a variety of diseases concerning patients with phlegm syndrome, such as cardiovascular (29 cases), digestive (24), respiratory (14), urinary (11), endocrine (7) and other diseases (30). These total scores of young, middle-aged and aged subgroups for those patients were 13.3±5.02, 14.74±6.17, 12.55±5.4 compared to 1.91±1.35, 1.92±1.73, 2.53±2.23 for those healthy population respectively (P=0.000). The score of expectoration-item was the highest (2.57±1.16) in patients with respiratory diseases. The patients in digestive diseases showed the highest score (1.83±1.34, 2.63±1.10) in the item of poor appetite and abdominal distension. The score of the item of lost of taste and greasy mouth were high in patients with digestive (1.46±1.02, 1.67±1.20), respiratory (1.71±1.49, 1.43±1.40) and urinary diseases (1.60±1.51, 1.50±1.18), daytime somnolence (2.29±1.11) and sticky stool (2.14±1.35) high in endocrine diseases, heaviness in the body (2.40±1.35) high in urinary diseases. **CONCLUSIONS:** The measurement of expected differences in the PRS-PS scores by disease species and known groups supports the discriminant validity of the PRS-PS.

PHP233
AREA-LEVEL SOCIOECONOMIC STATUS INDICATORS FOR OBSERVATIONAL STUDIES OF MEDICATION USE: A COMPARISON OF ZIP CODE AND CENSUS-BLOCK GROUP BASED AGGREGATION
Gopalakrishnan C[1], Gagne JJ[1], Sarpatwari A[1], Dejene SZ[1], Dutcher S[2], Levin R[1], Franklin JM[1], Desai R[1]
[1]Brigham and Women's Hospital and Harvard Medical School, Boston, MA, USA, [2]U.S. Food and Drug Administration, Silver Spring, MD, USA
OBJECTIVES: Electronic healthcare data are critical for evaluating medication outcomes in routine care. However, they typically do not record information on socioeconomic status (SES), which may be an important confounder in observational studies. Therefore, we merged area-level SES data from the US Census Bureau with patient-level electronic healthcare data and compared broader-level ZIP code-based aggregation with more granular census-block group-based aggregation in an illustrative cohort of generic versus brand-name atorvastatin initiators. **METHODS:** We identified a cohort of generic or brand-name atorvastatin initiators between November 30, 2011 and December 31, 2013 from Medicare claims linked to electronic health records from the Partners healthcare system in Boston. Using geocoding, patient addresses were spatially linked to data from the American Community Survey to assign area-level SES variables to each patient based on the census block group and the ZIP code of his/her address. These variables were used to compute a validated deprivation measure, the RTI SES index, which incorporates measures of unemployment, education, poverty, and housing in a single measure (range 0-100). Correlation between block group-based SES index (SESBG) and ZIP code-based SES index (SESZC) was reported. Differences in the SES index between generic and brand-name atorvastatin initiators were evaluated using t-tests. **RESULTS:** Among 7,109 eligible patients, the mean (+/- standard deviation) SESZC (58.98 +/- 5.52) was similar to the mean SESBG (59.08 +/- 6.34), with a Pearson correlation coefficient of 0.81. When the SES index between generic atorvastatin initiators was compared to brand-name atorvastatin initiators, both SESZC (58.88+/- 5.50 vs. 59.79+/- 5.65) and SESBG(58.98+/- 6.35 vs. 59.89+/- 6.28) suggested that brand-name initiators had higher SES than generic initiators ($p<0.001$ for both). **CONCLUSIONS:** Aggregated SES data based on ZIP codes, which are easily accessible in most data sources, reasonably approximate SES data based on census block groups, which require availability of street-level addresses.

PHP234
BRAZILIAN EQ-5D-3L POPULATION NORMS
Monteiro A[1], Santos B[1], Cintra MA[2], Santos M[1]
[1]Instituto Nacional de Cardiologia, Rio de Janeiro, Brazil, [2]Instituto Nacional De Cardiologia, Rio de Janeiro, Brazil
OBJECTIVES: The EQ-5D is a widely used generic health-related quality of life measure commonly applied to describe health outcomes and to measure disease burden. This study aims to generate Brazilian population norms for EQ-5D-3L. **METHODS:** We performed a multicenter cross-sectional study was performed in three Brazilian urban areas. The final sample consisted of 5772 respondents, aged from 18 to 64 years. Amongst other information, respondents were asked to self-report their health status using the EQ-5D-3L descriptive system and visual analogue scale (EQ-VAS). Data on socio-demographic characteristics was obtained through specific questionnaires. The Brazilian TTO scoring algorithm was used to derive the utility values. **RESULTS:** Mean values were computed for both weighted index scores and self-rated health status (EQ-VAS), and stratified by gender and age groups. Health status declines with age, ranging between 0.87 for the youngest group 18-29 year-olds and 0.76 for 60-64 year-old. Men (0.85) reported higher scores than woman (0.79). Lower education levels were associated with lower EQ-5D index score in most age groups. **CONCLUSIONS:** This study provides EQ-5D reference values for the Brazilian population. These values can be used by local decision makers and researchers on economic evaluations and population health studies.

PHP235
INTERNATIONAL COMPARISON OF EQ-5D TARIFF SCORES BETWEEN THE UK AND JAPAN
Iwatani T[1], Noto S[2], Tsugawa K[1]
[1]St.Marianna University School of Medicine, Kawasaki, Japan, [2]Niigata University of Health and Welfare, Niigata, Japan
OBJECTIVES: Japanese researchers have insufficient health utility data on the Japanese population. Thus, they often resort to using parameters based on UK data in economic evaluations. Therefore, a need exists for an international comparison of EQ-5D tariffs between the UK and Japan as a fundamental validation analysis. The aim of our research is the evaluation of the differences in elicited EQ-5D-3L and -5L tariff scores across the range of different health states derived from the UK and Japanese populations. **METHODS:** Utility values are acquired from published database. (https://www.ohe.org/publications/valuing-health-related-quality-life-eq-5d-5l-value-set-england and http://www.niph.go.jp/ journal/data/64-1/supplement.xls)Tariffs derived from the two countries are compared using mean and standard deviation as well as the correlations between countries. **RESULTS:** The Japanese EQ-5D-3L score was 0.423±0.217, and that for the UK was 0.147±0.312. In the case of EQ-5D-5L, the Japanese score was 0.449±0.154, and that for the UK was 0.391±0.228. The corresponding correlations between countries were 0.74 and 0.91. **CONCLUSIONS:** We identified that the Japanese and UK EQ-5D-5L tariff are more highly correlated than are the EQ-5D-3L tariffs. One reason for the EQ-5D-3L tariffs being different is that the N3 score, which is a constant that is added if any level-three value is scored, varies substantially between the countries; specifically, the UK N3 score was 19.2 times higher than that of Japan. Although the role of EQ-5D-5L differs from that of EQ-5D-3L, utility data from EQ-5D-5L can be better extrapolated than can EQ-5D-3L utility values.

PHP236
ASSESSMENT OF HEALTH-RELATED QUALITY OF LIFE (HRQOL) OF GENERAL POPULATION OF FEDERAL TERRITORY OF PAKISTAN
Haq N[1], Nasim A[1], Riaz S[1], Shaheen H[1], Yasmin R[1], Ain QU[2]
[1]University of Balochistan, Quetta, Pakistan, [2]Riphah International University, Islamabad, Pakistan
OBJECTIVES: Assessment of Health-Related Quality of Life (HRQOL) Of General Population Of Federal Territory Of Pakistan. **METHODS:** A cross-sectional study was conducted in Islamabad and Rawalpindi. Population sample (n=2582) was collected by using stratified sampling approach. The EQ-5D 3L tool was used to measure health-related quality of life (HRQOL) of healthy population of by socio-economic demographic characteristics. The descriptive and inferential statistics have been done by using SPSS version 20. **RESULTS:** Result showed that mean age of respondents was 29.12 years. Maximum respondents 69.1% were male. Majority of respondents 19.7% had 20k-30k PKR income. Most of respondents 34.3% were having bachelor education. Occupation wise maximum respondents 26.2% were doing private job employee. Maximum 94.9% were from urban locality. Sixty-one percent were single and most of respondents 75.2% had their own house. Total of 56 health states reported by the respondents of which most prevailing was having no problems in any domain. EQ-5D descriptive score and EQ-VAS score were 0.58 ± 0.45 and 0.63 ± 0.33 respectively. The percentage of people responding to any problems in the five EQ-5D-3L dimensions increased with age and males have

better health as compared to female in all age groups except elder age group where females have better health as compared to males. Comparison of mean score and inferential statistics shown all demographics were significantly associated (P<0.01) with mean EQ5D score and VAS. **CONCLUSIONS:** This study showed federal territory population HRQOL data measured by the EQ-5D tool. Current study concluded that health status of federal territory of Pakistan people have lower EQ5D index score compared to other cities of Pakistan. Concern should be made to improve general health status of healthy people.

PHP237

ASSESSMENT OF THE QUALITY OF PHARMACOECONOMIC EVALUATION LITERATURE IN CHINA

Zhang F[1], He X[1], Xiang W[2], Li SC[3]
[1]Shenyang Pharmaceutical University, shenyang, China, [2]Shenyang Pharmaceutical University, Shenyang, China, [3]University of Newcastle, Callaghan, NSW, Australia

OBJECTIVES: To evaluate the quality of Chinese pharmacoeconomic evaluation literatures published between 2012 to 2014 retrieved from the Chinese National Knowledge Infrastructure (CNKI) to assess their adherence to the recommendations of the Chinese Pharmacoeconomic Guidelines. **METHODS:** Identified literature was screened according to pre-specifc criteria to access legibility for inclusion. Each included literature was systematically compared against the recommendations proposed by the Chinese guideline. The level of adherence was expressed descriptively as percentage. **RESULTS:** After culling, 259 literatures were included in the comparative analysis. When compared to a previous study evaluating the quality of similar literature published between 1997 and 2007, our results showed improvements in certain technical aspects over the years. Particularly, the improvement was seen in more diverse evaluation methods being used, increased use of cost-utility analysis (2.43% in 2012-2014 vs. 0.26% in 1997-2007) and use of discounting (45.00% in 2012-2014 vs. 4.35% in 1997- 2007). In addition, small number of studies were starting to apply modelling. **CONCLUSIONS:** The quality of economic evaluation literature had improved in recent years, with more researchers realizing the importance and necessity of using discounting, sensitivity analysis and modeling when conducting economic evaluation. Our study also highlights certain important areas when conducting economic evaluation needing further attention in China. These include the ICER threshold of economic analysis, more detailed guidance in performing sensitivity analysis and modelling as well as transferability of cost data across different regions. Overall, our results would support the positive contributing role of the Chinese Economic Guideline in promoting economic evaluation in China.

PHP238

A SURVEY OF THE NEED OF SLEEPING AND RESTING AMONG ICU PATIENTS

Pusztai D[1], Fullér N[1], Ferenczy M[2], Szunomár S[1], Boncz I[1], Máté O[1], Fusz K[1], Oláh A[1]
[1]University of Pécs, Pécs, Hungary, [2]University of Pécs, Szombathely, Hungary

OBJECTIVES: The aim of the research was to measure the changes in sleeping qualities and quantities in hospital and determine those factors what have the worst and best effects on sleeping. **METHODS:** Our research was retrospective, quantitative on the Cardiac Surgery Department of Pecs's hospital. The formula of addmission criteria were the age above 18, the time/place orientation, longer staying in intensive care unit (ICU) than 3 days (N=82). Beside a standard and own-structured questionnaire we examined the medical datas of the patients as well. To statical analysis we used the Ms Excel 2010 and SPSS 22.0. programms, Chi-square-probe, T-probe, linear regression statistic method, Mann-Whitney-U probe, descriptive statistics, and it came out that the p<0.05. **RESULTS:** In comparison of the sleep quality and quantity, both variables changed in negative direction in ICU. The most common factors that influence sleep are: thrist, uncomfortable posture, changed sleeping-programm, existing disease, probes and catheters and environmental noises. There is a significant difference between the sleep quality and quantity at home, in the ICU and on standard department (p<0.001). We found medium, positive connection between the feeling of pain and sleep quality at home (r=0.266, p=0.015), the sleep quantity in ICU and existing disease (r=0.314, p=0.004), probes and catheters (r=0.332, p=0.002), and noises (r=0.317, p=0.003). The ICU related factors (fright, closeness. detection of not real things) mostly influence the ICU sleep quality, quantity and the slept through hours amount. **CONCLUSIONS:** In changed environment, mainly in the ICU, the sleep quality and quantity are poor compared to home's and standard department's. The patients complain of many factors what have influenced the sleeping, including thrist and the uncomfortable posture.

PHP239

PROXIMAL VERSUS DISTAL IMPACTS OF DISEASE: DRIVERS OF BOTHERSOMENESS RATINGS IN PATIENT-REPORTED OUTCOME (PRO) STUDIES

Tutuncu A[1], Egan S[1], Evans C[2], Cala ML[2], Ryan A[2], Khurana L[3], Dallabrida SM[3]
[1]Endpoint Outcomes, Long Beach, CA, USA, [2]Endpoint Outcomes, Boston, MA, USA, [3]ERT, Boston, MA, USA

OBJECTIVES: To understand the rationale behind subjects' selections of their most bothersome symptom in PRO qualitative research. **METHODS:** 419 subjects were sampled in the areas of diabetes, chronic obstructive pulmonary disease (COPD), osteoarthritis (OA) and depression. Recruitment employed free-media-advertising-based population sampling methods in Boston. Eligible adult subjects were screened to confirm diagnosis and disease severity. Subjects in all four groups were asked to report the most bothersome symptom related to their disease and then indicate a reason for why they selected that symptom. **RESULTS:** Subjects in all four diseases most frequently chose their most bothersome symptom based on the impact it had on their lives. Subjects with diabetes (n=104) most commonly reported that a symptom was the most bothersome due to loss of productivity (14.4%) and that they felt a need for medication (11.5%). Subjects with COPD (n=104) most commonly reported that a symptom was the most bothersome due to it causing them to be less productive (26.9%). Subjects with OA (n=104) most commonly reported that a symptom was the most bothersome due to functional limitations (37.5%). Subjects with depression (n=107) most commonly reported that a symptom was the most bothersome due to it causing them to be less productive (17.8%) and that it negatively affected their activities of daily living (8.4%). That is, in depression subjects, limitations at work and home bothered subjects more than traditional symptoms of depression (e.g., feeling sad) or for COPD subjects, shortness of breath. **CONCLUSIONS:** The majority of patients across diseases reported a way in which the disease limited some aspect of their life. This implies that patients consider how their symptoms bother them in terms of impacts, and the impact of the disease matters to patients, rather than the symptom itself.

PHP240

SOCIOECONOMIC DISPARITIES IN MEDICATION ADHERENCE AMONG PRIVATELY INSURED PATIENTS IN THE UNITED STATES

Xie Z, Joyce G, St. Clair P, Goldman D
University of Southern California, Los Angeles, CA, USA

OBJECTIVES: Socioeconomic Disparities in Medication Adherence Among Privately Insured Patients in the United States. **METHODS:** This study analyzed the drug prescription history of patients enrolled in healthcare plans provided by a large private insurance provider from 2011 to 2013. We identified patients younger than 65 years old by the end of 2013, who were prescribed an oral antidiabetic (N=57,133), antihypertensive (N=159,227), or antihyperlipidemic (N=144,761) medication and filled it at least twice. We followed these patients for at least a year after their first fill and measured patients' adherence using proportion of days covered (PDC). We then studied the relationship between patients' adherence and their income, education and race using regression analysis to understand how much patients' characteristics (age, gender, geographic area of residence, and comorbidity), copay, income and education explains the racial disparity in medication adherence by type of medication. **RESULTS:** Across all three types of medications studied, we found significant disparities in medication adherence by socioeconomic status of the patients. White patients were more adherent than non-White (Asian, Black and Hispanic) patients. Medication adherence improves with patients' education attainment and income level. Socioeconomic disparities were largest for those on antihyperlipidemic medications. Our regression analysis on racial disparities shows that racial disparities persist, after we control for patients' characteristics, copay, education and income. We were able to explain more of the black and white gap in adherence compared with that between Hispanic and white beneficiaries. **CONCLUSIONS:** Privately insured patients from lower socioeconomic backgrounds are less likely to adhere to their medications. Reducing copay and improving patient's education could potentially reduce these disparities. However, more research and efforts should be made to understand their reasons for nonadherence and effective intervention mechanisms.

PHP241

MULTIPLE CHRONIC CONDITIONS IN OLDER PEOPLE AND THEIR EFFECTS ON HEALTH CARE UTILIZATION: A NETWORK ANALYSIS APPROACH USING SHARE DATA

Srakar A[1], Prevolnik Rupel V[2]
[1]Institute for Economic Research, Ljubljana and Faculty of Economics, University of Ljubljana, Ljubljana, Slovenia, [2]Institute for Economic Research, Ljubljana, Ljubljana, Slovenia

OBJECTIVES: The presence of multiple coexisting chronic diseases in individuals and the expected rise in chronic diseases over the coming years are increasingly being recognized as major public health and health care challenges. At present, the common belief is that persons with multiple diseases have high rates of health care utilization (Starfield, 2006; Glynn et al., 2011; Salisbury et al., 2011). In our article we want to study the influence of multiple diseases to health care utilization of the elderly, using network analysis and regression methods. **METHODS:** In our article we use SHARE dataset of Wave 5, including data on 14 European countries and Israel. We model the presence of multiple coexisting chronic diseases as a network analysis problem, controlling for endogenous network formation (Goyal and Joshi, 2003; Soramaki et al., 2007). This has special scientific relevance as, to our knowledge, network analysis has not been used so far to study this problem, and, also, very seldom before in the analysis using SHARE data. To appropriately model the presence of multiple chronic diseases we also use tools from multivariate analysis. To verify the effects of multiple diseases on the rates of health care utilization we construct several different health care utilization variables and model the effects of different combinations of most commonly connected diseases on the health care utilization using econometric models from causal inference (controlling for endogeneity). **RESULTS:** Preliminary results confirm that a) the method of network analysis can be used for this purpose and provides a set of 6 main groupings/clusters of diseases with common prevalence among the elderly; b) the groupings have strongly statistically significant effects on the health care utilization. **CONCLUSIONS:** The analysis provides a new statistical method and model with extensive applications for the analysis of multiple coexisting diseases in health economics and medical sciences in general in future.

PHP242

THE INFLUENCE OF TIME HORIZON ON RESULTS OF COST-EFFECTIVENESS ANALYSES

Kim DD[1], Wilkinson CL[1], Pope EF[1], Cohen JT[2], Chambers JD[2], Neumann PJ[2]
[1]Center for the Evaluation of Value and Risk in Health, Institute for Clinical Research and Health Policy Studies,Tufts Medical Center, Boston, MA, USA, [2]Tufts Medical Center, Boston, MA, USA

OBJECTIVES: To document variations in time horizons used in published cost-effectiveness analyses (CEAs) that assume a US payer perspective, and examine

how the assumed time horizon influences results. **METHODS:** We systematically reviewed the Tufts Medical Center Cost-Effectiveness Analysis (CEA) Registry. We included all US-based studies that: used a healthcare payer perspective, were published during 2005-2014, and received a Registry quality score of 4 or better on a seven-point scale. We classified the identified CEAs as short-term (time horizon ≤ 5 years) and long-term (> 5 years). We analyzed associations between study characteristics (e.g., intervention type, prevention stage, and funding sources) and the specified time horizon. Finally, we developed case studies with selected interventions to illustrate the association between the time horizon and the cost-effectiveness estimates. **RESULTS:** The literature review identified 782 articles that met our inclusion criteria. Among the identified studies, 552 studies (74%) utilized a long-term time horizon while 198 studies (25%) used a short-term horizon. Of 32 studies that employed multiple time horizons, we reviewed 23 intervention-specific incremental cost-effectiveness ratios (ICERs). The extension of the time horizon yielded more favorable ICERs in 19 cases, and less favorable ICERs in 4 cases. In our case studies, the use of a longer time horizon also yielded more favorable cost-effectiveness ratios. **CONCLUSIONS:** The time horizon used in CEAs can substantially influence the value assessments of medical interventions. To capture broad societal impacts on costs and health effects, we encourage the use of time horizons that extend sufficiently into the future.

PHP243

EVALUATION OF MEDICATION ADMINISTRATION ERRORS BY PHARMACIST IN PEDIATRIC INPATIENTS

Ahmed T[1], Haq N[1], Rehman M[2], Wagas M[3], Minhas M[1], Anwar M[1], Mehmood S[2]
[1]University of Balochistan, Quetta, Pakistan, [2]Bolan Medical Complex Hospital, Quetta, Pakistan, [3]Hanyang University, Gyeonggi-do, Ansan, South Korea

OBJECTIVES: The study was designed to evaluate the frequency of administration errors and prevention Strategy in a pediatric ward of a teaching hospital, Quetta, Pakistan. **METHODS:** The study was prospective observational based, assessment of all the treatment chart of admitted patients by Pharmacist during the study period and analyzed the medication administration errors as per WHO guidelines. Data was collected from pediatric ward Bolan Medical Complex Hospital, Quetta from the period of October - November 2015 in a data collection form. Data was analyzed by using SPSS version 20. **RESULTS:** The total number of 287 patients treatment chart were assessed and the total drug administration were 8179, out of which drug administration to male patients were 5156 (63%) and female patients 3023 (37%). The total administration errors were recorded 6718 (82.13%), which include 6607 (98.34% of total errors) were omission errors, followed by 43 (0.64%) wrong time error, and 41 (0.61%) un-authorized drug error. **CONCLUSIONS:** There was a high percentage of administration errors in inpatient settings in which omission error was most frequent administration error made by nurses during the process of medicines administration. The only solution is that the educational training should be provided to nurses improve their administration process skills according to World Health Organization guidelines and Pharmacist intervention is needed in this regard.

PHP244

SATISFACTION WITH LIFE AMONG GENERAL POPULATION OF PUNJAB. PAKISTAN

Akram A[1], Fayyaz F[1], Hamid R[2]
[1]University of Balochistan, Quetta, Pakistan, [2]University of Milan, Milan, Italy

OBJECTIVES: To evaluate the satisfaction with life of general population of Punjab. Pakistan. **METHODS:** The study was designed as a cross sectional, online survey. Satisfaction with life was assessed by using Ed diener Satisfaction with Life Scale. Descriptive analysis was used to elaborate people's demographic characteristics while inferential statistics were applied to report the association among study variables. $P<0.05$ was taken as significant. **RESULTS:** A total of 960 participants responded to the survey. The cohort was equally distributed in terms of gender and was dominated by participants of 20-25 (44.5%) years old. Seven hundred and twenty (75.0%) were unmarried and 392 (40.8%) had graduate level of education. Overall 682 (71.0.5%) participants reported satisfaction with their lives. Two hundred and fifty-six (26.7%) participants were dissatisfied from their lives respectively. People in urban locality have positive trend of satisfaction when compared with the rural ones. No significant association was reported among other study variables. **CONCLUSIONS:** This study provides baseline assessment for the Satisfaction with life of general population of Punjab, Pakistan. The study revealed the impact of the following conditions on the various satisfaction with life domains measured: Education, work, personal income & Locality. Overall the percentage of study correspondents who are satisfied with their life (71.05%) is more as compared to the percentage of dissatisfied people. satisfaction with life could be further improved if better job and education opportunities are provided.

PHP245

RELIABILITY AND VALIDITY EVALUATION OF A PATIENT-REPORTED SYNDROME SCALE: QI-DEFICIENCY SYNDROME (PRS-QDS): QUALITATIVE METHODS

Yu L[1], Zhang HY[1], Wu TS[2], Li Q[2], Wang SQ[2], Qi wC[1], Yang GL[2]
[1]Affiliated Hospital of Liaoning University of Traditional Chinese Medicine, Shenyang, China, [2]Liaoning university of Traditional Chinese Medicine, Shenyang, China

OBJECTIVES: A self-rating scale for patients with Qi-Deficiency syndrome was established. This study was aimed to evaluate the reliability and validity of the PRS-QDS. **METHODS:** The reliability was assessed by retest reliability and intrinsic consistency reliability. The scale was filled again after 24-48 hours to evaluate the retest reliability. The Cronbach's α coefficient was used to assess the intrinsic consistency reliability. Content validity was assessed through the normative, rational and accurate study of the scale. Exploratory factor analysis was used to assess the construct validity. Studies have found that there was a correlation between Qi deficiency syndrome and hemoglobin concentration (Hb), Hb was used as the criterion validity of Qi deficiency syndrome. **RESULTS:** A sample of 130 patients (average age: 54, 46 males) completed the PRS-QDS. 96% of the patients completed the scale, and the median completion time was 2.2 min. The retest reliability of the scale was 0.954, and ranged from 0.872 to 0.972 for the 10 items. The Cronbach's α coefficient of the scale and three dimensions: fatigue, shortness of breath and spiritlessness were 0.827, 0.674, 0.768 and 0.614 respectively. The correlation coefficients of 3 dimensions and their respective dimensions were 0.771-0.866. Spearman correlation coefficients between total score and 10 items were 0.369-0.761. Three common factors were extracted through the maximum variance rotation method consisting with the theoretical fraymework. The correlation coefficient between hemoglobin concentration and the scale was -0.718. The global score, three dimensions and all items were negatively correlated with Hb. Higher PRS-QDS scores were associated with a lower hemoglobin concentration. **CONCLUSIONS:** The PRS-QDS was proved to have a good reliability and validity. Through this study, a practical, self-rating tool was provided for patients with Qi-Dificiency syndrome.

PHP246

ANALYSIS OF THE PART OF THE GENERIC DRUGS IN THE MEDICINES FORMULARY OF A MOROCCAN HOSPITAL CENTER

Lachhab Z, Serragui S, Cherrah Y, Ahid S
Mohammed V University, Rabat, Morocco

OBJECTIVES: The aim of this study is to determine le rate of generic drugs in tertiary hospital **METHODS:** In this study we carried out a qualitative and quantitative analysis of the part of brand name and generic drugs in the hospital medicines formulary of the Ibn Sina University Hospital Center of Rabat updated in 2016. **RESULTS:** From the 520 articles studied in the 2016 formulary, only 372 articles are retained in call for tenders of drugs (71.5%). The qualitative analysis showed a slight dominance of the brand name compared to the generics with 52% and 48% respectively. Regarding the quantitative analysis, generic drugs account for 59% of the global budget of the call for tenders. according to the ATC classification, The L, B and J class consume respectively the largest part of the budget allocated to the brand name (22.8%, 19.7%, 17%). Whereas for the generic, we find mainly the classes A, J and B (39.2%, 38.4%, 13.5 %) **CONCLUSIONS:** According to this study, we find that despite the procedure for the acquisition of medicines by tender, within our hospital center, the penetration rate of the first medicines exceeds half even if this mode of acquisition is in favor Of the lowest-priced drug that is the generic.

PHP247

POTENTIAL FACTORS ASSOCIATED WITH INTERVIEW QUALITY IN EQ-5D VALUATION PILOT STUDY IN TAIWAN

Chin H[1], Li C[2], Chen J[1], Hsu C[3], Tang C[4], Peng Y[5], Lin Y[4], Gau C[6], Lin H[1]
[1]China Medical University, Taichung, Taiwan, [2]China Medical University Hospital, Taiwan, Taichung, Taiwan, [3]Kaohsiung Chang Gung Memorial Hospital, Kaohsiung, Taiwan, [4]Taipei Medical University, Taipei, Taiwan, [5]Kaohsiung Medical University, Kaohsiung, Taiwan, [6]Center for Drug Evaluation, Taipei, Taiwan

OBJECTIVES: Following EuroQol EQ-5D valuation study protocol, Taiwan pilot study was just finished. The responses and quality control findings were obtained for quality improvement of interview. The aim of this study was to explore the other indicators to evaluate the QC and its potential associated factors in pilot study. **METHODS:** In addition to evaluate the main QC criteria in EuroQol EQ-5D valuation study protocol, we intend to explore the other QC parameters and its potential factors in EQVT study in Taiwan. While interviewers were informed to demonstrate the 3 practice time-trade off (TTO) tasks, the corresponding final answers could be the reference to anchor and compare the logic of participants' responses. Concerning Asian people tended to give up life in the worst health state, the responses toward the TTO final answers of the worst health status were compared and contrasted with that for the 3 practice TTO tasks. The associated factors of background questions using the descriptive analysis, independent ttests and appropriate bivariate analysis were also evaluated. **RESULTS:** In the pilot study, 10 trained interviewers have completed 50 pilot interviews. 26% of them ever experienced severe illness, 62% had their family members experience severe illness and 46% chose to give up 20 out of 20 years in the worst health state. While the TTO final answers for the worst health state was strongly correlated with that of severe practice of TTO task ($r=0.56$), those who experienced with severe illness in caring for others and disagreed that "bad living better than good death" tended to give up more time than the counterparts ($ps<0.05$). **CONCLUSIONS:** The associations of TTO final answers between the worse health state and the practice severe task and the participants' experience of severe illness and belief about "death" could be other potential factors to evaluate the quality of interview in EQ-VT study.

PHP248

NUTRITION INTERVENTIONS POSITIVELY IMPACT HEALTH OUTCOMES OF COMMUNITY-BASED ADULTS: A SYSTEMATIC REVIEW

Li J, Partridge J, Sulo S
Abbott Nutrition, Columbus, OH, USA

OBJECTIVES: Although ample research supporting the positive effects nutrition interventions have on hospitalized patients exists, less is known about the role nutrition interventions play on the health outcomes of community-dwelling adults. This review paper aims to systematically evaluate the literature exploring the association between nutrition and health outcomes among community-based patients, including free-living individuals and home care residents.

METHODS: PRISMA guidelines were followed for the literature review. Articles including original studies, pilot programs, and analytical reports of previously published papers were sourced from MEDLINE, EBSCO, Embase®, Foodline®: SCIENCE, and Google Scholar. After selection criteria were employed, only 24 of 401 (6.0%) articles were deemed eligible. **RESULTS:** Of the reviewed studies, majority explored nutritional interventions including oral nutritional supplementation (ONS), dietary advice, and nutritional counselling implemented for a minimum of 3 months. Majority of patients were free-living adults at-risk of or diagnosed with malnutrition. Most common study population were surgical patients; other populations included patients with oncology diagnosis, Alzheimer disease, gastrointestinal issues, chest infection, decompensated alcoholic liver disease, or disease-associated malnutrition complications. Among the improved health outcomes reported, anthropometric measures including less weight loss were the most common. Improved well-being/health status utilities, increased protein/energy intake, reduced readmission or postoperative morbidity or complications, and improved handgrip strength were frequently reported. Inconclusive results were reported regarding nutrition support impact on patient quality of life. **CONCLUSIONS:** Overall, nutrition interventions were found to have improved health outcomes among community-based patients. However, the reported studies are limited by their retrospective design, study setting heterogeneity, relatively small sample size, and lack of standardized measurements for assessing malnutrition and reported outcomes. Future research using more rigorous methods is needed to provide further support for the impact nutrition-based interventions can have on health outcomes of adults living in different community settings, and informing the design of new nutrition interventions.

PHP249

FROM RUSSIA WITH LOVE: VALUATION OF EQ-5D HEALTH STATES USING AVAILABLE DATA

Kind P, Gerry C
HSE University, St. Petersburg, Russia

OBJECTIVES: To calibrate EQ-5D using an extant Russian data sources. **METHODS:** The 2005 Russia Longitudinal Monitoring Survey (RLMS) contains data from 10,140 respondents (56.9% female) who self-reported problem levels on EQ-5D dimensions. An overall self-assessment of health (SRH) was also captured using a 5-point categorical rating scale (very good-very bad). Each respondent is represented by a vector of 6 elements – 5 indicating the level of problem on each of the EQ-5D dimensions and 1 indicating SRH status. Data were analysed using an ordinal regression with SRH as the dependent variable; each EQ-5D dimension/level was represented by a pair of dummy variables. The value decrements identified by the regression coefficients were rescaled so that full health scored 1 and the worst defined health status scored zero. A summary EQ-5Dindex score for each respondent was computed and used to test psychometric robustness including capacity to differentiate between known groups. **RESULTS:** 31% of respondents reported having no problems on ANY dimension. 94/243 EQ-5D health states were observed in the data. Pain/discomfort produced the highest decrements (level 2/3 = 0.149/0.291 respectively), followed by usual activities and mobility. The mean EQ-5Dindex in those with diagnosed cardiovascular or respiratory conditions was significantly lower (0.611 & 0.669 respectively) than the mean of corresponding population without (0.829). The index is higher for respondents who use healthcare resources less frequently. **CONCLUSIONS:** As in other countries, HTA in Russia, requires a value metric to quantify health benefits; however there are currently no Russian social preference weights for use in economic evaluation. Although the methodology used here is somewhat at odds with that used in other health jurisdictions, it is based on a standardised descriptive classification (EQ-5D) that has worldwide coverage. This study demonstrates the feasibility of calibrating EQ-5D using data that maintain national domestic integrity thereby avoiding reliance on values imported from 3rd party countries.

PHP250

DISCRIMINANT VALIDITY FOR A PATIENT-REPORTED SYNDROME SCALE: BLOOD-STASIS SYNDROME (PRS-BSS)

Yu L[1], Zhang HY[1], Zhang MC[2], Li Q[2], Yang KX[2], Pang lL[1], Yang GL[2]
[1]*Affiliated Hospital of Liaoning University of Traditional Chinese Medicine, Shenyang, China,* [2]*Liaoning university of Traditional Chinese Medicine, Shenyang, China*

OBJECTIVES: In a previous study, we had established a patient-reported syndrome scale: blood-stasis syndrome (PRS-BSS) which had satisfactory reliability and validity. This study aimed to assess the discriminant validity of the PRS-BSS for distinction in the two groups of patients and healthy people. **METHODS:** A sample of 50 cases of patients (age: 57±13years, 17 males) with blood stasis were enrolled. The patients mostly come from the department of cardiology, spleen and stomach, rheumatology. The patients completed the PRS-BSS and changhai pain feet pain score at the same time. 30 cases of healthy population(age: 53±11years, 11 males) completed the PRS-BSS. The discriminant validity of the PRS-BSS were examined by using statistical methods such as correlation coefficient, T test and analysis of variance. **RESULTS:** The scale was composed of 4 dimensions (activity, sleep, mood, and aggravation) and 10 items. The correlation coefficient of 4 dimensions and pain score were 0.703, 0.342, 0.461 and 0.495, respectively. The correlation coefficient of the PRS-BSS score and pain score was 0.741($P=0.000<0.05$). It was found that higher PRS-BSS scores were associated with the higher degree of pain. T test results showed that the scores of the patients with blood-stasis syndrome were obviously higher than those of healthy subjects ($P<0.001$), which indicated the PRS-BSS could distinguish the known people. **CONCLUSIONS:** The discriminant validity was good. Two groups of the patients and healthy people can be distinguished clearly.The efficacy assessment of the PRS-BSS will be needed to evaluate in the futher research.

PHP251

ERRORS IN PATIENT REPORTED OUTCOMES (PROS): PATIENTS' UNDERSTANDING OF HOW TO RECORD A HEADACHE DAY

Dias N, Zhao L, Durand EM, Gary ST, Tuller JM, Dallabrida SM
ERT, Boston, MA, USA

OBJECTIVES: Patient-reported outcomes (PROs) collected as endpoints in clinical trials often require patients to report symptom severity, frequency, or the impact of symptoms on quality of life. It is generally accepted that variability in PROs should be reduced to ensure data quality, however, assessment variability due to the subject's interpretation of measurement parameters may be overlooked. **METHODS:** We collected data from 485 individuals who were asked to respond to the following scenario, "If you were participating in a clinical trial that asked you to report how many days you had a headache in a week, and you had a headache from 8:00 pm Sunday night to 8:00 am Monday morning, does it count as 1 or 2 days with a headache?". In addition, demographic data, as well as whether patients have ever participated in clinical trials, were also collected. **RESULTS:** Among the total participants, 434 people responded to this question. A strong majority of responders (76.5%, n = 332) answered the question incorrectly. Only 23.5% (102 patients) answered the question correctly ("2 days. I had a headache on Sunday and Monday"). Of those that answered incorrectly, 27.1% (n= 90) felt that there was not enough information to answer the question. Interestingly, among this majority of 332 patients (76.5%) who chose incorrect answers, 94 (28.3%) also reported that they have participated in a clinical trial at some point. **CONCLUSIONS:** These findings suggest that without standardized training, patients have a wide-range of interpretations and would report highly variable data during a clinical trial. FDA guidance states that "the headache diary should be shown to be well defined and reliable for the target population." Therefore, custom training including specific guidance on headache diary completion and understanding of trial expectation would be highly beneficial in improving clinical trial data quality while complying with the FDA's recommendations.

PHP252

FATHERS IN CHILDBIRTH EDUCATION

Karácsony I[1], Böszörményi O[2], Brantmüller É[3], Szabó L[4], Ipolyi D[3], Boncz I[4], Oláh A[4], Pakai A[5]
[1]*University of Pécs, Szombathely, Hungary,* [2]*Veszprém County City Institute of Primary Health Care, Veszprém, Hungary,* [3]*University of Pécs, Kaposvár, Hungary,* [4]*University of Pécs, Pécs, Hungary,* [5]*University of Pécs, Zalaegerszeg, Hungary*

OBJECTIVES: Childbirth as one of the most beautiful events in an individual's life, has been integrated into the „healthcare machinery", being involved to the labor/delivery is unnatural to many fathers today. Our aim was to discover influencing factors of the fathers participating in childbirth education and the effect of their perceptions of the delivery. **METHODS:** Our study was set up in Veszprém, Hungary, in 2014 amongst families having the delivery the father involved. (N=100) We used mean, prevalence and Chi2 test to statistical analysis. Evaluation of the questionnaires was done by MS Excel software. **RESULTS:** Fathers with lower qualification has less knowledge on expecting a baby, and the awarding of childbirth education is also low ($p<0.05$). The higher the father is qualified, the earlier is his decision on the presence at the labor/delivery. Participation in childbirth education is depending on the baby's place in the birth-hierarchy ($p<0.05$), the qualification of the father ($p<0.05$), but not influenced by the fact if the child was planned or not in the family ($p>0.05$). Those with higher levels of education, prepare more consciously for having a baby. 94.5% of the mothers had positive experience about their partner's support in the labor/delivery, while after childbirth, 43% of the couples experienced positive change in their relationship. 29% of the interviewed mothers answered that the father becomes more understanding, 14% of them experienced better communication. Childbirth is a positive change of quality in family relationships ($p<0.05$), perceptions are strong and determining in the couple's life. **CONCLUSIONS:** Early involving the father in the prenatal care is important for their later relationship to their child. It is essential and necessary to provide more information to the lower qualified individuals, and also to emphasize the importance of childbirth education to fathers as well.

PHP253

HEALTHCARE PROFESSIONAL'S PERCEPTION WITH PHARMACIST'S RELATIONSHIP AND COUNSELING IN SAUDI ARABIA

Alomi YA[1], Al-Hathlool SA[1], Almulhim MI[1], Alashaq AA[1], Abo-Shalf Y[2], Alathan M[3]
[1]*Ministry of Health, RIYADH, Saudi Arabia,* [2]*King Fahad Hospital Alhasa, RIYADH, Saudi Arabia,* [3]*King Fahad Hospital Alhassa, Riyadh, Saudi Arabia*

OBJECTIVES: To explore the healthcare provider's perception of pharmacist's relationship and counseling in Saudi Arabia. **METHODS:** It is a 4-months cross-sectional survey of healthcare professional's perception and attitude toward pharmacists. The questionnaire consisted of two-part demographic information, and second part Sixty-Six questions divided into four domains. It included general understanding ideas about the pharmacist, healthcare professional's perception, and attitude during pharmacy visit, health professional's opinion with pharmacist's relationship and counseling, and healthcare provider's perception challenges and improves pharmaceutical care. The 5-points Likert response scale system, and closed, ended questions used. The survey distributed through social media to more one thousand lists through what's up an application. The study made an electronic format, and it analyzed domain three through survey monkey system. **RESULTS:** The total responders were (170) healthcare providers. Of those 150 (93.8%) was Saudi and 10 (6.3%) was non-Saudi. The gender distribution 129 (75.9%) was female, and 41 (24.1%) was male. The majority of them in age (18-44) 95.8% and located at Riyadh region 69 (41.6%), and East Province region 36 (21.7%). Most of the healthcare providers were pharmacist 81 (59.55%), nurses 27 (19.85%), and physician 24 (17.6%). The highest score of statements was the pharmacist

delivers the medication in a polite way (3.96), the pharmacist answer questions in an excellent way (3.67), all pharmacists characterized with courtesy and respect (3.45), and the pharmacists had carefulness and competency skills (3.23). The lowest statements scores were the pharmacist follow up and call the about patient conditions after dispensing (1.86), the pharmacist asks about medication compliance (2.71) and the pharmacist check about medication reconciliation (2.79). **CONCLUSIONS:** The healthcare professional's perception about communication and counseling need to improve with emphasis on medication follow-up, medication adherence, and medication reconciliation. Corrections of healthcare care provider's needs will improve the perceptions, the communications, and avoid the unnecessary additional cost.

PHP254

THE HEALTH STATUS AND COHERENCE- FEELING OF NURSES WORKING IN DIFFERENT WORK SCHEDULE

Fusz K, Bohner A, Pusztai D, Müller Á, Váradyné Horváth Á, Lendvai-Emmert D, Boncz I, Betlehem J, Oláh A

University of Pécs, Pécs, Hungary

OBJECTIVES: The coherence-feeling is the main element of salutogenesis which is a valid factor of health. The different work schedule influences the nurses circadian rythm and health condition. The aim of this research is to find the least stressful work schedule, to measure the health status and coherence-feeling of the nurses. **METHODS:** During the quantitative, cross-sectional research we used convinient sampling method to take the datas from four hospitals of the Southern Transdanubian region and in the breaks of the advanced trainings held by the Faculty of Health Sciences, University of Pécs. Altogether 355 nurses from standard departments filled the Sense of Coherence questionnaire. Data were analysed with t-test, chi-square test, ANOVA, Kruskal-Wallis and linear regression in SPSS 22.0. **RESULTS:** The 76.6 % of the responders thought that the irregular work schedule is more stressful than the regular ones. Out of the regular work schedules the best is: 1 daytime shift followed by 1 night shift and 2 days of break (62.5 %). The average point of the coherence-feeling is 61.76. The coherence-feeling of those who work in daytime shift is better than those work in shift work (t=2.933; p=0.004). Irregular work schedule nurses' coherence-feeling is lower than the flexible shift workers's (p=0.04). The most favourite regular multiwork schedule workers' coherence-feeling is higher than the secondly more frequent regular schedule workers' (p=0.022). Ppsychosomatic symptoms incidency is higher among nurses working in shift work than working in daytime work schedule (p=0.031). **CONCLUSIONS:** The irregularity of the work schedules are very stressful for nurses. Because of the health condition of the nurses- and the patient care- it is really practical to create the less stressful work schedule.

PHP255

EXPOSING PHYSICIANS TO RESEARCH METHODOLOGIES TO GAIN PROVIDERS' PERCEPTIONS AND PERSPECTIVES ON IMPROVING REAL-WORLD EVIDENCE (RWE): AN IN-PERSON PHYSICIAN FORUM METHOD

Ernst FR, Feinberg BA, Fillman J, Godat L, Nabhan C

Cardinal Health, Dublin, OH, USA

OBJECTIVES: The generation and utilization of real-world evidence (RWE) are reliant on the providers of healthcare, who make treatment decisions, assess results, and participate in research via pre- and post-marketing studies. To improve the value of analytical insights which inform clinical decision-making, researchers must help expose physicians to RWE research methods and then understand with physician perceptions and perspectives on the value of the generated data. The purpose of the research was to evaluate the value of live physician forums for these purposes. **METHODS:** Attendees are screened via online survey to achieve broad representation of geography, practice type and affiliations and preserve unique audience. Each forum has a RWE research topic focus e.g., patient reported outcome (PRO) methods, medical record reviews, database studies, limitations of clinical trials. Presentations to attendees and open forum discussions at each summit conference are used to gather instant feedback via an audience response system (ARS). **RESULTS:** Five forums were conducted with 320 oncology physicians between February 2014 and October 2016. An average of 64 physicians attended each forum. Most (85%) physicians attended a single forum, but others attended more than one. Almost all (94%) providers attending one forum believed that RWE studies are necessary to inform clinical practice due to the limitations of RCTs. In the same forum, 97% believed that RWE can drive efficiency and improve healthcare quality. Although >90% of providers in another forum believed that PROs are very/somewhat valuable for patient treatment, only 20% reported the ability to gather PRO data. A majority (86%) of physicians in another forum reported no previous involvement in any HEOR research, although most were willing. **CONCLUSIONS:** Understanding the perceptions and perspectives on evidence generation, including RWE, PROs, and RCTs is essential as medicine transitions to value based care. In-person physician forums facilitate information exchange between treating physicians and researchers.

PHP256

PATTERN OF MARKET EXCLUSIVITY AND THE ENTRY OF ABBREVIATED NEW DRUG APPLICATIONS

Wittayanukorn S, Dutcher S, Zhao L, Babiskin A

Division of Quantitative Methods and Modeling, Office of Research Standards, Office of Generic Drugs, Center of Drug Evaluation and Research, U.S. Food and Drug Administration, Silver Spring, MD, USA

OBJECTIVES: The Office of Generic Drugs (OGD) publishes bioequivalence (BE) guidances for specific products to support generic drug development. Each guidance describes the studies recommended for abbreviated new drug applications (ANDAs) that reference a particular new drug application (NDA). The purpose of this study was to evaluate the impact of BE guidance availability on the entry of generic competition when the reference product for a new molecular entity (NME) loses exclusivity. **METHODS:** A cross-sectional study using exclusivity and patent data from the Orange Book published in 12/2016 was conducted. Other sources include product-specific BE guidances, Drugs@FDA, and National Drug Code directory. Exclusivity patterns, distribution of ANDAs approved after loss of exclusivity (LOE), patent term-related to NME NDAs, and BE guidances-related to NMEs were examined using descriptive statistics and chi-squared tests. **RESULTS:** A total of 171 NME-associated NDAs with LOE between 7/28/2015-3/06/2027 were identified. The number of NMEs with LOE was highest in 2017 (n=34). As of 12/2016, LOE has happened for 33 NME NDAs; whereas 138 NME NDAs are still under their exclusivity period. Of the NME NDAs where LOE has happened, 12.5% have a generic approved/tentatively approved and the average number of ANDAs approved (±SD) per NDA is 2.25 (±1.89). For the remaining NME NDAs in this group with no generics, 82.14% are still under their patent term. Further, findings demonstrate that BE guidances were published prior to ANDA approval. On a yearly basis, BE guidances have been published for an average of 86.33% (±15.44%) of all NME NDAs. **CONCLUSIONS:** Although BE guidances cover for the majority of NDA with NME exclusivity, exclusivity period, as well as patent term, may determine the entry of ANDAs into the market after LOE has happened. Further studies are warranted to analyze other factors that may impact ANDA entry.

PHP257

DOES PROVIDING MORE SERVICES INFLUENCE HEALTHCARE UTILIZATION RATES AND PROCESSES OF CARE AMONG MEDICAL HOMES?

Djatche L[1], Alcusky M[2], Singer D[1], Hegarty SE[1], Keith SW[1], Lombardi M[3], Maio V[1]

[1]*Thomas Jefferson University, Philadelphia, PA, USA,* [2]*UMass Medical School, Worcester, MA, USA,* [3]*Parma Local Health Authority, Parma, Italy*

OBJECTIVES: To evaluate whether variability of healthcare utilization metrics and process of care exists in Medical Homes (MHs) depending on the extent of services offered. **METHODS:** A retrospective study was conducted using the 2015 population-based healthcare database of residents in Parma Local Health Authority, Emilia-Romagna, Italy. Data were analyzed for 118,356 patients ≥ 14 years receiving care from primary care physicians in small, medium and large MHs. Health care utilization metrics and process of care were computed for all patients across MH types. Healthcare utilizations encompassed hospital admissions, including ambulatory care sensitive conditions (ACSCs) hospitalizations, emergency department (ED) visits, specialty visits, pharmacy, 30-day and 90-day readmissions. Process of care measures comprised diabetes care metrics (e.g., HbA1c monitoring, microalbumin, lipid panel, eye exam). Negative binomial GEE regression models compared healthcare utilization rates and logistic GEE regression models compared the prevalence of process of care measures between MH sizes. **RESULTS:** Of all 16 MHs in Parma, 5 were classified as large MHs, 6 as medium MHs, and 5 as small MHs. There was no significant difference in healthcare utilizations across MH types, except for 90-day congestive heart failure readmissions that were higher in small and medium sized-MHs compared to large MHs (RR small vs large: 2.71, 95%CI:1.48-4.99; RR medium vs large:1.79, 95%CI:1.11-2.89). No significant differences for rates of recommended diabetes care processes were found, except for microalbumin tests that were more commonly performed in small and medium MHs (OR small vs large: 1.43, 95%CI:1.03-1.99: OR medium vs large:1.96, 95%CI:1.50-2.57). **CONCLUSIONS:** This early evaluation of recently implemented MHs found little evidence of differences in healthcare utilization metrics and processes of care among MHs depending on the scope of services offered. Further research is needed to characterize the relationship between healthcare metrics and organizational structures of MHs.

PAYER PERCEPTIONS AND UTILIZATION OF THE INSTITUTE FOR CLINICAL AND ECONOMIC REVIEW (ICER) VALUE ASSESSMENT FRAMEWORK

Tennant L[1], Gittings K[1], Migliaccio-Walle K[1], Campbell C[1], Danavar A[1], Kanaskar A[2]

[1]*Xcenda, Palm Harbor, FL, USA,* [2]*Thomas Jefferson University, Philadelphia, PA, USA*

OBJECTIVES: This study aimed to evaluate payer perceptions and utilization of the Institute for Clinical and Economic Review (ICER) Value Assessment Framework in coverage decisions. **METHODS:** A double-blinded, web-based survey was disseminated to 57 individuals within managed care organizations, heath systems, and academic institutions in November 2016. The survey assessed payers' experience and involvement with the ICER Framework, their perceived strengths and limitations of the Framework, and the level of influence the Framework had in recent coverage decisions. **RESULTS:** 55 payers representing 47 organizations completed the survey. All respondents were active members of a pharmacy & therapeutics committee. The majority of payers (67%) were familiar with the ICER Framework methodology and 36% reported reviewing one or more ICER evaluations within the preceding 12 months. Few participants (11%) reported that their organization actively engaged in a prior ICER review (eg, providing public comments, meeting attendance). 51% of respondents said that ICER's recommendations had not influenced decisions, 44% noted occasional influence on decisions, and 5% said the recommendations often influenced decisions within their organization. As a whole, respondents indicated that use of real-world evidence (60%), transparency of methodology (53%), and choice of clinical outcomes (44%) were strengths of the Framework. Limitations noted by payers included: timing of evidence reporting vis-a-vis decision making needs (45%), lack of stakeholder engagement (38%), and use of fixed thresholds for cost per quality-adjusted life year and budget impact (35%). Regardless of current application, the

majority of respondents (96%) agreed the Framework has potential to be more influential in future decision-making. **CONCLUSIONS:** While many payers are familiar with the ICER Framework and recognize its potential impact, its actual application in the decision-making process has been limited. Findings from this survey indicate that utilization for decision-making may be increasing, though additional studies will be needed to confirm anticipated trends.

PHP259

CROSS-COUNTRY VARIATION IN HTA PREFERENCES; QUALITATIVE EVIDENCE FROM AN INTERNATIONAL SURVEY OF STAKEHOLDERS

Efthymiadou O, Kanavos P
London School of Economics and Political Science, London, UK

OBJECTIVES: Several interviews with stakeholders have compared how Health Technology Assessment (HTA) activities, evidentiary requirements and approaches to dealing with uncertainty differ across countries. Nevertheless, no studies have elicited cross-country, HTA stakeholders' preferences on criteria that shape coverage decisions. We aimed to identify the extent to which prioritization of criteria, uncertainties and other factors that inform HTA decision-making differs across countries. **METHODS:** HTA stakeholders in Brazil, England, France, Italy, Netherlands, Spain and Sweden were invited via email to complete a survey. A number of clinical, economic and other criteria (i.e. rarity/orphan status and stakeholder input, among others) considered in HTAs, along with factors related to clinical evidence uncertainties, unmet need and innovative nature of treatment were ranked in terms of their importance on a 7-point-Likert-scale. Responses were anonymised and analysed using descriptive statistics. **RESULTS:** Responses were received from Brazil(n=9), England(n=7), France (n=10), Italy(n=6), Netherlands(n=3), Spain(n=3) and Sweden(n=3). "Achievement of/Concerns around clinical benefit" was the only clinical criterion/uncertainty ranked as 6(=high) and/or 7(=very high) in importance by 100% of respondents in each country. The requirement for/uncertainty around "Appropriate comparators" was highly important overall but country preferences fluctuated; i.e. ranked above 6 by more than 80% of respondents in all counties apart from Spain and Sweden (50% and 33% respectively). "Budget impact analysis" was the most important economic criterion overall, although not consistently ranked across countries; i.e. ranked above 5 by 100% of respondents in all countries apart from Italy and France (78% and 57% respectively). More subtle diffrences were identified in the priorities of innovation, disease severity and stakeholder input towards HTA decision-making across countries. **CONCLUSIONS:** We demonstrated cross-country variation in HTA stakeholders' preferences, especially for economic and other criteria related to innovation and unmet need, possibly underlying differences in HTA recommendations. Further investigations are required to map the patterns that differentiate coverage decisions across countries.

PHP260

DOCUMENTATION OF SYSTEMATIC REVIEW OR META-ANALYSIS IN NATIONAL PHARMACOECONOMICS GUIDELINES

Origasa H[1], Teramukai S[2], Noma H[3]
[1]*University of Toyama, Toyama, Japan,* [2]*Kyoto Prefectural University of Medicine, Kyoto, Japan,* [3]*Institute of Statistical Mathematics, Tokyo, Japan*

OBJECTIVES: To survey how much systematic review or meta-analysis (SR/MA) related items were addressed in national pharmacoeconomics guidelines. **METHODS:** We searched pharmacoeconomics guidelines by way of a repository of them from 33 countries (https://www.ispor.org/peguidelines/index.asp), public literature databases, and a paper dealing with a comparison of eight national guidelines for network meta-analysis (Value Health 2014;17:642-54.). Excluding method reviews, indirect comparison specific guidelines, unreadable documents, 16 general pharmacoeconomics guidelines were selected as a study population. They include Portugal (1998), Hungary (2002), France (2004), Austria (2006), Canada (2006), Taiwan(2006), Belgium (2008), Poland (2009), Ireland (2010), United States (2012), Norway (2012), United Kingdom (2013), Australia (2013), Germany (2013), South Africa (2013), Scotland (2014). We developed 26 checklists of SR/MA including 14 basic and 12 technical ones. **RESULTS:** Guidelines have been published from 1998 to 2014. All came from Western countries except Taiwan. SR/MA term and RCT/observational studies term were most commonly used in 13 of 16 (81%). Literature search was addressed in 10 of 16 (63%). Indirect comparison was addressed in 9 of 16 (56%). Guidelines of top 3 acceptance rate came from Germany (17/26=65%), United Kingdom (15/26=58%), and Scotland (13/26=50%) which were relatively recent ones. French and Portuguese guidelines did not accept any item related to SR/MA. Median acceptance rate was 5.5/26 (21%). **CONCLUSIONS:** Although national pharmacoeconomics guidelines have been published in many countries, only 21% of the SR/MA related items were addressed. Yet, it seems to be increasing in recent guidelines.

PHP261

THE CHANGING ROLE OF COST-EFFECTIVENESS IN COMMON DRUG REVIEW RECOMMENDATIONS

Mills F
Wyatt Health Management, Oakville, ON, Canada

OBJECTIVES: We sought to understand the changing role of cost-effectiveness analysis (CEA) at the Common Drug Review (CDR), the health technology assessment agency providing reimbursement recommendations to all provinces in Canada outside Quebec. The emergence of the pan-Canadian Pharmaceutical Alliance (pCPA) for collective price negotiation has changed the way CEA is used by CDR. Our analysis sought to characterize the use of threshold analysis, (i.e. explicit suggested price discounts calculated using HTA methods), the impact of elimination of confidential pricing, disagreement between submitted ICERs and re-analyses by CDR reviewers, and the fate of cost-effective drugs in negotiations with the pCPA. **METHODS:** Our analyses relied on publicly-available source documents, obtained primarily from the HTA agency's website. Documents included reimbursement recommendations, process updates and provincial public plan drug listing updates. We compared the percentage of drugs considered cost-effective, according to the text of the reimbursement recommendation, and its change over time since the introduction of new recommendation codes in 2012. We also determined the percentage of recommendations which included explicit threshold analyses, and also those with more general price recommendations. We also recorded the ICERs submitted and reported by CDR, and those considered plausible by CDR reviewers. Finally, we analyzed the time from HTA recommendation to completion of pCPA negotiations, focusing on the success of drugs considered cost-effective by CDR. **RESULTS:** Use of threshold analysis has increased dramatically, from 2.70% to to 37.21% of recommendations between 2012-2016. Confidential pricing has been used in 25-44% of submissions since 2012. 105/116 submissions receiving conditional recommendations since 2012 featured some form of price control. Disagreement between submitters and CDR reviewers is frequent and substantial, and only a minority of drugs are considered cost-effective. These drugs actually take longer to get through the pCPA negotiation process. **CONCLUSIONS:** CEA is used rigorously by CDR to secure substantial discounts for innovative treatments.

PHP262

AN ANALYSIS OF REAL WORLD DATA USE BY GLOBAL MARKET ACCESS STAKEHOLDERS

Tarlecki A, Horowicz-Mehler N, Powers E, Doyle JJ
QuintilesIMS Real World Insights, New York, NY, USA

OBJECTIVES: There are clinical and financial impacts of not having real-world data (RWD) upon market entry such as delayed approval, suboptimal reimbursement, and unfavorable re-evaluation. We aimed to assess the use of RWD for market access (MA) decisions globally and trends in the number of RWD studies to evaluate growing interest in RWD. **METHODS:** A global search was conducted in the HTA Accelerator©database from 2008 to 2016 for any recommendation of conditional reimbursement or approval requiring collection of RWD. An online search was conducted in the United States, United Kingdom, Australia, and Canada for uses of RWD by regulators and payers. Clinicaltrials.gov was searched for trends in the number of "observational" studies in the US and UK registered from 2010 to 2016. **RESULTS:** 17 HTAs recommended reimbursement or approval conditional on providing additional economic (7) or clinical (10) RWD. In the UK, the National Health Service is ramping up RWD capabilities by integrating clinical datasets. In Australia, the Pharmaceutical Benefits Advisory Committee is supporting risk-based approaches that condition reimbursement on RWD collection. The Canadian Agency for Drugs and Technologies in Health recently published a framework that suggests RWD may play a role in recommendations for orphan diseases. In 2016, the US issued a draft guidance on the use of RWD to support regulatory decision-making for medical devices. There was an increase in RWD studies in the UK, from 15.7% in 2010 to 21.5% in 2016 of all observational and interventional studies. RWD use declined in the US over the same period, from 18.2% to 15.1%. **CONCLUSIONS:** With the recognized value of RWD in MA decisions, there is a need to monitor stakeholders' use of RWD to optimize treatment access. There is also a need to approach evidence generation systematically to differentiate assets beyond approval and initial P&R.

PHP264

OPTIMIZING ICER'S 'CARE VALUE' FRAMEWORK: AN ANALYSIS OF STAKEHOLDERS' PROPOSALS FOR IMPROVEMENT

Beckerman R[1], Wong SL[2], Phillips AL[3]
[1]*Maple Health Group, LLC, New York, NY, USA,* [2]*EMD Serono, Inc., Billerica, MA, USA,* [3]*EMD Serono, Inc., Rockland, MA, USA*

OBJECTIVES: The Institute for Clinical and Economic Review (ICER) evaluates the value of medical technologies according to a proprietary 'care value' framework, which takes a third-party United States payer perspective. In 2016, ICER held a national call for suggestions for framework improvements. Herein is a critical assessment of publicly available stakeholder responses that were submitted to ICER. **METHODS:** 50 responses were submitted, 46 of which were publicly available. Suggestions/criticisms were extracted and classified by category (framework structure, framework methodology, parameter estimation, analysis perspective, or assessment) and respondent type (manufacturer, trade group, patient advocacy, consultancy, payer, or individual). Descriptive statistics were used to analyze trends. **RESULTS:** 17 patient advocacies, 12 manufacturers, 11 trade groups, 4 individuals, 1 payer, and 1 consultancy publicly responded to ICER's national call. 39 unique suggestions/criticisms of the framework were documented. The most commonly cited (>50% of respondents) included the limitations of a 'QALY-only methodology', the arbitrary nature of ICER's 'affordability cap', the lack of early and broad stakeholder engagement, and a lack of focus on the patient. Manufacturers and trade groups were most similar in their critiques, additionally focusing on the framework's lack of transparency, the conflation of 'value' with budget impact, the use of a static willingness-to-pay threshold across disease areas, the biases inherent with a short-term analysis horizon, and the lack of clinical expertise on the assessment panels. Patient advocacies were most likely to focus on the optimal role of the patient in ICER's assessment. **CONCLUSIONS:** Diverse stakeholders provided suggestions regarding ICER's value assessment of medical technologies. There is consensus among stakeholders that the framework's methodology should be revised, with a goal of focusing on the patient perspective of value, and that ICER's value assessment process should be modified to promote increased transparency and broad stakeholder engagement.

PHP265
REVIEW OF PUBLICLY AVAILABLE ECONOMIC EVALUATION REPORTS BY HAS
Motrunich A[1], Millier A[2], Aballéa S[2], Toumi M[3]
[1]Creativ-Ceutical, Rotterdam, The Netherlands, [2]Creativ-Ceutical, Paris, France, [3]Aix-Marseille University, Marseille, France
OBJECTIVES: In 2013, Economic and Public Health Assessment Committee (CEESP) was asked to review economic evaluations of innovative and high-budget-impact drugs/medical devices, and to publish efficiency opinions. The purpose of these efficiency opinions is to inform the price committee on methodological compliance of manufacturer's cost-effectiveness dossier, when confronted to French Health National Authority (HAS) recommendations. The objective of this study is to review and summarize deviations formulated by CEESP in dossiers published until December 2016. **METHODS:** All available published efficiency opinions published by CEESP were reviewed. Based on developed extraction table, a three-level classification was proposed to identify main CEESP deviations. Study objectives, structural choices, measurement and valorization of health states and costs, modeling, results presentation and sensitivity analyses were addressed as the principal dimensions with further split. Descriptive analysis was conducted for each assessed product depending on the type of CEESP deviation, and results were aggregated by topic. **RESULTS:** Overall, 19 efficiency opinions were identified on the official HAS website, among which 7 presented results that were invalidated by CEESP. All assessment reports included minor deviations and 90% of them reported at least one major or important deviation. Overall, 236 deviations were reported, the majority (62%) being minor, while 33% were considered important and 5% considered major. Main identified issues concerned results presentation and sensitivity analyses (55% of all major and 29% of all important deviations), as well as modeling methodological approach (27% of major and 34% of important deviations). **CONCLUSIONS:** CEESP considers an accumulation of methodological deviations to invalidate results. Our findings suggest that pharmaceutical industry could be more efficient in their initial submissions and during the dialogue with HAS, by avoiding most commonly identified problems in previous CEESP submissions. However, the lack of threshold leads to uncertainty on how these results impact price of intervention.

PHP266
VALUE FRAMEWORKS TO SET TONGUES WAGGING: ANALYSIS OF OPINIONS AND DISCUSSIONS ON THE MOST POPULAR VALUE FRAMEWORKS
Koczula KM[1], Noon K[1], Wickstead RM[2], Ghosh W[1], Uchea C[1], Kusel J[2]
[1]Costello Medical Consulting Ltd., Cambridge, UK, [2]Costello Medical Consulting Ltd., London, UK
OBJECTIVES: Value frameworks are a new and emerging field in the United States (US). Since the establishment of the Institute for Clinical and Economic Review (ICER), there has been much online debate on the use of value frameworks. We aimed to explore online discussions and opinions on five existing value frameworks. **METHODS:** A pragmatic literature review was conducted in Google using search terms for the ICER, American Society of Clinical Oncology (ASCO), Memorial Sloan Kettering Cancer Center DrugAbacus (MSKCC), and National Comprehensive Cancer Network (NCCN) value frameworks and the National Institute for Health and Care Excellence (NICE) in the United Kingdom (UK). The first 60 results for each term were screened against inclusion criteria. Eligible records included journal articles, blogs and open letters. Independent opinions were extracted for analysis and classified as positive/negative/neutral. **RESULTS:** A total of 67 records were included, providing 252 opinions for analysis. ICER was the most frequently discussed framework (50% of all opinions), yet 82% of comments on ICER were negative. Commonly cited criticisms were lack of transparency and reproducibility of economic models and need for more patient-centered evidence. The majority of negative comments were from patient representatives, clinicians and pharmaceutical companies. NICE, ASCO and MSKCC had 62%, 58% and 50% negative opinions, respectively. In contrast, the NCCN framework had the highest percentage of positive opinions (76%) related to being of significant value to physicians, transparent for patients and affiliated with outstanding research. **CONCLUSIONS:** ICER was the most discussed framework, but had the most negative comments, possibly due to ICER's call for feedback in July 2016. NCCN appeared to be the most positively received framework. Despite NICE being well established in the UK, the majority of opinions were negative. Limitations of this study include use of Google only and subjective opinion selection.

PHP267
HEALTH TECHNOLOGY ASSESSMENT NUCLEUS IN A REFERENCE PUBLIC HOSPITAL IN BRAZIL
Vinhas de Souza M[1], Ferreira MA[1], Moreira L[2], Grunwald B[2], Silva B[2]
[1]UFRGS.HCPA.GHC, Porto Alegre-RS, Brazil, [2]UFRGS.HCPA, Porto Alegre-RS, Brazil
Health Technology Assessment Nucleus (NATS) nested in reference hospitals nationwide distributed in Brazil were created in 2011-2012. Hospital de Clinicas de Porto Alegre (HCPA) a reference university public hospital in the southernmost province of Brazil stablished its nucleus in 2012, before this decentralized committees performed HTA evaluations. **OBJECTIVES:** Evaluate the results of NATS implementation at HCPA, by reviewing its technical production and analyzing the decisions referent to incorporations requests. **METHODS:** We reviewed all requests for inclusion of health technologies sent to NATS and Drugs and Therapeutics Committee (COMEDI) since October, 2012. The database evaluated included the online requests of health technologies filled during the time and the register of both committee meetings. The results of the requests for health technologies inclusion were categorized as accepted or rejected and also classified (according UK-NHS Innovation Center criteria and to 'Morgan et al' criteria) as innovation or not. **RESULTS:** During the period of time (Oct/2012-Dec/2016) there were in total 75 requests for inclusion of new health technologies (equipment, vaccines, health products and medicines) in the HCPA. Thirty-three of these requests concern the inclusion of equipment, vaccines or 'health products' and forty were related to medicines. Of the 73 requests 30 (13 equipment/vaccines/health products and 17 medicines) were accepted— 41% of all requests. Also 41% of all inclusion requests regarded innovative products and 43% of all incorporated technologies were considered innovations. **CONCLUSIONS:** Of all requests for health technology inclusion, less than half were accepted after evaluation. Considering the aspect innovation only 43% of incorporated health technologies represented innovative products, this proportion was even lower between the medicines. Possible causes are the high cost of these products and what does the term innovation could represent, notable when discussing innovate drugs—the variability of the 'level' of innovation is an important variable to consider.

PHP268
PERSPECTIVE USE OF HTA IN THE DECISION-MAKING PROCESS IN UKRAINE
Piniazhko O[1], Ilyk R[1], Zalis'ka O[1], Brezden O[2]
[1]Danylo Halytsky Lviv National Medical University, Lviv, Ukraine, [2]Jagellonian University, Krakow, Poland
OBJECTIVES: HTA introduction and implementation for the development of the National list of essential medicines (NLEM) took place in Ukraine in 2016 in the context of National Drug Policy for the time period until 2025.The regulation states that the selection of medicines should be based on HTA approaches. Consequently, HTA and pharmacoeconomic analysis is highly relevant currently in the decision making process in line with the international requirements. The study aimed to outline the main steps in HTA development in Ukraine in 2016 and future directions. **METHODS:** Systematic review, expert interviews within deliberative process with main stakeholders were conducted. A legislation, scientific publications on the study question were analyzed and presented. **RESULTS:** In Ukraine a legal framework was developed in 2016 for the elaboration of the National list of essential medicines. HTA should be used for the inclusion of medicines based on the applied evidence of quality, efficacy, effectiveness, safety and economic evaluations adhering to the Order of MOH No. 84 dated 11.02.2016 and Order of MOH No. 1050 dated 07.10.2016. HTA implementation in 2016 consisted of legislation, capacity building regarding HTA training for members of Expert committee of MOH and development of NLEM. Reimbursement programs for cardiovascular disease, T2D, asthma are going to be started in April 2017 due to the adopted regulations. **CONCLUSIONS:** HTA use in the decision-making in Ukraine will provide an access to innovative treatments for patients and transparent, consistent decision-making process in assessing the health technologies for inclusion on regulatory lists and reimbursement programs.

PHP269
INFORMING THE PROCESS OF INNOVATIONS UPTAKE IN HOSPITALS IN TUNISIA
Gutierrez-Ibarluzea I[1], Jameleddine M[2], Ben Brahem Touil A[2], Grati H[2], Asua Batarrita J[1], Zghal K[2]
[1]Basque Office HTA-OSTEBA. Ministry for Health, Basque Government, Bilbao, Spain, [2]National Instance for Assessment and Accreditation in Health Care, Tunis, Tunisia
OBJECTIVES: Informing about decisions taken is crucial in order to reduce variability in practice and inequities in the access to health care services in the same country. In many countries and regions, hospitals are autonomous in their decisions around the incorporation of health technologies, and different decisions could be taken about the same technology. Tunisia recently implemented a HTA agency (INASanté) to inform decisions around health technologies and it should have an impact in obtaining information around what has been implemented in real world practice and why. **METHODS:** An analysis of how decisions were taken for different technologies (drugs, procedures and medical devices) and which were the key elements of this decision-making process was performed. This comprised a SWOT analysis and direct contact with stakeholders for "in depth" interviews according to best practices in qualitative research. Based on this analysis, a flow chart of decisions was built and the main pitfalls were identified in order to make proposals to bridge the gap and structure the information around innovations uptake in hospitals. **RESULTS:** Weaknesses were: the inexistence of standardized forms for the inclusion of health technologies in the hospital formularies, the inexistence of explicit grids with criteria and the lack of information among hospitals around the decisions. The stakeholders identified INASanté as an opportunity to structure the process of technology uptake in hospitals, to standardize the processes and to centralize information around decisions. **CONCLUSION**S:Hospitals in Tunisia require a structured and informed process of health technologies uptake. This process should include: a standardized form for proposals submission, criteria for prioritization, a defined timetable for resolutions, a grid that includes criteria for decision-making and a centralized database of proposals and final decisions. Without compromising hospitals' independency, INASanté could propose a manual and centralize the information in order to avoid duplicates and reduce inefficiencies.

PHP270
PERSPECTIVE OF HEALTH TECHNOLOGY ASSESSMENT IN CHILD HEALTH CARE IN JAPAN
Gai R
National Center for Child Health and Development of Japan, Tokyo, Japan
OBJECTIVES: In Japan, the allocation of public health resource is expected to be based on a rational judgement on the social value, and Health Technology Assessment (HTA) serves as a powerful tool for the value assessment. Child health care is inevitably influenced by such the tendency of value-based approach. This

study aims to provide an overview and perspective of HTA in child health care, under a context of epidemiological transition, health care system and social changes in Japan. **METHODS:** Narrative review of health issues of children in epidemiological transition, child health care financing and provision system, challenges to evaluate pediatric health outcomes, and the expected role of value-based approach in policy making. **RESULTS:** The decrease of the overall child mortality has on aggregate led to relative increase in priority of two issues in child health care: a largely expended need of the long-term care for survivors saved by advanced neonatal and pediatric medicine but with disabilities and chronic diseases, even though the incidence is very rare; and an integrated support to child health and development targeting the majority of population at the community. A geographical disparity remains in child health care financing and provision. Adequate and effective resource allocation is expected to strengthen the child health care provision system by addressing its problems on sustainability. For effective resource allocation and the reform of the current provision system of child health care, a value-based approach is urgently necessary, even though compared to that in adult, the standard methodology for evaluation of health utility and outcomes in children is still waiting for the establishment. For child health care, the current standard methodology on cost-effectiveness have a limitation. **CONCLUSIONS:** HTA is expected to play a crucial role on evidence-based pediatric policy making. The evaluation methodology specific for children' health outcomes needs to be developed.

HEALTH CARE USE & POLICY STUDIES – Patient Registries & Post-Marketing Studies

PHP271

POSTMARKETING COMMITMENT TRENDS IN PEDIATRIC PATIENT POPULATIONS

Desai J, Albano JD, Sinclair S
INC Research, LLC, Raleigh, NC, USA

OBJECTIVES: In 2003, the Pediatric Research Equity Act (PREA) was passed to improve the quality of pediatric information in drug labeling. This legislation authorizes FDA to require pediatric studies of marketed drugs that are not adequately labeled for children after other opportunities to obtain data on a voluntary basis have been exhausted. The requirement for such studies may be waived if studies in children are impossible; there is evidence suggesting the drug will not be safe in children; the drug does not represent a therapeutic benefit over existing therapies for children or the drug is not likely to be used in a substantial number of children. We evaluated the trends in post-marketing commitments/requirements (PMC/Rs) in pediatric populations. **METHODS:** Publicly available FDA databases were analyzed to identify all new molecular entities approved between January 1, 2011 and January 1, 2016 and associated PMC/Rs in pediatric populations. Study designs were categorized as safety/non-safety, observational/interventional research, and drugs/biologics. **RESULTS:** Between 01/01/2011 and 01/01/2016, there were 414 newly approved products. Of these, 305 (74%) included at least one PMC/R, 157 (38%) included at least one pediatric PMC/R, and 154 (37%) were labeled for pediatric use. Among those labeled for pediatric use, 139 (90%) were drugs and 15 (10%) were biologics. There were 1,153 PMC/Rs in total. Among these, 555 (48%) were pediatric PMC/Rs. Of these pediatric PMC/Rs, 493 (89%) were drugs, 62 (11%) were biologics, 509 (44%) were safety studies, and 102 (9%) were observational studies. The greatest number of pediatric PMC/Rs was seen in infectious disease 140 (25%) and general medicine 68 (12%). **CONCLUSIONS:** Following passage of the PREA, many pediatric PMC/Rs have been required by the FDA. In the future, we should expect to see more pediatric PMC/Rs in drugs, safety studies, and for infectious disease and general medicine therapeutic areas.

PHP272

REFERENCE GROUPS USED IN PREGNANCY EXPOSURE REGISTRIES: CHALLENGES AND OPPORTUNITIES

Covington D[1], Buus R[1], Blum C[2]
[1]*Evidera, Bethesda, MD, USA,* [2]*PPD, Wilmington, NC, USA*

OBJECTIVES: Pregnancy registries monitor pregnancies exposed to specific drugs to determine risk of major birth defects. Ideally, registries should be designed to include internal reference groups. When this is not practical, external reference groups should be carefully selected. This study sought to examine reference groups used by pregnancy registries in 2017 versus 2009 and discuss pros and cons of each. **METHODS:** We collected data on all currently ongoing pregnancy registries identified on the FDA pregnancy website and compared data from 2017 with 2009. Sources of data included the FDA website, registry publications or websites, clincaltrials.gov, and registry staff. In the two time periods, we descriptively evaluated the number of ongoing registries, their characteristics, and reference groups employed. **RESULTS:** In 2009 we identified 38 pregnancy registries and obtained data on 79%. In 2017, we identified 103 registries and obtained data on 92%. In 2009 only 63% used an internal comparator versus 86% in 2017. Also, in 2009 only 73% used 2 or more comparators versus 81% in 2017. Internal comparators included unexposed women with/without the disease. External comparators included population-based rates, data from other studies and the literature. Each comparator has advantages and disadvantages; an external population-based comparator can provide stable estimates for specific malformations, whereas internal comparators usually have limited sample size to assess specific malformations but can provide more comparable estimates of overall malformations. **CONCLUSIONS:** Data from the FDA website indicate a 2.7-fold increase in pregnancy registries from 2009-2017. We noted a trend toward use of 2 or more comparators and toward use of internal comparators. Internal comparators may be scientifically superior but can be challenging and costly. While there is no ideal comparator for a pregnancy registry, using more than one generally improves overall validity and statistical power.

HEALTH CARE USE & POLICY STUDIES – Population Health

PHP273

CLINICAL AND HEALTH CARE USE IMPLICATIONS OF IMPROVING POPULATION HEALTH

Chen F, Iacobucci W, Dall T
IHS Markit, Washington, DC, USA

OBJECTIVES: This research quantifies the impact of achieving select population health improvements on disease prevalence and healthcare use. Such information can help inform how population health policies and practices might affect future patient outcomes and health system needs. **METHODS:** Using a previously published Markov-based microsimulation approach, we modeled a hypothetical scenario of sustained 5% body weight loss for overweight and obese adults; improved blood pressure, cholesterol, and blood glucose levels for adults with elevated levels; and smoking cessation. Published clinical trials and observational studies informed model parameters and achievable clinical improvements. Relationships between patient characteristics and healthcare use came from Poisson and logistic regression analysis estimated from the 2010-2014 Medical Expenditure Panel Survey and 2014 Nationwide Inpatient Sample. A nationally representative adult sample from the 2013-2014 National Health and Nutrition Examination Survey was extrapolated to national totals using Census Bureau population projections. **RESULTS:** Cumulative between 2015 and 2030, achieving these lifestyle and clinical goals results in 9.6 million fewer people with heart disease, 3.3 million fewer strokes, 2.4 million fewer heart attacks, and reduced incidence of cancer and other diseases. Per capita inpatient days, emergency visits, and ambulatory care declines. Reduced mortality suggests an additional 6.3 million adults alive in 2030. Cumulative over the first three years, national inpatient days decline by 4.3 million days and emergency visits by 3.4 million. By 2030, annual inpatient days are 6 million higher and emergency visits 1.7 million higher. By 2030 an additional 16,400 physicians would be required to support the extra 6.3 million people. **CONCLUSIONS:** The long term implications of achieving the modeled population health outcomes is reduced morbidity and mortality, but increased use of healthcare services to support a larger population. Health system planning should reflect that improved population health causes short term reductions in demand for healthcare services but long term demand will rise.

PHP274

UTILIZATION PATTERN OF ORAL ANTICOAGULANTS IN HIP AND KNEE REPLACEMENT PATIENTS IN UNITED STATES, 2010-2016

Borse M[1], Farley J[2]
[1]*University of North Carolina, Chapel Hill, NC, USA,* [2]*UNC Eshelman School of Pharmacy, Chapel Hill, NC, USA*

OBJECTIVES: Since their introduction to the US market in 2010, non-Vitamin K oral anticoagulants (NOACs) have sought to address the issues of not only efficacy, but also safety, ease of use, and patient compliance. However, little is known about the trends in the utilization of these medications after hip or knee replacement surgery. In this study, we analyzed changes in prescription volumes for oral anticoagulants since the introduction of NOACs in United States in major orthopedic surgery patients. **METHODS:** Using Truven Health MarketScan data, we analyzed prescription volumes for warfarin, dabigatran, rivaroxaban, and apixaban from January 2010 to September 2016 in patients undergoing total knee or hip replacement surgery. The total prescription volume was calculated quarterly and included new fills and refills for these medications. **RESULTS:** The overall volume of oral anticoagulant prescriptions in hip and knee replacement surgery patients in United States has increased annually since 2010. Since the availability of the NOACs, the proportion of total oral anticoagulant prescriptions attributable to warfarin in these patients has steadily decreased, from 99% in 2010 to 72% by September 2016. The largest increase in NOAC prescribing occurred between 2012 and 2014, which corresponds to the timeframe when rivaroxaban was first listed on most formularies. By September 2016, rivaroxaban held a 19% share of the oral anticoagulant market in orthopedics, whereas dabigatran and apixaban together accounted for approximately 9%. **CONCLUSIONS:** Since their approval, the NOACs have represented a growing share of total OAC prescriptions in orthopedic surgery patients in United States. This trend is expected to continue because the NOACs are given preference over warfarin in guidelines on venous thromboembolism prevention in major orthopedic surgery patients. An understanding of the current prescribing patterns will help to influence health policy and reimbursement strategies.

STUDY OF POLY PHARMACY AT A TERTIARY CARE TEACHING HOSPITAL BANGALORE

Samnejad B
al-ameen college of pharmacy, bangalore, India

OBJECTIVES: The study was designed to study the extent of polypharmacy among the prescriptions received at Out Patient pharmacy in St.Philomena's Hospital, Bangalore, to identify the most common class of drugs prescribed in polypharmacy prescription, to identify the drug interactions among the prescribed drugs, to identify the various therapeutic classes involved in major drug interactions. **METHODS:** A prospective hospital based observational study was carried out in the outpatient department of St.Philomena's hospital.The research student, collected all the prescriptions received at OP pharmacy. All the prescriptions were carefully analyzed for polypharmacy and the data were pooled and analyzed. **RESULTS:** A total number of 200 polyphonic prescriptions were found in the outpatient pharmacy of St.Philomena's Hospital. During the study period of 6 months, it was found that the majority of the prescriptions were prescribed to female 101(50.50%) and 99(49.50%) were prescribed to male .Among 200 prescriptions it was found that 134(67%) contain 5 drugs followed by 42(21%) contain 6

drugs, 15(7.50%) contain 7 drugs and 9(4.50%) contain more than drugs. The most common therapeutic class was found to be Analgesics pertaining to 122(61%) drugs followed by antibiotics, which were 65(32.50%) drugs and 55(27.50%) drugs were Vitamins. It was found that the majority of polypharmacies have been occurred in the age group of adults 113(56.50%) patients followed by neonates and infants 52(26%) patients and geriatrics 19(9.50%) patients. Among 200 prescriptions, 82 drug interactions were observed which were found to be 43(52.43%) major followed by36 (43.90%) moderate and3 (3.65%) minor. Among the Major interactions, anti-inflammatory drugs were found to be the most commonly participating therapeutic class of drug in interactions. **CONCLUSIONS:** only 10% of prescriptions were found to have polypharmacy which was commonly observed in female patients. Among polypharmacy prescriptions less than 50% had drug interactions, majority of which were major drug interactions.

PHP276

IMPACT OF DISPLAYING INPATIENT PHARMACEUTICAL COSTS AT THE TIME OF ORDER ENTRY: LESSONS FROM A TERTIARY CARE CENTER

Merola D[1], Conway SJ[2], Brotman D[2], Pinto BL[3], Feldman L[2], Miller RG[2], Shermock KM[3]
[1]Shenandoah University, Winchester, VA, USA, [2]Johns Hopkins School of Medicine, Baltimore, MD, USA, [3]The Johns Hopkins Medical Institutions, Baltimore, MD, USA

OBJECTIVES: Expensive medicines are often utilized when there are comparable alternatives available at a lower cost. Increasing prescriber awareness of medication cost at time of ordering may help promote cost-conscious use of medications in the hospital. Our objective was to evaluate the impact of cost messaging on the ordering of nine expensive medications. **METHODS:** This was a retrospective analysis of an institutional cost-transparency initiative in a 1,145-bed tertiary care academic medical center (The Johns Hopkins Hospital). Prescribers who ordered medications through the computerized provider order entry system at the Johns Hopkins Hospital. Each medication was compared to its pre-intervention baseline utilization dating back to January 1, 2013. For the seven medications with alternatives offered, we also analyzed use of the suggested alternative during these time periods. Interrupted time series and segmented regression models were used to examine prescriber ordering before and after implementation of cost messaging for nine high-cost medications. **RESULTS:** Following the implementation of cost messaging, no significant changes were observed in number of orders or ordering trends for intravenous formulations of eculizumab, calcitonin, levetiracetam, linezolid, mycophenolate, ribavirin, and levothyroxine. An immediate and sustained reduction in medication utilization was seen in two drugs that underwent a policy change in addition to the drug cost messages during our study, intravenous pantoprazole and oral voriconazole. Intravenous pantoprazole became restricted at our facility due to a national shortage (-985 orders per 10,000 patient days; $p<0.001$) and oral voriconazole was replaced with an alternative antifungal in oncology order sets (-110 orders per 10,000 patient days; $p=0.001$). **CONCLUSIONS:** Provider cost transparency alone did not significantly influence medication utilization at our institution. Active strategies to reduce ordering resulted in dramatic reductions of ordering.

PHP277

EVALUATION OF EFFECTIVENESS OF HEALTH CANADA'S DEAR HEALTHCARE PROFESSIONAL LETTERS ON PRESCRIBING PRACTICE IN CANADA

Abu Alhassin M[1], Krewski D[2], Mattison DR[2]
[1]University of Ottawa, Ottawa, ON, Canada, [2]Risk Sciences International, Ottawa, ON, Canada

OBJECTIVES: Health Canada's Dear Healthcare Professionals Letters (DHPLs) are used to communicate health risks information to healthcare practitioners. Since DHPLs may contain critical health risks information, they may result in measurable shifts in the prescribing practice. However, current research suggests that DHPLs may not be effective in communicating safety-related information. Continuing on a previous 2012 research conducted by Risk Sciences International that evaluated Health Canada's DHPLs' impact on prescribing practice, this study performed a qualitative descriptive analysis to identify: the attributes of DHPLs that result in a significant change in prescribing habits and; to develop recommendations and a conceptual framework for the communication of information on safely use of prescription drugs in Canada. **METHODS:** Health Canada's DHPLs issued from 2005 to 2015 were obtained. Relevant attributes of the DHPLs that are most likely to result in a change in prescribing practice were identified and examined using descriptive analysis. **RESULTS:** A total of 280 DHPLs were identified. Letters varied in terms of clarity of key information, format, content and length. Results suggest that 65% of DHPLs were warnings on drug side effects with the majority were considered serious adverse reactions; 12% of DHPLs were informative of new indications; 18% were warnings about product impurity and 5.7% of letters were warnings about drugs having the potential to lead to medication errors; only 33% of letters reported references. The target population was precisely described in 68% of the DHPLs. Fifty-four percent of the letters provided new recommendations, while 25% advised the close monitoring of patients to reduce the drug-related risks. **CONCLUSIONS:** This study suggests several attributes related to content and format of DHPLs could affect their effectiveness on the prescribers' behavior. Further research is needed to examine the correlation between these attributes in DHPL and changes in prescribing rates.

PHP278

ADHERENCE TO TREATMENT GUIDELINES AFTER OPIOID DEPENDENCE HOSPITALIZATION IN MEDICAID AND COMMERCIALLY INSURED POPULATIONS

Teigland C, Parente A, Jones BT, Niu X, Perkins M
Avalere Health - An Inovalon Company, Bowie, MD, USA

OBJECTIVES: To evaluate adherence to recommended evidence-based treatment guidelines and receipt of FDA-approved opioid addiction medications in Medicaid and commercial patients within 30-days of discharge from an opioid hospitalization. **METHODS:** The patient population was extracted from a large nationally representative and statistically de-identified administrative claims database. Our cohort included members aged 18-64 between Jan. 1, 2010 and Sept. 30, 2014 who were hospitalized for opioid abuse, dependence or overdose and continuously enrolled at least 90-days prior to hospitalization and at least 30-days post-discharge. Use of FDA-approved medication was defined as receipt of buprenorphine, naltrexone or methadone. We also evaluated use of benzodiazepines (contraindicated), antipsychotics and antidepressants (prevalent use). **RESULTS:** We identified 76,611 patients with an opioid misuse hospitalization; 16,859 (22%) with commercial insurance and 59,752 (78%) with Medicaid. Medicaid beneficiaries were more likely to be female (57% vs 44%) and older on average. A similar proportion filled an opioid prescription following hospitalization (20%). The percent receiving recommended treatment post-discharge was low for both cohorts, but significantly lower for Medicaid patients (8. 6% vs 18. 5%). Overall, a higher proportion of Medicaid patients did not fill a prescription for any of the medications evaluated (41% vs 28%). **CONCLUSIONS:** There is an unprecedented opioid epidemic in the U. S. leading to healthcare and social costs estimated at $55 billion annually. The U.S. Department of Health and Human Services has made expanding use of medication addiction treatment a top priority, but this study found >90% of Medicaid beneficiaries do not receive recommended dependence medications and found disparities in treatment between Medicaid and commercial patients. These findings point to the need to identify and limit barriers to prescribing opioid treatment medications like buprenorphine—such as physician certification requirements and restrictions on the number of patients they can treat—in order to reduce opioid overdoses and deaths in the U. S.

HEALTH CARE USE & POLICY STUDIES – Quality of Care

PHP279

REMS SURVEY RESPONSE RATE BY METHOD OF RECRUITMENT

Veley K[1], Covington D[1], Sites S[1], Kinard R[2]
[1]Evidera, Bethesda, MD, USA, [2]PPD, Wilmington, NC, USA

OBJECTIVES: REMS surveys seek to assess survey participants' awareness and understanding of key risk messages of REMS programs and are thus critical to maintaining effective REMS programs. This study sought to examine REMS survey response rates by method of patient recruitment (i.e., mode of invitation delivery and source of patient contact information). **METHODS:** This retrospective analysis of patient survey data, collected from all five REMS surveys conducted by a major CRO from 2014-2016, examined recruitment and survey completion metrics. Response rates were compared across two modes of invitation delivery and sources of patient contact information. Mode 1: sponsor-provided list of patients willing to be contacted regarding the product, but not necessarily product users; patient survey invitations were delivered via email with the survey link embedded. Mode 2): pharmacy claims data from a nationwide retail pharmacy chain; patient survey invitations were delivered via hardcopy mail to a targeted group of patients who filled prescriptions for the product in the last year. Surveys were available both online and via telephone. **RESULTS:** Using Mode 1, 19,650 surveys were distributed and 10,800 were distributed using Mode 2. Only 4.3% (n=1314) responded to the surveys. Regardless of recruitment method, the majority of patients (85%) completed the surveys online rather than via telephone. Response rates were higher for surveys using Mode 2 (7.4%) compared to surveys using Mode 1 (2.6%). **CONCLUSIONS:** This study was limited in its ability to separate source of participant contact information from mode of invitation delivery. However, results suggest that specifically targeting product users (Mode 2) may play a larger role in survey response than consent or ease of participation - embedded link in emailed invitations (Mode 1). Further research is needed to compare response rates for pre-consented patients with and without product exposure.

HEALTH CARE USE & POLICY STUDIES – Regulation of Health Care Sector

PHP280

EXPLORATION OF KNOWLEDGE AND PERCEPTION OF REGULATORY PHARMACIST REGARDING DRUG REGULATION IN PAKISTAN

Khan G, Haq NU, Nasim A, Riaz S
University of Balochistan, Quetta, Pakistan

OBJECTIVES: The Study aimed to explore the knowledge and perception of Regulatory pharmacists regarding Drug Regulation in Pakistan. **METHODS:** A cross sectional descriptive study was conducted to evaluate the Knowledge and perception of Regulatory Pharmacist regarding Drug Regulation in Pakistan from November - June 2016. The study was carried out in Pakistan major cities of Pakistan where regulatory pharmacists were practicing. Study tool comprised of Demographics and six main domains including; Amendment in Existing Drug regulation, Procedural flaws and delay, Lack of knowledge and Training, Lack of budget and other facilities, Political Influence and security Issues, Poor communication and administration between different bodies. All analyses were done by using SPSSv20. **RESULTS:** Result showed that maximum respondents 155 (57.2%) age ranges between 32-41 years. Most of respondents 185 (68.3%) were male having B-Pharmacy. Majority 123 (45.4%) of respondents were Drug inspectors. maximum of respondents 148(54.6%) were disagreeing in that Drug act1976 is complete and comprehensive for drug regulation in Pakistan and provide complete and comprehensive leverage to Provincial Government to made rules. Majority of respondents 119(43.9%) were disagree that Drug act provide proper procedure for all regulatory activities. While 95(35.1%) were disagree in that Academic learning provides proper knowledge to Regulatory Pharmacist during study. Most of pharmacists 145(53.5%) were agree that they have security issues when they go for inspection. Majority of respondents 138(50.9%) were disagree that information which is present by one authority is not disseminate to other. **CONCLUSIONS:** Study concluded that regulatory pharmacists in Pakistan had mixed perceptions towards drug regulations. The findings showed that misapprehensions about certain sections/subsections of drug law persist among regulatory pharmacists. It is high time that the policy makers and regulatory pharmacists should sit together for mutual consensus development regarding the discrepancies in the current drug act.

PHP281
PATIENT ACCESS OPPORTUNITIES AND CHALLENGES FOR BIOSIMILARS: A REVIEW OF THE UNITED STATES MARKETPLACE
Kline SE
Pricing Solutions, Devon, PA, USA
OBJECTIVES: Rising health care budgetary pressures combined with an aging patient population and increasing incidence of chronic diseases provide great opportunities for biosimilars. The 2010 Affordable Care Act includes a Biologics Price Competition and Innovation Act. The government initiatives balance the stringent regulatory environment to reduce the complex, costly issues creating high barriers for manufacturers. This research reviews the current US biopharmaceutical regulatory pathway, definitions and status of the US marketplace. **METHODS:** A search strategy using the term "biosimilars" AND "US FDA" was used to identify peer-reviewed literature published from 2010-2016 reporting the current state of the US biosimilar marketplace. Additionally the "grey" literature (e.g., government publications, reports, newsletters, fact sheets) were also reviewed. **RESULTS:** A biological product is approved by showing it is highly similar to an FDA-approved biological reference product. The biosimilar must have no clinically meaningful safety and effectiveness differences from the reference product. Only minor differences in clinically inactive components are allowable. An interchangeable biological product is biosimilar to an FDA-approved reference product and meets additional standards for interchangeability. An interchangeable biological product may be substituted for the reference product by a pharmacist without the intervention of the prescriber of the reference product. The first US biosimilar pharmaceutical product (i.e., filgrastim-sndz) launched in September 2015. There are only four biopharmaceuticals currently approved for sale in the US. **CONCLUSIONS:** Historically multiple regulatory pathways existed (e.g., section 505(j) of the Food Drug & Cosmetics Act, 351(k)) for guiding the development of biopharmaceuticals. However, even given the current improved legislation ambiguity still exists, for example, regarding the definition of "highly similar" and "no clinically meaningful differences". Thus these and other questions persist about the pathway that are likely slowing product development and market uptake. Continued analytical, pharmacological, and clinical research should improve our knowledge and development of these products.

HEALTH CARE USE & POLICY STUDIES – Risk Sharing/Performance-Based Agreements

PHP282
CHARACTERISTICS OF MANAGED ACCESS AGREEMENTS FOR MEDICINES IN AUSTRALIA
Robinson MF, Roughead E
University of South Australia, Adelaide, Australia
The Australian Pharmaceutical Benefits Advisory Committee (PBAC) recommends subsidy of a medicine for an indication (MIP) based on appraisal of the evidence for comparative clinical effectiveness, cost effectiveness and financial cost. PBAC advises what uncertainties exist in the evidence. Where uncertainties exist, the Australian Government uses a wide range of managed entry agreements (MEAs) to make medicines available in the national Pharmaceutical Benefits Scheme (PBS). **OBJECTIVES:** To describe the characteristics of all MEAs established by type of action, source of recommendation, and therapeutic area (ATC). **METHODS:** Extracted information for all MEAs implemented between January 2012 and May 2016. A typology for the type of action was developed. **RESULTS:** Eighty-six MIPs were PBS-listed with 171 MEAs. 74% of MIPs had two or more MEAs. 51% of MIPs provided additional health benefit (cost effective) and 49% the same benefit (cost minimised) over comparators. 51% of MIPs treated cancers or immune diseases (ATC L). PBAC recommended MEAs for 90% of MIPs. 82% of MEAs were simple financial agreements; of the 8 possible financial actions 33% were discounts, keeping the actual price confidential, and 43% required reimbursement if financial caps were exceeded. 13% of MEAs relied on performance measures linked to reimbursement; most of the 6 possible MEAs limiting subsidised continuation to patient response. Coverage with evidence development (CED) MEAs were least common (5%); 5 of the 8 CED required review of outcomes from clinical trials already underway. **CONCLUSIONS:** The Australian Government relies on financial agreements to manage access. There may be barriers to implementation of more complex MEAs. The PBAC is involved in implementing many MEAs through the evaluation and appraisal of evidence.

PHP283
CURRENT AND FUTURE USE OF OUTCOMES–BASED CONTRACTING BY US PAYERS
Moore R, Lewis C
Decision Resources Group, Nashville, TN, USA
OBJECTIVES: U.S. payers are increasingly using outcomes-based contracts with pharmaceutical companies to place greater financial risk on therapies' ability to demonstrate real-world clinical success. This study examines payer's current and future use of outcomes-based contracts (OBCs), drivers of their use, overall design, and challenges encountered to identify the future of these arrangements. **METHODS:** In the U.S., 41 health plan pharmacy and medical directors were surveyed about their current or expected use of outcomes-based contracts, including 15 already operating OBCs and 13 expecting to do so in the next 12 months. In addition, 100 cardiologists were surveyed over the impact of OBCs on their prescribing. **RESULTS:** 68% of surveyed payers either currently or expect to have OBCs in place in the next year, typically based on pharmacy and medical claims data. Existing OBCs were most commonly driven by cost-saving goals (47%) while payers planning OBCs in the next year also cite client demands (23%) and a desire for the pharmaceutical industry to justify prices (23%). Under existing OBCs, physicians are required to report patient-level data on drug usage (53%), medical utilization (53%) and hospital discharges (40%). Among surveyed cardiologists, 73% reported being more willing to prescribe a drug shown by OBCs to be as clinically or cost-effective as presumed. However, 53% of payers identified trusting and verifying the integrity of the pharmaceutical company's data as their largest challenge. **CONCLUSIONS:** OBCs appear poised for continued growth, driven by a desire to better align efficacy with price. Physicians report they are monitoring OBCs and are likely to reward therapies that demonstrate presumed effectiveness with increased prescribing. However, the relative newness of many of these agreements suggest their design will evolve in the coming decade. In addition, payer skepticism for the quality of data reported by the drug industry represents a stumbling block on their expanded use.

PHP284
RISK-SHARING MODELS IN HEALTH CARE SYSTEMS: LITERATURE REVIEW
Restrepo P[1], Cuestas A[1], Vergara C[1], Yucumá D[1], Castañeda-Cardona C[2], Rosselli D[1]
[1]*Pontificia Universidad Javeriana, Bogotá, Colombia,* [2]*NeuroEconomix, Bogotá, Colombia*
OBJECTIVES: To review the current risk-sharing and pay-for-performance models in indexed literature and to describe characteristics and outcomes obtained after the implementation of these models. **METHODS:** We conducted a review of the literature in Medline, Embase and Lilacs, using the free terms "risk sharing", "risk management" and "pay for performance", without language or publication date limits. Economic studies, systematic and non-systematic reviews of the literature, as well as descriptive studies about risk-sharing and international payment models were included. **RESULTS:** Of the 1009 articles initially identified, 35 were included for the analysis. Most sturies come from United States and the UK, but there are also experiences form Belgium, Italy, Spain, South Africa, Sweden; there are also documented experiences from Philippines, Tanzania, Zambia, Rwanda, Burundi, Democratic Republic of Congo, Vietnam, Peru, and China. Implementation of risk-sharing models had good overall performance and most papers show a significant improvement in different variables, such as decreased mortality and improvement in quality of care provided to patients mostly with chronic diseases. Payment arrangements between health care providers and pharmaceutical industry facilitated the implementation of new technologies in different health care systems. **CONCLUSIONS:** Due to the diversity of interventions and of healthcare system structures, the evidence available is still insufficient to draw conclusions. "Risk sharing" includes a wide range of approaches, is far from a uniform intervention, and depends on the interaction of numerous variables, including the magnitude and distribution of the incentives, and the amount of technical support available.

PHP285
ASSESSMENT OF MANAGED ENTRY AGREEMENTS IN EUROPE AND THE US
Fortier K, Riodin EL, Nadkarni S
Compass Strategic Consulting, Inc., New Haven, CT, USA
OBJECTIVES: Managed entry agreements (MEAs) provide manufacturers and payers the opportunity to work together, provide new contracting and payment mechanisms, and improve patient access. This is particularly relevant in the US, where drug costs are rising and the healthcare system is complex, with multiple payers and payer types. While theoretically promising, MEAs are often multifaceted and difficult to implement. This research aims to assess the successes and failures of MEAs in UK, Italy, France, and the US to identify key learnings and barriers for expansion in the US. **METHODS:** Secondary research identified managed entry agreements in UK, Italy, France and US from 2007 to 2017. A review of publically available health authority websites, peer-reviewed journals, and news sources was conducted to identify MEAs, the types of agreements (i.e., risk share, evidence based pricing, etc.), outcomes, and the perceived level of success. Data were then analyzed to understand the successes and key characteristics that may have supported the program's success. **RESULTS:** Type of MEA varied significantly within and throughout countries. In the UK and Italy, most MEAs were considered to have been successful, whereas French MEAs had neutral outcomes. Successful programs typically identified benefits for both the manufacturer (i.e., decreased time to review by NICE in UK) and the payer (lower overall cost to NHS in UK). Few MEAs in the US have publically available information or data. Of those, all but one considered the program to be successful, while all simultaneously noted that MEAs require significant additional effort, sometimes stymying the perceived success. **CONCLUSIONS:** Most MEAs were successful at decreasing cost to the intended health system and improving manufacturer relations with payers. Increased transparency in the US could improve local learnings from existing MEAs. Linking health outcomes to payments was a chief driver of success in most MEAs.

PHP286
RISK-SHARING AGREEMENTS (RSA) IN EMERGING MARKETS: IS IT A WAKE-UP CALL OR IS IT INNOVATION TOO LATE?
Subbotina E[1], Duttagupta S[2], Yong C[2], Chowdhury C[2]
[1]*CBPartners, London, UK,* [2]*CBPartners, New York, NY, USA*
OBJECTIVES: Recent years have witnessed emerging market (EM) countries adopting various forms of RSAs in order to manage public financing of innovative pharmaceuticals. South Korea, Taiwan, and Russia have either provided guidance or executed pilot programs in the recent past. This research aimed to analyse existing RSA structures across these countries and identify commonalities and divergences to postulate future of RSAs in EMs. **METHODS:** A pragmatic review of literature (in English and local language, as appropriate) and government resources on the RSA policies was undertaken for this research. Implementation examples, including completed pilots and proposed disease priorities were also reviewed to identify key differences from the developed markets. Guidance on implementation (South Korea),

pilot examples (Taiwan) and legislation and regional diversity (Russia) were analyzed. **RESULTS:** Common themes for RSAs in EM included evolution of legislative guidance to reflect drug development trends, infrastructure availability, industry engagement and healthcare financing uniformity across the country. In Korea, industry groups and payers have initiated discussions on evolving RSAs to include combination drugs. Financing infrastructure and data governance capabilities will reflect the agreements' designs, as seen in Taiwan's pilot programs. Potential restrictions on the orphan drug RSAs in Russia can arise due to the regional financing principles, limited by lack of interlinked data collection across institutions and regions. In the future, maturity of the RSAs will enable linkage to HTA requirements, such as in Korea and Taiwan, while the Russian RSAs being developed in parallel with the local HTA methodology leave uncertainty to the industry regarding their evaluation principles. **CONCLUSIONS:** Clear legal framework, data privacy, ownership, accessibility and evaluation principles, remain the cornerstone of success likelihood among RSAs in EMs. Several country-specific factors, including existing infrastructure and financing systems will impact the emerging RSAs, and should be taken into account to tailor implementation in any EM.

PHP287

EVALUATING THE EFFICIENCY OF COVERAGE WITH EVIDENCE DEVELOPMENT IMPLEMENTATION

Chen S[1], Carlson JJ[2]
[1]University of Washington, SEATTLE, WA, USA, [2]University of Washington, Seattle, WA, USA

OBJECTIVES: The coverage with evidence development (CED) program within the Center for Medicare and Medicaid Services (CMS) is used to generate additional data to support national coverage decisions for medical technologies. Coverage for patients is provided, but only in the context of approved clinical studies including clinical trials or observational registries. In this study, we evaluated the time to implementation of clinical studies for CMS CED programs. **METHODS:** We reviewed CMS's website for data on CED National Coverage Determinations (NCD) and abstracted the release date, date of first approved clinical study, and last modified date for each case. We estimated the mean time to study implementation overall and by type of study. We also used linear regression to assess the trend in mean time to implementation, as well as the impact of recency (NCD with past 5 years) on mean time to implementation. **RESULTS:** We found 22 CED NCD's among which 17 had a study implemented. The mean time to implementation or end of study was 731 days. Among NCDs with a study implemented, the mean time was 405 days (clinical trials: 515 days; registries: 48 days). We found a trend toward a shorter time to CED implementation over time (155 days shorter each year, $p = 0.035$). Recent cases had a time lag 944 days shorter than older cases ($p = 0.039$) The majority of recent cases have their first related clinical study approved within 200 days after the release of NCD. **CONCLUSIONS:** Our findings suggest some difficulty implementing clinical studies following a CED determination, but less so with registries. However, these difficulties may be lessening over time.

PHP288

REDEFINING "REASONABLE AND NECESSARY"? AN EMPIRICAL, COMPARATIVE ASSESSMENT OF MEDICARE'S COVERAGE WITH EVIDENCE DEVELOPMENT

Chenoweth MD[1], Chambers JD[2]
[1]Tufts University, Medford, MA, USA, [2]Tufts Medical Center, Boston, MA, USA

OBJECTIVES: Medicare employs coverage with evidence development (CED) to provide conditional coverage for an intervention to allow for the collection of evidence of its effectiveness. In this study, we examined how private payers cover interventions for which Medicare has employed CED. **METHODS:** First, we identified all drugs, medical devices, clinical therapies, and diagnostic technologies that are covered under CMS's Coverage with Evidence Development (CED) program. Second, we located coverage policies for CED interventions issued by the largest private payers that make their coverage policies publicly available. Third, to categorize coverage policy restrictiveness, we compared private payer coverage to corresponding FDA labels and categorized coverage as equivalent to, less restrictive, or more restrictive than the labeled indication. **RESULTS:** Between September 1998 and February 2016, CMS completed 246 national coverage analyses, 18 of which (7.3%) applied Coverage with Evidence Development. We identified 258 coverage policies issued by private payers for these CED technologies. We identified significant variation in both the number of policies payers' issued and their coverage of CED technologies. Private payers did not cover the majority of CED technologies (138 of 258 policies; 53.5%). Health Net and Highmark were the payers that most often covered CED technologies (62.5%). Private payer coverage was equivalent to corresponding FDA approval in 68.3% of cases, more restrictive in 25.0%, and less restrictive in 6.7%. **CONCLUSIONS:** When covering health care technology, the conventional wisdom is that private payers follow Medicare's lead. However, we found significant variation in private payer coverage of this set of innovative medical technologies. Overall, these findings provide insight into Medicare's application of CED and suggest that patients enrolled in different health plans may have variable access to innovative medical technologies.

PHP289

IQWIG VERSUS THE G–BA – FREQUENCY OF DIVERGENT OPINIONS IN GERMANY AND THEIR IMPACT ON GLOBAL PRICING

Macaulay R[1], Mohamoud Z[1], Schmidt B[2]
[1]PAREXEL, London, UK, [2]Regulatory Benefits, Munich, Germany

OBJECTIVES: Since 2011, under the Pharmaceutical Market Restructuring Act (AMNOG), new pharmacological therapies in Germany are subject to an early benefit assessment (EBA) upon launch. The Institute for Quality and Efficiency in Health Care (IQWiG) usually conducts an initial assessment, followed by the Federal Joint Committee (G-BA) issuing a final verdict. If a newly approved drug is not deemed to offer an additional benefit over available therapies, it is not granted premium-pricing, instead being subject to reference pricing. This research assesses how the G-BA's assessments differ from IQWiG's. **METHODS:** All EBA resolutions were extracted from the English-language G-BA website alongside corresponding IQWiG press releases (01/01/2012-01/13/2017) and key information compared. For extracted outcome data, the focus was the subgroup of greatest additional benefit. **RESULTS:** Of 100 identified G-BA and IQWiG EBA assessments, 68% (68/100) did not differ in their additional benefit. The G-BA concluded on an additional benefit where IQWiG deemed none in 10% (10/100) of cases, G-BA and IQWiG both agreed that additional benefit was offered but differed in its extent in 20% (20/100; 15 cases: G-BA's rating was lower, 5 cases: G-BA's was higher). In the 2 cases where IQWiG's verdict was 'lesser benefit', the G-BA ultimately concluded no additional benefit was proven. As for the level of certainty with which additional benefit was demonstrated, in 85% (39/46) the G-BA's verdict matched IQWiG's assessment; in 4% (2/46) of cases, the G-BA's certainty rating was higher, in 11% (5/46) it was lower. **CONCLUSIONS:** Even after an unfavourable IQWiG assessment, companies should fully engage with the EBA consultation process, as the G-BA has frequently shown the flexibility to deviate from IQWiG's initial assessment. As many countries use external reference pricing for price-setting and Germany is one of the most frequently referenced countries, this has global revenue implications.

PHP290

THE NICE CRUNCH? CAPACITY CONSTRAINTS LEADING TO POTENTIAL INCONSISTENCIES IN THE ASSESSMENT OF DRUGS IN ENGLAND

Macaulay R, Gray P, Griffiths EA
PAREXEL, London, UK

OBJECTIVES: When developing Single Technology Appraisal (STA) guidance, the National Institute for Health and Care Excellence (NICE), commissions an independent academic centre (Evidence Review Group [ERG]) to develop a report that critically appraises the manufacturer's submission and review published evidence. This research aims to compare the work of different ERGs and whether this may affect STA outcomes, particularly in light of recent reforms to the Cancer Drugs Fund (CDF), which have increased the number of NICE STAs to be undertaken. **METHODS:** All final appraisal determinations (FADs) resulting from STA processes were screened and the outcome, disease area (classified by ICD10 category), and academic centre was extracted (up to 11/20/2016). Statistical comparisons were conducted using a Chi-squared test. **RESULTS:** 272 NICE STAs were identified, supported by 12 different ERGs (highest: 33 [Southampton], lowest: 1 [Schering]). Rates of positive recommendation (defined as 'recommended' or 'optimised') varied numerically but not significantly by appraisal centre (p=0.79, highest: BMJ-TAG [93%, 14/15], lowest: Schering [0%, 0/1]). However, there were notable variations in recommendation rates by therapy area and the considered therapy areas varied substantially between different ERGs. An annual average of 23.5 STAs were undertaken (highest: 42 [2016], lowest: 4 [2006]) with a large upsurge in the last two years driven by increased oncology submissions. This has coincided with an increased number of ERGs supporting oncology appraisals (average: 8.0 [2015-2016] vs. average: 4.2 [2006-2014]), including in cancer types they had not previously appraised. **CONCLUSIONS:** To date, the likelihood of a positive recommendation has not significantly varied by ERG, with numerical differences largely due to variations in therapy areas appraised. However, NICE are conducting increasing numbers of submissions, resulting in ERGs increasingly supporting TAs in therapy areas for which they have no prior experience, potentially introducing a risk for non-uniform implementation of NICE's methodology.

PHP291

A REVIEW OF US BIOSIMILAR APPROVALS: WHAT EVIDENCE IS FDA REQUIRING, AND HOW ARE MANUFACTURERS RESPONDING?

Hung A[1], Mostovoy L[2], Vu Q[3]
[1]University of Maryland, School of Pharmacy, Baltimore, DC, USA, [2]BlueCross BlueShield Association Federal Employee Program, Washington, DC, USA, [3]University of Maryland, School of Pharmacy, Baltimore, MD, USA

OBJECTIVES: To identify the types and quantities of evidence the FDA is requiring for biosimilar approval, and the corresponding evidence manufacturers have provided in their 351(k) biosimilar approval applications. **METHODS:** We searched through FDA general guidances, drug-specific approval documents, and webcasts to collect data. The following data were collected: approval indications and dates, reference product names, manufacturer names, evidence on similarity in analytical and functional characteristics, pharmacokinetics, pharmacodynamics, efficacy, safety, and immunogenicity, evidence used for extrapolation claims, and other notable points of discussion during FDA Advisory Committee meetings. **RESULTS:** There are currently four biosimilars approved in the United States. For these biosimilars, a large evidence base is provided to demonstrate similarity in analytical and functional characteristics, while fewer clinical studies are provided to demonstrate efficacy. Extrapolation allows biosimilars to be approved for indications in which clinical studies were not conducted, as long as they show similar analytical and functional characteristics relevant to the known or likely mechanism of action for the extapolated indication(s). **CONCLUSIONS:** As increasingly more biosimilars go through the 351(k) biosimilar approval pathway, we will better understand what evidence is required for biosimilar approval in the United States.

PHP292
PAYERS' FAMILIARITY AND UTILIZATION OF CURRENT VALUE ASSESSMENT FRAMEWORKS AND OPINIONS ON IDEAL VALUE FRAMEWORK CRITERIA
Shah-Manek B, Zywiec KS, Chan L, Shah R, Pang T, Ignoffo RJ
Touro University - California, Vallejo, CA, USA
OBJECTIVES: Organizations, such as the Institute for clinical and economic review (ICER), the American Society of Clinical Oncology (ASCO) and the national comprehensive cancer network (NCCN), have developed value assessment frameworks to determine "value" of drug therapies. These frameworks are being incorporated into clinical guidelines and may serve as the basis for purchasing and insurance coverage decisions. The purpose of this study is to determine payer perspectives of all 5 value frameworks, compare value frameworks with payers' own value assessment methods, and reach a consensus on payer opinions of the ideal value framework. **METHODS:** A Delphi study with 12 managed care pharmacists was performed to determine payers' opinions of the value frameworks and the characteristics of the ideal value framework. The study included 2 electronic anonymous surveys and a teleconference to discuss the results. Results are reported descriptively. **RESULTS:** Participants most familiar (somewhat familiar, familiar, and very familiar) with NCCN (89%), followed by ACC/AHA (78%), ICER (67%), ASCO (44%) and MSKCC DrugAbacus (33%). ICER, NCCN and ACC/AHA are currently being used by the participants, mainly as additional sources of clinical information, and each value framework is being considered for use in the future. The main reason for not utilizing value frameworks was more information was needed. The most participants (38%) said their company's drug evaluation was similar (somewhat similar and very similar) to NCCN, followed by ICER (33%). All respondents agreed that drug evaluations will become more transparent with increased utilization of value frameworks. Most participants reported that the ideal framework should be an online tool (67%) updated each time a new drug in a class is approved (55%). **CONCLUSIONS:** All participants agree that value frameworks would contribute to transparency of drug evaluation but the health plans need more information about the value frameworks before they will be widely utilized.

HEALTH CARE USE & POLICY STUDIES – Conceptual Papers

PHP293
IS LONGER SURVIVAL MORE VALUABLE THAN BETTER QUALITY OF LIFE? INSIGHTS FROM REAL OPTIONS THEORY
Li M, Garrison LP
University of Washington, Seattle, WA, USA
The quality-adjusted life-year (QALY) combines expected survival and quality of life into a single composite measure, and assumes that a QALY gain from life extension is equivalent to a QALY gain from quality-of-life (QoL) improvement. However, a recent systematic review (Ryen 2015) provided empirical evidence that willingness-to-pay (WTP) estimates for a QALY were consistently higher when the QALY gain was from life extension as compared to from QoL improvement. Originating from corporate finance, real options theory recognizes that in some cases initial investments may create opportunities (options) for subsequent investments. Such initial investments therefore have two value elements: the static or passive net present value of direct cash flows and the option value of operating flexibility and strategic interactions. Similarly, a treatment that prolongs survival creates options as it opens up opportunities for patients to benefit from future treatments should they become available during the extended life. In a stated-preference study, survey respondents may consider this additional benefit from longer survival and factor that into their WTP, which could be the reason for a higher WTP for life extension. One of the implications of this is that in a value-based reimbursement system where "a QALY is a QALY is a QALY", the option value of life-extending treatments may be omitted, thus resulting in under-reward of such innovations. Current cost-effectiveness modeling practice has generally not factored in the impact of (unknown) new future treatments. Accounting for option value in technology assessment requires modeling arrivals of new treatments and their health benefits and costs, and/or patient's preference and WTP on attributes of potential future treatment opportunities (such as efficacy, time of arrival, likelihood of arrival, etc.). Further research is needed on the methods for operationalizing real option value and its implications on the cost-effectiveness of a treatment and optimal resource allocation.

PHP294
HEALTH IMPACT FRAMEWORK FOR CURES AND HIGH IMPACT MEDICAL TECHNOLOGIES
Carlson JJ[1], Bansal A[1], Suh K[1], Yeung K[2], Garrison LP[1], Basu A[1]
[1]University of Washington, Seattle, WA, USA, [2]Group Health, Seattle, WA, USA
Objective: A number of recent treatment advances have been labelled cures but a consistent definition of cure does not exist in research or clinical practice. Further, no single framework exists that can capture key factors in the evaluation of medical technologies and cures. Our objective was to develop a general framework for characterizing the health impact of medical products that can cover high impact technologies and cures. **Methods:** We performed a systematic literature review to identify uses of the word cure in five high burden disease areas: heart disease, human immunodeficiency virus, diabetes, depression, and cancer (prostate and breast). We then applied Walker and Avant's concept analysis to identify key factors contained within cure definitions. We then developed a comprehensive framework that captures key factors related to a medical technologies' clinical and economic impact and which includes curative technologies. **Results:** The key concepts that we identified were: 1) clinical impact, which could be measured using the QALY shortfall or proportional QALY shortfall, 2) economic impact, which can be measured as the incremental net total costs and 3) the timing of the clinical or economic impacts. The key factors that are captured in the framework are: disease burden alleviated, net incremental treatment costs, timing of clinical effects and costs, and the distribution of clinical and economic outcomes for the target population. **Conclusions:** We developed a comprehensive framework that captures the key factors in the evaluation of medical technologies and cures. The framework can be used to illustrate an individual technology's impact relative to an alternative as well as facilitate comparative evaluations across technologies.

PHP295
CONSTRUCTING DISCRETE CHOICE INSTRUMENTS FOR REGULATORY ASSESSMENT OF MEDICAL DEVICES
Wilson L[1], Szeto D[1], Benz H[1], Ho M[2], Saha A[2]
[1]University of California, San Francisco, San Francisco, CA, USA, [2]FDA, Silver Springs, MD, USA
Objective:FDAs Center for Devices and Radiological Health (CDRH) shows commitment to integrating patient voice into device benefit-risk determinations, but the methods are largely undeveloped. We suggest specific methods to follow to integrate device-development and patient outcomes as attributes for conjoint analysis. **Methods:**We developed patient attributes for a choice based conjoint and a standard gamble tool for use in regulatory approval of new technologies for upper limb prosthetics. There are ground breaking innovations in prosthetics, that theoretically could increase the ability of those missing an upper limb to control their hand/arm movement by thought or muscle movements and with potential to also feel sensation through the prosthetic. However, at least 30% of those who adopt new upper limb prosthetics do not end up using the devices. We suggest the steps that can be used to guide the quantitative translation of highly technical outcomes into patient centered outcomes. **Results:**We provide the measurement tools for a choice based conjoint and a standard gamble tool for adoption of upper limb prosthetic devices such as osteointegration and myoelectric control. We show how pictures and videos can better convey a complex motion and a functional ability. We describe an activity by both patients with upper-limb loss and device-developers that can help translate electrical based metrics into larger grouped patient life-skills for improved patient-centered regulatory decision making. Activity: Prioritization of functional life skills most needed, and selection of the mix of device technical attributes (grip strength, closure speed, degrees of freedom of motion) and deficiencies (failure, weight) required to perform different levels of each functional skill). **Conclusion:** Integrating device developers and potential device users together to translate the technical outcomes into patient-centered outcomes is essential for selection of attributes for discrete choice experiments which will result in useable information for regulatory approval decisions.

PHP296
THE PATIENT VOICE IN VALUE ASSESSMENT: A RUBRIC TO INCREASE PATIENT CENTRICITY
Perfetto EM[1], Oehrlein EM[2], Boutin M[1], Reid S[1], Gascho E[1]
[1]National Health Council, Washington, DC, USA, [2]University of Maryland, School of Pharmacy, Baltimore, MD, USA
OBJECTIVES: Professional societies and other organizations have recently taken a visible role in the US defining treatment value and providing recommendations to payers and clinicians via value assessments. While patient perspectives routinely differ from those of other stakeholders, it is not always apparent patients were engaged in value framework development or assessments. If value frameworks are to be used to inform decisions affecting treatment access, the patient community wants robust processes in place to incorporate the patient voice. To aid stakeholders in achieving patient-centered value assessments, the National Health Council (NHC), with stakeholder input, created the Patient-Centered Value Model Rubric (Rubric). **METHODS:** The NHC held a multi-stakeholder, invitational roundtable in early 2016. Participants reviewed existing patient-engagement rubrics; discussed experiences with value frameworks; debated and thematically grouped hallmark patient-centeredness characteristics; and developed illustrative examples of the characteristics. These materials were organized into the Rubric, and vetted via multi-stakeholder peer-review. **RESULTS:** The Rubric describes two complementary, direct and indirect, pathways for addressing the six domains of patient-centered value frameworks: Partnership, Transparency, Inclusiveness, Diversity, Outcomes, and Data Sources. Specific examples were created to illustrate how patient engagement and centeredness can be operationalized. While direct patient engagement is the ideal goal, where the patient community has an active role, indirect means of engagement can also contribute to patient-centeredness. Indirect means include using existing data sets that capture patient views and preferences. **CONCLUSION**: The Rubric is intended to assist all stakeholders, especially the patient community, in assessing the level of patient-centeredness and engagement in a given value framework or model used to conduct a value assessment. It can be a guide to support developers in conceptualizing plans for meaningfully engaging patients. The Rubric will be refined over time based upon feedback from patient, patient group, framework developer, and other stakeholder-use experiences.

PHP297
CONCEPT ANALYSIS ON CURES FOR ILLNESSES WITH HIGH DISEASE BURDEN
Suh K[1], Basu A[1], Yeung K[2], Bansal A[1], Garrison LP[1], Carlson JJ[1]
[1]University of Washington, Seattle, WA, USA, [2]Group Health, Seattle, WA, USA
OBJECTIVES: A number of recent treatment advances have been labelled cures but a consistent definition of cure does not exist in research or clinical practice. The purpose of this study was to review the term cure and establish an operational definition. **METHODS:** We conducted a systematic literature review to identify uses of the word cure. All relevant definitions were collected in five disease areas of high disease burden: heart disease, human immunodeficiency virus, diabetes, depression, and cancer (prostate and breast). Walker and Avant's concept analysis method was applied. Frequently used attributes of cure within each disease area were compared and reduced to the fewest number of defining attributes that would differentiate cure from similar concepts. Subsequent steps included

identifying ideal, borderline, and related cases, as well as antecedents and consequences of cure. **RESULTS:** Three defining attributes were identified: complete and permanent remission, reversing or eliminating the underlying cause of disease, and treatment or other interventions no longer being necessary. These attributes of cure set a high benchmark, making cure difficult to be achieved and measured, especially at the individual level. One potential operational definition may be statistical cure—when a patient's mortality risk returns to that of the general population. This definition is used in epidemiologic modeling studies given sufficiently long follow-up. However, this does not capture the quality-of-life dimension inherent with disease. The recent concept of the quality-adjusted life-year (QALY) shortfall, i.e. the difference between the quality-adjusted life expectancy of a patient with disease versus that of the general population may provide the best operational definition—alleviation of the QALY shortfall. **CONCLUSIONS:** The concept of cure was assessed to establish an operational definition as more treatments are expected with "curative" intent. Although difficult to measure, we suggest that the best operational definition for cure is the alleviation of the QALY shortfall.

PHP298

MARKET ACCESS CHALLENGES FOR VACCINE LAUNCHES

Mukku S, Battepati B, Digiacomo F, Edathodu A
Access Infinity, London, UK

Objectives: Vaccine launch from a market access perspective could be more complex than launching general drugs. The study was conducted to assess the complexities of launching various types of vaccines and differences in market access pathways. Factors of modes to include in the National Immunization program (NIM), procurement dynamics, evidence requirements, value elements influencing access were assessed. The project was focussed in selected European countries including France, Italy, Germany, UK, Spain, Norway and Belgium. **Methods**: The project was conducted through in depth secondary research including assessment of pathways and critical analysis of HTA outcomes of selected vaccines through analogue analysis. **Results**: The analysis confirmed that there are several stakeholder institutions in addition to those involved in general drug assessments who influence the success of a vaccine. Most importantly NITAG (national immunisation technical advisory groups) in various countries play an important role. There is variance in how different countries approach the inclusion of vaccines in the national immunisation program. Not all countries have clearly defined criteria making it difficult for vaccine manufactures to understand how to develop a market access strategy for vaccines. They could follow either a vaccine pathway, generally defined by national immunisation program or a therapeutic pathway, which is similar to the standard drug access pathway. Also the modes of procurement vary including direct purchase by hospitals to national or regional tendering. Elements such as efficacy of the vaccine, its influence on the individual and global population, schedule, target population, price, unmet need and target disease carry different weightings influencing the success of vaccine from a market access perspective. **Conclusions:** The study gave clear strategy for a pharmaceutical company wanting to launch a vaccine. HTA agencies in general have a positive perspective towards vaccines and have support systems that could be explored for their successful market access launch.

US NATIONAL HEALTH CARE PLAN ABSTRACT

Mathur A
New York University, East Brunswick, NJ, USA

Abstract Objectives: National public healthcare programs have been topics of discussion during presidential elections in the United States of America (US) since 1945. This paper examines the claims and counterclaims of the Medicare for All (MfA) healthcare plan proposed during the 2016 US presidential primaries from a social, health economic perspective. **Methods:** A narrative literature review was conducted of English-language public domain sources published between January 1, 2015 and January 1, 2017 using PubMed, EMBASE, CINHAL, and Google Scholar utilizing the following search terms: "national", "health", "plan", "universal", "insurance", "single", "payer", "federal", "United States", "Medicare for All". The "federal" and "plan" search terms were least useful for generating additional, non-redundant content. **Results:** The two most common issues raised with MfA were economic viability and political possibility; administrative impact: service delivery system, payment policies, benefit design and utilization management issues, was less frequently addressed. The economic critiques of MfA frequently involved federal payers and budget impact perspectives, while the MfA proposal was based upon a broader, social perspective. Administrative impact critiques focused greatly on short-term considerations or potential pit-falls left unaddressed in MfA and identified large information gaps. **Conclusions:** The recent MfA debate was extremely similar to its predecessors; no overarching consensus was reached, with a clear trend toward negative MfA assessments. The quality of the counterclaims presented was often greatly limited and did not address the ethical issues of the wealthiest country in world history not providing universal, comprehensive healthcare for its citizens when other countries of lesser means can.

PHP300

EVOLUTION OF REGULATORY REQUIREMENTS FOR RETROSPECTIVE OBSERVATIONAL STUDIES USING MEDICAL RECORDS IN FRANCE, GERMANY, SPAIN AND THE UK

Sluga O'Callaghan M, Derrien V, Mai C
AplusA Research, LYON, France

Background: While clinical trials remain the gold standard for drug approval, additional information is required on how specific drugs perform in a real-world setting. Observational studies providing Real World Evidence (RWE) help fill the knowledge gap between clinical trials and actual clinical practice and are increasingly demanded for submission by health authorities. By providing information on real-world environment, the analysis of retrospective data from medical records addresses the needs of key stakeholders before and after the drug approval. To harmonize legislation across European countries, the European regulatory framework is evolving (EU CRT N° 536/2014) and requires each local country legislation to follow. According to the European Medicines Agency (EMA) (statement Dec 2015) this new regulation should come into effect by October 2018 at the latest. In the interim, country specific legislation must be respected resulting in a high level of complexity for multi-country observational studies. **Methodology**: Documentary Method – critical analysis of country specific legislations, government body requirements and recommendations. **Results**: In France, the Loi Jardé became effective in November 2016, but will require a new amendment for observational studies in order to conform with the forthcoming EU law. In Germany, studies involving the collection of retrospective medical records are mainly classified as 'Anwendungsbeobachtungen (AWB)', and require only the notification to central entities. Spain has a straightforward regulatory classification system for observational studies, but requires site-based Research Ethics Committee (REC) approvals. Even though the current legislation of the UK for observational studies is probably the most straightforward (e.g. service evaluation), the future evolution of regulations is highly uncertain due to BREXIT. **Conclusions**: Although EU harmonization of legal requirements for observational studies is supposed to take place in October 2018, we can expect many twists and turns until this is translated in real-world practice!

PHP301

APPROPRIATENESS AND LIMITATIONS OF COST–EFFECTIVENESS METHODOLOGIES IN ONCOLOGY

Herren C, Vora S, Shortenhaus SH, Bowman L
Eli Lilly and Company, Indianapolis, IN, USA

There is strong evidence to suggest that the quality-adjusted life-year (QALY) and its use in cost-effectiveness analysis (CEA) to determine the incremental cost-effectiveness ratio (ICER) has important limitations in oncology, and alternative analyses of value should be considered. The ICER is the incremental cost associated with a new intervention versus an existing intervention, divided by the change in effectiveness measured in QALYs. In some countries, if the ICER for a new product meets a pre-defined threshold then it receives access and reimbursement. When this CEA method is used to assess new oncology agents, they often fail to meet these thresholds, and have limited public use. This CEA method only determines a drug's value for a particular place in therapy at first regulatory approval, and not the value for evolving therapeutic uses as commonly seen in oncology. Recommended health-related quality of life instruments used to develop the QALY were not designed for measuring health status change within disease states where vitality is important, thereby inaccurately reflecting cancer-related quality of life. Finally, this CEA method does not routinely account for societal issues, such as cost offsets, lost productivity, or caregiver requirements. There is evidence suggesting that countries using the ICER and QALY reimburse fewer cancer drugs, take longer to provide access for patients, have subsequent lower and slower clinical adoption rates of new cancer medicines, and have lower cancer overall survival. Alternative approaches presently used abroad to value oncology therapies involve clinical innovation scores, flexible thresholds, special end-of-life criteria, pragmatic decision-making and patient access schemes. In the United States, market-based solutions like risk-sharing agreements, value-based contracting, and considerations of Multi-Criteria Decision Analysis are growing. CEA using the ICER and QALY should be only one criterion amongst many to be considered when deciding access and reimbursement for oncology therapies in the US.

PHP302

OVERVIEW OF HORIZON SCANNING PROCESSES FOR MEDICAL TECHNOLOGIES: RATIONALE AND REQUIREMENTS

Chadda S, Upton CM, Moeller A
SIRIUS Market Access, London, UK

Given ongoing medical innovation, it is essential that healthcare policy makers prepare for the costs of emerging health technologies that will enter the market. Horizon Scanning is an important tool used by such policy makers, which enables them to predict costs and prepare the necessary national budgets and resources required for health technology reimbursement. Horizon Scanning organizations generally use two main approaches: 1) Routine scanning, whereby ongoing 'horizontal' scans are performed to identify significant and urgent healthcare advances regardless of healthcare area; and 2) In-depth 'vertical scanning' which focuses on healthcare areas with known significant or unmet needs. Horizon Scanning organizations rely on regular communication with manufacturers in order to ensure that both routine and in-depth Horizon Scanning can be carried out efficiently. Using the information obtained from Horizon Scanning, the organizations put together technology briefings, alerts and in-depth Horizon Scanning reports which can be made publicly available minus confidential information. Horizon Scanning organizations in different countries require information on emerging technologies at different times. Some require information once phase III clinical trials have been initiated, whilst others can range in requiring information from three to one years prior to expected market entry. The data requested across European Horizon Scanning organizations broadly include some or all of the following; product name, indication, regulatory status, mechanism of action, epidemiology, likely comparator products, current clinical research evidence, potential product benefits, costs of product and comparators, estimated net budget impact, information and service implications. If manufacturers proactively engage with Horizon Scanning organizations, it allows healthcare reimbursement agencies to optimally prepare for the arrival of new healthcare technologies, thus increasing the likelihood of patients with unmet needs gaining access to new technologies in a timely manner.

PHP303
REDUCING THE IMPACT OF MENTAL HEALTH-RELATED COSTS IN THE WORKPLACE WITH A PROGRAM TARGETING COGNITION
Cliveden PB, Sparrowhawk KT, Ratto M
MyCognition Ltd, London, UK
Depression is recognised as the major cause of mental illness worldwide, affecting an estimated 22.7% of the U.S. working population (Evans-Lacko S. 2016). Depression significantly affects performance and undermines productivity with high rates of presenteeism and absenteeism (estimated annual costs of $5,524 and $390 respectively per person; total costs of ~$90-100 billion (Evans-Lacko S. 2016; Greenberg et al. 2015)). Sixty-two per cent of costs are associated with co-morbid mental disorders, such as anxiety, stress, and sleep disorders (Greenberg et al. 2015). These disorders are related to cognitive issues that depression-affected people experience in attention, memory, and executive functions, leading to complications in concentrating, solving problems, or making decisions, and are the main factors determining a presenteeism-associated lack of productivity. Solutions that specifically target depression-related, co-morbid disorders associated with presenteeism will be cost-saving. A project recently launched in a London-based, world-wide organisation, aiming to investigate, prevent, and manage potential cognitive employee health–related issues, adopts a cognitive assessment and training software, already tested in psychiatric populations (Domen A. et al. 2015; Nieman D. et al. 2015; Domen A. et al. 2016), in combination with a behavioural program targeting employees' habits in sleep, exercise, diet, and hydration. The 15-minute online assessment used allowed employees to monitor their cognitive health from their own digital devices, while employers received an anonymised and aggregated view of cognitive health trends in their organisation. The assessment may help to raise awareness of the risk of mental illness in the workplace, enabling an evaluation of the outcomes of the combined solutions that were adopted. Assuming that a combined cognitive and behavioural program may reduce costs by 10%, U.S. employers should be able to realise a savings of around $550 per person in presenteeism costs alone.

PHP304
MONOPSONY OF ORPHAN DRUGS
Afify Y
American University in Cairo, Cairo, Egypt
One of the challenges facing any health authority is the marketing of orphan drugs. Orphan drugs are those medicines used to treat patients with rare diseases. The scarcity of the rare disease makes it a non-attractive area for research and development to investigate new molecules, and for industry to invest in the marketing of orphan drugs. In most countries, the government is the provider for those services to rare diseases. Although many of these diseases like Gaucher, Willson's and more were discovered long ago, there is no variability in medicines available to treat those diseases. The number of companies investing in the market of orphan drugs is known and that leads to the control of the market. Monopoly takes place in most cases of orphan drugs with high prices and low availability. Non Profit organizations exist in a parallel performance to governments to provide a unified voice and support people living with rare diseases. The model shouldn't be left to the Non Profit Communities and charity organizations. All Governments in collaboration with World Health Organization must have an entity to support, care, and treat people with rare diseases. In the market dynamics, when demand side is one stakeholder, the prices will fall. This is called monopsony where prices can be controlled by the buyer. People living with rare diseases are all the same regardless of the geographic borders they are behind especially in the small open world. There should be no dependence on governments, charity organizations to provide the healthcare and orphan drugs to people living with are diseases. The entity created under the umbrella of WHO should compile all rare diseases and orphan drugs to support and provide the one demand for the world to treat all rare diseases.

PHP305
TAKING PATIENTS AS PARTNERS IN RESEARCH
Dang A, Laghate T, Vsn M
MarksMan Healthcare Solutions LLP, Health Economics and Outcomes Research (HEOR) and RWE (Real World Evidence), Navi Mumbai, India
Despite the increasing number and scope of patient involvement initiatives, there is no accepted master framework for systematic patient involvement in pharma-led medicines development. Patient engagement is more productive, but inconsistent and fragmented on a broader level. Incorporating the patient's perspective in healthcare research is strongly promoted by policy makers, funding bodies and international regulators. Patients have a personal experience of disease that is not available to most researchers, which complements researchers' analytical skills and scientific perspective. Involving patients in research projects improves both the methodology and outcomes of the research, and also offers invaluable additional insights. Contributions by patients to the design, implementation and evaluation of research leads to effectiveness, credibility, and often to more cost efficiency as well. It is essential to ensure that high quality research brings real benefits for patients and their daily lives. Increasing number of studies are now being conducted involving patients in the research. Effective patient engagement is a time consuming process and involves significant investment. The research team and patient partners need to be open to the risks and be flexible in this work together. Mutual trust and integrity are key components to keep open conversation flowing and offers the possibility of allowing the patient voice to impact research studies, which can be incredibly valuable in providing end-use of research results. Future studies with a direct impact on patient-centered outcomes research would directly benefit from engagement with patients as full-team members in their research programs.

PHP306
THE IMPLEMENTATION OF AN EDUCATIONAL PATIENT PROGRAM IN A SPECIALIZED CENTER FOR RHEUMATOID ARTHRITIS IN COLOMBIA
Santos-Moreno P[1], Rodriguez F[1], Villarreal L[1], AZA A[1], Jaimes H[1], Jaimes J[1], Buitrago-Garcia D[2], Castro C[2], Caicedo-Escobar C[3]
[1]*Biomab, center for rheumatoid arthritis, bogota, Colombia,* [2]*SIIES investigation and research, Colombia, bogota, Colombia,* [3]*Universidad Nacional de Colombia, Bogota, Colombia*
Rheumatoid arthritis (RA) is a chronic, inflammatory autoimmune disease of unknown etiology, it is a long term condition that causes pain, disability and affects the quality of life (1). In countries like the United Kingdom has been demonstrated how patient education can empower the individual giving as a result a better decision making between the practitioner and patient in order to obtain better health care outcomes compared to patients that are not involved in educational activities (1). In a specialized RA center in Bogotá Colombia during 2016 we started a patient and caretaker oriented program to support the clinical treatment in patients with RA. The structure of the program was an educational-recreational strategy where we integrated health education (disease activity, pharmacovigilance, psychology and nutrition) and recreational activities such as crafts, yoga, aerobics and dance lessons with a periodicity of two times per week. We called the program "Gest-Art". As a result of this pilot program we obtained a positive impact and perception among patients and care takers; we had the participation of 600 people during the whole year. From this experience we can conclude that the implementation of this educational program opened the opportunity to empower and motivate our patients and care takers to be actively participative with the disease management and health care, also the program has been a space for the patients to share their experiences and to propose new strategies to improve the program which opens the communication channels to build in 2017 a multi-participative program where the patients and care takers are a fully participative component. References 1. Prothero L, Georgopoulou S, de Souza S. Patient involvement in the development of a handbook for moderate rheumatoid arthritis. 2016.

PHP307
UTILIZING HEOR METHODS TO SUPPORT QUALITY DATA AND DECISION-MAKING FOR BETTER HEALTH OUTCOMES THROUGH COMPLEMENTARY AND INTEGRATIVE HEALTH APPROACHES
Jadhav PM[1], Parthasarthy S[2]
[1]*CRC Pharma LLC, Parsippany, NJ, USA,* [2]*Innovation Communications Group, New York, NY, USA*
The 1994 Dietary Supplement and Health Education Act (DSHEA) has been a key factor in influencing the use of Complementary and Integrative Health (CIH) approaches. Along with natural products or dietary supplements, there has been an increase in the use of mind-body approaches such as yoga, osteopathic and chiropractic manipulations, etc., with estimates of approximately 36% of the US population having used at least one such approach in prior two years1 and 33.2% of the US population using it for pain management as per the National Health Information Survey (NHIS).2 From patient perspective, there has been a consistent increase over the last two decades in the use of CIH approaches for various disease indications despite this being out-of-pocket expenditure. This is because it is at odds with the Commercial Payers' perspective that focuses on elements like evidence-based improvements in health outcomes, specific clinical endpoints and lower cost (decreased hospitalizations, medication use, emergency room visits). CIH approaches that include conventional treatment along with complementary practices, may augment patient health experience positively, reducing health disparities and provide better health outcome at potentially lower cost, satisfying both the patient and commercial payer's perspective. 1 For conventional healthcare systems to adopt truly integrated CIH approach, the major drivers will have to include clinical and cost-effectiveness parameters. Outcomes research assessing impact on quality of life, can be pivotal in bringing this approach to the commercial payer's domain. We also propose an organized database accessible to the relevant stakeholders, mapping the use of CIH approaches by patients in the real world. Such information linking specific approaches to specific therapeutic areas can lead to better understanding and help in devising strategies to selectively bring CIH approaches to the mainstream. Kinser PA, et.al. Evidence based Complementary and Alternative Medicine, Vol 2016, Article ID 2156969 https://nccih.nih.gov/health/integrative-health accessed on 18th Jan 2017

OVERCOMING THE CHALLENGES OF ESTABLISHING EXPANDED ACCESS PROGRAMS IN EUROPEAN MEMBER STATES – A REGIONAL REVIEW
Jones CA[1], Béjot J[2], Prades E[2], Darchy A[2], Muscionico D[3]
[1]*Voisin Consulting Life Sciences, Camberley, UK,* [2]*Voisin Consulting Life Sciences, Paris, France,* [3]*Voisin Consulting Life Sciences, Lausanne, Switzerland*
OBJECTIVES: To review current status and challenges associated with mechanisms governing the provision of unlicensed pharmaceutical compounds in areas of high unmet need outside of clinical trials. Recommendations for avoiding common pitfalls will be provided based on review of actual case studies in selected markets. **DISCUSSION**: While the European Medicines Agency (EMA) provides recommendations through the Committee for Medicinal Products for Human Use (CHMP), Expanded Access Programs (EAPs) are mainly regulated at country level. The main markets (EU5, Austria, Belgium, The Netherlands, Portugal and some Nordic countries) have defined EAP procedures. Most Eastern European countries do not, or are currently developing legislation. The EU directive does not set requirements for charging of investigational medicinal product, Member States set their own pricing and reimbursement rules. This lack of a common legal framework has led to national programs that differ widely due to differences in clinical practices, hospital structures, national insurance systems, pricing and reimbursement and funding pathways. The possibility of charging for these products is different from one country to another. Furthermore,

future price can be influenced by the price of the product in an EAP and by the timing of the negotiations. The complexity of managing these programs has increased, particularly in countries where it can take over 20 months to agree reimbursement after marketing authorization, delaying patient access. Underestimation of the set-up complexities, language issues, cost and duration of an access program, failure to reliably predict demand and ensure that sufficient drug is available, and failure to define an appropriate exit strategy are common challenges. **CONCLUSIONS:** Implementation of an EAP requires a multidisciplinary strategic approach and allocation of substantial resources. It is important to work with local representatives to understand the specific regional requirements in each country to mitigate potential risks e.g. inadvertently establishing price precedents or benchmarks.

IMPACT OF HEALTH SECTOR REFORMS ON HOSPITAL PRODUCTIVITY IN TURKEY: A DATA ENVELOPMENT ANALYSIS (DEA) BASED MALMQUIST INDEX APPROACH

Younis M[1], Mollahaliloglu S[2], Kavuncubasi S[2], Simsek F[3], Kostak M[3], Yildirim S[4], Nwagwu E[1]

[1]*Jackson State University, Jackson, MS, USA,* [2]*Baskent, Ankara, Turkey,* [3]*Ministry of Health, Ankara, Turkey,* [4]*Bolton Group, Ankara, Turkey*

OBJECTIVES: Health sector reforms are policy changing processes designed to solve efficiency, quality and equity problems associated with the delivery of health services. Health sector reforms create sustained, purposeful and fundamental changes in the health sector (Berman, 1995). As pointed out by Cassels (1995), governments of developing countries have to ensure that an appropriate share of public revenue is allocated to health, that the benefits of publicly-funded health care are equitably distributed; and that resources are used as efficiently as possible, both in terms of maximum health gain for the fund invested and minimum cost for the range of health services provided. Since 2003, the Turkish Ministry of Health (MoH) has embarked upon the implementation of a Transformation Program (HTP) to design a human (i.e., patient) centered health system (Akdağ, 2003). **METHODS:** The Authors used Data Envelopment Analysis and Malmquist index to measure hospital efficiency and productivity in Turkey, after the Turkish government healthcare Reform. **RESULTS:** That study found that he hospital sector in Turkey improved in efficiency and productivity since the implementation of health care reform. This has contributed to lower healthcare spending. **CONCLUSIONS:** Healthcare sector in Turkey has improved overtime bringing Turkey one step closer to joining the European Union, although the service, quality, and productivity are other values that need attention

PHP310

THE TOWWERS PROGRAM: A PILOT PROGRAM TO CAPTURE REAL-WORLD EVIDENCE IN A POPULATIONAL ENVIRONMENT - THE QUEBEC EXPERIENCE

Frappier J

Data 4 Actions, Blainville, QC, Canada

In the province of Quebec, over the past 30 years, the proportion of healthcare cost has increased significantly, regardless of all the cost containment policies that have been implemented within the system. Today, healthcare represents 48% of the government expenses. Health is a priority but it is not the only one. International organizations are searching to solve the puzzle of coping with patient access – patient centeredness - clinical relevance - affordability – breaking the silos – real world evidence as a mean to optimize patient health and control cost increase. In the province of Quebec, a pilot project is underway to address these issues: the TOWWERS program. The TOWWERS program is a dynamic, interactive, web clinical registry that shares the patient clinical summary (the DOC-P) amongst healthcare professionals and the patient. The ultimate goal of the TOWWERS program is to transform healthcare policymaking paradigm based on budgets towards clinical results, increasing accountability and collaboration of the various actors to develop relevant market access strategies and track the efficiency of treatment plans for the various actors. During this conference, we will share our ongoing experience of a major public-private health partnership of healthcare professionals, patients and their advocacy groups, payers, governments and industry.

CHALLENGES FACING PHARMACEUTICAL PRICING IN EGYPT AFTER CURRENCY DEVALUATION HOW TO REACH EQUILIBRIUM

Abotaleb A[1], El Shobaky AS[2], Ashraf RM[3]

[1]*World health organization (WHO), cairo, Egypt,* [2]*central administration of pharmaceutical affairs, cairo, Egypt,* [3]*janssen Egypt, cairo, Egypt*

The central bank of Egypt announced the floatation of the Egyptian pound in November 2016 leading to a significant devaluation against the USD. The pharmaceutical industry was critically affected by the flotation because; ● Pharmaceutical products are subject to compulsory pricing and They represent 31 % of total health spending. ● many of the Products In The Market Had Been Priced Years Earlier at a much Lower Exchange Rate. Which lead to pharmaceutical industry facing the following challenges: ● products went below profitability ● business size shrank by 50% overnight. Consequences were: ● Inability to maintain supply to fulfill tender requirements that were awarded before the devaluation. ● All Patient access programs were reassessed &in many cases suspended. ● Products shortage due to exit of suppliers from Egyptian market and due to distributer and pharmacist holding back stock in anticipation of a price increase. Which create an urgent need from stakeholder (pharma industry – regulatory body) to adress the following: ● How the reprising process could achieve the equilibrium between a fair price for the industry and patient accessibility. ● How to control drug shortage. ● With 71% out of pocket for health expenditure how to minimize the effect of price increase on public. Methods: The following strategies should be implemented : ● Developing clear &fair pricing guidelines that enhance value recognition. ● establish a price elasticity model that accommodates market equilibrium between supply & demand ● (re)pricing policy should be a multi criteria decision including (profit margins for supplier-socioeconomic factors - life saving products –orphan drugs -) ● Enhancing perfect competition elements like(Property rights, exit and entry to the market large number of buyers and sellers, transparent information) ● Expanding health services packages for new social layers to minimize the impact of price increase

EQUITY, LAW AND SOCIAL JUSTICE IN THE CONTEXT OF COLOMBIAN HEALTH SYSTEM

Garzón-Orjuela N[1], Moreno L[1], Gonzalez K[1], Eslava-Schmalbach J[2]

[1]*National University, Bogota, Colombia,* [2]*National University of Colombia, Bogota, Colombia*

The present work is the result of a perspective exercise that aims to reflect from the conception of human rights to the consequences of a health system centered more on the treatment of diseases that ultimately becomes inefficient. This study is a perspective paper about equity, justice and rights in the context of the Colombian Health System, going from a philosophical conception of first- and second-order rights, to finally characterize the current Health System to which the Colombian population is "exposed". With real examples it is shown that Colombia fails at being a welfare State, focusing in first-order rights more than in second-order rights. This work demonstrates not-favorable outcomes on collective rights of the Colombian population, partly due to the lack of morality of its implicit actors, to the fragile structure for a true regulation of the health system, and corruption in health, among other causes. With all of these issues, there is no space for a true social justice, leading to a worsening status of health inequities. The importance of this work is to generate and to promote new policy efforts to change the current weak and unstable Colombian health care system that could finally lead to an improvement of social justice and inequities in health.

"THE PICKWICKIAN SYNDROME" A STORY OF BULG AND THE ROLE OF PROBIOTICS

Tadisetti P

Chalapathi institute of pharmaceutical sciences, GUNTUR, India

In the present scenario, the health of Homo sapiens is drastically deteriorating due to man's desire for rapid industrialization and urbanization. The heart-warming conditions like cardiovascular disease remain the world's main cause of mortality and are linked to high blood cholesterol and chronic low grade inflammation. The emerging trends of multidrug resistance among several groups of microorganisms against different classes of antibiotics led to use of probiotics for cholesterol lowering has been extensively studied and is considered a prospective option to prevent cardiovascular diseases like pickwickian syndrome which is also known as the Obesity hypoventilation syndrome (OHS). The use of probiotics for cholesterol lowering has been extensively studied and is considered a prospective option to prevent cardiovascular disease. In this study we report the causes of Pickwickian syndrome,clinical safety and efficacy of cholesterol lowering probiotics like Lactobacillus reuteriand other strains. **KEYWORDS**: Cardiovascular disease, biotechnology, probiotic, Lactobacillusreuteri,Obesity Hypoventilation Syndrome (OHS)

THE IMPORTANCE OF CHARACTERISING UNCERTAINTY IN MODEL-BASED ECONOMIC EVALUATIONS OF STRATIFIED MEDICINE

Gavan S, Thompson A, Payne K

The University of Manchester, Manchester, UK

Stratified medicine requires that treatment decisions are informed by a strategy (usually a test) that reveals previously unobserved heterogeneity within a patient population. The relative costs and benefits of a stratified medicine can be evaluated with a model-based cost-effectiveness analysis (CEA). Understanding the type and impact of the uncertainty inherent in model-based CEA is necessary to inform the appropriate allocation of health care budgets. In contrast to conventional pharmaceuticals, there is frequently a lack of evidence that demonstrates the relationship between a test result and the treatment-related health outcome, which can, among other factors, contribute towards greater uncertainty. The objective of this conceptual study is to discuss the importance of characterising the types of uncertainty in model-based CEA relevant to stratified medicine. Four types of uncertainty were defined, using systematic searches of the literature and supported by identifying relevant examples of uncertainties within appraisals for the NICE Diagnostics Assessment Programme: methodological, structural, parameter, and decision uncertainty. Methodological uncertainty is apparent when decision-makers and analysts consider whether the CEA evaluative framework is appropriate for a stratified medicine. Structural uncertainty arises from different views about the relevant test-and-treatment pathways and the appropriate choice of model type needed to reflect the positioning, frequency, and consequence of test combinations. Consideration of parameter uncertainty is essential given the relatively poor evidence base available to populate model-based CEA. The interpretation of value of information analyses within model-based economic evaluations of stratified medicine should be made with reference to both parameter and structural uncertainties. Decision uncertainty associated with recommendations for stratified medicine may be greater than for conventional pharmaceuticals resulting from limitations in the support-

ing evidence base. It is vital that decision-makers are aware of the influence of all types of uncertainty to fully understand the opportunity cost and relative value of introducing stratified medicine into practice.

IMPLICATIONS FROM HEOR AND RWE MODELS FOR BIOPHARMACEUTICAL COMMERCIAL ANALYTICS TO DEMONSTRATE DRUG VALUE THROUGH SALES AND MARKETING OF SPECIALTY MEDICINES

Chressanthis GA
Axtria, Berkeley Heights, NJ, USA

Biopharmaceutical industry trends show an increased focus on specialty medicines. Specialty medicines account for 35% of US drug total spending, half of total spending growth is on new drugs available for <2 years, and with oncology comprising 35% of all 2015 new drug launches. However, biopharma pricing of specialty medicines is not economically sustainable. There is a growing gap between rising costs of pharmaceutical R&D for drug innovation and individual/societal willingness and ability to pay for this innovation. Numerous complications arise from specialty medicines catering to orphan drug-like patient populations. Drug pricing and demonstration of value problems are acute with targeted personalized anti-cancer medicines. What can biopharma companies do to demonstrate value for specialty medicines when conducting sales and marketing? Traditional commercial model design that emphasizes unit sales growth will not suffice. The literature lacks practical mechanisms companies can use to bridge implications from HEOR/RWE models with commercial operations for successful demonstration of drug value that benefits patients and the healthcare system. This proposed research presentation will provide a conceptual framework that combines traditional HEOR/RWE models with commercial analytics (defined as commercial model design, payer/patient/sales/marketing analytics, commercial analytics innovation center, and cloud information management) to support informative sales and marketing activities of specialty medicines. The result will be a more effective demonstration of drug value through sales and marketing by improving health outcomes, cost-effectiveness, and overall healthcare spending. Commercial analytics activities are becoming interdependent as opposed to distinctly-operating functions. Payer/patient analytics will be the principal emphasis and drive all commercial decisions leveraging outcomes from HEOR/RWE modeling. All remaining analytics will be to support payer/patient outcomes. A new approach to commercial analytics is needed, requiring greater alignment among these activities, an open-system framework in solving commercial problems, data environment constructed to support these activities, and leadership/organizational changes.

ANALYSIS OF ADVERSE DRUG REACTIONS IN PATIENTS WITH TUBERCULOSIS ALONE AND IN COMBINATION WITH HIV COINFECTION : A PROSPECTIVE OBSERVATIONAL STUDY

Narne HM3
Acharya Nagarjuna University, GUNTUR, India

OBJECTIVES: The main objective of the study is to monitor and detect adverse drug reactions during treatment of pulmonary tuberculosis, and to compare their incidence, frequency and severity with patients having TB-HIV co-infection. **METHODS:** We conducted a prospective study on patients who visited DOTS center between December 2014 and November 2016 in Govt. Infectious Disease Hospital, Guntur, Andhra Pradesh, India. Any symptomatic adverse event observed by the clinician or reported by the patient was recorded in the standard patient treatment booklet of the National Tuberculosis and Leprosy Programme. **RESULTS:** One hundred and thirty two patients completed the study. Maximum number of ADRs observed in one patient is 13.Twenty six patients (19.6%) had TB-HIV co-infection. Majority (53.1%) of the events are moderate. All the serious events occurred in TB-HIV group.Out of 132 patients,thecommonly occurring ADRs were neuropathy (n=40, 10.3%) followed by anorexia (n=39, 10%) and polydipsia (n=36, 9.25%). Gastrointestinal ADRs were highest in number followed by the nervous system related reactions.Type A reactions were more common in TB group ($p < 0.001$). **CONCLUSIONS:** ADRs are more likely to occur and to persist in HIV co-infected patients than in HIV uninfected patients. Clinicians should employ various strategies for preventing drug-induced patient discomfort and harm, such as reducing the dose or stopping the suspected offending medicine.

PIN2

ACTIVE VERSUS PASSIVE PHARMACOVIGILANCE: ADALIMUMAB-RELATED INFECTIONS REPORTED IN OBSERVATIONAL STUDIES COMPARED WITH THE FDA'S ADVERSE EVENT REPORTING SYSTEM CASES

Chen C, Borrego M, Roberts M, Raisch DW
University of New Mexico College of Pharmacy, Albuquerque, NM, USA

OBJECTIVES: To compare adalimumab-related infections reported in observational studies to those reported in the U.S. FDA's Adverse Event Reporting System (FAERS). **METHODS:** Using MedDRA® preferred terms (PTs), infection and infestation cases in FAERS with adalimumab as the primary suspect drug were extracted though EvidexTM. Completed observational studies with results reported on ClinicalTrials.gov (OS-CTs) were extracted. Exclusion criteria for observational studies were: 1) did not assess safety, 2) contained duplicate data from another observational study and 3) reported only serious adverse events. For each infection PT, the percentage of the total number of infections from each source was determined. **RESULTS:** In FAERS, 58,012 cases with 824 different infection PTs were found. The 10 most frequently reported PTs in FAERS were nasopharyngitis (15.5%), sinus (7.8%), pneumonia (6.2%), bronchitis (5.6%), influenza (4.5%), urinary tract infection (3.9%), Herpes Zoster (3.3%), upper respiratory tract infection (2.6%), cellulitis (2.2%) and ear infection (1.8%). Twenty-four OS-CTs were included, comprising 2,284 cases with 272 infection PTs. The 10 most frequently reported PTs in OS-CTs were nasopharyngitis (15.7%), bronchitis (13.7%), urinary tract infection (10.8%), pneumonia (5.7%), respiratory tract infection (4.2%), upper respiratory tract infection (2.8%), Herpes Zoster (2.2%), sinusitis (1.9%), sepsis (1.7%) and pharyngitis (1.7%). Thus, 7 of the top 10 infection PTs matched and 3 were reported at rates within 0.5% of each other. Respiratory cases accounted for 6 and 7 of the top 10 infection PTs in FAERs and OS-CTs, respectively. **CONCLUSIONS:** The study demonstrates good comparability between adalimumab-related infection cases reported in FAERS and OS-CTs. Differences in the percentages of cases may relate to severity, as likely only the most severe infections would be reported to FAERS. Results indicate that passive (FAERS) and active (observational studies) pharmacovigilance provide similar results for common infections. This finding supports the usefulness of FAERS in post-marketing drug safety assessment.

PIN3

ANTIBIOTIC UTILIZATION, TREATMENT OUTCOMES, AND ECONOMIC IMPACT IN SEPSIS PATIENTS: RETROSPECTIVE ANALYSIS OF A LARGE US ELECTRONIC HEALTH RECORD DATABASE

Peyerl FW, Khangulov VS, Hayashi DE, Talaga AK, D'Souza FT
Boston Strategic Partners, Inc., Boston, MA, USA

OBJECTIVES: Approximately 7% of total healthcare expenditure in the US is due to hospitalizations for severe infections. Treatment of sepsis patients accounts for 1.15 MM hospital admissions every year. The objective of this study was to examine antibiotic utilization and associated outcomes and cost in a large sample of US sepsis patients. **METHODS:** An electronic health record dataset (Cerner Health Facts®) containing over 600 hospitals and 272MM patient visits was examined for this retrospective study. Adult inpatients and outpatients diagnosed with sepsis during an emergency admission between January 2010 and March 2015 were retrospectively analyzed. **RESULTS:** The final study population included 47,842 patient visits. The most common antibiotics used were vancomycin (14.4%), piperacillin-tazobactam (14.3%), and levofloxacin (12.8%). Based on median severity of illness scores, gentamicin and piperacillin-tazobactam were prevalently used to treat severe infections. Patients with severe infections were observed to have high length of stays (LOS), with gentamicin (median LOS 7.5 days), metronidazole (median LOS 8.7 days), and linezolid (median LOS 8.7 days) patients having the highest LOS of the top ten antibiotics. Patients on linezolid experienced the highest mortality rates (17%) and cost per patient (mean total cost of $40,226), despite having similar severity of illness scores to other commonly used antibiotics. In contrast, patients treated with levofloxacin experienced the lowest median cost per visit ($22,902) and mortality rate (6%). **CONCLUSIONS:** Sepsis patients treated with levofloxacin experienced the lowest patient cost per visit and mortality rate compared to sepsis patients treated with other antibiotics. Severe patients, treated with other antibiotics such as piperacillin-tazobactam, gentamicin, and linezolid, experienced higher mortality rates, longer length of stays, and higher treatment costs.

PIN4

ANTIBIOTIC UTILIZATION, TREATMENT OUTCOMES, AND ECONOMIC IMPACT IN PNEUMONIA PATIENTS: RETROSPECTIVE ANALYSIS OF A LARGE US ELECTRONIC HEALTH RECORD DATABASE

Peyerl FW, Khangulov VS, Hayashi DE, Talaga AK, D'Souza FT
Boston Strategic Partners, Inc., Boston, MA, USA

OBJECTIVES: In 2014, the US healthcare spending surpassed $3.0 trillion with nearly 1/3 ($971 billion) spent on hospitalizations. An estimated 1.14 MM patients are admitted to the hospital every year for treatment of pneumonia. The objective of the present study was to examine the current antibiotic utilization and associated outcomes and cost in a large sample of US pneumonia patients. **METHODS:** We examined prospectively collected data from a US electronic health record dataset (Cerner Health Facts®) representing 614 US hospitals and over 272MM patient encounters. Inpatient and outpatient encounters between January 2010 and March 2015 involving adult patients diagnosed with pneumonia during an emergency admission were retrospectively analyzed. **RESULTS:** The final study population included 103,502 patient encounters. The most common antibiotics used were levofloxacin (19.7%), ceftriaxone (13.8%), and azithromycin (11.0%). Gentamicin, ciprofloxin, and piperacillin-tazobactam were commonly used to treat more severe infections, based on median severity of illness score. Severe patients treated with these antibiotics were observed to have a high median length of stays (LOS) compared to patients treated with the other top ten antibiotics, with gentamicin (median LOS 9.0 days), metronidazole (median LOS 8.9 days), and ciprofloxin (median LOS 7.0 days) patients having the highest LOS. Patients on gentamicin had higher mortality rates (18% vs. 13% as the next highest in top ten) and cost per patient (median total cost of $80,682 vs. $39,314 as the next highest in top ten), potentially due to high median severity of illness scores compared other commonly used antibiotics. **CONCLUSIONS:** This analysis identified key trends in antibiotic usage in pneumonia patients. Gentamicin was used to treat severe patients, resulting in longer length of stays and higher costs per patient. Conversely, patients treated with other commonly used antibiotics such as levofloxacin, ceftriaxone, and azithromycin, were less severe and experienced shorter length of stays and lower mortality rates.

PIN5

TREATMENT OUTCOMES AMONG HIV/AIDS PATIENTS TREATED DURING HAART THERAPY AT INFECTIOUS DISEASE CLINIC

Khan K[1], Khan AH[2], Sulaiman SA[2], Soo CT[3], Ahmad SI[4]
[1]Universiti Sains Malaysia, Pulau Pinang, Malaysia, [2]Universiti Sains Malaysia, Penang, Malaysia, [3]General Hospital Penang, Pulau Pinang, Malaysia, [4]International Medical University, Kuala Lampur, Malaysia

OBJECTIVES: Current study is aimed to explore and to observe clinical treatment outcomes during HAART therapy among HIV/AIDS patients. **METHODS:** An observational retrospective study of all patients diagnosed of HIV infection and on HAART therapy from Jan 2007 to Dec 2012 was conducted at infectious disease department of Hospital Pulau Pinang, Malaysia.Data was descriptively analyzed by using statistical package for social sciences (SPSS 20). **RESULTS:** Out of 792 patients that underwent HAART therapy, 607 (76.6%) were male and 185 (23.3%) were female patients. The treatment outcome of the total study population (792) on the basis of recovery of CD4 cells count to the normal range was (≥350 cells/mm3). Out of total patients (792), 645 (81.4%) patients improved their CD4 cells count under the treatment of HAART therapy out of which 488 (61.6%) male and 157 (19.8%) female patients were improved to a normal range of CD4 cells count. On binary logistic regression both Malay (OR 2.32, p <0.001) and Chinese patients (OR 0.37, p <0.001) were found to be statistically significant. Patients having age less than 30 years (OR 0.58, p 0.09), with secondary education level (OR 0.44, p 0.001), and Graduate patients (OR 0.50, p 0.09) were also have a signification association with treatment outcomes. Non-smokers (OR 2.16, p 0.001), non-alcoholic (OR 1.42, p 0.05) and non-drug abusers were also found to be statistically significant. **CONCLUSIONS:** The study indicates the clinical treatment outcomes in non-smokers, non-alcoholics and non-drug abusers HIV patients were higher. Also indicate a significant treatment outcomes on educated patients which may be due to the awareness about the infection. However, a multicenter study with a large sample size may provide us with better understanding of this relationship

PIN6

OUTCOMES AND ECONOMIC BURDEN OF ANTIBIOTIC-RESISTANT SEPSIS PATIENTS: RETROSPECTIVE ANALYSIS OF A LARGE US ELECTRONIC HEALTH RECORD DATABASE

Peyerl FW, Khangulov VS, Hayashi DE, Talaga AK, D'Souza FT
Boston Strategic Partners, Inc., Boston, MA, USA

OBJECTIVES: Hospitalizations for severe infections account for approximately $212 billion in annual spending, at an average cost of $15,500 per occurrence. Sepsis accounts for approximately 12% of all hospital stays and over 40% of bacterial sepsis cases are caused by drug resistant organisms. The objective of the present study was to examine the outcomes and costs associated with drug resistant sepsis in a large sample of US patients. **METHODS:** We examined an electronic health record (EHR) database with information collected from 614 hospitals across the US. Encounters involving adult inpatients and outpatients diagnosed with sepsis during an emergency admission between January 2010 and March 2015 were retrospectively analyzed. **RESULTS:** The final study population included 47,842 patient visits. The most common bacterial species in sepsis infections were Escherichia coli (19%), Staphylococcus aureus (10%), and Staphylococcus sp. Coag Negative (7%). Sepsis patients with drug resistant infections experienced higher median hospital costs ($14,088) compared to patients with drug susceptible infections ($11,084). Acute kidney injury was 16% more prevalent in patients with drug resistant sepsis (drug resistant 26.8%; drug susceptible 23.0%). Patients with drug resistant infections experienced 22% longer length of stays (LOS) in the intensive care unit (ICU) and 26% longer LOS in the hospital (median ICU LOS 4.4 days vs. 3.6 days; median hospital LOS 9.0 days vs. 7.1 days). We observed a similar trend for mortality rate, as patients with drug resistant pneunomia were over 300% more likely to die in the hospital (mortality rate 5.64% vs. 1.27%). **CONCLUSIONS:** This analysis identified important differences in clinical outcomes, LOS, and cost in sepsis patients with drug resistant bacterial species and drug susceptible bacterial species. Drug resistant bacterial infections resulted in higher mortality rates, longer hospital stays, and higher treatment costs.

PIN7

OUTCOMES AND ECONOMIC BURDEN OF ANTIBIOTIC-RESISTANT PNEUMONIA PATIENTS: RETROSPECTIVE ANALYSIS OF A LARGE US ELECTRONIC HEALTH RECORD DATABASE

Peyerl FW, Khangulov VS, Hayashi DE, Talaga AK, D'Souza FT
Boston Strategic Partners, Inc., Boston, MA, USA

OBJECTIVES: Approximately 13.7 million hospital discharges in 2013 (~30% of all hospital discharges) involved treatment of infectious organisms. An estimated 1.14 MM patients are admitted to the hospital every year for treatment of pneumonia and over 20% of bacterial pneumonia cases are caused by drug resistant organisms. The objective of the present study was to examine the outcomes and costs associated with drug resistant pneumonia in a large sample of US patients. **METHODS:** This retrospective study examined prospectively collected data from a large, de-identified US electronic health record database covering >49M patient encounters from >600 participating facilities. We retrospectively analyzed encounters involving adults diagnosed with pneumonia during an emergency inpatient or outpatient admission between January 2010 and March 2015. **RESULTS:** The final study population included 103,502 patient visits. The most common bacterial species in pneumonia infections were Staphylococcus aureus (9%), Staphylococcus sp. Coag Negative (9%), and Escherichia coli (9%). Drug resistant infections resulted in higher median hospital costs per patient compared to drug susceptible infections ($16,171 vs. $11,451). Patients with drug resistant pneumonia were 26% more likely to experience acute kidney injury (drug resistant 24.6%; drug susceptible 19.5%). Length of stays (LOS) in the intensive care unit (ICU) and hospital were 26% and 33% higher, respectively for patients with drug resistant pneumonia (median ICU LOS 7.5 days vs. 6.0 days; median hospital LOS 11.9 days vs. 9.0 days). Additionally, patients with drug resistant pneumonia had higher mortality rates (3.40% vs. 0.81%). **CONCLUSIONS:** This analysis identified greater hospital costs, longer length of stays, and higher mortality rates in pneumonia patients with drug resistant bacterial species compared to patients with drug susceptible bacterial species. These findings provide insights into resource allocation for treatment of drug resistant infections and support the importance of developing treatment options to circumvent established antibiotic resistances.

PIN8

CONCOMITANT UTILIZATION OF COMPLEMENTARY AND ALTERNATIVE MEDICINE, AND ANTIRETROVIRAL THERAPY AMONG HIV-INFECTED PATIENTS: PREVALENCE, PATTERNS AND OUTCOME

Mgbere O[1], Arafat R[1], Wang X[2], Essien EJ[2]
[1]Houston Health Department, Houston, TX, USA, [2]University of Houston, Houston, TX, USA

OBJECTIVES: To evaluate the prevalence and patterns, and covariates of concomitant use of complementary and alternative medicine (CAM) and Antiretroviral Therapy (ART) and the impact on ART adherence and viral load suppression among HIV-infected patients engaged in care in Houston/Harris County, Texas. **METHODS:** Data used for this study were obtained from the Medical Monitoring Project (MMP) survey conducted in Houston/Harris County, Texas between 2009 and 2013. We estimated the prevalence and patterns of concurrent use of CAM and ART among persons receiving HIV medical care in the past 12 months, and determined the relationship with ART adherence and viral load suppression. The data obtained were subjected to descriptive and inferential statistics using the SAS software version 9.4. **RESULTS:** Concomitant use of CAM and ART (CAM-ART) was significantly (p<0.0001) more prevalent among Whites (44.9%, 95% CI: 33.4-56.4) than blacks (34.0%, 95%CI: 24.6-43.4) and Hispanics (17.1%, 95%CI: 9.3-24.9). CAM-ART use increased significantly (p<0.0001) with age and education, peaking at age 45-54 years (42.1%, 95% CI: 32.7-51.6) and among those educated beyond high school (62.0%, 95%CI: 49.9-74.1). More males than females used this self-management approach (79.3% vs. 18.7%, p<0.0001). Common CAM modalities used include biologically based therapies (84.5%), mind–body medicine/manipulative body-based therapies (25.4%), spiritual healing (14.2%), and energy therapies (2.4%). Among CAM-ART users, 83.5% (p<0.0001) were adherent to ART. We noted no significant variations in viral load suppression among CAM-ART users and non-users. **CONCLUSIONS:** The use of these therapies is suggestive of complementary roles rather than as substitutes for ART. However, it is very important that CAM-ART users consult with their clinicians to avoid any potential side effects or interactions with ART, and to ensure patient safety. Further research is needed to explore reasons for use and the possible health benefits or risks associated with long term use of CAM.

PIN9

BURDEN OF INVASIVE PNEUMOCOCCAL PNEUMONIA AMONG INDIAN CHILDREN: A SYSTEMATIC REVIEW AND META-ANALYSIS OF OBSERVATIONAL STUDIES

Tiwari P, Ahlawat R, Singhal R
National Institute of Pharmaceutical Education and Research (NIPER), S.A.S. Nagar, Punjab, India

OBJECTIVES: Pneumococcal pneumonia is a vaccine preventable disease. Despite this fact, it is one of the leading causes of childhood morbidity and mortality in Indian children. Limited data on its burden and serotype prevalence is one of the reasons for non-inclusion of the vaccine in national immunization schedule. The aim of the present study is to estimate the overall prevalence of invasive bacterial pneumonia caused by Streptococcus pneumoniae in Indian children. **METHODS:** This systematic review was performed using Cochrane Library; Pubmed; Google Scholar and Science Direct. Further, the reference list of related papers was also screened for additional studies. Patients under 12 year of age and diagnosed with invasive bacterial pneumonia caused by S. pneumoniae was included. Published studies up to JANUARY 2016 were included. Publication bias was assed by using the Egger's and Begg's tests along with funnel plot. Newcastle-Ottawa scale was used to assess the study quality. Heterogeneity was assessed using Cochrane Q-statistics test and I2 statistics. Random-effects model was used to report the pooled prevalence with 95% confidence intervals (CI). **RESULTS:** A total of 6 studies, covering a total of 40083 patients and from different geographical regions in India were included. The number of study participants ranged from 132-37070. And, the period of surveillance ranged from 1–2 years. The pooled prevalence of bacterial pneumonia caused by S. pneumoniae in Indian children under 12 year of age was found to be 24.5% (95% confidence interval 11.2%-45.4%). The pooled prevalence of bacterial pneumonia caused by S. pneumoniae 45.9% (30.6%-62%) was found to be higher in children under 6 years of age. **CONCLUSIONS:** Bacterial pneumonia caused by S. pneumoniae has a significant burden among Indian children. The inclusion of pneumococcal vaccine in the Indian public health programme may help in decreasing this burden.

PIN10

INCIDENCE OF PERTUSSIS AMONG INDIVIDUALS AGED 0-64

Tong J, Buikema AR, Horstman T
Optum, Eden Prairie, MN, USA

OBJECTIVES: Pertussis is an infectious respiratory disease which affects individuals of all ages. Pertussis incidence has increased in recent decades, despite established childhood vaccination programs. To better understand recent trends in pertussis disease, and the impact of new adult vaccination recommendations, we used administrative health care claims data to estimate the incidence of pertussis among individuals aged 0-64 from 2006 to 2015. **METHODS:** Individuals aged 0-64 years with evidence of a pertussis diagnosis from 1/1/2006-12/31/2015 were identified from commercial claims in the Optum Research Database (ORD). Annual pertussis incidence was calculated as the ratio of newly diagnosed pertussis cases

over the total person-time at risk. Incidence rates were standardized to the 2010 US Census on age, sex and geographic division. **RESULTS:** From 2006-2015, 17,350 pertussis cases aged 0-64 were identified with 61.3% of cases among adolescents or adults. The overall standardized incidence of pertussis was 14.6 cases/100,000 person-years (PY). The incidence of pertussis among all age groups peaked in 2012 at 23.3/100,000 PY (178.9/100,000 PY among infants <1) and declined to 12.9/100,000 PY in 2015 (infants: 96.5/100,000 PY), consistent with trends reported by the CDC using nationwide surveillance data. On average, standardized incidence rates estimated from the ORD were more than twice as high as those reported by the CDC. **CONCLUSIONS:** Our results suggest that pertussis incidence may be higher than previously estimated, and that medical claims data can provide an important alternative perspective on disease incidence. Incidence of pertussis has been declining since the CDC recommended vaccination for all adults in 2012, with more rapid declines among infants. Findings from this study highlight the continued importance of pertussis management and prevention strategies among individuals from all age groups, especially adolescents and adults as they are known to represent a main source of transmission to infants.

PIN11

INCIDENCE AND TREATMENT OUTCOME OF TUBERCULOSIS AMONG MALAYSIAN PRISONERS

Khan AH[1], Sulaiman SA[1], Muttalif A[2], Hassali MA[1], Aftab RA[3]
[1]Universiti Sains Malaysia, Penang, Malaysia, [2]Hospital Kuala Lumpur, Kuala Lumpur, Malaysia, [3]Universiti Sains Malaysia, Pulau Pinang, Malaysia

OBJECTIVES: To assesses the incidence of TB among prison inmates in four Malaysian states and evaluate their treatment outcomes. **METHODS:** A multicenter, cross-sectional, retrospective study was conducted in the eleven prisons in four Malaysian states, which were selected based on high burdens of TB in Malaysia (Sabah, Sarawak, Pulau Pinang, and Selangor). Patients with confirmed TB were selected for the study based on tuberculin skin testing, and further established by chest radiograph (CXR), sputum positive and culture positive test. **RESULTS:** A total of 405 inmates were diagnosed with TB. The majority were male inmates (n=397, 98%). The mean age of inmates with TB was 39.28 (SD ± 10.12) years. The sample was ethnically diverse and consisted mainly of Malays (n = 203, 50.1%) followed by Chinese (n = 98, 24.2%), Indians (n = 64, 15.8%), and other ethnicities (n = 40, 9.9%). Of the 405 inmates with TB, the majority were in Selangor state prison (n= 312, 77%); the incidence rate was755/100,000. The overall incidence of TB among the four state prisons in Malaysia was 440/100,000. The treatment outcomes of 279 (68.8%) inmates with TB was successful; 31 (7.7%) were defaulters; 12 (3%) were transferred to other prisons, 34 (8.4%) died, and treatment was continued in 49 (12.1%) inmates with TB. TB, age group (p 0.002), marital status (0.001), duration of sentence (p 0.005), and other factors were independently associated with the tuberculin skin test. **CONCLUSIONS:** A high incidence of TB was among the prison inmates in four Malaysian states indicates that the existing medical care in prisons requires improvement in order to address the spread of TB in prison.

PIN12

CHANGING EPIDEMIOLOGY OF PNEUMOCOCCAL MENINGITIS IN THE UNITED STATES, 2008-2013

Jacobs DM, Yung F
University at Buffalo, Buffalo, NY, USA

OBJECTIVES: The purpose of this study was to characterize U.S. national trends of the incidence of pneumococcal meningitis (PM), with an interest in differences prior- and post-licensure of the 13-valent pneumococcal conjugate vaccine (PCV13). The objectives were 1) to describe the incidence and related outcomes of PM patients and 2) to evaluate risk factors for PM among adults with selected chronic medical conditions. **METHODS:** This was a retrospective analysis of the National Inpatient Sample from 2008 to 2013. Patients were identified with the International Classification of Diseases, Ninth Edition, Clinical Modification diagnosis code for PM (320.1). Three periods were observed: 2008-2009 (pre-PCV13), 2010 (transition year), and 2011-2013 (post-PCV13). Data were weighted to generate national estimates and hospitalizations were reported per 100,000 discharges. In-hospital mortality and length of stay (LOS) were presented descriptively and a multivariable logistic model was utilized to identify risk factors associated with PM. **RESULTS:** During 2008-2013, there were 9283 hospitalizations due to PM in the U.S. Incidence of PM remained steady up to the introduction of PCV13 following which PM incidence increased from 3.96 hospitalizations/100,000 in 2011 to 4.14/100,000 in 2013. From 2011-2013, similar increases were seen for median LOS (8.64 days to 9.3 days) and in-hospital mortality (9.55% to 11.19%). In children aged <2 years the rate of PM hospitalizations increased from 2011-2013 (0.18/100,000 to 0.22/100,000) with a similar increase among children aged 2 to 4 years (0.06/100,000 to 0.18/100,000). Significant risk factors for PM in adults aged 19-64 years included alcoholism (aOR=2.89; 95% CI: 2.16, 3.86), diabetes (aOR=1.80; 95% Cl: 1.44, 2.25), and chronic heart failure (aOR=2.44; 95% CI: 1.64, 3.63). **CONCLUSIONS:** Following the introduction of PCV13, incidence of PM increased in the U.S. with a similar trend in patient mortality and hospital LOS. Selected chronic medical conditions in which PCV13 is not indicated are risk factors for PM.

PIN13

COMPARISON OF ADVERSE PREGNANCY OUTCOMES BETWEEN ANTI-MALARIAL DRUGS: A BAYESIAN NETWORK META-ANALYSIS OF RANDOMIZED CONTROLLED TRIALS AND COHORT STUDIES

Sridharan K[1], Sivaramakrishnan G[1], Kanters S[2]
[1]Fiji National University, Suva, Fiji, Fiji, [2]Precision Health Economics, San Francisco, CA, USA

OBJECTIVES: Head to head comparison studies are difficult to conduct in pregnant women. Bayesian network meta-analysis can be used to estimate the differences between treatment arms, between studies. The present study is a network meta-analysis of safety of anti-malarial drugs used to treat malaria in pregnant women. **METHODS:** A thorough literature search was conducted in electronic databases for either randomized controlled trials or prospective cohort studies in pregnant women with malaria, prescribed two different classes of anti-malarial drugs and reported adverse pregnancy outcomes such as still birth, miscarriage and congenital abnormalities. Odds ratio with 95% confidence interval was used as the effect estimate. Random-effects model was chosen and the Markov Chain Monte Carlo method was used to run 10,000 iterations. Step plots, rankogram using surface under the cumulative ranking curve (SUCRA) and inconsistency in results between direct and indirect comparisons were evaluated. **RESULTS:** A total of 1242 papers were obtained with the search strategy, of which nine evaluating 15 treatment arms in a total of 9476 participants were found eligible for this meta-analysis. No significant differences in risk of adverse pregnancy outcomes were observed between the different anti-malarial drugs evaluated in the present review. The combination of amodiaquine with sulphadoxine-pyrimethamine was found to be the safest anti-malarial agent. **CONCLUSIONS:** The anti-malarial drugs recommended by various guidelines as well as those assessed in randomized controlled trials and prospective cohort studies in pregnant women with malaria have comparable effect on adverse pregnancy outcomes.

INFECTION – Cost Studies

A BUDGET-IMPACT ANALYSIS OF QUADRIVALENT INFLUENZA VACCINE USE IN THE UNITED STATES

Talbird SE[1], La EM[1], Poston SA[2], Hogea CS[2]
[1]RTI Health Solutions, Research Triangle Park, NC, USA, [2]GSK, Philadelphia, PA, USA

OBJECTIVES: Influenza causes annual epidemics whose clinical and economic impacts show large seasonal variability. Although quadrivalent influenza vaccines (QIVs) provide broader protection against circulating influenza B lineages, use of trivalent influenza vaccines (TIVs) in the United States (US) persists. The objective of this study was to estimate the clinical and budgetary impact of converting remaining TIV market share to QIV in the US, while accounting for influenza's seasonal epidemiologic variability more precisely than previous models. **METHODS:** A budget-impact model was constructed using season-specific epidemiological parameters (e.g., attack rates, hospitalization rates) derived from Centers for Disease Control and Prevention published data for eight recent seasons; previous modeling approaches used average parameter values across seasons, including average attack rates from vaccine clinical trials conducted over limited seasons. The base-case estimates the annual budget impact (2016 US$) of converting 100% of current TIV market share to QIV in the US population aged ≥6 months. Influenza cases prevented were estimated using 2015/2016 vaccine coverage estimates, as well as influenza A/B type-specific vaccine efficacy data. Influenza-related outcomes and costs were then estimated using a decision-tree framework. Scenario analyses considered different payer perspectives and TIV market share conversions. **RESULTS:** Using mean parameter values across the eight influenza seasons, converting TIV market share to QIV resulted in 84,272 fewer influenza cases, 1,354 fewer hospitalizations, and 67 fewer deaths annually, with a corresponding budget impact of $0.013 per-person per-month (PPPM). Results varied substantially based on the epidemiological data from individual seasons, ranging from 211,557 fewer influenza cases and a PPPM cost of $0.001 using data from 2007/2008 to 11,904 fewer influenza cases and a PPPM cost of $0.025 using data from 2006/2007. **CONCLUSIONS:** The model estimated that conversion of TIV to QIV results in decreased clinical burden and deaths while slightly increasing costs. Using season-specific epidemiological inputs demonstrated outcome variability by season.

PIN15

BUDGET IMPACT OF ELBASVIR/GRAZOPREVIR (EBR/GZR) FOR THE TREATMENT OF CHRONIC HEPATITIS C (CHC) GENOTYPES 1 AND 4 IN A UNITED STATES (US) HEALTH PLAN

Corman SL[1], Nwankwo C[2], Jiang Y[3]
[1]Pharmerit International, Bethesda, MD, USA, [2]Merck & Co., Inc., Kenilworth, NJ, USA, [3]Merck Sharp & Dohme Ltd., Hoddesdon, Hertfordshire, UK

OBJECTIVES: To assess the financial consequence to a US health plan's direct pharmacy budget when EBR/GZR is added to the formulary for the treatment of G1 and 4 CHC patients. **METHODS:** The budget impact model (BIM) compared two scenarios, without EBR/GZR (scenario 1) and with (scenario 2) EBR/GZR on the formulary. The impact of the addition of EBR/GZR to the formulary was assessed within the context of other FDA-approved treatments for CHC G1 and 4 infection, which were assumed to be on formulary. Regimens and treatment durations were assumed to follow FDA-approved labeling and differed by genotype, presence of cirrhosis, and presence of chronic kidney disease (CKD) stage 4/5. Costs included medication wholesale acquisition costs and RAV testing, and were calculated over a 3-year time horizon. The incremental pharmacy cost of adding EBR/GZR to the formulary was estimated by calculating the total and per-member-per-month (PMPM) costs, with or without EBR/GZR in patients with and without CKD. **RESULTS:** Using an assumed plan size of 4,000,000 members, it was estimated that 11,465 patients with G1 or 4 CHC would be treated over 3 years. The total cumulative direct pharmacy budget was estimated at $1,062,307,272 (scenario 1) without EBR/GZR, and $1,002,922,056 after adding EBR/GZR to the formulary (scenario 2), a reduction of $59,385,216 (5.59%) over 3 years. PMPM cost decreased from $7.38 to $7.16 (-3.00%) in year 1, $6.94 (-5.87%) in year 2, and $6.79 (-7.90%) in year 3. In CKD stage 4/5 patients, total direct pharmacy budget was estimated at $14,930,787 (scenario 1) before adding EBR/GZR and $14,871,236 after adding EBR/GZR to the formulary (scenario 2), a 0.40% reduction. **CONCLUSIONS:** Based on the inputs and assumptions used in the BIM, the introduction of EBR/GZR to the formulary was projected to be cost savings to direct pharmacy budget of a health plan over a 3-year period.

PIN16

RETURN OVER INVESTIMENT ANALYSIS ON PNEUMOCOCCAL 13-VALENT CONJUGATE VACCINE CAMPAIGN IN PATIENTS OVER 50 YEARS IN BRAZILIAN PRIVATE HEALTHCARE

Alexandre RF, Santana CF, Squiassi HB
Pfizer, São Paulo, Brazil

OBJECTIVES: Evaluate the estimated time to achieve breakeven point in a pneumonia vaccination campaign using 13-valent conjugate vaccine in a Brazilian Private Healthcare System (BPHS). **METHODS:** A model developed to measure the time to achieve the breakeven point in a vaccination campaign. For this analysis where taken in consideration pneumococcal diseases epidemiologic data (DATASUS); mortality rates, demographic data (IBGE) and vaccine effectiveness, in a cohort of 2 million lives (based on average of top 10 largest Brazilian Private Health Plans). Were considered direct costs regarding patient treatment and indirect costs such as loss working day. For comparison were produced two scenarios: Scenario 1 the campaign was financed in 50% by the healthcare plan and scenario 2, where the cost is 100% with no cost for the patient. **RESULTS:** Applying the demographic rate of age groups were obtained the target population to be vaccinated (N=455,600). The total investment cost of the vaccination campaign for scenario 1 was BRL 30.2 million, and approximately BRL 60.5 million in scenario 2. The total cost of the pneumococcal diseases events were BLR 179.9 million direct expenses; including indirect costs were BLR 255.7 million. The breakeven point of investment in scenario 1 was under 2 years considering only direct costs and approximately 1 year, when including indirect costs. For scenario 2 the point was reached in approximately 3.5 years considering only the direct costs and approximately 2.5 years when including the indirect costs. **CONCLUSIONS:** The vaccination campaign using the 13-valent conjugate vaccine may represent an alternative medium-term investment improving overall health of the policyholder's portfolio, reducing the number of claims. Vaccine properties of immunological memory guarantee that a greater investment is needed only once, at the outset, requiring a lower maintenance cost for new entrants

PIN17

ECONOMIC OUTCOMES OF DENGUE FEVER IN HOSPITALIZED CASES IN VIETNAM: A CROSS-SECTIONAL STUDY

Le ND[1], Phung NH[1], VO TQ[2]
[1]*University of Medicine and Pharmacy, Ho Chi Minh, Viet Nam,* [2]*Mahidol University, Bangkok, Thailand*

OBJECTIVES: Dengue is the most rapidly-spreading mosquito-borne viral disease in the world. The disease is now endemic in more than 100 countries in the World Health Organization (WHO) regions. In 2014, Vietnam had recorded 43,000 cases in 53 provinces with 28 deaths. **METHODS:** A cross-sectional study was conducted in six months between September 2015 and March 2016 at Cu Chi Provincial General Hospital. Cost-of-illness (COI) in this study is estimated under the incidence–based approach from the societal perspective. **RESULTS:** Among 168 patients were interviewed, proportion of adults suffering dengue fever are almost double that of children (64.3% vs 35.7%). The day loss of patient and caregiver were 7.8 ± 2.9 days and 7.6 ± 2.1 days, respectively. Study also found out the average cost per case was 139.3 ± 61.7 USD. The average cost per child was not significantly higher than per adult (151.0 ± 63.5 USD and 132.7 ± 59.9 USD, respectively; $p = 0.068$). The component with the highest proportion of total cost was the cost of hospital bed (50.2%). According to the sensitivity analysis, if the cost of hospital bed and ultrasonic cost was reduced by 10%, the total treatment cost of dengue fever will fall by 5% and 1.6%, respectively. **CONCLUSIONS:** This study can be the basis for formulating investment plans and allocating funds for the treatment and prevention of this disease. In order to estimate the entire socioeconomics burden of disease due to dengue virus, a larger study including both dengue fever and dengue hemorrhagic fever, in several hospitals is needed.

PIN18

DIRECT MEDICAL COST OF INFLUENZA IN VIET NAM: A RETROSPECTIVE STUDY

Phung NH[1], Le ND[1], VO TQ[2], Nguyen TH[3]
[1]*University of Medicine and Pharmacy, Ho Chi Minh, Viet Nam,* [2]*Mahidol University, Bangkok, Thailand,* [3]*Ear Nose Throat Hospital, Ho Chi Minh, Viet Nam*

OBJECTIVES: Influenza which is imposed a considerable economic and social burden is a common cause of influenza-like illness among children. This study was conducted to estimate cost of illness based on provider perspective of influenza. **METHODS:** A retrospective study was conducted between January 2013 and December 2015 at at Ho Chi Minh city Hospital of Tropical Diseases. Demographic and clinical information was collected from medical records. Treatment cost are composed of cost of hospital bed, cost of diagnosis test, cost of X-ray/Imaging, cost of operation, cost of pharmaceuticals and cost of consumable material. **RESULTS:** Average cost per episode of all aged group was 112.58±239.60 USD, the highest cost was contributed by Adults group (313.28±560.50 USD), whereas the lowest cost was Children group (80.62±120.83 USD). According high risk factor group, average cost per day is 42.14 USD for any cardiovascular disorders group; diabetes-cardiovascular patient (41.15 USD), and elderly patient groups (48.52 USD). **CONCLUSIONS:** Direct medical cost of influenza-related hospitalizations imposes a heavy burden on patients and their families in Vietnam. Further study is needed to provide more comprehensive evidence on the economic burden of influenza.

PIN19

GENERATING DEMAND ESTIMATES TO INFORM THE VALUE OF DENGUE VACCINE INTRODUCTION IN 6 DIFFERENT COUNTRIES IN LATIN AMERICA AND THE CARIBBEAN

Martin del Campo J, De Broucker G, Greenberg A, Garcia CR, Constenla DO
Johns Hopkins University, Baltimore, MD, USA

OBJECTIVES: The first dengue vaccine was approved at the end of 2015 and has been authorized in 11 countries so far around the world. We estimated the potential vaccine demand using different introduction scenarios for two different vaccines in 6 different endemic countries in Latin America and the Caribbean to enable vaccine producers and public health agencies to have better strategies for a timely introduction of the vaccine. **METHODS:** We developed an Excel-based model and calculations were based on 2016-2045 population projections for our selected countries. For each of these countries, we considered 4 different introduction scenarios assuming a country-wide routine vaccination and catch-up vaccination campaigns. Assumptions on expected vaccination coverage were based on country-specific public sector immunization performance. We estimated the potential demand and costs of introducing a dengue vaccine in 6 different Latin American countries, based on key stakeholder preferences. We explored the impact of vaccine demand when the price drops faster and countries introduce sooner. **RESULTS:** Under our assumptions, Mexico would require the largest amount of annual doses in the first 5 years with 70.74 million doses and El Salvador the lowest with 3.88 million doses to vaccinate adults and children under any scenarios. The total vaccine cost for 30 years' projection varies by country. Mexico has the highest cost with $10.1 billion USD and El Salvador the lowest with $566 million USD. For these countries, if we experience an early price drop from $20 to $10 USD per dose in the first two years, the annual vaccine program costs (cost per dose, vaccination equipment, fixed and variable implementation cost) would increase by 50%. **CONCLUSIONS:** Our results project an upper-limit estimate of vaccine demand, with actual demand depending on each country priorities, cost and product profile. Policymakers in these selected countries should consider appropriate implementation strategies

PIN20

BUDGET IMPACT AND COST-EFFECTIVENESS ANALYSES OF NEWLY AVAILABLE TREATMENTS FOR CHRONIC HEPATITIS C INFECTION IN HONG KONG

Li X, Chan SN, Tam AW, Chan EW
University of Hong Kong, Hong Kong, China

OBJECTIVES: To evaluate the cost-effectiveness and the budget impact of introducing oral direct-acting antivirals (DAAs) to the hospital formulary in Hong Kong. **METHODS:** We developed a decision analytic model to compare short-term costs and health outcomes of chronic HCV genotype 1 infection in Hong Kong patients on the current standard treatment (triple therapy of pegylated interferon, ribavirin and boceprevir) to new treatments (sofosbuvir, ledipasvir/sofosbuvir or ombitasvir/paritaprevir/ritonavir and dasabuvir). Costs, sustained viral response (SVR) and incremental cost-effectiveness ratio (ICER) defined as incremental cost per treatment success were estimated for the cost-effectiveness evaluation. Five-year healthcare expenditures before and after the introduction of new treatments were compared to assess the budget impact to the public healthcare system. **RESULTS:** Medication costs accounted for >85% of overall treatment costs for all treatments. Compared to the current standard treatment, new treatments improved the SVR from 59-66% to 82.3-99.8% upon patient treatment history and cirrhosis conditions. New treatments mainly dominated current treatment as cost-saving options given their greater effectiveness and lower costs with ICERs ranged from -$3,395 to -$43,643 per treatment success. Introducing new treatments associated with 16.5% ($99.2 million) budget increase on HCV management over five years. A 50% change in medication costs reflected a change in budget ranging from -$229.2 to $426.5 million. **CONCLUSIONS:** New HCV treatments are cost-effective alternatives to current standard care in Hong Kong. Introducing the new treatments to the public hospital formulary yields moderate budget increase in five years.

PIN21

IMPACT OF CARBAPENEM RESISTANCE ON CLINICAL AND ECONOMIC OUTCOMES AMONG INPATIENTS WITH ACINETOBACTER BAUMANNII INFECTION OR COLONIZATION IN A HOSPITAL OF ZHEJIANG PROVINCE CHINA

Zhen X[1], Chen Y[2], Li Y[1], Zhang H[1], Hu X[1], Dong P[2], Dong H[3]
[1]*Zhejiang Univerisity, Hangzhou, China,* [2]*Pfizer Investment Co., Ltd., Beijing, China,* [3]*Zhejiang University, Hangzhou, China*

OBJECTIVES: The prevalence of carbapenem resistant Acinetobacter baumannii (CRAB) was seen a marked increasing in China. There is a significant impact of carbapenem resistance on both clinical and economic outcomes. This study aims to examine hospital mortality, length of stay, intensive care unit stays and average hospitalization expenses among inpatients with CRAB infection or colonization (CRAB/CSAB infection or colonization is replaced with CRAB/CSAB) and carbapenem susceptible A. baumannii (CSAB) in a tertiary teaching and general hospital in Hangzhou, Zhejiang Province, China. **METHODS:** Sixty-five percent inpatients, whose clinical specimens were submitted to the microbiological laboratory, between January 1, 2013, and December 31, 2015, were randomly selected every year, due to the large quantity of inpatients. The 1:2 propensity-matched samples were used for analysis to address the selection bias. Univariate analysis was performed to compare the characteristics of inpatients with CRAB versus CSAB. Kruskal-Wallis non-parametric test and multivariate linear regression model was conducted to evaluate the average hospitalization expenses. **RESULTS:** A total of 1007 inpatients with CRAB and 773 inpatients with CSAB were included. Compared to inpatients with CSAB, those with CRAB were significantly associated with a more than 3-fold increase in hospital mortality, a 3-day increase in mean length of stay, an 8-day increase in intensive care units stays and a 2-fold increase in average hospitalization expenses. **CONCLUSIONS:** The results of this study highlight the heavy burden CRAB posing on current Chinese healthcare system, emphasizing the importance of optimizing treatment pathway as early as empirical treatment stage and enhanced efforts in controlling carbapenem resistance, which calls for reliable resistance surveillance data, better prediction of the risk of CRAB infections, and improved antimicrobial stewardship programs in Chinese hospitals.

PIN22

THE HEALTH AND ECONOMIC IMPACTS OF ANDROGENIC ANABOLIC STEROIDS AS ADD-ON THERAPY FOR HIV PATIENTS

Whitmire SM[1], Noone JM[2], Zacherle E[3], Gordon BD[4], Blanchette CM[2], Howden R[4]
[1]University of North Carolina; Precision Health Economics, Charlotte, NC, USA, [2]University of North Carolina, Charlotte, NC, USA, [3]Precision Health Economics; University of North Carolina at Charlotte, Charlotte, NC, USA, [4]University of North Carolina at Charlotte, Charlotte, NC, USA

OBJECTIVES: Anabolic androgenic steroids (AAS) are a potential treatment for muscle wasting, a common consequence of advanced HIV. Prevalence of use and health outcomes associated with AAS are not well understood for HIV patients. The purpose of this study was to evaluate economic and health outcomes of HIV patients receiving AAS therapy compared to non-AAS treated HIV patients. **METHODS:** A retrospective cohort analysis was conducted with a large commercial claims database (2009-2014). HIV patients (ICD-9-CM: 042, 043, and 044) who received their first AAS treatment between January 2010 and June 2013 were identified. Patients without AAS treatment were selected if they had a primary diagnosis of HIV between January 2010 and June 2013. For analysis, a 6-month pre-period and a 24-month post-period were used to assess disease related utilization and cost. AAS treated and non-AAS treated patients were matched 1:1 using Greedy propensity score matching. **RESULTS:** 663 HIV patients were identified in the time window, of which 45 (6.8%) received AAS. There were disparities between the AAS and non-AAS groups in age (47.7 ± 7.61 vs 44.9 ± 9.93; p=0.028), proportion that were male (100% vs 81%; p=0.0012), HIV medication days' supply (305.4 ± 237.6 vs 233.6 ± 218.2; p=0.035), and HIV medication cost ($9192.30 ± 5981.40 vs $6506.90 ± 5337.00; p=0.001). Fifty-eight patients were matched on demographic and severity indices. Age, gender, and pre-index costs were not different between groups. In 2 years of follow up, healthcare utilization costs were not different. AAS-treated patients tended to have fewer emergency room visits (0.76 ± 1.77 vs 1.21 ± 1.97; p=0.16). **CONCLUSIONS:** HIV patients taking AAS therapy were older, male, and were taking larger amounts of HIV medication. Additionally, AAS-treated HIV patients tended to have less healthcare resource utilization. This study is limited by the small population of HIV patients receiving AAS therapy.

PIN23

COMPARISON OF HIV ANTIRETROVIRAL DRUGS PRICES IN THE US AND CANADA

Alshehri A[1], Seoane-Vazquez E[2], Rodriguez-Monguio R[3], Schneider T[1], Eguale T[1]
[1]MCPHS University, Boston, MA, USA, [2]Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA, [3]University of Massachusetts Amherst, Amherst, MA, USA

OBJECTIVES: To compare the prices of HIV antiretroviral (ARV) drugs in the US and the Canadian provinces Ontario and Quebec. **METHODS:** US wholesale acquisition cost (WAC) prices were collected from the online database RedBook (Truven Health Analytics) on Nov 17, 2016. Prices for public programs of the provinces of Quebec and Ontario were collected from the respective webpages on the same date. The defined daily dose (DDD) for each HIV ARV was extracted from online database of the World Health Organization. Prices for 30 DDD were calculated and converted into US dollars. Wilcoxon Signed rank test was conducted in the analysis using SPSS V21.0. **RESULTS:** There were 38 HIV ARV drugs approved by the FDA and available in the US market, 29 in Ontario and 33 in Quebec. There were 8 drugs with generic competition in the US, and 8 in Ontario and Quebec. The study included 28 brand and 5 generic products that were available in the US, Ontario and Quebec. The median cost of brand HIV ARV drugs per 30-DDD was $833.50 (range=$412.20- $3086.04) in the US, $357.85 (range=$58.50-$1548.54) in Ontario (p<.05 vs. the US), and $325.81 (range=$56.80-$1518.17) in Quebec (p<.05 vs. the US). The median cost of generic HIV ARV drugs per 30-DDD was $276.49 (range=$23.15- $549.57) in the US, $166.86 (range=$42.60-$240.34) in Ontario, and $166.86 (range=$42.60-$240.34) in Ontario. The price of generic nevirapine 200mg was lower in the US than in Ontario and Quebec. **CONCLUSIONS:** The US had more HIV ARV drugs than Ontario and Quebec. Prices of brand HIV ARVs were significantly higher in the US than in Ontario and Quebec. Quebec had non-statistically significant lower prices than Ontario.

PIN24

INPATIENT AND OUTPATIENT COSTS CARE BEFORE AND AFTER A VACCINATION CAMPAIGN IN HIGH-RISK ADULT IN PANAMA IN 2015

George E, Espinosa E, Chow A
AXA Assistance, Panama City, Panama

BACKGROUD: Panama Canal Area Benefit Plan (PCABP) is a Benefit Plan administered by AXA Assistance.Axa-Assistance represents around 35-40% of private health market in Panama. Our Plan has more than 10,000 Members and almost of our Members are ≥ 50 years older and suffering multiple comorbidities, mostly related to chronic cardiometabolic disease, as well as, diabetes, hypertension, stroke, arteriosclerosis, arthritis. Before 2015 none of plan's member received 13-Valent Pneumococcal Conjugate Vaccine (PCV13). **OBJECTIVES:** To estimate number of inpatient and outpatient cases included the different of cost, before and after vaccination campaign in our high-risk older population from a private perspective (AXA Assistance). **METHODS:** We compared 2 periods: January-July 2015 and January–July 2016. A vaccination campaign was developed during November 2015 and was performed in 1000 high-risk members. **RESULTS:** Period of January-July, 2015 were reported 379 cases of community-acquired pneumonia (CAP) (165 inpatient hospital, 214 outpatient hospital). In a period January-July 2016, 344 cases of CAP were reported (149 inpatient hospital, 195 outpatient hospitals). The average cost of inpatient and outpatient set was $ 10,879 and $ 265.56 respectively. Average time of hospitalization 2015 vs 2016 was 16.2 days UCI and 7.8 ward days vs 15.4 days UCI and 7.5 days. The average age hospitalized is 81 years and outpatient 74 years. **CONCLUSIONS:** PCV13 vaccine campaign reduces number of cases, length of stay. This intervention generate saving costs for PCABP administered by AXA Assistance.

PIN25

COST OF HOSPITALIZATION AND OUTPATIENT TREATMENT FOR HERPES ZOSTER IN HONG KONG OLDER ADULTS

You J[1], Ming W[1], Tsang O[2], Chan P[1]
[1]The Chinese University of Hong Kong, Shatin, Hong Kong, [2]Princess Margaret Hospital, Lai Chi Kok, Hong Kong

OBJECTIVES: The population at risk for herpes zoster (HZ) is increasing with prolonging life expectancy in Hong Kong. HZ treatment cost data are essential to assist the cost-effective implementation of zoster vaccination program. We aimed to describe HZ clinical outcomes and direct cost in older adult patients treated in Hong Kong inpatient and outpatient settings. **METHODS:** A retrospective, observational study was conducted in two clusters of Hospital Authority, the largest public healthcare provider in Hong Kong. Medical records of patients aged ≥50 years with HZ diagnosis at outpatient clinics and general hospitals in January 2011 to December 2013 (prior to zoster vaccine became available in Hong Kong) were reviewed. Outcome measures included HZ-related length of hospital stay (LOS), outpatient visits, treatment cost, and HZ-related complications. **RESULTS:** We reviewed 215 HZ cases (46% male; age 70±12 years), 102 (47%) were hospitalized patients and 113 (53%) were outpatient cases. Of the 102 inpatient cases, 15 (15%) were immunocompromised patients. Median LOS was 4 days (IQR 3-8) days. HZ-related complications occurred in 47 (46%) inpatient cases. Median inpatient treatment cost was HKD21,630 (IQR HKD15,030-38,430) (USD1=HKD7.8). Inpatient cost for immunocompromised patients (HKD49,990; IQR HKD26,125-90,310) was significantly higher than non-immunocompromised cases (HKD20,095; IQR HKD15,030-33,750) (p<0.001). Immunocompromised patient was associated with high (≥75th percentile) inpatient treatment cost (OR 8.88; 95%CI 2.67-29.55; p<0.001). For the 113 outpatient cases, 26 (23%) patients were immunocompromised. 58 (51%) patients used one-time outpatient clinic service and 55 (49%) patients had 4.9±3.2 clinic visits for HZ treatment. Outpatient treatment cost (HKD1,100; IQR HKD1,100-4,785) was significantly lower than inpatient treatment cost (p<0.001). There was no significant different between the outpatient treatment costs in immunocompromised and non-immunocompromised patients. **CONCLUSIONS:** Inpatient HZ treatment cost was substantially higher than outpatient cost. Immunocompromised patient was associated with high inpatient HZ treatment cost in older Hong Kong adults.

PIN26

AGE-SPECIFIC ECONOMIC BURDEN OF RESPIRATORY SYNCYTIAL VIRUS (RSV) HOSPITALIZATIONS IN THE UNITED STATES, 2009-2013: AN ANALYSIS OF HEALTHCARE COST AND UTILIZATION PROJECT (HCUP) NATIONWIDE INPATIENT SAMPLE (NIS)

Shah A, Narayanan S
Market Access Solutions LLC, Raritan, NJ, USA

OBJECTIVES: Age-specific economic burden of RSV hospitalizations is poorly documented. We assessed national estimates of age-specific economic burden of RSV hospitalizations in the US. **METHODS:** A retrospective cohort study using the HCUP NIS between January 2009 and December 2013 was conducted. NIS includes discharge data on 20% of all US hospitalizations. Hospital admissions for RSV were identified using records with a principal ICD-9 diagnosis code of 466.11 or 480.1. We analyzed hospitalizations in 5 age categories (<1, 1–4, 5–49, 50–64, and >65yrs). Total inpatient costs (converting charges to cost using cost-to-charge ratio), hospital length of stay (LOS), and mortality during the inpatient visit were assessed. **RESULTS:** A total of 75,427 RSV hospitalizations were identified. The highest hospitalizations were in patients <1yr (72%) followed by 1-4yr age group (25.3%). Mean LOS was highest in the 49-64yr age group (8.3 days, SE 0.6) and lowest in the 1-4yr age group (3.0 days, SE 0.03). Correspondingly, mean cost per stay was highest in the 49-64yr age group ($29,777.00, SE 4518.0) and lowest in the 1-4yr age group ($5,639.97, SE 201.6). in <1yr and 1-4yr age groups. Records with a presence of asthma or COPD had 27% and 35% higher mean cost per stay, respectively. Based on weighted frequency, total national hospitalization cost of RSV admissions between 2009 and 2013 was $2.3 billion of which $1.5 billion (67.4%) was attributable to patients of age <1yr. Inpatient mortality was highest (5.1%) in the 49-64yr age group. **CONCLUSIONS:** Economic burden of RSV varies dramatically by age groups. RSV hospitalizations are highest in the children <5yrs and accounts for 90% of the total national hospitalization costs of RSV. Elderly patients, though low in numbers, have higher mortality, LOS, and cost per stay compared to young children.

PIN27

ECONOMIC IMPACT OF DENGUE IN LATIN AMERICA: A SYSTEMATIC REVIEW

Laserna A[1], Barahona-Correa JE[1], Baquero L[1], Castañeda-Cardona C[2], Rosselli D[1]
[1]Pontificia Universidad Javeriana, Bogotá, Colombia, [2]NeuroEconomix, Bogotá, Colombia

OBJECTIVES: Dengue fever affects tropical and subtropical regions, mainly low income areas. The incidence has been increasing steadily in Latin America, and despite costs variation between countries, its economic impact is consistently high. This study reviews papers on economic impact of dengue in Latin America. **METHODS:** We performed a systematic review in Pubmed (Medline), EMBASE and BVS, which includes Latin American databases. Nopublication date or language limits were used. All papers that considered costs (either direct medical, out-of-pocket, productivity or social) were included. Costs are expressed in 2015 American Dollars (USD). **RESULTS:** From a total of 848 initial references, 16 studies were selected for data extraction (2 each from Brazil, Colombia, Cuba, Mexico, Puerto Rico and Panama; and 1 each from Argentina, Venezuela, and Nicaragua; 2 articles included several countries). In general, the main impact of the disease was caused by productivity costs. Total average annual cost in Latin America has been estimated in more than USD $3 billion; 60% of which is represented by Brazil, followed by Mexico and Colombia. Direct costs are higher

for hospitalized cases (Brazil $424 per case, Mexico $1,216, Colombia $523). In non-hospitalized patients, which are more than 95% of cases, direct medical costs are low but social costs (both productivity costs and out-of-pocket expenses) are significant (Brazil $117, Mexico $109, Colombia $115). **CONCLUSIONS:** Different social, environmental and political factors have influenced the increasing incidence of dengue fever. Difficulties in application of preventive policies have been a limitation for vector control; therefore, many preventable cases need to receive treatment, generating a high economic impact to the health systems and to society in general. It is essential to develop new public health interventions, such as the vaccination, to decrease the propagation of the disease.

PIN28

ASSESSING THE ECONOMIC BURDEN AND 30-DAY READMISSION RATES AMONG PATIENTS WITH CLOSTRIDIUM DIFFICILE INFECTION IN THE US VETERANS HEALTH ADMINISTRATION POPULATION

Borra S[1], Cao Y[1], Wang L[1], Baser O[2]
[1]STATinMED Research, Plano, TX, USA, [2]Columbia University and STATinMED Research, New York, NY, USA

OBJECTIVES: To assess the health care costs, 30-day readmission rates, and predictors of 30-day readmission among patients diagnosed with clostridium difficile infection (CDI) in the US Veterans Health Administration (VHA) population (01OCT2010-30SEP2015). **METHODS:** Patients diagnosed with CDI were identified (International Classification of Disease, 9th Revision, Clinical Modification code: 008.45) from the VHA dataset for the identification period (01OCT2011-30SEPT2014). The initial diagnosis date was designated as the index date. Patients without a CDI diagnosis, who were of the same age, race, and sex as study CDI patients, were identified for comparison. An index date was randomly selected to minimize bias. Adult patients were required to have continuous medical and pharmacy benefits for 1 year pre- and post-index date. Health care costs and 30-day readmission rates during the follow-up period were compared among 1:1 matched patients with and without CDI. Logistic regression was used to examine the predictors of 30-day readmission. **RESULTS:** After matching, there were 18,794 patients in each group. Patients with CDI had higher 30-day readmission rates (25.9% vs 0.6%, $p<0.0001$) and incurred significantly higher inpatient ($73,937 vs $892; $p<0.0001$), outpatient ($9,168 vs $2,035; $p<0.0001$) and total costs ($83,106 vs $2,928; $p<0.0001$) than those without CDI. The likelihood of 30-day readmission was lower among patients aged 26-34 years as compared to those aged ≥65 years (odds ratio [OR]: 0.5; p=0.0002). Readmission was higher among patients with higher mean Charlson Comorbidity Index (CCI) scores (OR: 1.1; $p<0.0001$). **CONCLUSIONS:** Patients with CDI had a significantly higher economic burden and 30-day readmission rates than those without CDI. Age and CCI scores were significant predictors of 30-day readmission.

PIN29

ECONOMIC IMPACT OF TREATMENT FAILURE IN PATIENTS WITH SKIN AND SOFT TISSUE INFECTIONS TREATED WITH METHICILLIN-RESISTANT STAPHYLOCOCCUS AUREUS (MRSA) ANTIBIOTICS IN THE PERSPECTIVE OF BRAZILIAN PRIVATE HEALTHCARE SYSTEM

Matsuo AL[1], Massaoka MH[1], Paloni Ed[2], Formigoni-Pinto MR[1]
[1]AstraZeneca, Cotia, Brazil, [2]Orizon, Barueri, Brazil

OBJECTIVES: To evaluate the economic burden of treatment failure and cure rates in patients with skin and soft tissue infections treated with any anti-MRSA antibiotic in first or subsequent lines. **METHODS:** The Orizon database is an administrative database containing over 18 million lives of the Private System. Eligibility criteria were patients with ICD-10 codes: A26, A26.0, A26.8, A26.9, A46, H60.0, H60.1, K12.2, L00, L02, L02.1, L02.2, L02.3, L02.4, L02.8, L02.9, L03, L03.0, L03.1, L03.2, L03.3, L03.8, L03.9 and L08 from May/2012 to Jun/2013. A total of 531 hospitalizations were identified and stratified in two groups: group I (patients that initiated the treatment with any anti-MRSA) and group II (used an anti-MRSA except in the first line). Direct medical costs (DMC) per patient-year were calculated as the sum of medical claims for each patient with an exchange rate of 1 USD = 3,43 BRL. **RESULTS:** In group I (n=322), the mean length of stay (LOS) was 12.5 days, the mean DMC was USD 8,046.817 and presented a cure rate with any anti-MRSA of 85.7%. In the subset of cured patients (n=267), the mean LOS was 11.0 days with a mean DMC of USD 6,908.877. It was noteworthy that in group II the cure rate with an anti-MRSA was similar in comparison with group I (84.7%). As expected, the costs were much higher, presenting a mean DMC of USD 16,504.46 and a mean LOS of 21.7 days, even in the subset of patients cured with an anti-MRSA (n=177, mean LOS 19.9 days and mean DMC of USD 14,317.02). **CONCLUSIONS:** The cure rates among patients with skin and soft tissue infections that initiated with an anti-MRSA or used after initial failure were high, however the economic impact of delayed appropriate anti-MRSA treatment was associated with an almost doubled resources use and LOS.

PIN30

DIRECT MEDICAL COSTS OF HOSPITALIZATIONS FROM DIABETIC AND NON-DIABETIC PATIENTS ASSOCIATED WITH SKIN AND SOFT TISSUES INFECTIONS IN THE BRAZILIAN PRIVATE HEALTHCARE SYSTEM

Matsuo AL[1], Massaoka MH[1], Paloni Ed[2], Formigoni-Pinto MR[1]
[1]AstraZeneca, Cotia, Brazil, [2]Orizon, Barueri, Brazil

OBJECTIVES: To estimate the mean cost of hospitalizations by diabetic and non-diabetic patients associated with skin and soft tissues infections. **METHODS:** The Orizon database is an administrative database containing over 18 million lives of the Private Health System. Eligibility criteria were patients (≥ 18 years) with ICD-10 codes: A26, A26.0, A26.8, A26.9, A46, H60.0, H60.1, K12.2, L00, L02, L02.1, L02.2, L02.3, L02.4, L02.8, L02.9, L03, L03.0, L03.1, L03.2, L03.3, L03.8, L03.9 and L08 from May/2012 to Jun/2013. We also stratified by age (18 to 35, 36 to 59 and above 60 years) and diabetic comorbidity. Direct medical costs (DMC) per patient-year were calculated as the sum of medical claims for each patient with an exchange rate of 1 USD = 3,43 BRL. **RESULTS:** A total of 1,846 patients were identified over the analysis period. In the non-diabetic group (n = 1605), the mean length of stay was 5.3 days with a mean DMC of USD 2,081.77. In contrast, the diabetic group presented a mean of 11.9 days and a DMC of USD 7,617.88 (n = 241). When stratified by age groups, the mean length of stay and DMC for the non-diabetic group were 4.4 days and USD 1,444.45 (18 to 35 years, n = 771), 5.5 days and USD 2,110.66 (36 to 59 years, n = 605) and 8.1 days and USD 4,151.21 (60 years and above, n = 229). In the diabetic group, the mean length of stay and DMC were 8.0 days and USD 3,199.38 (18 to 35 years, n = 19), 11.7 days and USDS 5,950.39 (36 to 59 years, n = 95) and 13.3 days and USD 10,216.39 (60 years and above, n = 127). **CONCLUSIONS:** older and diabetic patients affected by skin and soft tissues infections clearly increase the economic burden in the Brazilian private healthcare system.

PIN31

ANALYSIS OF TREATMENT COSTS OF MALARIA IN A TERTIARY CARE HOSPITAL : AN INDIAN PERSPECTIVE

Pariti B
SDA Bocconi School of Management, Milan, Italy

OBJECTIVES: To study malaria disease prevalence, demographics of patients, and pattern of complications within patients under study and to determine average total cost for inpatient treatment of malaria, and to analyse total cost of treatment with respect to various departmental services of a tertiary care hospital. **METHODS:** A retrospective, cross sectional study was performed at Kasturba hospital (a tertiary care hospital) to determine average total cost of treatment for single episode of malaria. Patients diagnosed with malaria from January 1, 2010 to December 31, 2011 were included in study. Data for treatment costs were obtained from hospital's billing section. Prescribing patterns for anti-malarials were studied and major treatment regimens were evaluated by pharmacoeconomic methods such as cost-effectiveness analysis and cost minimization analysis. **RESULTS:** Out of total 522 patients that were followed, 323(62 %) patients had P.vivax malaria; 189 (36%) had P.falciparum malaria and 10 (2 %) had mixed malaria. Malaria caseswere further classified into complicated and uncomplicated cases as defined by WHO, NIMR and CDC guidelines. Average total treatment cost for single episode of malaria was found to be INR 11338 (US$ 220) at our study site. Average length of hospitalization stay was found to be 6 days. Treatment cost of complicated malaria was found to be significantly higher than uncomplicated malaria. Parenteral artesunate was found to be most commonly prescribed anti-malarial, followed by chloroquine. ICER value for parenteral artesunate over quinine was found to be INR 27583 (US$ 535). **CONCLUSIONS:** Our study estimates high cost of treatment with new anti-malarials. It also proves high cost-effectiveness of parenteral artesunate over quinine for treatment of severe malaria. Treatment costs can be significantly reduced by early conversion from intravenous artesunate to oral artemisinin based combination therapies.

PIN32

COST-EFFECTIVENESS OF ANTIVIRAL PROPHYLAXIS DURING PREGNANCY TO PREVENT PERINATAL HEPATITIS B INFECTION IN SOUTH KOREA

Lee D[1], Park SM[2], Shin HY[3]
[1]Seoul National University Hospital, Seoul, South Korea, [2]Seoul National University, Seoul, South Korea, [3]Myongji Hospital, Seonam University, Goyang, South Korea

OBJECTIVES: To analyze the cost-effectiveness of the nationwide Perinatal Hepatitis B Prevention Program (PHBPP) and identify the optimal strategy of eliminating mother-to-child transmission of hepatitis B virus (HBV) in Korea. **METHODS:** A decision tree model with a Markov process was developed and simulated over the lifetime of the 2014 birth cohort in Korea. The current PHBPP was compared against two other strategies, universal hepatitis B vaccination and the PHBPP with antiviral prophylaxis, by their costs and health outcomes. The Korean National Health Insurance (NHI) database was investigated to estimate the costs of HBV-related diseases and utilization of health resources. Costs were assessed from the health care system perspective. Health outcome measures were Quality-adjusted Life Years (QALYs), and the number of HBV-related diseases and deaths. The Incremental Cost-Effectiveness Ratio (ICER) produced from the analysis was evaluated by the amount of Willingness-to-Pay (WTP) in the Korean society. **RESULTS:** The nationwide PHBPP in Korea is cost-saving compared to the universal hepatitis B vaccination. An introduction of antiviral prophylaxis to pregnant women with a high viral load of HBV saved 55 QALYs (ICER: $19,163 per QALY) and averted 13 HBV-related deaths per 100,000 people compared to the current PHBPP. **CONCLUSIONS:** Considering that the WTP of Korea is $30,000, the strategy of PHBPP with antiviral prophylaxis is cost-effective. To further decrease the burden of perinatal hepatitis B in Korea, adding antiviral prophylaxis to the current PHBPP is recommended.

PIN33

COST-EFFECTIVENESS OF HUMAN PAPILLOMA VIRUS (HPV) VACCINATION IN NIGERIA: A DECISION ANALYSIS USING PRAGMATIC PARAMETER ESTIMATES FOR COST AND PROGRAMME COVERAGE

Ekwunife OI[1], Lhachimi SK[2]
[1]Nnamdi Azikiwe University, Agulu, Nigeria, [2]Universität Bremen, Bremen, Germany

OBJECTIVES: World Health Organisation recommends routine Human Papilloma Virus (HPV) vaccination for girls when its cost-effectiveness in the country or region has been duly considered. We therefore aimed to evaluate cost-effectiveness of HPV vaccination in Nigeria using pragmatic parameter estimates for cost and programme coverage, i.e. realistically achievable in the studied context. **METHODS:** A micro-simulation frame-work was used. The natural history for cervical cancer disease was remodelled from a previous Nigerian model-based study. Costing was based on health providers' perspective. Disability adjusted life years attributable to cervical

cancer mortality served as benefit estimate. Suitable policy option was obtained by calculating the incremental costs-effectiveness ratio. Probabilistic sensitivity analysis was used to assess parameter uncertainty. One-way sensitivity analysis was used to explore the robustness of the policy recommendation to key parameters alteration. Expected value of perfect information (EVPI) was calculated to determine the expected opportunity cost associated with choosing the optimal scenario or strategy at the maximum cost-effectiveness threshold. **RESULTS:** Combination of the current scenario of opportunistic screening and national HPV vaccination programme (CS + NV) was the only cost-effective and robust policy option. However, CS + NV scenario was only cost-effective so far the unit cost of HPV vaccine did not exceed $5. EVPI analysis showed that it may be worthwhile to conduct additional research to inform the decision to adopt CS + NV. **CONCLUSIONS:** National HPV vaccination combined with opportunist cervical cancer screening is cost-effective in Nigeria. However, adoption of this strategy should depend on its relative efficiency when compared to other competing new vaccines and health interventions.

PIN34

ECONOMIC EVALUATION OF RACECADOTRIL (HIDRASEC®) FOR THE TREATMENT OF PEDIATRIC PATIENTS WITH ACUTE DIARRHEA

Soto Molina H[1], Diaz-Alvarez O[1], Sanchez-Trejo K[1], Rodriguez-Mendoza MM[2]
[1]*HS Estudios Farmacoeconómicos S.A. de C.V., Mexico City, Mexico,* [2]*Independet consultant, Mexico, Mexico*

OBJECTIVES: To asset the cost-effectiveness relation between racecadotril (Hidrasec®) adjuvant with electrolytes for the treatment of pediatric patients with acute diarrhea from the Mexico's National Health System perspective. **METHODS:** A cost-effectiveness analysis was conducted through a decision tree. The model structure was taken from the published economic study (Rautenberg et al., 2012). The analysis compared racecadotril (Hidrasec®) plus electrolytes vs electrolytes by themselves. The effectiveness measure was the absent of diarrhea 48 hours after the administration of the treatment and the proportion of patients that did not require hospitalization. Based on the natural history of the disease, the time horizon was of 6 days. The transition probabilities was taken from the clinic literature (Lehert et al., 2011) (Álvarez et al., 2009). It was only considered direct medical costs, which are pharmacological costs and cost of a hospitalization per day, there were obtained from institutional sources. **RESULTS:** In a 1,000 patients cohort, racecadotril (Hidrasec®) adjuvant with electrolytes, resulted in the absent of diarrhea 48 hours after the administration of the treatment in 580 patients, in comparison with only 320 patients a cause of only electrolytes, which means an incremental effectiveness of 320 patients. 97.44% and 73.43% of the patients treated with racecadotril (Hidrasec®) adjuvant with electrolytes and with electrolytes alone, respectively, did not require hospitalization, having an increase of 24% because of the use of racecadotril (Hidrasec®). The average cost per patient treated with racecadotril (Hidrasec®) adjuvant with electrolytes was $99.41 USD, in comparison with electrolytes alone that was $354.39 USD, having a saving of $254.98 USD. **CONCLUSIONS:** From the Mexico's National Health System perspective, racecadotril (Hidrasec®) adjuvant with electrolytes for the treatment of pediatric patients with acute diarrhea, is a dominant therapy vs electrolytes alone, generating a bigger effectiveness with a less cost per patient.

PIN35

A COST-EFFECTIVENESS ANALYSIS OF A WHOLE GENOME SEQUENCING TEST COMPARED TO THE STANDARD CARE IN PATIENTS WITH HOSPITAL-ACQUIRED BACTEREMIA

Ding Z
University of Pittsburgh, Pittsburgh, PA, USA

OBJECTIVES: Recently researchers at the University of Pittsburgh and University of Pittsburgh Medical Center reported the detection of KPC-positive K. pneumoniae from patients undergoing endoscopic retrograde cholangiopancreatography ((ERCP) from a single hospital. KPC-positive K. pneumoniae isolates are essentially resistant to all the commonly available antimicrobials. Therefore, it is crucial to identify them early with high accuracy to prevent it infecting other patients. With its high sensitivity and significantly lowered price, whole genome sequencing has been considered as a way to help facilitate the identification of KPC-positive K. pneumoniae. However, evidence for its cost-effectiveness is lacking. **METHODS:** Here in this study, cost-effectiveness of adopting whole genome sequencing (WGS) following every ERCP procedure was modeled and was compared with the standard of care (SOC, high-level infection). A hypothetical cohort of 1000 patients was simulated for ten years using the four-state Markov model. KPC-positive K. pneumoniae-caused infection-related healthcare cost over ten years and quality-adjusted life year (QALY) were estimated for both the WGS strategies and the SOC strategy. **RESULTS:** When the probability of infection of KPC-positive K. pneumoniae through ERCP was assumed at 1% in a hospital in the Mid-Atlantic geographic region, and the cost for the WGS was assumed at $100 per test, the 10-year cost for a cohort of 1000 patients in the SOC strategy is $1,107,095; while the cohort will gain 8736.6 QALYs during that span. If the hospital adopts the WGS test strategy, the total 10-year cost is $218,696; while the cohort will gain 9485.9 QALYs. Under these conditions, the SOC strategy was dominated by the WGS strategy. Sensitivity analysis of critical variables indicates the robustness of the model. **CONCLUSIONS:** In summary, from the provider's perspective, the WGS strategy is more cost effective in identifying PC-positive K. pneumoniae.

PIN36

THE COST-EFFECTIVENESS OF STRATEGIES TO VACCINATE AGAINST VARICELLA IN MEXICO

Perezbolde C[1], Monsanto H[2], Pillsbury M[3], Kyle J[4], Wolfson LJ[3]
[1]*Merck Sharp & Dohme, Mexico City, Mexico,* [2]*Merck Sharp & Dohme IA LLC, Carolina, PR, PR,* [3]*Merck & Co., Inc., Kenilworth, NJ, USA,* [4]*Atlas Data Systems, Berkeley Heights, NJ, USA*

OBJECTIVES: The annual reported incidence of varicella in Mexico between 2010-2014 ranged from 221,000-371,000 cases annually. Seroprevalence data indicates that the true number of cases is likely between 1.6-2.3 M annually. Despite availability of varicella vaccines in the private sector and for selected patients in the public sector since 2000, vaccine uptake remains variable. The objective of this study was to evaluate the cost-effectiveness of possible varicella vaccination strategies in Mexico. **METHODS:** A dynamic transmission model of varicella infection was calibrated to reported age-specific outpatient varicella incidence data from 2003-2011, and adjusted for care-seeking behaviour patterns. Ten experts from Mexican health institutions provided input to summarize patterns of health care resource utilization (HCRU) for natural varicella among patients in different age groups (<1, 1-4, 5-9, 10-14, 15-44, 45-64, 65+). This was combined with local unit cost data to estimate varicella treatment costs. Five vaccination strategies were considered (1 dose; 1 dose + catchup 2nddose; 1 dose + campaign; 2 dose; and 2 dose + campaign). **RESULTS:** All strategies were cost-saving and will vary between 3.17T MXN to 3.5T MXN over 10 years (145B to 162B USD). The 1 dose strategy will reduce varicella cases and deaths by 35% in Year 1, 80% in Year 5, and 90% in Year 3. Higher-order strategies such as 2 dose + campaign will reduce varicella burden more quickly, lead to reductions of 61% , 87% and 92% in years 1,5, and 10. **CONCLUSIONS:** Both one and two dose universal varicella vaccination are cost-saving interventions, due to high use of health care resources for management of varicella in Mexico. Conservative rates of coverage (90% 1st dose and catchup, 80% 2nd dose) were assumed so health benefits could actually be higher. Choosing a vaccination strategy will depend on goals for speed of reduction of disease burden and budget concerns.

PIN37

POTENTIAL COST-EFFECTIVENESS FOR USE OF 13-VALENT PENUMOCOCCAL CONJUGATE VACCINE IN TAIWANESE ELDERLY AND IMMUNOCOMPROMISED ADULTS

Chang CJ[1], Wen Y[2], Wu H[1], Fann CS[3]
[1]*Chang Gung University, Tao-Yun, Taiwan,* [2]*Chang Gung University, Taoyuan, Taiwan,* [3]*Academia Sinica, Taipei, Taiwan*

OBJECTIVES: Use of PCV13 is recommended to the elderly and the adults with immunocompromising conditions. Additionally, use of PCV13 to immunocompromised adults who also receiving a single dose of 23-Valent Pneumococcal Polysaccharide Vaccine (PPV23) before is also recommended (PPV23-PCV13 sequence vaccination). This study is aimed to predict the potential cost-effectiveness of PPV23-PCV13 sequence vaccination to the elderly and immunocompromised adults in Taiwan. **METHODS:** Cost-effectiveness analysis from societal perspective was performed using a micro-simulation model. Cost-effectiveness of PPV23-PCV13 sequence vaccination versus PPV23 alone vaccination to a population of 50,000 was predicted on the time horizon of 70 years. Parameters in the model included demographic, epidemiological data, direct medical costs, indirect costs and vaccine efficacy data were derived from published literatures and Taiwan's National Health Insurance Database. All Results of cost-effectiveness analysis were presented by the incremental cost-effectiveness ratio (ICER) to illustrate the incremental cost (in New Taiwan Dollars, NTD) for one additional life-year (LY) gained. Sensitivity analysis was performed to evaluate the robustness of the results of micro-simulation model. **RESULTS:** Compared with PPV23 alone vaccination, PPV23-PCV13 sequence vaccination definitely increased vaccination cost but it would reduce total costs including vaccination costs, direct medical costs and indirect costs. Overall, PPV23-PCV13 sequence vaccination was more cost-saving than PPV23 alone vaccination. And, PPV23-PCV13 sequence vaccination would save an additional 0.0065 discounted LYs. The ICER for PPV23-PCV13 sequence vaccination for the elderly and immunocompromised adults was estimated about -284,000 NTDs per LY. **CONCLUSIONS:** PPV23-PCV13 sequence vaccination could achieve potential health economic and clinical benefits. For the elderly and immunocompromised adults in Taiwan, PPV23-PCV13 sequence vaccination was considered as the dominant vaccination strategy compared with PPV23 alone vaccination.

PIN38

COST-EFFECTIVENESS ANALYSIS OF COMBINED ANTIRETROVIRAL THERAPIES FOR TREATMENT OF HIV-1 POSITIVE PATIENTS IN BULGARIA

Djambazov S, Vekov T
Medical University Pleven, Pleven, Bulgaria

OBJECTIVES: The aim of this study is evaluation of incremental costs, incremental health benefits and their incremental ratio (ICER) of CART (E/C/F/TAF and E/C/F/TDF) in comparison with most commonly used therapeutic alternatives in clinical practice in Bulgaria for treatment of HIV-1 positive patients in 2016. **METHODS:** A systematic review of published cost-effectiveness analyses data for CART for treatment of HIV-1 positive patients is performed in MEDLINE, EMBASE, Web of Science, Cochrane Library, covering the period January 2010 – June 2016.Data for health benefits in terms of additional QALY are directly transferred for the purposes of this analysis, due to similar population and characteristics of health systems. Data for the costs of CART are based on local reference prices in Bulgaria, published in Positive drug list as of July 2016. **RESULTS:** If we consider a cost-effectiveness threshold of three times GDP per capita in Bulgaria (WTPth 36 221 BGN, 2015) E/C/F/TDF is cost-effective therapy compared to ABC/3TC/LPV (ICER 34 546 BGN/QALY). **CONCLUSIONS:** In conclusion, CARTs E/C/F/TAF is cost-effective, when compared to commonly used therapeutic alternative in Bulgaria ABC/3TC/LPV and should be recommended as first therapeutic choice, based on HTA pharmacoeconomic analysis.

PIN39

USING CRICKET GAMES TO PREVENT TRANSMISSION OF HIV IN SCHOOL CHILDREN IN CAMEROON

Patrick MO[1], Ambe SN[1], Amina AB[2], Ayuketang AM[1], Nvenyi TN[3]
[1]Effective Basic Services, Bamenda, Cameroon, [2]Broad Green Clinic, Bamenda, Cameroon, [3]St Mary Soledad Hospital, Bamenda, Cameroon

OBJECTIVES: To evaluate the cost effectiveness of using cricket ambassadors compared to regular sports teachers for training school children on life skills against HIV/AIDS. **METHODS:** We conducted a cluster randomized control trial of 13 schools in the city of Bamenda in Cameroon for change in knowledge and intention on sexually related HIV prevention approach. The 3 arm study consisted of group 1 where a cricket ambassador was attached to a school to further strengthen skills in cricket and HIV/AIDS prevention messages in addition to school sports teacher, group 2 with school sports teacher coaching only and group 3 a control group with standard national approach to HIV prevention. Data was collected at baseline, 1 month, 3 months and 6 months post intervention. We compared cost effectiveness between 3 groups based on cost invested against total number of children recruited. **RESULTS:** A total of 909 students participated in the study. Analysis suggest cricket games increased knowledge by 36.1% when cricket games with ambassadors was used; by 38.2% when teachers only was used and by 2.9% when standard national approach was used. There was no difference in intention. The ambassador schools arm was able to reach out the most of students (444 students) as compared to the cricket only and control arms (250 and 209 students respectively). The various groups cost 135 versus 160 versus 191 XAF per child trained on life skills. **CONCLUSIONS:** Using ambassadors for cricket games will be most cost effective approach for training school kids in life skills.

PIN40

SAUSALIN VS METRONIDAZOLE IN TREATMENT OF GIARDIASIS: PHARMACOECONOMIC ASSESSMENT

Begaidarova R, Kaliyeva S, Yukhnevich Y, Tonkabaeva B, Begey N
Karaganda State Medical University, Karaganda, Kazakhstan

OBJECTIVES: The treatment of giardiasis is a global problem for public health of Asian countries in despite of the low cost of such popular drug as Metronidazole. The treatment with Metronidazole is ineffective in most cases due to adverse effects of this drug and the high level resistance of Giardia intestinalis. Sausalin is the new drug for treatment of giardiasis. It was synthesized by Scientific holding «Phytochemistry» Kazakhstan. The aim of present study was to conduct the cost-effectiveness analysis of Sausalin vs Metronidazole in adults with giardiasis. **METHODS:** A randomized controlled trial that was assessed with pharmacoeconomic methods was undertaken in this study. There were included 70 patients with confirmed giardiasis. Two groups were formed randomly. The patients in the study group received Sausalin, in the second group included patients treated by metronidazole. The rate of eradication of parasites was evaluated as outcome and the cost-effectiveness of Sausalin and metronidazole were determined. **RESULTS:** A high percentage of eradication of the parasite was detected in study group, which amounted to 82% for therapy with Sausalin ($p < 0.01$) and only 56.8% ($p < 0,01$) for therapy with Metronidazole. The indicators of cost-effectiveness were 9.7 for Sausalin therapy and 13.56 for therapy with Metronidazole. The adverse effects were detected in 5 patients of Metronidazole group, such as vomiting and nausea. **CONCLUSIONS:** The use domestic preparation Sausalin is economically feasible taking into account the high level of eradication and the safety profile of the drug.

PIN41

COST-EFFECTIVENESS ANALYSIS OF FIRST-LINE ADMINISTRATION OF TENOFOVIR ALAFENAMIDE (TAF), A NOVEL NUCLEOTIDE REVERSE TRANSCRIPTASE INHIBITOR (NRTI), FOR THE MANAGEMENT OF CHRONIC HEPATITIS B (CHB) IN THE UNITED STATES (US)

Dusheiko G[1], Lim J[2], Liou I[3], Tafazzoli A[4], Deniz B[4], Saint-Laurent Thibault C[5], Gordon S[6], Nguyen MH[7]
[1]Kings College Hospital, London, UK, [2]Yale University School of Medicine, New Haven, CT, USA, [3]University of Washington, Seattle, WA, USA, [4]Evidera, Bethesda, MD, USA, [5]Evidera, Montreal, QC, Canada, [6]Henry Ford Hospital, Detroit, MI, USA, [7]Stanford University Medical Center, Stanford, CA, USA

OBJECTIVES: To estimate the health and economic value of TAF versus tenofovir disoproxil fumarate (TDF) or entecavir (ETV) in the management of patients with CHB from the third-party US payer perspective. **METHODS:** A lifetime cost-effectiveness model was developed using discretely integrated condition event (DICE) simulation. Health and cost outcomes for the overall population and patient subgroups (e.g. treatment-naïve and treatment-experienced) were analyzed separately. Inputs were obtained from published randomized trials and epidemiological/outcome studies, real-world database analyses and expert opinions. Model structure/assumptions/inputs were agreed by a group of clinical experts and health economists. As observed in the two pivotal trials, the model assumed similar HBV suppression and resistance rates between TAF and TDF, and improved ALT reduction and bone/renal safety with TAF. Efficacy and safety data for ETV were obtained from published studies. **RESULTS:** Over a lifetime, initiation of TAF was associated with fewer hepatic complications (cirrhosis, hepatocellular carcinoma, liver transplantation), renal and bone related events and deaths when compared to TDF and ETV, which resulted in higher quality-adjusted life years (QALYs) per patient (0.02-0.34) on long-term projection. Total costs per patient with TAF were lower (−0.35% to −1.15%) compared with TDF and higher (3.1% to 4.0%) compared with ETV. The model suggested that TAF usage dominated versus TDF in the overall population with greater cost saving and better clinical outcomes in the TE population. Compared with ETV, incremental cost-effectiveness ratios (ICERs) were below the commonly accepted threshold of $50,000/QALY in the overall population. Sensitivity analyses showed that results were robust. **CONCLUSIONS:** Driven by its favorable efficacy, safety, and resistance profile, TAF is projected to lead to better health outcomes and to be cost effective compared to TDF and ETV, leading to either dominance or generally favorable cost-effectiveness ratio (i.e., ICER < $50,000/QALY).

PIN42

COST-EFFECTIVENESS OF HEPATITIS C TREATMENT FOR LEBANESE PATIENTS IN EARLY STAGES OF LIVER DISEASE

Nasser S, Abi Nader T, Mansour H
Lebanese American University, Byblos, Lebanon

OBJECTIVES: To conduct a cost effectiveness analysis comparing 'early treatment' versus 'delayed treatment' for Lebanese hepatitis C virus patients starting at a given level of fibrosis. **METHODS:** This study was conducted from the payer's perspective to evaluate the cost-effectiveness of using novel Direct Acting Antiviral agents in two treatment strategies, early treatment (initiated at fibrosis stages F2/F1/F0) versus delayed treatment (till fibrosis stages F3/F4). The model followed a typical patient's QALY at each stage and throughout the progression of the disease as reported in the literature. Direct medical cost were identified, measured and valued from third party payers in Lebanon and based on patient case scenario from medical center. Incremental cost effectiveness analysis was then conducted measuring the incremental cost per QALYs gained and per life year extended. **RESULTS:** The initiating of novel treatment soon after early stage diagnosis have led to an incremental cost effectiveness analysis (ICER) of 587 Euros per QALY gained. On the other hand, when outcomes of such treatment were measured over just the one-year duration when patient would receive treatment right after early stage diagnosed instead of delaying treatment until an advanced stage, the ICER was 27,268 Euros per QALY gained. In addition, when extended life year was used as the outcomes, the analysis showed that early treatment is associated with 1,527 Euros per additional life year extended. The one-way Sensitivity Analysis showed that a 25% decrease in the cost of dual drug option or if triple drug option was used, the ICER would significantly decrease to 16,982 Euros per QALY gained when treatment is initiated at early stage. **CONCLUSIONS:** 'Earlier treatment' is cost effective compared to 'delayed treatment' and thus reinforce the need to screen for HCV at early age so that initiation of therapy could be done as soon as confirming diagnosis.

PIN43

EXPLORING ECONOMIC VALUE IN TREATING PSEUDOMONAS AERUGINOSA INFECTIONS IN CYSTIC FIBROSIS – EARLY MODELLING TO INFORM PRODUCT DEVELOPMENT

Graz M[1], Walker S[2], Alderson D[3], Morris J[3], Graz H[1]
[1]Neem Biotech, Abertillery, UK, [2]University of York, Heslington, York, UK, [3]Cogentia Healthcare Consulting, Cambridge, UK

OBJECTIVES: To develop an economic model to explore the relative contribution of potential mechanisms driving the value of a new technology to manage Pseudomonas aeruginosainfections in Cystic Fibrosis (CF). **METHODS:** Following a literature review to identify published models in CF, a previously published model (Tappenden et al, 2013) was replicated and adapted to explore a variety of clinically plausible mechanisms by which a new technology could impact upon health-related quality of life, resource use and cost. These included: drug acquisition costs, reduction in inhaled aminoglycoside use, exacerbation risk, exacerbation level (major/minor), exacerbation costs, exacerbation disutility, mortality risk, CF progression and HRQL. The model estimated costs from the perspective of the NHS and health outcomes using quality-adjusted life-years (QALYS) in line with UK guidelines for economic evaluation and was developed probabilistically to account for parameter uncertainty. The new technology was defined as an adjunct to standard of care treatment (in this case inhaled aminoglycosides). **RESULTS:** Model results indicated that the cost-effectiveness of the new technology in CF was highly sensitive to its price with large shifts in incremental cost-effectiveness observed across relatively small changes in the daily acquisition cost. The potential reduction in adjunctive inhaled aminoglycoside therapy was the next most important driver of cost-effectiveness. The third most important driver of cost effectiveness was reduction in risk of exacerbations. **CONCLUSIONS:** The development of an early model allows for a detailed understanding of the mechanisms which drive the potential value of a new technology. This can be used to focus not only technology development but also the design of studies for evidence collection to best capture the value. The wider benefits of reduced inhaled aminoglycoside use, e.g. reductions in resistance and treatment-related side-effects, are an area of uncertainty and warrant further research.

PIN44

COST MINIMIZATION ANALYSIS OF RILPIVIRINE/EMTRICITABINE/TENOFOVIR IN TREATMENT NAÏVE HIV+ PATIENTS WITH ADVERSE EVENTS WHEN TREATED WITH STANDARD THERAPY

Guirant-Corpi L[1], Olivares N[1], Aguirre A[2], Wendt K[3]
[1]Janssen Mexico, Mexico City, Mexico, [2]Janssen, Sao Paulo, Brazil, [3]Janssen, São Paulo, Brazil

OBJECTIVES: In Mexico, efavirenz/emtricitabine/tenofovir is the standard of treatment for antiretroviral-naïve patients; however efavirenz is highly associated with neurocognitive adverse events due to its central nervous system toxicity. The aim of this analysis was to estimate the annual cost of treatment for rilpivirine/emtricitabine/tenofovir compared to available alternatives for those patients virologically suppressed and intolerant to efavirenz in Mexico. **METHODS:** Nine randomized clinical trials were included to perform a meta-analysis of an unadjusted indirect comparison of alternatives evaluated in terms of the percentage of patients with undetectable viral load (HIV-RNA <50 copies/mL) at 48 weeks of treatment. A cost-minimization analysis was developed to determine the annual cost of treatment for rilpivirine/emtrcitabine/tefonovir as single tablet regimen

(STR) compared to dolutegravir, raltegravir, atazanavir/ritonavir and darunavir/ritonavir as part of a highly active anti-retroviral therapy (HAART) with emtricitabine/tenofovir as backbone for patients intolerant to efavirenz in Mexican healthcare system. Cost analysis included only acquisition drug costs that were obtained from published sources. Costs are expressed in 2016 USD ($1USD= $20MXN). **RESULTS:** The meta-analysis performed suggested comparable efficacy and safety between the alternatives evaluated. Annual cost of treatment for rilpivirine/emtricitabine/tenofovir was estimated in $2,458 versus $3,720 and $4,460 for dolutegravir and raltegravir schemes, respectively; and versus $3,142 and $3,475 for HAART that included atazanavir/ritonavir and darunavir/ritonavir, respectively, as third component of the regimen. Annual savings with rilpivirine/emtricitabine/tenofovir ranged from $684 to more than $2,000 per patient compared to annual cost of treatment of the other alternatives evaluated. A sensitivity analysis over the acquisition price (+/-10%) showed that even with an increase up to 10% in the cost of rilpivirine/emtricitabine/tenofovir, it remained as the least expensive alternative. **CONCLUSIONS:** The use of rilpivirine/emtricitabine/tenofovir as STR is a cost-saving alternative in patients intolerant to efavirenz compared to other options approved and locally available in the Mexican healthcare system.

PIN45

COST-UTILITY ANALYSIS OF OUTPATIENT DALBAVANCIN FOR ACUTE BACTERIAL SKIN AND SKIN STRUCTURE INFECTIONS (ABSSSI) VERSUS INPATIENT VANCOMYCIN FOLLOWED BY ORAL LINEZOLID

Shapouri S, Devine B
University of Washington, Seattle, WA, USA

OBJECTIVES: Guidelines support patients requiring intravenous (IV) therapy for acute bacterial skin and skin structure infection (ABSSSI) in the absence of severe infection or unstable comorbidities can be managed effectively in the outpatient setting. The potential cost and quality of life differences associated with a shift in care from inpatient to outpatient care through the use of dalbavancin, a long-acting IV antibiotic, for patients with ABSSSI with no or few comorbidities was examined. **METHODS:** A decision analytic model from a payer perspective was developed to assess direct medical costs (inpatient and outpatient) and quality of life differences for patients with ABSSSI with no or few comorbidities (Charlson Comorbidity Index (CCI) score <1). Patients with ABSSSI received an inpatient treatment pathway of IV vancomycin followed by oral linezolid or outpatient treatment with IV dalbavancin (single infusion). Cost parameters included hospital length of stay (LOS) determined by presence or absence of systemic infection symptoms and CCI score, hospitalization costs, medications, laboratory, diagnostic and therapeutic services delivered to the patient. Inputs were obtained from published literature and evidence-based assumptions. Due to the lack of literature for ABSSSI, we estimated utility weights for inpatient versus outpatient treatment. **RESULTS:** Mean costs for the inpatient treatment pathway were $10,610. Shifting to outpatient treatment with IV dalbavancin was estimated to save approximately $3,840 per patient versus an inpatient treatment pathway. The quality-adjusted-life-days (QALDs) associated with the inpatient treatment pathway versus outpatient treatment with IV dalbavancin were 15.4 versus 15.6, respectively. **CONCLUSIONS:** In patients with ABSSSI with no or few comorbidities, shifting IV treatment for ABSSSI to an outpatient setting with dalbavancin resulted in a >36% decrease in medical costs and an incremental QALD gain versus an inpatient treatment pathway. The outpatient treatment with IV dalbavancin dominated the inpatient treatment pathway.

PIN46

SINGLE-DOSE ORITAVANCIN AVOIDS HOSPILIZATION AND SHORTENS LENGTH OF STAY FOR TREATMENT OF SKIN AND SKIN STRUCTURE INFECTIONS IN US HOSPITALS

Armstrong S[1], Liao N[2], Fan W[1]
[1]*The Medicines Company, Parsippany, NJ, USA,* [2]*Windary LLC, Lebanon, NJ, USA*

OBJECTIVES: When single-dose oritavancin was introduced in 2014 for the treatment of acute bacterial skin and skin structure infection, it was hypothesized that its single-dose formulation may help US hospitals reduce use of inpatient beds through treatment entirely in the outpatient setting and reduction in length of stay (LOS) for admitted patients. This analysis sought to assess the real world impact of oritavancin to US hospitals. **METHODS:** Data were extracted from the Premier Hospital Database for the first full year of oritavancin availability (2015). Hospital admission rates and LOS were assessed for patients receiving oritavancin for skin infection and compared with patients receiving any other intravenous (IV) antibiotic grouped by infection severity (no systemic symptoms, with systemic symptoms, life-threatening infection) and presence of comorbid conditions using Charlson Comorbidity Index score (CCI). **RESULTS:** There were 208,113 records for patients 18+ with a primary diagnosis of skin infection and administration of IV antibiotic. Among 203 patients who received oritavancin, the average CCI was 1.46; 24.1% patients CCI≥3; 9.8% life-threatening condition (4.4%) or systemic symptoms (5.4%). 144 (70.9%) oritavancin patients were treated as outpatients. For the 59 patients who were hospitalized (LOS=4.0d), 56 patients received oritavancin after the discharge of hospitalization or on day of discharge. Compared to patients receiving other IV antibiotics, the patients who received oritavancin had consistently lower admission rates (rate reduction up to 45.4%) across all levels of infection severity and CCI. If admitted, oritavancin patients had shorter LOS (LOS reduction up to 1.8 days) across all severity levels except CCI=1 group. **CONCLUSIONS:** This analysis finds that use of oritavancin avoided hospitalization and shortened length of stay for skin infection patients. As skin infections represent 2% of all US hospital admissions, increased use of oritavancin may represent an opportunity to recover several hundred thousand bed days for use with other patients.

INFECTION – Patient-Reported Outcomes & Patient Preference Studies

PIN47

A CLAIMS-BASED ANALYSIS OF HEPATITIS A, B, AND A/B VACCINATION SERIES COMPLETION AND COMPLIANCE AMONG US ADULTS

Patterson BJ[1], Cheng WY[2], Trofa AF[1], Duchesneau ED[2], Macheca M[2], Masseria C[3], Duh MS[2]
[1]*GlaxoSmithKline, Philadelphia, PA, USA,* [2]*Analysis Group, Inc., Boston, MA, USA,* [3]*Pfizer, Inc., New York, NY, USA*

OBJECTIVES: Literature on guideline adherence for hepatitis A, B, and A/B vaccines is limited. We assessed hepatitis A, B, and A/B vaccination completion and compliance rates among US adults. **METHODS:** Data were from Truven Marketscan commercial/Medicare and Medicaid healthcare claims (Q1 2007-Q3 2015). Patients had ≥1 claim for a hepatitis A, B, or A/B vaccine, ≥19 years at first claim ("index date"), ≥12 months of enrollment pre-index date, ≥18 months of enrollment post-index date, and <2 hepatitis A or B diagnoses pre-index date. Using CDC guidelines, we defined completion as receiving the correct number of doses separated by minimum intervals and compliance as receiving the correct number of either monovalent or bivalent vaccines within the product labels' specified timeframes. % patients completing and complying with the hepatitis A and B series were presented with % patients completing stratified by monovalent versus bivalent vaccine as initial dose. **RESULTS:** 395,323 commercial/Medicare and 13,822 Medicaid patients were included. Patients were on average 43.4 years old and mostly female. Among commercial/Medicare patients with a monovalent-vaccine initial dose, completion rates were 32.0% and 39.6% for hepatitis A and B, while 65.1% received at least a second dose of hepatitis B vaccine. Among patients initiating with a bivalent vaccine, 47.3% and 47.2% completed the hepatitis A and B series, with approximately 74.6% receiving at least two doses of hepatitis B vaccine. Among Medicaid patients, completion rates for hepatitis A, B, and A/B vaccines ranged from 21.0%-24.1%. Compliance rates for hepatitis A, B, and A/B vaccines were 27.9%, 12.2%, and 23.9% in commercial/Medicare patients, and 18.4%, 5.6%, and 9.9% in Medicaid patients. **CONCLUSIONS:** Adult completion and compliance rates for hepatitis A, B, and A/B vaccines are suboptimal. Research investigating completion and compliance predictors is needed.

PIN48

ASSESSING THE LEVEL OF ADHERENCE IN TUBERCULOSIS TREATMENT AMONG PATIENTS ACCESSING DIRECTLY OBSERVED TREATMENT SHORT-COURSE (DOTS) IN TERTIARY HOSPITALS IN NSUKKA, ENUGU STATE, NIGERIA

Omachonu RA
University of Nigeria, Nsukka, Nsukka, Nigeria

OBJECTIVES: To assess the level of adherence in tuberculosis treatment amongst patients accessing the Directly Observed Treatment Short-course (DOTS) in Nsukka tertiary hospitals, and to determine patient related factors that influence adherence. **METHODS:** The study was a cross-sectional prospective study, conducted using data from questionnaires administered on tuberculosis patients (n=250) accessing the DOTS treatment in 3 tertiary hospitals, namely: Bishop Shanahan Hospital, Nsukka; District Hospital, Nsukka; and General Hospital, Enugu-Ezike. The instrument used in this study was a modified Morisky medication adherence scale-eight (MMAS-8). Chi-square was used to determine the relationship between demographic factors with the level adherence at $P < 0.05$. **RESULTS:** Study showed that 84% of the participants had high adherence, 12% had medium adherence; while 4% of the participants had poor adherence. Results showed that the severity of the symptoms as significantly ($\chi 2 = 6.031$; $p = 0.049$), associated with the level of adherence among patients in TB treatments. **CONCLUSIONS:** The DOTS therapy is cost-efficient; and has high efficacy level when the positive factors that influence high adherence level: good relationship with health care workers to patients and easy access to medications are present. Poor relationship with health care workers to patients, long distance to DOTs facility, alcoholism, poor patients behavior, lack of understanding of treatment regimen, and lack of motivation to tuberculosis regimen have negative impacts on the level of adherence among TB patients accessing the DOTS therapy in Nsukka tertiary hospitals.

PIN49

PARENTS' ADHERENCE, KNOWLEDGE AND ATTITUDES TOWARDS CHILDHOOD VACCINATION PROGRAM IN SAUDI ARABIA

Aljumah K, al Badr H, Alzaidi N, al Mutari A, Alhwaitan A
MOH, Riyadh, Saudi Arabia

OBJECTIVES: to assess parents adherence, knowledge, and attitudes on childhood vaccination program among Saudi population. **METHODS:** A cross-sectional study was conducted during November 2016 in Riyadh, Saudi Arabia. Convenient method of sampling was adopted. Parents with children of 0-2 years old were invited to participate. Data was collected through face- to -face interview method using Arabic validated questionnaire to collect demographic data, education level, time of vaccination, adherence, knowledge about childhood vaccination program and attitudes of the parents. **RESULTS:** A total of 180 parents were participated. The mother was interviewed in 99 % of cases, Infant's ages ranged between 2-24 months (mean 10.7 months, standard deviation (SD) 8.2). 28.2 % of sample reported their child is a first child, and this is first exposer to vaccination program. Parents had good adherence to vaccination program ruched up to (87%) on time without delay, main reason for not-adhere to vaccination program was lack of education. On other hand knowledge on aspects related to the general role of vaccination in prevention of some infectious diseases and important of timing of the first dose in vaccination schedule (95.2%), (86.9%). However, poor knowledge was documented among parents in other aspects like the importance of administration of multiple doses of the same vaccine to child immunity (41.6%), administration of multiple vaccines at the same time have no negative impacts on child immunity (47%). The Physicians representing the main

source of information for patients about vaccination (77.6 %). Parents attitudes towards immunization was positive, 98% reported the important of vaccination, only 10 % of participants thought that vaccination one of risk factors induced autism. **CONCLUSIONS:** Although parents had good adherence, knowledge and positive attitudes on some aspects related childhood immunization, gaps in both studied domains were identified. Educational interventions are needed to upgrade parents' knowledge.

PIN50

IMPACT OF A DENGUE EPISODE ON QUALITY OF LIFE OR DALYS: SYSTEMATIC REVIEW

Shepard DS[1], Zeng W[1], Halasa YA[1], Durand L[2], Coudeville L[3]
[1]Brandeis University, Waltham, MA, USA, [2]Sanofi Pasteur Mexico, Ciudad de México, Mexico, [3]Sanofi Pasteur, Lyon, France

OBJECTIVES: With about 4,000 times as many symptomatic non-fatal dengue cases as dengue deaths, quantitative disability assessments are critical to assessing the cost-effectiveness of dengue control interventions. Yet, most cost-effectiveness studies assess disability only subjectively or through proxy conditions (e.g., any acute infection). To strengthen the needed evidence base, we conducted a systematic literature review of the disability or quality of life lost from a symptomatic dengue episode. **METHODS:** We searched major data bases for entries in English, Spanish, Portuguese or French through 2016 with "dengue" combined with "quality of life" or disability, quality-adjusted life year, QALY, disability-adjusted life year, DALY, or foreign equivalents. We first examined titles and abstracts from Cochrane Database of Systematic Reviews, PubMed, POPLINE, EconLit, and Google Scholar for relevance. We next excluded duplicates, obtained the full text of relevant entries, and analyzed entries with numerical quality-of-life assessments. We scored these entries' relevance using a 6-attribute scale (0-100%). Fitting level of disability (0.00-1.00) as a function of time from the dengue episode's start until recovery, we computed the average duration, average loss per day, and episode loss in DALYs (area under the disability curve). **RESULTS:** We identified 4,335 entries, reviewed full text of 17, and found 6 meeting our criteria (Armien, 2008; Lum, 2008; Luengas, 2016; Martelli, 2011; Nguyen, 2013; Whitehorn, 2016). Their median score was 76% (range 58-89%). All but Luengas studied acute cases, giving the following medians (with ranges) for ambulatory episodes: duration in days 10.2 (9.5-20.0), disability weight 0.500 (0.235-0.800), and area 0.0162 (0.0041-0.0367). For studies including hospitalized episodes, disability ranged 16%-47% higher than for ambulatory episodes. **CONCLUSIONS:** As the burden of dengue episodes varies across sites, pooled results are more robust. This systematic review should contribute to evidence-based effectiveness measures for cost-effectiveness studies of vaccination, vector control and other dengue control interventions.

PIN51

EVALUATION OF THE PERFORMANCE PROPERTIES OF THE INFLUENZA PATIENT-REPORTED OUTCOMES INSTRUMENT (FLU-PRO) IN PATIENTS WITH INFLUENZA-LIKE ILLNESS (ILI)

Powers J[1], Bacci ED[2], Leidy NK[3], Stringer S[3], Memoli MJ[4], Han A[4], Fairchok MP[5], Coles C[6], Owens J[6], Chen W[7], Arnold JC[8], Danaher PJ[9], Lalani T[10], Hansen EA[11], Burgess TH[7], Millar EV[7], Hernández A[12], Rodríguez-Zulueta P[13], Ortega-Gallegos H[14], Galindo-Fraga A[15], Ruiz-Palacios GM[14], Pett S[16], Fischer W[17], Gillor D[18], Macias LM[19], DuVal A[20], Rothman R[20], Dugas A[20], Guerrero ML[15]
[1]Division of Clinical Research, NIAID, NIH, Rockville, MD, USA, [2]Evidera, Seattle, MD, USA, [3]Evidera, Bethesda, MD, USA, [4]National Institute of Allergy and Infectious Diseases, Bethesda, MD, USA, [5]Madigan Army Medical Center; Infectious Disease Clinical Research Program, Uniformed Services University, Tacoma, WA, USA, [6]Uniformed Services University, Bethesda, MD, USA, [7]Infectious Disease Clinical Research Program, Uniformed Services University, Rockville, MD, USA, [8]Naval Medical Center, San Diego, CA, USA, [9]Air Force Medical Operations Agency (AFMOA), Lackland, TX, USA, [10]Naval Medical Center, Portsmouth, VA, USA, [11]Naval Health Research Center, San Diego, CA, USA, [12]Instituto Nacional de Enfermedades Respiratorias, Ciudad de México, Mexico, [13]Hospital General Dr. Manuel Gea González, Ciudad de México, Mexico, [14]Instituto Nacional de Ciencias Médicas y Nutrición Salvador Zubirán, Mexico City, Mexico, [15]Instituto Nacional de Ciencias Médicas y Nutrición Salvador Zubiran, Ciudad de Mexico, Mexico, [16]University College London, London, UK, [17]University of North Carolina, Chapel Hill, NC, USA, [18]University Hospital of Cologne, Köln, Germany, [19]Hospital General de Agudos JM Ramos Mejia Servicio de Inmunocomprometidos, Buenos Aires, Argentina, [20]Johns Hopkins University School of Medicine, Baltimore, MD, USA

OBJECTIVES: Test the reliability, validity, and responsiveness of the FLU-PRO for evaluating presence and severity of symptoms in adults with influenza-like illness (ILI). **METHODS:** Analyses of data from subjects testing influenza-negative participating in the prospective, observational study used to develop and evaluate the FLU-PRO. Adults (≥18 years with ILI) were recruited through outpatient settings in the US, UK, Mexico, Peru, and Argentina, and completed the 37-item draft FLU-PRO daily for up to 14-days. Laboratory tests confirmed the presence/absence of influenza. The performance of the final 32-item FLU-PRO, developed and validated with data from influenza-positive subjects, was tested. The FLU-PRO assesses signs/symptoms across six body systems: Nose, Throat, Eyes, Chest/Respiratory, Gastrointestinal, Body/Systemic. Reliability was estimated using Cronbach's alpha (α; Day 1) and intraclass correlation coefficients (ICC; 2-day reproducibility). Convergent and known-groups validity were assessed using patient global assessments of symptom severity (PGA; none, mild, moderate, severe, very severe). Patient report of return to usual health was used to assess responsiveness (Day 1-7). **RESULTS:** N=220 ILI patients, mean age=39.3, 64.1% female, 88.6% white. N=61 (28%) were hospitalized at some point in their illness. Reliability: α Total score = 0.90; α subscales = 0.72 to 0.86; ICC (Day 1-2) Total score = 0.64; ICC subscales= 0.46 to 0.78. At Day 1, FLU-PRO scores correlated (≥0.30) with the PGA (except Gastrointestinal). FLU-PRO scores were significantly different across PGA severity groups (Total: F=81.7, $p<0.001$; subscales: F=6.9-62.2; $p<0.01$). Mean improvement in FLU-PRO scores from Day 1 to 7 was significantly greater in patients reporting return to usual health compared with those who did not ($p<0.05$ for Total and all subscales, expect Gastrointestinal and Eyes). **CONCLUSIONS:** Results suggest FLU-PRO total and domain scores are reliable, valid, and responsive in studies of adults with ILI, with or without documented influenza virus infection.

PIN52

DEVELOPMENT OF A DAILY DIARY TO ASSESS SIGNS AND SYMPTOMS OF GENITAL HERPES

DeMuro C[1], Gnanasakthy A[2], Price M[2], Winnette R[2], Desphande A[3]
[1]RTI Health Solution, Research Triangle Park, NC, USA, [2]RTI Health Solutions, Research Triangle Park, NC, USA, [3]Genocea Biosciences, Cambridge, MA, USA

OBJECTIVES: Genital herpes (GH) is a common and highly contagious infection typically spread through sexual contact. GH affects more than 600 million people worldwide (CDC, 2016). New treatments in development are designed to reduce frequency, duration and severity of signs and symptoms. In order to accurately assess these treatment benefits, fit for purpose measures are required. **METHODS:** In alignment with the FDA PRO Guidance (FDA, 2009), a rigorous qualitative research study was undertaken to identify concepts of relevance and importance to patients with GH. Specifically, following a targeted literature review, semi-structured interview guides were created: one for use with clinical experts and a second for use with adult patients with GH. Individual interviews were conducted by trained staff and concept saturation was tracked. Diary items were generated following standard qualitative evaluation and pilot-tested in two rounds of interviews with a new sample of GH patients. **RESULTS:** Four clinical experts participated in individual interviews. Experts endorsed concepts identified in the literature and described challenges/proposed solutions for the measurement of signs and symptoms for GH. Patient input was gathered via in-depth interviews (n=20) of individuals with varying disease duration, severity and a mix of educational background and ethnicity. The result was a preliminary list of patient derived disease state attributes and an initial version of a conceptual framework. Items were tested and refined utilizing cognitive debriefing interviews with a new sample. The result is an 8-item diary (GH-SSD) designed for daily administration in a clinical trial setting with three items to assess the presence of GH lesions, lesion type, and the presence of prodrome symptoms. The remaining items assess itching, pain, pain with urination, draining/discharge, and swelling. **CONCLUSIONS:** The GH-SSD is a brief PROM developed in full alignment with the FDA PRO guidance. Content validity was supported, and psychometric assessment is underway.

PIN53

CONTENT VALIDATION OF A NEW PATIENT-REPORTED OUTCOME (PRO) INSTRUMENT IN HOSPITAL-ACQUIRED BACTERIAL PNEUMONIA (HABP)

Howard K[1], Clifford S[1], Saretsky T[1], Cho M[1], Wang S[1], Hoffmann SC[2], Talbot GH[3], Powers JH[4]
[1]ICON Plc, San Francisco, CA, USA, [2]Foundation for the National Institutes of Health, Bethesda, MD, USA, [3]Talbot Advisors, LLC, Anna Maria, FL, USA, [4]George Washington University School of Medicine, Washington, DC, USA

OBJECTIVES: Currently no PRO instrument has been developed to capture HABP patients' symptoms and functioning. The goals of this study were to identify patient-reported HABP symptoms and impacts to develop items for a new HABP PRO instrument. **METHODS:** Patients were recruited at four US clinical sites. The study was conducted in two stages via telephone interviews. One-on-one concept elicitation (CE) interviews were conducted until concept saturation was achieved. In developing items for the new HABP PRO instrument, our previously developed Community-Acquired Bacterial Pneumonia (CABP) PRO instrument item pool was utilized given observed overlap of concepts between the two patient populations. Combined CE/cognitive debriefing (CD) interviews were then conducted with additional HABP patients to further explore the HABP disease experience and assess relevance and understanding of items, response options, instructions, and recall period of the new instrument. Data were analyzed using an iterative process to identify themes and concepts documented according to FDA PRO Guidance. **RESULTS:** Eighteen patients participated in CE (n=8) and combined CE/CD (n=10) interviews. Mean age of the sample was 62 years (SD = 12, range: 41-84); 50% were male. Similar to CABP, the most common spontaneously reported symptoms among HABP patients were difficulty breathing (72%), cough (56%), chest pain (56%), fever (50%), and lack of energy (50%). Significant impacts on physical (72%) and emotional (67%) functioning were also reported. Analysis of CD data indicated all 10 patients interpreted the large majority of items on the HABP PRO as intended, and reported the concepts covered were comprehensive and relevant to their illness. **CONCLUSIONS:** Results support the content validity of the HABP PRO items within a HABP population. Future research will assess the measurement properties of this new instrument.

ANTIVIRAL THERAPY IMPROVES THE HEALTH-RELATED QUALITY OF LIFE OF PATIENTS WITH CHRONIC HEPATITIS B VIRUS INFECTION IN CHINA

Luo N[1], Tang H[2], Ning Q[3], Jiang J[4], Dou X[5], Lv G[6], Tang Z[7], Li M[7], Liu J[7], Jia J[8]
[1]National University of Singapore, Singapore, Singapore, [2]West China Hospital, Sichuan University, Chengdu, China, [3]Affiliated Tongji Hospital of Tongji Medical College of Huazhong University of Science and Technology, Wuhan, China, [4]The First Affiliated Hospital of Fujian Medical University, Fuzhou, China, [5]Shengjing Hospital of China Medical University, Shengyang, China, [6]GCP ClinPlus Co., Ltd., Beijing, China, [7]Bristol-Myers Squibb, Shanghai, China, [8]Beijing Friendship Hospital, Capital Medical University, Beijing, China

OBJECTIVES: This study aimed to evaluate the effect of antiviral therapy on patients' health-related quality of life (HRQoL) in an observational clinical study of

nucleos(t)ide analogue (NUC) treatment for chronic hepatitis B (CHB) in China. **METHODS:** NUC naïve CHB patients were recruited from 63 hospitals across China. The HRQoL of the patients was assessed using the EQ-5D-3L questionnaire prior to initiation of NUC treatment and reassessed at 24, 48, 72, and 96 weeks after treatment initiation. Changes in 'poor' HRQoL status, defined as reporting any of the five EQ-5D health problems, and the EQ-VAS score were examined, with missing data imputed using the last-observation-carried-forward method. **RESULTS:** Of 3438 patients (mean age: 39.5 years; female gender: 26.2%) enrolled, the majority was inpatient (53.6%) and treated with entecavir (53.1%). The proportion of patients (95% confidence interval [CI]) in poor HRQoL monotonically decreased from 24.9% (23.4% to 26.3%) before treatment to 18.1% (16.8% to 19.3%) at 24 weeks, 16.6% (15.4% to 17.9%) at 48 weeks, 15.1% (13.9% to 16.3%) at 72 weeks, and 14.3% (13.1% to 15.4%) at 96 weeks after treatment initiation. The mean EQ-VAS score (95%CI) increased from 83.3 (82.9 to 83.8) before treatment to 86.5 (86.1 to 86.9) at 24 weeks, 86.9 (86.5 to 87.4) at 48 weeks, 87.4 (86.9 to 87.8) at 72 weeks, and 87.9 (87.5 to 88.3) at 96 weeks after treatment initiation. Among 854 patients who were in poor HRQoL before treatment, only 33.6% remained in poor HRQoL at 96 weeks after treatment; the mean EQ-VAS score (95%CI) increased from 75.3 (74.3 to 76.3) before treatment to 84.2 (83.3 to 85.2) at 96 weeks after treatment. **CONCLUSIONS:** The HRQoL of CHB patients in mainland China continuously improves in their first two years of antiviral therapy. The treatment effect is more salient among patients in poor health.

DESCRIPTIVE ANALYSIS OF HEALTH-RELATED QUALITY OF LIFE IN HIV/AIDS PATIENTS AT A HEALTH INSURER IN COLOMBIA

Muñoz-Galindo IM[1], Diaz JA[2], Moreno JA[1], Guarin NE[1], Arevalo HO[1], Hoyos-Beltrán FJ[3]
[1]*Salud Total EPS, Bogotá D.C., Colombia,* [2]*Universidad Nacional de Colombia, Bogotá D.C., Colombia,* [3]*Salud Total EPS, Bogotá, Colombia*

OBJECTIVES: To measure health-related quality of life (HRQOL) and to explore its determinants in a HIV/AIDS patients sample at a health insurer. **METHODS:** A cross-sectional descriptive study was performed out with the application of EuroQol 5 dimensions system (EQ-5D-5L) and Visual Analog Scale (VAS). Proportional non - probabilistic sampling was carried out, with distribution in 8 cities. Clinical data were obtained from medical history and sociodemographic data through an annex to the survey. HRQL index values were obtained based on the literature. A Spearman correlation analysis was performed between the dependent variables (EQ-5D-5L index and mean EQ-VAS). The means were compared by stratum among clinical and sociodemographic variables using the Kruskal-Wallis test. IBM-SPSS 22® statistical package was used. **RESULTS:** Analyzable data were obtained from 265 patients. The mean (SD) of EQ-5D-5L index was 0.95 (0.09) and the EQ-VAS 86.99 (16.10). We obtained 59 health states and the most frequent were 11111 (48.30%) followed by 11112 (6.04%). The correlation between the dependent variables was positive ($r = 0.53$). The mean EQ-5D-5L index was lower as age increased. HRQOL values between clinical variables were not different, while at socio-demographic level showed significant differences ($p < 0.05$) by socioeconomic stratum with a EQ-5D-5L index 0.92 (0.11) in stratum 1, and 0.97 (0.04) in strata 3 to 5; while in employment the mean EQ-VAS was 75.33 (25.25) in unemployed and 90.08 (11.71) in dependent employees. **CONCLUSIONS:** Regarding the clinical conditions of the patients, there were no significant differences in HRQOL, however, this analysis suggests that sociodemographic conditions such as employment and income affect the well-being of these patients. It is recommended to carry out complementary studies to evaluate the validity and psychometric properties of EQ-5D-5L in this population.

PIN56

A COMPARISON OF PATIENT REPORTED OUTCOME MEASURES DESIGNED OF USE IN HEPATITIS C VIRUS

Wei H, Franic DM
University of Georgia, Athens, GA, USA

OBJECTIVES: Chronic hepatitis c virus infection (HCV) affects over 150 million people worldwide and an estimated 2.7-3.9 million people in the US. HCV is the most common chronic blood borne viral infection in the US and the leading cause of chronic liver disease and transplantation. The objective of this study was to compare and contrast the psychometric properties of disease-specific patient reported outcome measures (PROMs) used in HCV. **METHODS:** Comprehensive literature review was conducted to identify self-administered PROMs in English with at least one publication citing psychometric properties. Selected instruments were evaluated based on: conceptual model, practicality (≤15minutes to complete), depth (floor and ceiling effects ≤15%), reliability (internal consistency and test retest), construct validity (convergent and divergent or confirmatory factor analysis), and responsiveness for group level decision making. **RESULTS:** Ten instruments were evaluated: Chronic Liver disease Questionnaire (CLDQ), Chronic Liver Disease Questionnaire-HCV (CLDQ-HCV), hepatitis c virus patient reported outcomes instrument (HCV-PRO), chronic hepatitis c virus treatment satisfaction (HCVTSAT), hepatitis quality of life questionnaire (HQLQ), liver disease quality of life (LDQOL), liver disease symptom index version 1 and 2 (LDSI V1/V2), Patient Reported Outcome Quality of Life survey for HCV (PROQOL-HCV), and liver disease and care specific patient satisfaction instrument (QUOTE-LIVER). All instruments except HQLQ and LDQOL did not meet practicality criteria. CLDQ-HCV, HCV-PRO and HQLQ met study criterion for reliability and construct validity. Reliability data was not available for most scales. Criterion for construct validity was also met for CLDQ, LDSI-V1/V2, LDQOL and HCVTSAT. Lack of meeting study criteria was due predominantly to unavailable psychometric data. **CONCLUSIONS:** If health related quality of life is the study objective CLDQ-HCV met all study criteria, followed by HCV-PRO: however; if patient satisfaction is the goal, HCVTSAT met most study criteria. PROM instrument choice must also consider study objective in addition to psychometric properties.

PIN58

QUALITY OF LIFE OF PERSONS LIVING WITH HIV IN A BIG CITY: SEARCHING FOR PREDICTORS

Mauyenova D, Karp L
Astana Medical University, Astana, Kazakhstan

OBJECTIVES: Identify the most significant predictors affecting the quality of life (QOL) of persons living with HIV (HIV Persons) in a big city. **METHODS:** There was conducted three-stage study. At the first stage HIV morbidity and mortality follow up indicators of the HIV Persons who is living in megalopolis (Astana) were analyzed in comparison with the republican indicators for the 10 years period (2004-2013). At the second stage through the use of earlier developed by our force questionnaire, which is including 49 questions. At the third stage the QOL of HIV-infected persons was studied. The SF-36 questionnaire was chosen as the main tool for QOL research. The selection sample size hasincluded 170 respondents. **RESULTS:** It was found that HIV-infection morbidity indicators of the capital city were significantly lower than the countrywide indicators. Despite the stick-slip nature, a morbidity steady growth was marked, then that rate stabilized and became1.11 per 100 000 of population in 2013. Comparison of QOL indicators by gender in relation to the majority of the scales of physical health component (PHC) as well as the total PHC in general revealed that men QOL indicators were higher than women QOL indicators. In the meantime the mental health component (MHC) indicators in relation to the total MHC and to the most scales were higher in women, but statistical differences between all scales were not significant ($p > 0.05$). Comparison of QOL indicators showed no dependence on the time of the establishment of HIV status. It was found that the drug use significantly reduces the QOL. **CONCLUSIONS:** Results of the study revealed the multivalued role of predictors that influence the quality of life of persons living with HIV in a big city. HIV morbidity risk reduced factors allow to carry out practical recommendations on the prevalence of the disease containment.

PATIENT AND PHYSICIAN DIRECTED SURVEY ON HUMAN PAPILLOMAVIRUS VACCINE IN MUMBAI, INDIA

Bagwe P, Joshi M, Majumdar AS
Bombay College of Pharmacy, Mumbai, India

OBJECTIVES: i. An adult-directed survey to assess the knowledge of Human Papillomavirus (HPV), Cervical Cancer and Human Papillomavirus Vaccine, the perception and intent to vaccinate. ii. A health practitioner-directed survey regarding the provision of HPV Vaccination at the principal practice site. **METHODS:** The survey was carried out among willing participants (n=327) from Mumbai, India, 18 years of age or older. A structured questionnaire was distributed via email and other social networking sites. Another short survey was conducted among paediatricians, gynaecologists and general practitioners in Mumbai, India to gauge their practice methods and attitudes towards HPV vaccination. **RESULTS:** About 60% participants had a general understanding of HPV while 24% were familiar with the HPV vaccine. It was found that 3 out of every 5 doctors administer the vaccine, but only about 14% female participants had taken it. Due to lack of proper knowledge, 74% of the participants were apprehensive about taking the vaccine. Of the participants initially unaware, 40% were willing to take it after obtaining some information provided through the survey. **CONCLUSIONS:** The utilization of the recently introduced HPV vaccine is challenged not only by lack of education, but also by the high cost, feasibility and logistics of the three-dose regimen. The need of the hour is to increase awareness about HPV as a major cause of cervical cancer in young and middle-aged women and the availability of this vaccine as an effective prophylactic method. With proper patient counselling and management strategies, healthcare professionals can play a vital role in increasing the acceptability of the vaccine in adolescents, parents and the community.

PIN60

HEPATITIS C TREATMENT IN PATIENTS WITH HEPATITIS B VIRUS/HEPATITIS C VIRUS CO-INFECTION

Wang W, Park H
University of Florida, Gainesville, FL, USA

OBJECTIVES: Recently, FDA is warning about the risk of hepatitis B virus (HBV) reactivation among hepatitis C virus (HCV) patients under direct-acting antivirals (DAA) therapy, who had current or previous HBV coinfection. Understanding HCV treatment pattern among HBV/HCV coinfected population is important. This study aimed to examine HCV treatment uptake for patients with HCV/HBV coinfection compared to HCV mono-infection. **METHODS:** A retrospective cohort study was conducted using Truven Health MarketScan Commercial Claims Database (2008-2014). Patients >=18 years old with newly diagnosed HCV and had no use of HCV treatment before the first HCV diagnosis (index date) were included. HCV/HBV coinfection was defined as any HBV diagnosis within 12 months prior to index date. HCV treatment uptake was compared between HBV/HCV co-infected and HCV mono-infected patients by multivariate logistic regression, controlling for age, gender, region, payer, drug abuse and comorbidities (e.g. HIV, cirrhosis, etc.). Treatment types and initiation time were compared by Chi-square tests and two-way ANOVA. **RESULTS:** A total of 60,538 HCV patients were identified, with 1.3% HBV/HCV co-infection (n=788, mean age= 52yrs, 69.5% male) and 98.6% HCV mono-infection (n=59,750, mean age= 53yrs, 60.0% male). Only 4.6% of co-infected patients (n=36) initiated HCV treatment, whereas 17.2% mono-infected patients (n=10,281) did. Among HBV/HCV co-infected patients, 44.4%, 36.1% and 19.4% received interferon/ribavirin, DAA plus interferon/ribavirin, and all oral therapy, respectively; the corresponding percentages were 40.8%, 35.4%, and 23.8% for HCV mono-infected patients (p=0.81). The average time (months) to

initiating interferon/ribavirin, DAA plus interferon/ribavirin, and all oral therapy were 8.8, 17.6, and 13.8 for coinfection, and 7.5, 12.6, and 25.0 for mono-infection ($p<0.05$). After adjusting for baseline characteristics, HBV/HCV co-infected patients were 76% less likely to initiate HCV treatment (OR=0.24 95%CI 0.17-0.33). **CONCLUSIONS:** A lower rate of HCV treatment initiation was observed even in the era of direct-acting antivirals in HBV/HCV co-infected patients.

PIN61

IMPROVING FACTORS OF PPV23 VACCINE COVERAGE RATES IN ADULTS AGED 65 YEARS IN JAPANESE MUNICIPALITIES –NATIONWIDE COMMUNITY-BASED SURVEY

Murakami Y[1], Nishiwaki Y[1], Oba M[1], Watanabe A[2], Kanazu S[3]
[1]Toho University, Tokyo, Japan, [2]Tohoku University, Miyagi, Japan, [3]MSD K.K, Tokyo, Japan

OBJECTIVES: In the vaccination program for the 23-valent pneumococcal polysaccharide vaccine (PPV23) for elderly in Japan, various measures are taken by municipalities to raise PPV23 coverage rates. These measures include notification of program eligibility through newsletters, broadcasting and financial support to reduce out-of-pocket costs. We investigated whether both notification methods and financial support raise the PPV23 coverage rates in Japan. **METHODS:** A postal and web-based nationwide survey was sent in May 2015 to all municipalities of Japan (n=1741). We used a self-administered questionnaire to collect the PPV23 coverage rates in adults 65 years, which is the main outcome in this study. Details on notification method (number of times and type) and out-of-pocket costs for vaccination (financial support) were also collected by the questionnaire. Additional municipality-level variables (potential modifiers of vaccination) were collected from the national statistics in Japan, including demographic (population age), socio-economic (income, unemployment) and health system indicators (physician supply). Multiple regression was used to explore the effect of the notification methods and out-of-pocket costs on PPV coverage rates adjusting for municipality-level factors. **RESULTS:** 1022 responded to the survey (response rate 58.7 %). Median PPV coverage rate among municipalities was 41.3% (IQR; 32.2-48.5 %). In multiple regression, PPV coverage increased with the number of notifications sent to an eligible individual ($p<0.001$, adjusted means; none; 23.7 %, once; 42.8 %, twice; 49.2 %, three times and more; 47.4 %). PPV23 coverage decreased by 3.0 % (2.3-3.7%) per 1000 Yen increase in out-of-pocket costs ($p<0.001$). The type of notification was not significantly associated with PPV23 coverage (P=0.60). **CONCLUSIONS:** This study provides insight into factors that influence PPV23 vaccine coverage in Japanese municipalities. We found that the number of notifications sent to eligible adults, as well as out-of-pocket costs, were significantly associated with vaccine uptake.

PIN62

IMPLEMENTATION STATUS OF COST-EFFECTIVE VACCINES IN GAVI-ELIGIBLE COUNTRIES

Anderson JE, Thorat T, Neumann PJ, Cohen JT
Tufts Medical Center, Boston, MA, USA

OBJECTIVES: To examine implementation status for vaccine interventions evaluated in studies using "cost-effectiveness" measured in terms of cost-per-DALY averted, and catalogued in Tufts Medical Center's Global Health Cost-Effectiveness Analysis (GHCEA) Registry. **METHODS:** We reviewed the GHCEA Registry, which includes 479 cost-per-DALY averted studies published through 2015. We limited our search to vaccine-related interventions in countries eligible at some point from 2000 to 2016 for financial aid from the Global Alliance for Vaccines and Immunizations (GAVI). The 62 identified studies reported 590 incremental cost-effectiveness ratios (ICERs), each of which compares an intervention's cost and health impacts to a comparator program (or to no action). We classified ICERs as "cost-saving" (lower costs, better health), "highly cost-effective" (ICER < 1x per capita GDP), or "cost-effective" (ICER from 1x to 3x per capita GDP). Finally, for interventions with implementation status information (as characterized by GAVI and in-country sources), we used the Fisher exact test to assess the relationship between implementation and favorable cost-effectiveness ("highly cost-effective" or "cost-saving"), vs. unfavorable cost-effectiveness (at least one ICER not "highly cost-effective" or better). This last analysis restricted attention to studies pertaining to 2016 GAVI-eligible countries. **RESULTS:** The Registry catalogs articles on vaccines for 10 diseases. The most frequently reviewed interventions addressed HPV (49% of ICERs) and rotavirus (33%). Regions most studied included the WHO Africa Region (43%) and Southeast Asia (21%). The most common study sponsors were the Gates Foundation (40%) and government institutions (31%). The 590 ICERs were "cost-saving" (10%), "highly cost-effective" (80%), "cost-effective" (6%), or not cost-effective (4%). We had implementation information for 101 favorably "highly cost-effective" interventions and for 8 interventions with unfavorable cost-effectiveness. The implementation odds ratio for favorable vs. not favorable cost-effectiveness was 20 ($P < 0.001$). **CONCLUSIONS:** Favorably "highly cost-effective" vaccine interventions are most likely to be implemented.

PIN63

AVAILABILITY AND USE OF MALARIA RAPID DIAGNOSTIC TEST IN HEALTH FACILITIES IN GOMOA WEST DISTRICT,GHANA

Ayin CT
St Lukes Catholic Hospital, Apam, Ghana

OBJECTIVES: The objective of the study was to assess availability and use of malaria RDT in health facilities in the Gomoa West district and investigate adherence patterns of clinicians to the incorporation of malaria RDT results in case management. **METHODS:** A cross-sectional study was carried out in selected health facilities to review stock records for malaria RDT, and to assess malaria RDT availability over one year period. A pretested data extraction sheet was used to extract data on the proportions of suspected malaria cases tested with malaria RDTs. A structured questionnaire was administered to prescribers to collect data on adherence to RDT use and incorporation of RDT results in case management. Data were analyzed and chi square test was used to assess associations. Detailed analysis was done with logistic regression model to assess strength of associations. **RESULTS:** Least malaria RDT availability of 87.7% was recorded in 3 facilities. Three facilities recorded 100% availability. Overall, 256(73.6%) out of 348 suspected malaria cases were tested with malaria RDT. No significant associations were found between malaria RDT testing and age (below 5 years and 5 years and above), temperature and caseload per day. However there was significant association between facility type and malaria RDT testing (p value <0.001). Out of 137 positive malaria RDT results, 132(96.3%) received antimalarial.68 (37.1%) out of 119 negative results did not receive antimalarial whiles 51(42.9%) received antimalarial.There was significant association between malaria RDT results and prescribing of antimalarial (p value <0.001). **CONCLUSIONS:** Malaria RDT availability and RDT testing rates were optimal in all health facilities with testing rates better in CHPS and health centers than district hospital. However, given the proportion of patients receiving presumptive treatment is high (26.4%) and some negative malaria RDT cases receive treatment, there is the need to intensify education if success in adherence to guidelines is to be achieved.

PIN64

WELL-CHILD VISITS AND HPV VACCINATION IN PRETEENAGERS AGED 11-12 YEARS DURING 2007-2015 IN THE UNITED STATES

Zhang D, Kulkarni AS, Lindsay B
Merck & Co., Inc., Kenilworth, NJ, USA

OBJECTIVES: Well-child visits (WV) provide the best opportunities for vaccinations in the US. The Advisory Committee on Immunization Practices (ACIP) recommends vaccination of 11-12 year old (y/o) females and males with HPV (Human Papillomavirus) vaccine. This study aimed to estimate the % of preteenagers aged 11-12 years who had WV and who received the first dose of HPV vaccine (HPV1st) from 2007 to 2015 and to estimate, for those preteenagers who did not receive HPV1st, the % of them who would have another scheduled WV. **METHODS:** This was a retrospective database (MarketScan®) study. Eligible subjects were 11-12 y/o females and males who had continuous health plan enrollment since January 1, 2007 or January 1 of the year they turned 9 y/o and did not have HPV vaccine previously. Females were excluded if they had medical claims for pregnancy, delivery, cervical cancer, or hysterectomy. Percentages of WV and HPV1st, overall and during WV, were estimated. Descriptive analyses were used in assessing the study's objectives. **RESULTS:** There were a total of 2,363,820 eligible subjects; 56.8% 11 y/o and 43.2% 12 y/o; 63.5% female and 36.5% male. From 2007-2015, 53.4% of 11 y/o and 56.0% of 12 y/o had WV; 8.9% of 11 y/o and 12.8% of 12 y/o initiated HPV1st. Among those who initiated HPV1st, 57.3% and 55.5% were during WV for 11 y/o and 12 y/o, respectively. For those who did not receive HPV1st at 11-12 y/o, it was less likely they would have another scheduled WV, ranging from 39.7% at 12-13 y/o to 11.5% at 19-20 y/o and less likely they would initiate HPV1st, ranging from 9.2% at 12-13 y/o to 1.1% at 19-20 y/o. **CONCLUSIONS:** This analysis suggests that WV at 11-12 y/o provide the best opportunity to maximize the potential of the HPV vaccination program in the US.

PIN65

IMPACT OF DOLUTEGRAVIR AND TENOFOVIR ALAFENAMIDE ON HIV REGIMEN SWITCHING TRENDS

Deemer J[1], Katz J[1], Schoenebeck L[1], Brown S[2], DiBonaventura M[1], Meyers A[1]
[1]Ipsos Healthcare, New York, NY, USA, [2]Ipsos Healthcare, London, UK

OBJECTIVES: With the introduction the dolutegravir (DTG) single-tablet regimens (STRs) and emtricitabine tenofovir alafenamide (FTC/TAF) STRs, physicians have more prescribing options to treat HIV. The objective of this study is to identify whether the availability of these new treatments has impacted the frequency of switching therapy in the United States (US). **METHODS:** Data from the Ipsos HIV US Therapy Monitor (TM) and HIV Scope Study (Scope) were used. Both the TM and Scope are retrospective medical chart reviews of patients with HIV conducted in 3-month intervals (N=200 and N=100 physicians per interval, respectively). The TM study includes a sequential selection of 20 HIV patients per physician whereas Scope includes a sequential selection of 6 HIV patients initiating therapy and 6 HIV patients switching therapy (i.e., all other patients would not be included in the Scope study). Both studies included data on demographics, disease history and treatment patterns. **RESULTS:** TM had a total of N=296 physicians and Y=30,991 patients and Scope N=154 physicians and Y=7,348 patients. In the TM, the rate of switching HIV therapy significantly increased from Q3 2014 (7.4%) to Q3 2016 (14.1%) ($p<.01$), coinciding with the launches of the DTG STR (Q3 2014) and the first FTC/TAF STR (Q1 2016). During the same timeframe, Scope showed the top reasons for switching HIV therapy were 'simplification' and 'preemptive switch to avoid side effects' which increased from 2.1% to 20% ($p<.01$) between Q3 2014 and Q3 2016. **CONCLUSIONS:** Switching therapy was less common among HIV patients until the launch of DTG and FTC/TAF based STRs, which doubled the rates of switching. Physicians reported that simpler and more tolerable regimens were the key reasons for increased switching.

PIN66

ASSESSMENT OF A PHARMACIST-LED EDUCATIONAL PROGRAMME ON COMMUNITY RESIDENTS' KNOWLEDGE AND PERCEPTIONS OF ANTIBIOTIC RESISTANCE IN PENANG, MALAYSIA

Irawati L[1], Hassali MA[1], Saleem F[2], Alrasheedy AA[3]
[1]Universiti Sains Malaysia, Penang, Malaysia, [2]University of Baluchistan, Quetta, Pakistan, [3]Qassim University, Qassim, Saudi Arabia

OBJECTIVES: To assess the impact of an educational programme on community residents' knowledge and perceptions of antibiotic resistance in Jelutong District,

Penang, Malaysia. **METHODS:** A single cohort pre/post-intervention study was conducted among the community residents from 30th January to 30th April 2016. Using convenience sampling, 70 residents (aged ≥18 years) were invited to participate in an educational programme on antibiotic resistance. The programme included a talk, video presentation and the distribution of a booklet regarding this issue. The participants were asked to complete a validated, pre-tested self-administered questionnaire before the programme, immediately after the programme, at 1 month and 3 months follow-up. The questionnaire consisted of six statements assessing their knowledge of antibiotic resistance and four statements to assess their perceptions of this issue. The primary outcome measures were an increase of their antibiotic resistance knowledge and perception scores after participating in the programme. Data was analysed using the Statistical Package for the Social Sciences version 22.0 and was presented as mean ± standard deviation. **RESULTS:** Sixty eight of the 70 residents participated in the study (response rate = 97.14%), but six of them (8.82%) dropped-out at 3 months follow-up. Their knowledge scores were 1.24±0.81, 5.41±0.50, 5.03±0.67 and 4.39±0.95 before the programme, immediately after the programme, at 1 month and 3 months follow-up, respectively ($p<0.001$). Their perception scores were 1.24±0.81, 3.82±0.38, 3.50±0.50 and 3.13±0.34 before the programme, immediately after the programme, at 1 month and 3 months follow-up, respectively ($p<0.001$). **CONCLUSIONS:** The educational programme significantly increased the knowledge and positively changed the perceptions of the community residents towards antibiotic resistance. Therefore, further initiatives should include the scaling up of the programme to combat antibiotic resistance at the community level in Malaysia.

PIN67

IMPACT OF AN EDUCATIONAL INTERVENTION ON COMMUNITY RESIDENTS' KNOWLEDGE AND ATTITUDES TOWARDS ANTIBIOTICS IN PENANG, MALAYSIA

Irawati L[1], Hassali MA[1], Saleem F[2], Alrasheedy AA[3]
[1]*Universiti Sains Malaysia, Penang, Malaysia,* [2]*University of Baluchistan, Quetta, Pakistan,* [3]*Qassim University, Qassim, Saudi Arabia*

OBJECTIVES: To assess the impact of an educational intervention on community residents' knowledge and attitudes towards antibiotics in Jelutong District, Penang, Malaysia. **METHODS:** A single cohort pre/post-intervention study was conducted among the community residents between 30th January and 30th April 2016. Using convenience sampling, 70 residents (aged ≥18 years) were invited to participate in an educational intervention that included a talk, video presentation and the distribution of an antibiotic booklet about the responsible use of antibiotics. Pre-intervention, the participants were asked to complete a validated, pre-tested self-administered questionnaire. Then, they were asked to complete the same questionnaire immediately post-intervention, at 1 month and 3 months follow-up. The questionnaire consisted of nine statements assessing their knowledge of antibiotics and six statements to assess their attitudes towards antibiotics. The primary outcome measures were a post-intervention increase of their antibiotic knowledge and attitude scores. Data was analysed using the Statistical Package for the Social Sciences version 22.0 and was presented as mean ± standard deviation. **RESULTS:** Sixty eight out of 70 residents participated in the study (response rate = 97.14%), but six of them (8.82%) dropped-out at 3 months follow-up. Their knowledge scores were 2.50±0.92, 8.24±0.74, 7.85±0.78 and 7.23±0.42 at the pre-intervention, immediately post-intervention, at 1 month and 3 months follow-up, respectively ($p<0.001$). Their attitude scores were 2.32±0.72, 5.82±0.38, 5.50±0.50 and 5.13±0.34 at the pre-intervention, immediately post-intervention, at 1 month and 3 months follow-up, respectively ($p<0.001$). **CONCLUSIONS:** The educational intervention significantly increased the knowledge and positively changed the attitudes of the community residents towards antibiotics. Hence, further initiatives should include the scaling up of the intervention to promote the responsible use of antibiotics among community residents in Malaysia.

PIN68

PREVALENCE AND FACTORS ASSOCIATED WITH COMPLETING MMR VACCINATION SERIES IN A RECENTLY RESETTLED REFUGEE POPULATION

Singer D, Djatche L, Payton C, Maio V, Scott K
Thomas Jefferson University, Philadelphia, PA, USA

OBJECTIVES: Approximately 70,000 refugees are resettled to the US each year, and it is important that refugees receive immunizations to prevent communicable disease. The measles, mumps, rubella (MMR) vaccination is a two-part vaccination that protects against three diseases. This study sought to identify factors associated with MMR vaccination series completion in a refugee population resettled in the US. **METHODS:** We analyzed data from the Jefferson Longitudinal Refugee Health Registry, which contains clinical, demographic, and immunization data. The study population included refugees resettled to the US who received an initial domestic medical examination and follow-up care from a primary care clinic in Philadelphia from 2008-2014. Those not eligible for MMR vaccination per Advisory Committee on Immunization Practices guidelines were excluded. Prevalence of MMR completion was computed. Binomial logistic regressions were used to estimate the association of clinical and demographic factors with MMR series completion. **RESULTS:** Of the 1,150 refugees included in the study, 69% were 18-45 years old and 11% were under the age of 18. Forty-six percent of refugees had documentation of MMR vaccination series completion. Age group was significantly associated with MMR completion. Patients 4-11 years old were most likely to complete the series (OR 136, 95%CI: 45-419) compared to 65+ year-old patients. Country of origin was associated with increased MMR completion for patients from Myanmar who transited through Thailand (OR 4.7, 95%CI:2.7-8.4), Myanmar who transited through Malaysia (OR 2.9, 95%CI:1.8-4.7), Bhutan/Nepal (OR 5.5, 95%CI:3.6-8.2), and Eritrea/Ethiopia (OR 2.2, 95%CI:1.2-3.8) compared to Iraqi patients. Hypertension and diabetes diagnoses were not found to be significantly associated with MMR series completion. **CONCLUSIONS:** Age and country of origin were significantly associated with MMR completion. These findings can be used to identify quality improvement projects to ensure vaccination completion within a recently resettled refugee population.

PIN69

ANALYSIS OF ECONOMIC BURDEN OF INFLUENZA AND ARI IN UKRAINE

Leleka M[1], Zalis'ka O[1], Paparyha V[2]
[1]*Danylo Halytsky Lviv National Medical University, Lviv, Ukraine,* [2]*Kyiv National Economic University, Kyiv, Ukraine*

OBJECTIVES: Every year in Ukraine 15-17% of the total population suffers from influenza and ARI. In Ukraine the treatment cost is 6 USD during 5 days without complications. **METHODS:** We used data of the MoH of Ukraine about the incidence of influenza, data of the rate of influenza vaccination, cost analysis for influenza vaccine, modeling method. **RESULTS:** Number of patients with influenza and ARI in Ukraine in 2015-2016 year amounted to 5.8 mln people. The total treatment cost during 5 days without complications is 34.8 mln USD. The cost of flu vaccination is 6,87 USD (1 USD=27,5 UAH) per 1 patient in Ukraine. The rate of flu vaccination is 0.3% of the total population 2015-2016. The rate of flu vaccinations among the medical worker is 20%. Indirect costs for sick list and employee absence at work significant economic burden for the budget constitute . The minimum payment per patient for 1 day is 6 USD. It means, that the minimum payment for sick list for 5 days per patient is 30 USD and it refers to the expences of institution. In 2016 the number of economically active population was 16 million peoples. In modeling situations when 15% of people (2.4 million) is sick, the costs of sick list will be 72 mln USD, and the cost of vaccination will be 16,49 mln USD. **CONCLUSIONS:** Therefore, to reduce the economic burden on the health care system and reduce indirect costs necessary to increase the rate of vaccination among the working peoples of population. Rate of benefit amount to 4,4 times higher.

PIN70

EVALUATION OF CLINICAL AND ECONOMIC OUTCOMES ASSOCIATED WITH POTENTIAL MISCLASSIFICATION OF CLOSTRIDIUM DIFFICILE INFECTION

Keum J[1], Vu M[1], Jacob B[1], Peasah S[1], Shogbon A[1], Watkins JL[2], Bressler A[2]
[1]*Mercer University College of Pharmacy, Atlanta, GA, USA,* [2]*DeKalb Medical Center, Decatur, GA, USA*

OBJECTIVES: The Centers for Medicare and Medicaid Services (CMS) require public reporting of Clostridium difficile infection (CDI) rates as part of the Inpatient Quality Reporting Program. Under-performing hospitals may be at risk for significant financial penalties. This study evaluated incremental health care resource use and costs associated with potential misclassification of CDI. **METHODS:** This was a retrospective, observational study of inpatient adults with a positive stool sample for Clostridium difficile from January 1, 2015 to March 31, 2016 at a community hospital. Patients were classified as definite community-onset CDI (positive stool sample within 3 days of admission) or healthcare facility-onset (positive stool sample at least 3 days post-admission). The healthcare facility-onset group was analyzed to identify symptomatic patients within 3 days of admission but had a ≥3 day delay in sampling stool for Clostridium difficile. This group was defined as the possible community onset CDI group. Cost to the hospital was calculated as the sum of the cost of the additional days of hospital stay and the estimated cost of the CMS-imposed payment penalty using data from Georgia non-profit hospital estimates and CMS. The definite and possible community-onset groups were compared with respect to costs, demographics, admission diagnoses, laboratory findings, treatment, length of stay, re-admission, and death. **RESULTS:** A total of 130 patients were evaluated: definite community-onset CDI group (n=105) and possible community-onset CDI group (n=25). The possible community-onset group had a longer total length of stay (10.8 vs. 7.6 days, P=0.0075) and duration of inpatient CDI treatment (5.5 vs. 3.5 days, P=0.0352). Length of stay translated to $148,640 in total costs and financial penalties, due to a 1% reduction in total CMS payment, translates to $13,150. **CONCLUSIONS:** Inpatient misclassification of CDI may be associated with longer hospital stay and treatment duration, leading to significant economic consequences and implications for reporting and reimbursement metrics.

PIN71

EVOLUTION OF THE MARKET FOR INTEGRASE INHIBITORS FOR HIV INFECTION AMONG ADULT PATIENTS IN CANADA

Lavoie L[1], Stern L[2], O'Neil B[1]
[1]*LASER Analytica, Montreal, QC, Canada,* [2]*LASER Analytica, New York, NY, USA*

OBJECTIVES: Human immunodeficiency virus (HIV) infection, which leads to the progressive destruction of CD4+ lymphocytes essential for the immune system, is still a concern in Canada. Cases of acquired immunodeficiency syndrome have however decreased over the last 20 years mainly due to the introduction of highly active antiretroviral therapy (HAART). The objective of this study was to evaluate the Canadian market for integrase inhibitors in the last five years. **METHODS:** Data on retail prescriptions and drugstore and hospital purchases of antiretroviral drugs including integrase inhibitors for the treatment of HIV infection in Canadian adults were obtained from QuintilesIMS. The number of prescriptions and purchases (in $Can) were collected for 12-month periods ending November for the last five years (2012-2016). **RESULTS:** The contribution of integrase inhibitors to the total HAART market has been increasing steadily in the last five years; in terms of number of prescriptions and purchases, from 5.7% and 7.1% in 2012 to 22.1% and 32.4% in 2016, respectively. In 2016, second in the HAART purchase market was nucleoside reverse transcriptase inhibitor (NRTI) combinations (21.2%) followed by protease inhibitors (14.8%), combination NRTIs/non-NRTIs (NNRTIs; 14.3%), NRTIs (13.1%), NNRTIs (3.2%), entry inhibitor (0.9%) and fusion inhibitor (0.1%). In the integrase inhibitor class, marked increases in both prescriptions and purchases were observed in the last four years for elvitegravir/ cobicistat/emtricitabine/tenofovir disoproxil fumarate, in the last three years for dolutegravir and in the last two years for dolutegravir/lamivudine/abacavir while prescriptions and purchases for raltegravir

only increased slightly from 2012 to 2016. **CONCLUSIONS:** HAART for HIV infection in adults represents a market of almost three quarters of a billion dollars in Canada. In the last five years, market share of integrase inhibitors has increased markedly representing in 2016 one third of the total HAART market in Canada.

PIN72

ASSESSMENT OF AWARENESS REGARDING SWINE FLU (INFLUENZA A) AMONG MEDICAL AND PHARMACY STUDENTS OF PAKISTAN

Masood I[1], Seemab S[1], Ali S[1], Akbar J[1], Hassan A[2], Ayoub I[3]
[1]The Islamia University of Bahawalpur, Bahawalpur, Pakistan, [2]Bahawal Victoria Hospital, Bahawalpur, Pakistan, [3]The Islamia University Of Bahawalpur, Bahawalpur, Pakistan

OBJECTIVES: The study aimed to assess the awareness among medical and pharmacy students of different colleges and universities of Pakistan toward Swine flu (Influenza AH1N1). **METHODS:** A descriptive, cross sectional study design was adopted to conduct the study. A self-administered questionnaire was administered in 500 students of both urban and rural community of Pakistan during January 2016 to October2016. Respondents were selected by using convenient sampling method. Data was analyzed using IBM SPSS version 20. Descriptive statistics were applied to evaluate the data and chi square test was used to check association between dependent and independent variables. **RESULTS:** Among the participants, 221 (44.2%) were male and 279(55.8%) were female. Almost all respondents 455(91.0%) had knowledge about origin of disease, genotype: H1N1 268(53.6%), H1N2 198 (39.6%), mode of transmission: human 221(44.2%), pigs 298(55.8%) and preventive measures 475(95%) of swine flu. Participants were having less knowledge about vaccination 285(57%), lab screening, and availability of facilities to practitioner and patients by government regarding swine flu. **CONCLUSIONS:** Knowledge regarding swine flu pandemic was good among participants but need further improvement as well. Government should focus on providing isolated ward facility, special diagnostic and treatment facility to swine flu patients. Government should focus on facilitating mask availability to practitioners as protective measure

PIN73

KAP STUDY REGARDING HIV/AIDS PATIENTS CONDUCTED AMONGST PAKISTANI UNIVERSITY STUDENTS

Shujaat N[1], Akhtar F[1], Iqbal A[2], Shumzaid M[3], Shabir A[1], Abbas M[4], Muhammad Sharif H[5], Bibi H[1], Murtaza G[6]
[1]Hazara University, Mansehra, Pakistan, [2]COMSATS Institute of Information and Technology Abbottabad 22060, Pakistan, Abbottabad, Pakistan, [3]Riphah International University, Lahore, Pakistan, [4]China Pharmaceutical University, School of Pharmacy, Nanjing, China, [5]Women Institute of Learning, Abbottabad, Pakistan, Abbottabad, Pakistan, [6]Department of Pharmacy, COMSATS Institute of Information Technology, Abbottabad, Pakistan

OBJECTIVES: HIV/AIDS is a high risk disease with a little prevalence currently in Pakistan but due to low health budget, less educational programs, drug abusers, poverty, illiteracy, social and moral constraints. The main aim of this study is to design a study which assesses the knowledge and perception of young generation about HIV/AIDS especially the university students. **METHODS:** This study consists of a random cross sectional study design involving 200 university students. Data collection was done via validated questionnaire and SPSS 21.0 was used for statistical analysis. Independent and dependent variables were analyzed using odds ratio significant at 95% CI ($P < 0.05$). Pearson Chi-square was performed for finding association between dependent and independent variables. **RESULTS:** Overall response rate to our questionnaire was good. Gender and age showed a significant relationship ($P < 0.05$) with the knowledge of HIV/AIDS. Age of the students has a significant influence on the course of the available treatment options. Health information dissemination via different sources had a major role and demonstrated a significant relationship ($P < 0.05$) with the knowledge of the students. **CONCLUSIONS:** The response from different students was quite interesting and diverse. The desire to gain knowledge is inevitably shown from this study. The knowledge, their perception and their behavior and attitude towards an infected patient shows the need for health training and education regarding HIV/AIDS. The need of budget allocation towards initiating HIV/AIDS programs targeting awareness and education, by a Government or a government funded organization becomes vital to improve the literacy regarding HIV/AIDS. Campaigns regarding improvising the current knowledge and beliefs should be initiated. Certain health policy reforms will ascertain an increased positive perception about this dreadful disease and young generation equipped with education and knowledge will promote towards a healthier disease free and safe future.

PIN74

A COMPARISON OF THE PRICES OF HIV ANTIRETROVIRAL DRUGS MARKETED IN KUWAIT AND THE US

Alharbi A[1], Seoane-Vazquez E[2]
[1]MCPHS University, Boston, MA, USA, [2]Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA

OBJECTIVES: This study compared the prices of HIV antiretroviral (ARV) drugs marketed in Kuwait and the US in December 31, 2015. **METHODS:** A list of HIV antiretrovirals approved in the US was extracted from the FDA webpage on December 31, 2015. Average wholesale prices (AWP) were extracted from the RedBook (Truven Health). Prices of HIV ARV drugs in Kuwait was collected for the Ministry of Health list of drug prices. Descriptive statistics and Wilcoxon Signed rank test were conducted using Stata 13.1. **RESULTS:** The FDA approved a total of 28 single active ingredients and 12 fixed dose combinations (FDC) of HIV ARV drugs in the period of analysis. There were 7 single active ingredients (lamivudine, saquinavir, raltegravir, darunavir, zidovudine, atazanavir, and nevirapine) and 2 FDC (lopinavir/ritonavir and lamivudine/zidovudine) included in the Kuwait Ministry of Health pricing list. Those 9 drugs had a total of 11 formulations and 13 strengths. Those 13 products were also available in the US. The median Kuwait prices for HIV drug products as a percentage of the US prices was 23.8% (range: 13.5%-31.9%). The difference in prices between the two countries was statistically significant ($p < .001$). Generic bioequivalent alternatives were available in the US for the HVI ARV drugs lamivudine/zidovudine and lamivudine. Kuwait did not list any of those generic alternatives. However, the prices of the US HVI ARV generic drugs were higher than the prices of the Kuwait brands. **CONCLUSIONS:** The Kuwait Ministry of Health list of prices included less than one fourth of the HIV ARV drugs available in the US. The prices of brand HIV ARV in Kuwait were significantly lower than the corresponding brand and generic drug prices in the US.

PIN75

COMPARATIVE STUDY OF FUNDING OPPORTUNITY FOR AN EXPENSIVE INNOVATIVE OUTPATIENT TREATMENT IN EMERGING MARKETS

Kornfeld M[1], Belgaied W[2], Kornfeld Å[1], Toumi M[3]
[1]Creativ-Ceutical, Paris, France, [2]Creativ-Ceutical, Tunis, Tunisia, [3]Aix-Marseille University, Marseille, France

OBJECTIVES: To evaluate the funding opportunity for an innovative Hepatitis B treatment in six emerging markets with differently advanced public funding systems: South Korea, Turkey, Indonesia, Philippines, Thailand and Nigeria. **METHODS:** 1) Search in grey literature, on health authorities' and health insurance websites to establish country-specific market access policies. 2) Interviews with healthcare system and funding experts (4 experts per country) to understand funding opportunities. **RESULTS:** In all countries researched the funding of this innovative Hepatitis B drug can go through either a public route or a private one. Turkey and South Korea have the most advanced public coverage systems of the countries. The research found that countries could be grouped as markets where funding were perceived by the experts as going through primarily a) public coverage: Turkey and South Korea, b) out of pocket (OOP): Philippines and Thailand or c) private insurance: Indonesia and Nigeria. The opportunity for getting funding at a price similar to feasible price level in EU was greatest in private insurance markets (Indonesia and Nigeria). Lowest opportunity was seen in public coverage markets (Turkey and South Korea). OOP markets (Philippines and Thailand) offered a medium opportunity. **CONCLUSIONS:** This research shows that countries with less advanced public funding systems provide greater opportunity for funding new expensive this new drug than those with more developed public coverage systems due to high requirements on cost-effectiveness. Funding in countries with less developed public coverage is done through either private insurance pathways or by OOP payment. Though access to expensive drugs in countries with less developed public funding systems is not equitable it nevertheless provides the countries an opportunity to gain experience in the country-specific setting of a new drug. Emerging countries with more advanced public funding systems may be deprived of that opportunity.

PIN77

IMPACT OF EDUCATION STATUS OF MOTHER ON IMMUNIZATION OF YOUNG CHILDREN

Naaz M[1], Masood I[2], Nazir A[3], Arooj S[3], Amir S[3], Seemab S[2]
[1]The Islamia University Bahawalpur, Bahawalpur, Pakistan, [2]The Islamia University of Bahawalpur, Bahawalpur, Pakistan, [3]The Islamia University Of Bahawalpur, Bahawalpur, Pakistan

OBJECTIVES: The present study was conducted to find out the impact of mother's education on immunization status of children. **METHODS:** The study was a cross-sectional questionnaire based survey performed in different immunization centers of South Punjab, Pakistan. Total 424 parents with 12-23 months old children were interviewed about the vaccination status of children. Vaccination coverage was assessed by both vaccination card and parent's recall methods. SPSS version 20.0 was used to analyze the data. Appropriate statistics was applied to summarize and analyze the data. **RESULTS:** Complete immunization coverage was seen in 69.5% children while 30.5 % children were found incompletely immunized. Knowledge regarding immunization was also assessed and majority of parents were found with an average level of knowledge and mean knowledge score was 9.13+2.90. However a significant association ($p=0.001$) was observed between the maternal education and vaccination status of children. **CONCLUSIONS:** Results of the study concluded that complete vaccination trend was more common in educated mothers as compared to illiterate mothers. So vaccination coverage can be improved by educating and providing awareness to parents about immunization.

PIN78

UNDERSTANDING LOW UTILIZATION OF THE 8 WEEK SOFOSBUVIR/LEDIPASVIR SINGLE-TABLET REGIMEN AMONGST ELIGIBLE HEPATITIS C PATIENTS IN THE UNITED STATES

Katz J[1], Brown S[2], DiBonaventura M[1], Adams C[2], Riley D[1], Schoenebeck L[1]
[1]Ipsos Healthcare, New York, NY, USA, [2]Ipsos Healthcare, London, UK

OBJECTIVES: This research aims to estimate the proportion of hepatitis C (HCV) patients on sofosbuvir/ledipasvir (SOF+LED) that are eligible to finish treatment in 8-weeks and expected to finish the regimen in this timeframe. An additional aim was to identify factors associated with the use of the 8-week regimen. **METHODS:** Data from the Ipsos HCV Therapy Monitor was used. The HCV Therapy Monitor is a prospective medical chart review of patients with HCV conducted by hepatologists, gastroenterologists, infectious disease specialists, and internists in the United States. Physicians randomly selected elgibile patient charts and abstracted data on demographics, disease history and treatment patterns. Only US data from December 2015 to November 2016 was used (N=4,431 patients from N=168 physicians). Eligiblity for 8 weeks of SOF+LED was defined as being genotype 1, non-cirrhotic, naïve to previous HCV treatment, and a HCV viral load below 6 million IU/mL. Logistic regressions were used to predict use of an 8-week SOF+LED regimen (versus a longer duration) from

demographics and clinical characteristics. **RESULTS:** 67.5% of the sample was male, and the mean age was 51.5 years (SD = 12.5). 41.8% of the 4,431 patients in the study were eligible for 8 weeks of SOF+LED. Of these eligible patients, only 46.1% were currently treated and 32.6% were treated with SOF+LED regimen (35.2% of those treated with SOF+LED were expected to finish in 8 weeks). Substance abuse (OR = 2.7) and HIV co-infection (OR = 7.4) were significantly associated with SOF+LED expected treatment durations >8 weeks versus 8 week (both p<.05). **CONCLUSIONS:** A minority of currently treated eligible HCV patients were prescribed 8-weeks of SOF+LED. The low levels of use are partially a function of specific concomitant disorders and substance abuse issues. Despite the approval and access to SOF+LED for 8 weeks, utilization remains low.

PIN79

LONGITUDINAL BEHAVIOR CHANGE AND RISKS OF SEXUALLY TRANSMITTED DISEASE INFECTIONS/HUMAN IMMUNODEFICIENCY VIRUS INFECTION AMONG YOUNG AFRICAN AMERICANS: A LATENT TRANSITION ANALYSIS

Li Y[1], Mehta P[1], Chen H[1], Abughosh SM[1], Cuccaro P[2], Essien EJ[1]
[1]University of Houston, Houston, TX, USA, [2]University of Texas School of Public Health, Houston, TX, USA

OBJECTIVES: The aim of this study was to explore changes in risky sexual behaviors of African Americans (AA) from adolescence to adulthood and the associations of these changes with the risk of contracting sexual transmitted Infections (STI)/Human Immunodeficiency Virus (HIV). **METHODS:** Three waves (wave 1, 3 and 4) of the National Longitudinal Study of Adolescent to Adult Health were used. Five indicators (drinking, Lysergic-acid-diethylamide use, injection drug use, condom use, and number of sexual partners) and one predictor (living with both parents or not) were included to develop a latent profile of young AA's sexual behavior patterns utilizing latent transition analysis performed with SAS software version 7.3. **RESULTS:** A total of 960 AAs with 59.2% females in all waves were included in this study. Latent class and transition probabilities identified four sub-groups: Multiple Risk Behaviors (Class 1), Condomless Sex (Class 2), Less Sexual Activity (Class 3), and Condom Use (Class 4). Compared to those living with a single parent or other relatives, the individuals living with both parents were less likely to locate at class 1, 2, and 4 (odds ratios [ORs] for males respectively: 0.53, 0.44, and 0.67; ORs for females: 0.49, 0.61 and 0.15 respectively). The family structure was a significant predictor of individual's behavior pattern at their age of 14 years (p=0.0024). The majority of the AAs were at class 3 at the age of 14 years (male: 65.2%; female: 84.3%). Most young men switched to class 1 (32.3% at 21 years, 43.2% at 28 years); women relocated to class 4 (48.0% at 21 years, 45.5% at 28 years). The results of latent class and transition probabilities were confirmed with the individual's STI/HIV infection status during the past 12 months. **CONCLUSIONS:** Findings of this study highlight the need for tailored intervention programs that target different subpopulations at different points in time.

PIN80

THE INFLUENCE OF SOCIAL DETERMINANTS AND FAMILY STRUCTURE ON SEXUAL BEHAVIORS AMONG ADOLESCENTS FROM AN ECODEVELOPMENTAL PERSPECTIVE

Li Y[1], Chen H[1], Abughosh SM[1], Cuccaro P[2], Mehta P[1], Essien EJ[1]
[1]University of Houston, Houston, TX, USA, [2]University of Texas School of Public Health, Houston, TX, USA

OBJECTIVES: The aim of this study was to examine the differences in the influence of social determinants, modified by family structures, on sexually transmitted infection (STI)/Human Immunodeficiency Virus (HIV) related sexual behaviors among African American (AA) and non-Hispanic White American (WH) adolescents using the Ecodevelopmental theory. **METHODS:** A total of 5,908 adolescents in Wave I of the Add Health data were identified. Predictors were developed under four systems of the Ecodevelopmental theory. Sexual behavior was measured using a health score generated with six STD/HIV-related sexual behaviors. A higher health score indicates less risky sexual behaviors. An advanced linear regression analysis was employed using SAS software 9.3. **RESULTS:** Family structures were significantly different between the two groups (p<0.0001); 71% of WH lived with both parents, whereas 48% of AA were raised by single mothers. School bonding, feeling the love from mother and father, mother's attitude toward youth's sexual behavior, getting older, and youth's knowledge about condom use influenced health score of those who lived with at least one parent. Safety of the living environment was only associated with the health score of the youth living with single parent (β=-0.353, p=0.0191), while household income significantly modified the health score of the youth living with both parents (β=0.001, p<0.0001). The differences in health scores between WH and AA youth raised by a single-parent (β=0.263, p=0.0007) and both parents (β=0.201, p=0.0004) remained even after controlling for family structures. Specifically, the level of neighborhood satisfaction, mother's attitude toward youth's sexual behavior, father's attitude toward youth's use of birth control, and if father received public assistance are significant predictors of the health score of the youth brought up by relatives other than parents. **CONCLUSIONS:** These findings highlight the differences in factors influencing STD/HIV-related sexual risk behaviors among two young populations and can contribute to future intervention program development.

PIN81

IMPACT OF 9-VALENT HUMAN PAPILLOMAVIRUS VACCINE ON VACCINATION OF ADOLESCENTS AND YOUNG ADULTS IN THE PACIFIC NORTHWEST

Lindsay B[1], Groom H[2], Naleway A[2], Guzman-Cottrill J[3], Kurosky S[4]
[1]Merck & Co., Inc., Kenilworth, NJ, USA, [2]Kaiser Permanente Center for Health Research, Portland, OR, USA, [3]Infection Prevention Consulting of Oregon, Portland, OR, USA, [4]RTI Health Solutions, Research Triangle Park, NC, USA

OBJECTIVES: Describe human papillomavirus (HPV) vaccine uptake, initiation, completion, compliance, and missed vaccination opportunities among patients before and after introduction of 9-valent HPV vaccine (HPV9). **METHODS:** A retrospective patient cohort, males & females aged 9 to 26 years, enrolled in the Kaiser Permanente Northwest health plan between April 2012 and June 2016 was selected (N = 244,491). Vaccination and health care utilization data from electronic medical records and state-wide immunization registry were analyzed. Vaccine uptake (number of doses administered) was assessed during 4-month periods. Vaccine initiation, completion, compliance (received 3 doses within a 9 month period), and missed opportunities (eligible patient visits with no vaccination) were assessed over the entire study period and over 1-year periods pre- and post-HPV9 introduction in July 2014. **RESULTS:** Approximately 9,000 doses were administered during each 4-month period, with increases during periods spanning August through November (approximately 11,000 doses administered). During the study period, initiation was highest among patients aged 13 to 21 years, at 55%. Among those who initiated the series, 71.1% of patients completed two doses and 48.2% completed three doses of HPV vaccine; 28.2% were compliant with guidelines during the study period. Compliance was slightly lower prior to HPV9 introduction than during the post-period (21.3% and 28.0%, respectively). The proportion of patients with at least one missed vaccination opportunity was similar pre- and post-HPV9 introduction (56.0% and 53.6%, respectively). **CONCLUSIONS:** Uptake peaked at the start of the academic year. Among initiators, less than half completed three doses and few complied with dose-spacing recommended by the ACIP during the study period. Missed opportunities were common; reducing such occurrences may lead to higher completion and compliance as well as earlier immunization. Further analysis of reasons for missed opportunities and adolescent/young adult resource utilization may inform health care systems on improving HPV vaccine uptake and schedule compliance.

PIN82

ESTIMATING THE IMPACT OF UNIVERSAL VARICELLA VACCINATION IN JORDAN

Daniels V[1], Hayajneh WA[2], Weiss TJ[3], Pillsbury M[3], Kyle J[1], Wolfson LJ[3]
[1]Atlas Data Systems, Berkeley Heights, NJ, USA, [2]Jordan University of Science and Technology, Irbid, Jordan, [3]Merck & Co., Inc., Kenilworth, NJ, USA

OBJECTIVES: More than 50% of the Levant population has access to universal varicella vaccination (UVV). In order to avoid changes in the age-distribution of varicella cases, and significantly reduce disease burden, it is important for other countries in the region to consider UVV. The objective of this study is to assess the magnitude of current varicella disease burden and the potential impact of UVV in Jordan. **METHODS:** A dynamic transmission model of varicella infection was calibrated to available varicella seroprevalence data within the region and validated against local epidemiological data. The current burden was assessed by converting the calibration into age-specific incidence and mortality rates, and the impact of one-dose UVV administered at 12 months of age with 90% coverage (concurrent with MMR vaccination which as >95% coverage) was estimated. Alternative vaccination strategies were examined as sensitivity analyses. **RESULTS:** The model estimates the current burden of varicella to be 188,000 cases per year, an incidence rate of 2,475/100,000 persons. Varicella incidence is projected to decrease by 38% at 1 year, 79% at 5 years, 86% at 10 years, and 90% at 25 years. After 5 years of UVV, 743,000 cases and 93 deaths due to varicella will be prevented; over a 25 year period, more than 4 million cases and 500 deaths due to varicella will be prevented. Importantly, the public health benefits extend beyond vaccinees, with a 92% disease reduction in unvaccinated infants and an 84% reduction in unvaccinated adults. At low coverage levels (10%), such as might be seen with private-sector only varicella vaccination, slight shifts in the age-distribution of cases to older adults are likely. **CONCLUSIONS:** UVV in Jordan will significantly reduce varicella disease burden and protect against possible age-shifts in varicella case distribution that could be caused by synergies of private-sector only vaccination and high UVV rates within the region.

PIN83

THE IMPACT OF METHICILLIN-RESISTANT STAPHYLOCOCCUS AUREUS (MRSA) AND METHICILLIN-SENSITIVE STAPHYLOCOCCUS AUREUS (MSSA) INFECTION ON HOSPITAL READMISSIONS AMONG PATIENTS WITH PNEUMONIA

Yin L, Shao H, Shi L
Tulane University School of Public Health and Tropical Medicine, NEW ORLEANS, LA, USA

OBJECTIVES: To explore and quantify the association between MRSA/MSSA infection and readmission risk among patients with pneumonia. **METHODS:** Healthcare Cost and Utilization Project-State Inpatient Databases were used to identify all inpatient admissions with a primary diagnosis of pneumonia in Florida (2009-2013), Massachusetts (2010-2012) and California (2009-2011). Readmissions were measured by the CMS validated algorithm. MRSA and MSSA infections as secondary diagnoses were identified with ICD-9-CM codes. All pneumonia patients were categorized into three subgroups: MRSA-infected, MSSA-infected and non-MRSA/MSSA. Descriptive analysis was performed to compare demographic differences across three groups, and multivariate logistic regression was applied to evaluate the association between MRSA/MSSA infection and probability of readmission. **RESULTS:** Among 450,793 inpatient admissions with pneumonia, 2,285 (0.51%) had MRSA and 996 (0.22%) had MSSA. Compared to patients in the non-MRSA/MSSA group, patients in the MRSA group had higher Medicare coverage (72.56% vs 66.47%) and longer length of stay (LOS) (7.17 vs 5.36 days), while patients in the MSSA group were younger (65.51 vs 68.43 years old), predominantly male (56.48% vs 47.56%), had higher Medicaid coverage (12.25% vs 9.90%) and longer LOS (8.84 vs 5.36 days) (all p <0.05). Compared with non-MRSA/MSSA group (18.09%), the readmission rates wee higher in the MRSA (28.45%) and MSSA groups (23.80%) (all p<0.001). Controlling for demographic and illness factors, MRSA infection was associated with a higher risk of readmission (OR=1.497, p<0.001), while MSSA infection was also a risk factor for readmission (OR=1.201, p<0.018). Older age (OR=1.006, p<0.001), African American (OR=1.202, p<0.001, ref=whites), homeless status (OR=1.935, p<0.001) and longer LOS (OR=1.058, p<0.001)

were associated with greater readmission risk, while female (OR=0.883, $p<0.001$) and private insurance (OR=0.668, $p<0.001$, ref=Medicare) were associated with lower readmission risk. **CONCLUSIONS:** MRSA/MSSA infection among pneumonia patients was associated with a higher risk of readmission. Programs to reduce the risk for MRSA/MSSA infection at discharge would likely reduce readmissions.

PIN84

RESPIRATORY ILLNESS AND RESPIRATORY SYNCYTIAL VIRUS (RSV)-RELATED HOSPITALIZATION (RSVH) IN INFANTS WITH CONGENITAL AIRWAY ANOMALIES (CAA) IN THE CARESS REGISTRY (2005-2016)

Wong SK[1], Paes B[2], Li A[1], Mitchell I[3], Lanctôt K[1]
[1]Sunnybrook Health Sciences Centre, Toronto, ON, Canada, [2]McMaster University, Hamilton, ON, Canada, [3]University of Calgary, Calgary, AB, Canada

OBJECTIVES: Infants <2 years of age with congenital airway anomalies (CAA) may experience increased risks of respiratory illness-related (RIH) and RSV-related hospitalization (RSVH). This study compared RIH and RSVH hazards in infants with CAA versus infants prophylaxed for standard, approved indications (SD) and other serious underlying medical disorders (MD) in the Canadian RSV Evaluation Study of Palivizumab (CARESS). **METHODS:** CARESS is a prospective, observational study of children who received ≥1 injection of palivizumab across 32 Canadian hospital sites. Neonatal and demographic data were collected at enrolment. Post-injection data was collected monthly, including utilization and adherence, and outcomes related to respiratory illness events. **RESULTS:** 23,597 infants (955 CAA, 3346 MD, and 19296 SD) were enrolled. Group demographic differences ($p<0.05$) were found in: enrolment and gestational age, birth and enrolment weight, proportion of Caucasians, daycare attendance, smoking exposure, siblings, multiple births, household crowding, and family history of atopy. Palivizumab adherence, including inter-dose interval lengths, was 74.15% overall, and was similar across indications. 1655 infants were hospitalized 1970 times. CAA infants had an overall crude RIH rate of 11.6% (MD [10.1%], SD [6.3%]) and a significantly increased RIH hazard relative to MD (HR=1.59, 95%CI 1.30-1.94, $p<0.0005$) and SD (HR= 1.39, 95%CI 1.22-1.57, $p<0.0005$), Crude RSVH rates were: 1.75% (CAA), 1.45% (MD), and 1.30% (SD). Using Cox proportional hazard analysis, after adjusting for proportion of Caucasians, daycare attendance, siblings, smoking exposure, crowding, and atopy, the model was significant ($\chi2=75.98$, df=6, $p<0.0005$); however, based on indications for palivizumab the model was found to be insignificant (p=0.93). **CONCLUSIONS:** RIH risks were higher in CAA infants relative to MD and SD infants. However, hazard for RSVH appeared to be similar across indications, possibly due to the smaller CAA sample size compared to MD and SD.

PIN85

DOES THE INFORMATION-MOTIVATION-BEHAVIORAL SKILLS (IMB) MODEL ACCOUNT FOR ADHERENCE PROMOTION ACTIVITIES TARGETING PERSONS LIVING WITH HIV IN AMBULATORY-BASED SETTINGS?

Kibicho J[1], Dilworth T[2], Owczarzak J[3], Ndakuya F[1]
[1]University of Wisconsin-Milwaukee, Milwaukee, WI, USA, [2]Aurora St Luke's Hospital, Milwaukee, WI, USA, [3]John Hopkins University, Baltimore, MD, USA

OBJECTIVES: A substantial number of persons living with HIV (PLWH) have suboptimal ART adherence (<90%), which has implications for health outcomes. Despite empirical evidence that pharmacist interventions can increase ART adherence, pharmacists are underutilized resource in promoting ART adherence. Our objective was to examine how ambulatory-based pharmacists' knowledge, motivation, and behavioral skills influence the provision of adherence promotion activities (APA) to PLWH. **METHODS:** 188 ambulatory-based pharmacists providing HIV patient care rated 27 APA items and another 27 items related to the information-motivation-behavioral skills (IMB) model. We used Exploratory Factor Analysis (EFA) to identify latent constructs (APA, Information, Motivation, Behavioral Skills) and Structural Equation Modelling (SEM) with 2000 bootstrapping to assess the direct and indirect effects of IMB predictors on APA. We hypothesized that each IMB factor independently predicted APA, and that information and motivation indirectly predicted APA through Behavior Skills. **RESULTS:** EFA generated 1 APA factor (eigenvalue (λ)=5.11, variance explained (R2)=58%, Cronbach alpha (α)=0.92) and 3 IMB-factors having $\lambda>1$ ($1.25\leq\lambda\geq4.35$; R2=77%; $0.76\leq\alpha\geq0.90$). Initial SEM chi-square of $p<.001$ suggested the model failed to fit the data. Modification Indices suggested that Information was not a significant predictor of APA. After respecifying the model to exclude Information, all model fit indices fit the data well. All coefficients were statistically significant ($p<.05$), with correlations among factors ranging from -.29 to .33. The respecified model explained 58% of the variance in APA. **CONCLUSIONS:** Our findings provide partial support for the IMB model, since Information does not predict APA. Information influences APA indirectly through motivation and behavioral skills. Motivation is a significant predictor of both behavioral skills and APA. Ambulatory-based pharmacists' provision of APA is largely influenced by motivation-related factors. Thus, pharmacist-level interventions to promote ART adherence among PLWH in ambulatory-based settings should focus on increasing pharmacist motivation (e.g., reimburse for APA services).

PIN86

QUALITY IMPROVEMENT PRACTICES AND INNOVATIONS TO REDUCE VENTILATOR-ASSOCIATED PNEUMONIA

Merola D[1], Divers C[2], Wen L[2], Shermock KM[3]
[1]Shenandoah University, Winchester, VA, USA, [2]Bayer HealthCare Pharmaceuticals, Whippany, NJ, USA, [3]The Johns Hopkins Medical Institutions, Baltimore, MD, USA

OBJECTIVES: To perform a systematic review of practices, research, and innovations to reduce ventilator-associated pneumonia (VAP) rates in acute care facilities. **METHODS:** A systematic PubMed and Google search was conducted to identify publications that describe practices and innovations designed to decrease the rate of VAP from 2008 to present in the U.S. Identified sources were reviewed by independent reviewers to determine inclusion status. **RESULTS:** 489 publications were identified, of which 40 were judged to be relevant. The 40 included publications described 17 distinct practices or innovations that had been implemented to reduce the rate of VAP. Interventions that were demonstrated to be particularly effective were: prophylactic chlorhexidine mouth rinse, use of copper-infused bed linens, improved bronchial drainage, universal decolonization, critical care physicians available 24-hours a day, integration of efforts within a health-system, early and ongoing evaluation for ventilator weaning, and regular pulmonary and dental evaluations. In the pediatric population, a bundle of care that included elevating the head of the bed, daily sedation vacations, daily assessment of readiness to extubate, peptic ulcer disease prevention, and regular oral care has been shown to decrease VAP rates by 63-87 percent across a group of three hospitals that implemented the bundle. **CONCLUSIONS:** Healthcare institutions nationwide are conducting a variety of initiatives to reduce the incidence of VAP. These efforts include initiatives at the patient, provider and health-system levels. These practices should be embraced by acute care facilities to reduce the rate of VAP.

PIN87

ADULT VACCINATION MARKET UPTAKE, 2009-2015

Mao J, Buikema AR, Tong J, Korrer SD, Van Voorhis DL, Song R, Elliott C
Optum, Eden Prairie, MN, USA

OBJECTIVES: Adult vaccine-preventable diseases in the US are a major healthcare burden and vaccination is an important strategy to protect individuals, in particular those at higher risk of complications, from infectious diseases. Over the past several years, new adult vaccines along with changes in adult-vaccination guidelines have increased the number of vaccines recommended for adults. Adult vaccination rates in the US are measured by the Centers for Disease Control and Prevention using the National Health Interview Survey, however, there is no study examining adult vaccination trends among the US insured population. **METHODS:** Using commercial and Medicare Advantage with Part D (MAPD) data (2009-2015) for individuals aged ≥19 from the Optum Research Database, claims for pneumococcal vaccine (PPV and PCV), herpes zoster (HZ), tetanus/diphtheria booster (Td) and tetanus/diphtheria/pertussis (Tdap) were captured. The denominator was the average number of members enrolled annually. Vaccinations were examined over time by age group and insurance type (commercial or MAPD). **RESULTS:** From 2009 to 2015, per-member PPV use was low (1.3%-1.5%), Td use decreased (1.2%-0.5%); and HZ use increased (0.6%-1.1%). Increases were larger for Tdap (3.7%-5.6%) and PCV (3.8%-8.4%). As expected, PCV use varied by age-while low (≤1.2%) among members aged 19-59; use increased 241-, 770- and 2183-fold among members aged 60-64, 65-69, and 70+, respectively, driven predominantly by use of PCV13. By 2015, 3.3%, 26.1% and 34.9% of annual membership aged 60-64, 65-69, and 70+, respectively, received a PCV13 vaccine. **CONCLUSIONS:** Consistent with recent market and guideline changes, PCV13 use increased significantly among insured patients in 2015, and Tdap vaccine use is also increasing moderately over time. Use of other adult vaccines remains relatively stable, highlighting the need for additional strategies to promote adult vaccination.

RISK FACTORS ASSOCIATED WITH ORAL MUCOSITIS FOLLOWING HEAD AND NECK CANCER TREATMENT

Sussman M, Stern K, Menzin J
Boston Health Economics, Waltham, MA, USA

OBJECTIVES: Oral mucositis (OM), a debilitating side effect of chemotherapy treatment among patients with head and neck cancer (HNC), can impact quality of life and disrupt cancer treatment plans. Our goal was to assess the risk factors associated with OM among patients with HNC who undergo treatment with chemotherapy. **METHODS:** Using the Medicare 5% Standard Analytical Files from 1/1/2010-12/31/2014, elderly (≥65 years of age) patients were identified based on first-observed treatment with chemotherapy (index), a diagnosis of HNC within 3 months prior to index, and continuous eligibility ≥12 months pre- and ≥1 month post-index. The proportion of patients with an OM diagnosis within 30 days following index chemotherapy treatment and the setting of OM care were assessed. A logistic regression model was conducted to assess predictors associated with OM following chemotherapy treatment. **RESULTS:** 2,453 patients met inclusion criteria (mean age 73.4 (±6.4), 69% male, 90.5% White). Baseline mean Charlson Comorbidity Index score excluding cancer was 4.67 (±3.40), 49.9% of patients received concurrent radiotherapy within ±14 days of index, and 50.3% were diagnosed with >1 HNC location within 3 months before index. 7.6% of patients were diagnosed with OM within 30 days following index (mean 17 (±18.3) days from index to OM diagnosis), with the most common settings of OM-related care being outpatient hospital (47.3%), inpatient hospital (29.0%), and physician office (18.8%). Adjusted results indicated that >1 HNC location (adjusted odds ratio (OR): 1.56; 95% confidence interval (CI): 1.10-2.22), baseline gingival and periodontal disease (OR: 2.67; 95% CI: 1.24-5.38), and concurrent radiotherapy (OR: 4.63; 95% CI: 3.09-7.18) were significantly associated with an OM diagnosis. **CONCLUSIONS:** Our findings indicate that HNC disease burden, manifested by tumor site and treatment with radiotherapy, is associated with OM. Future research can examine the specific nature of chemotherapy and radiation therapy that may correlate with the risk of developing OM.

PCN2

PATTERN OF CHEMOTHERAPY-RELATED ADVERSE EFFECTS AMONG ADULT CANCER PATIENTS TREATED AT GONDAR UNIVERSITY REFERRAL HOSPITAL, ETHIOPIA: A CROSS-SECTIONAL STUDY

Gebresillassie BM[1], Erku DA[2], Belachew SA[2], Mekuria Ab[2]
[1]university of gondar, gondar, Ethiopia, [2]University of Gondar, Gondar, Ethiopia

OBJECTIVES: Adverse drug reactions (ADRs) are a global problem and constitute a major clinical problem in terms of human suffering. The high toxicity and narrow therapeutic index of chemotherapeutic agents makes oncology pharmacovigilance essential. The objective of the present study was to assess the pattern of ADRs occurring in cancer patients treated with chemotherapy in a tertiary care teaching hospital in Ethiopia. **METHODS:** A cross-sectional study over a 2-year period from September 2013 to August 2015 was conducted on cancer patients undergoing chemotherapy at Gondar University Referral Hospital Oncology Center. Data were collected directly from patients and their medical case files. The reported ADRs were assessed for causality using the World Health Organization's causality assessment scale and Naranjo's algorithm. The severities of the reported reactions were also assessed using National Cancer Institute Common Terminology CTCAE version 4.0. The Pearson's chi-square test was employed to examine the association between two categorical variables. **RESULTS:** A total of 815 ADRs were identified per 203 patients included in the study. The most commonly occurring ADRs were nausea and vomiting (18.9%), infections (16.7%), neutropenia (14.7%), fever and/or chills (11.3%), and anemia (9.3%). Platinum compounds (31.4%) were the most common group of drugs causing ADRs. Of the reported ADRs, 65.8% were grades 3–4, (severe level) 29.9% were grades 1–2, and 4.3% were grade 5 (toxic level). Significant association was found between age, number of chemotherapeutic agents, as well as dose of chemotherapy with the occurrence of grades 3–5 toxicity. **CONCLUSIONS:** The high incidence of chemotherapy-related ADRs among cancer patients is of concern. Setting up an effective ADR monitoring and reporting system (onco-pharmacovigilance) and creating awareness among health care professionals regarding the importance of ADR reporting may help prevent the problem.

PCN3

SORAFENIB TOLERANCE AND ADVERSE EVENTS IN THE FIRST LINE TREATMENT OF HEPATOCELLULAR CARCINOMA

Herren C[1], Beyrer JK[1], Chen L[1], Li L[1], Heaton PC[2], Bowman L[1], Girvan A[1]
[1]Eli Lilly and Company, Indianapolis, IN, USA, [2]University of Cincinnati, Cincinnati, OH, USA

OBJECTIVES: Sorafenib has demonstrated improved overall survival in hepatocellular carcinoma (HCC). Many patients (80%) taking sorafenib experience adverse events (AEs) leading to dose reductions (26%) and drug discontinuation (38%). First line (1L) utilization of sorafenib among patients in the US with HCC, real-world dosing, AEs, and tolerance of sorafenib are described below. **METHODS:** US patients with two separate diagnoses of HCC receiving 1L treatment with at least two prescriptions of sorafenib between July 1, 2007 and September 30, 2015 were retrospectively analyzed in the Truven Marketscan® Commercial and Medicare Supplemental claims databases. Descriptive statistics characterized baseline demographics, clinical attributes, prescribed and calculated average daily dose (ADD) of sorafenib, tolerance of sorafenib (calculated ADD of sorafenib >285mg/day), and AEs. **RESULTS:** Among 1,861 patients diagnosed with HCC receiving sorafenib 1L treatment, 1,157 (62%) patients received at least two pharmacy claims for sorafenib. Of the 1,157 patients, the mean age was 63 years (SD=10.15), and 81.6% were male. Of those (n=934) with complete prescription claims, the mean calculated ADD was 621.6mg/day (SD=223.7) (78% of the labeled dose), and 91.5% were tolerant to sorafenib (>285mg/day). The median time from initial diagnosis to sorafenib initiation was 44 days, and median duration of sorafenib treatment was 83 days. Most patients (86.9%) did not receive subsequent anti-cancer therapy. Anorexia/weight loss, nausea/vomiting, and musculoskeletal/joint pain were the most common AEs (>15%) during sorafenib treatment. **CONCLUSIONS:** Less than two thirds of patients with HCC in the US receiving 1L treatment with sorafenib receive a second prescription, and most do not receive subsequent drug therapy. These patients have lower calculated ADD than recommended per label, and experience a variety of adverse events demonstrating unmet medical need. Factors associated with dose reduction and discontinuation and whether these have an impact on real-world effectiveness of 1L sorafenib should be investigated.

PCN4

CHARACTERISTICS AND ADVERSE EVENTS OF PATIENTS WITH HEPATOCELLULAR CARCINOMA RECEIVING ONE SORAFENIB PRESCRIPTION

Herren C[1], Beyrer JK[1], Chen L[1], Li L[1], Heaton PC[2], Bowman L[1], Girvan A[1]
[1]Eli Lilly and Company, Indianapolis, IN, USA, [2]University of Cincinnati, Cincinnati, OH, USA

OBJECTIVES: Sorafenib has demonstrated improved overall survival in patients with hepatocellular carcinoma (HCC). Many patients (80%) taking sorafenib experience adverse events (AEs) leading to dose reductions (26%) and drug discontinuation (38%). The objective of this retrospective analysis is to describe patients in the US with HCC who cease sorafenib treatment after one prescription. **METHODS:** The study cohort was US patients with two separate diagnoses of HCC receiving first line (1L) treatment with one or more sorafenib pharmacy claims between July 1, 2007 and September 30, 2015 in the Truven Marketscan® Commercial and Medicare supplemental claims databases. Descriptive statistics characterized patient baseline demographics, clinical characteristics, sorafenib treatment-related variables, and AEs. **RESULTS:** Among 1,861 patients in the study cohort, 704 (38%) patients received only one sorafenib claim. Of the 704 patients, the mean age was 63.5 years (SD=10.74), and 78.8% were male. Non-alcoholic liver disease, cirrhosis, and hepatitis C were the most common (>25%) hepatic-related comorbidities. The mean prescribed average daily dose of sorafenib was 713.3mg/day (SD=179.45) (89% of the labeled dose) among patients with complete prescription claims (97.4%). The median time from diagnosis to sorafenib initiation was 35 days. Nausea/vomiting, anorexia/weight loss, fatigue, and musculoskeletal/joint pain were the most common AEs (>5%) during sorafenib treatment. Most patients (93.3%) did not receive subsequent therapy with an alternative anti-cancer agent, however, for those who did the median time to initiation of subsequent therapy was 49 (Range: 1-456) days after sorafenib initiation. **CONCLUSIONS:** Over one-third of patients with HCC in the US fill only one sorafenib 1L prescription, and most do not receive subsequent drug therapy, demonstrating unmet medical need. Some patients receive less than the labeled dose. Factors associated with dose reduction and discontinuation and the impact on real-world effectiveness of first line sorafenib should be investigated.

PCN5

ASSESSMENT OF DOSE PER CYCLE OF DEXAMETHASONE IN LENALIDOMIDE-DEXAMETHASONE REGIMEN TO TREAT RELAPSED/REFRACTORY MULTIPLE MYELOMA PATIENTS IN THE UNITED STATES

Potluri R[1], Zyczynski T[2], Davis C[2], Vij R[3]
[1]SmartAnalyst Inc., New York, NY, USA, [2]Bristol-Myers Squibb, Lawrenceville, NJ, USA, [3]Washington University School of Medicine, St Louis, MO, USA

OBJECTIVES: While high-dose dexamethasone (Dex; 480 mg/cycle) is effective in combination with lenalidomide (Len) in relapsed/refractory multiple myeloma (RRMM) patients, emerging evidence points to increased use of low-dose (≤160 mg/cycle) Dex in this combination regimen. We assessed frequency of use of high- vs low-dose Dex in RRMM patients in real-world practice in the US. **METHODS:** Patients who received treatment for myeloma between July 2012–September 2014 were identified from a large US claims database. Index date was defined as the first diagnosis of multiple myeloma or claim for a myeloma drug during the study period. Patients were stratified into two groups: Group (G)1 if they had continuous enrollment and prescription eligibility for a 12-month period prior to index date (indicating newly diagnosed, treatment-naïve status); G2 if they did not have 12-month continuous enrollment prior to index date. Dex dose per cycle in the first four cycles of Len-Dex treatment in RRMM patients was evaluated. **RESULTS:** Overall, 8891 and 16,489 patients were identified in G1 and G2, respectively. In total, 6620 distinct lines of treatment (LOTs) were identified in G1 and 29,287 in G2. Len-Dex RRMM LOTs accounted for 4.6% (n=304) in G1 and 7.1% (n=2080) in G2. The median (Q1–Q3) Dex dose per cycle across the first four cycles in RRMM LOTs was 121 (75–156) mg in G1 and 102 (70–154) mg in G2. In G1, median dose was consistent across LOTs 2, 3 and 4 (137, 113 and 114 mg/cycle, respectively). More than two-thirds of these LOTs showed a Dex dose of ≤160 mg/cycle. **CONCLUSIONS:** This real-world study of Len-Dex use among RRMM patients shows that the majority receive low-dose Dex, and confirms the growing use of low-dose Dex in this combination regimen. Additional analyses may inform revision of treatment guidelines for RRMM.

PCN6

INDIRECT COMPARISONS OF SAFETY OF TARGETED THERAPIES FOR METASTATIC RENAL CELL CARCINOMA: A NETWORK META-ANALYSIS

Heo JH, Park C, Rascati KL
The University of Texas at Austin, Austin, TX, USA

OBJECTIVES: Renal cell carcinoma (RCC) is the most common type of kidney cancer. Disease specific survival for metastatic RCC (mRCC) was significantly improved with the introduction of the targeted agents since 2005. However, there are not enough head-to-head clinical trials comparing the safety between several pairs of targeted therapies. This study aimed to compare toxicity outcomes among targeted agents in patients with mRCC by using network meta-analysis (NMA). **METHODS:** The PubMed, MEDLINE, Cochrane Library, and Web of Science were searched to identify phase II or III randomized clinical trials (RCTs) of targeted therapies in patients with mRCC published between January 2000 and September 2016. Discontinuation rates due to severe adverse events were compared using risk ratios (RRs) and 95% confidence intervals (CIs). A network of the RCTs involving targeted agents was constructed to conduct the Bayesian NMA. The surface under the cumulative ranking curve (SUCRA) of each treatment was calculated to assess the probability of the best treatment. **RESULTS:** A total of 11,265 patients with mRCC were included from 28 RCTs. Among the first-line therapy, the RRs of discontinuation were not significantly different among treatments, except that the combination therapy of temsirolimus/bevacizumab was associated with a higher risk of discontinuation due to severe adverse events compared to everolimus, placebo/interferons, and temsirolimus (RR=2.69 (95% CI=1.18-6.13), RR=2.99 (95% CI=1.58-5.66), and RR=3.60 (95% CI=1.40-9.25), respectively). For second-line therapy, axitinib had significantly lower relative risks of discontinuation compared to cabozantinib, everolimus, lenvatinib, and other treatments. In RRs of discontinuation, the largest values of SUCRAs were found in temsirolimus among the first-line therapy (83.1) and axitinib among the second-line therapy (95.1). **CONCLUSIONS:** Regarding medication safety, temsirolimus and axitinib may be appropriate options in the first-line and second-line therapy in patients with mRCC, respectively.

PCN7

RACIAL DIFFERENCES AND COMPARATIVE EFFECTIVENESS OF RITUXIMAB-BASED THERAPIES AMONG ELDERLY FOLLICULAR LYMPHOMA (FL) PATIENTS – A RETROSPECTIVE COHORT STUDY USING SEER-MEDICARE LINKED DATABASE

Sanyal S, Calip GS
University of Illinois at Chicago, Chicago, IL, USA

OBJECTIVES: Follicular Lymphoma (FL) is the most common indolent lymphoma (15,000 cases diagnosed in US, 2016). Limited evidence exists on racial differences in treatment and the comparative effectiveness of rituximab-based chemo/immunotherapy treatment regimens among elderly FL patients. Herein, we examined the differences in treatment utilization for elderly FL patients stratified by race and characterized the comparative effectiveness of treatments on cancer-specific and all-cause mortality. **METHODS:** We conducted a retrospective cohort

study of patients (age ≥ 66 years) diagnosed with first primary FL from 2001-2011, using the SEER-Medicare database. Differences in risk of all-cause and cancer-specific mortality by race were examined using Cox proportional hazards models. Adjusted hazard ratios and 95% CIs were also estimated to determine the comparative effectiveness of rituximab-based chemotherapy versus observation only. **RESULTS:** Among 4,849 elderly FL patients, treated patients tended to be younger than patients receiving observation only. African-American patients were less likely (44%) to receive treatment versus Caucasian patients (53%). Our findings suggested benefit of rituximab-based chemo/immunotherapy across all races, although only statistically significant for Caucasian patients, for cancer-specific mortality (Caucasian: HR=0.55, 95% CI:0.44-0.68; African-American: HR=0.62, 95% CI:0.30-1.41; Hispanic: HR=0.69, 95% CI:0.42-1.28; Asian/Pacific Islander : HR=0.65, 95% CI:0.27-1.40) and all-cause mortality (Caucasian: HR=0.53, 95% CI: 0.46-0.62; African-American: HR=0.61, 95% CI:0.28-1.93; Hispanic: HR=0.51, 95% CI:0.23-1.10; Asian/Pacific Islander : HR=0.54, 95% CI:0.20-0.94). Further subgroup analyses suggested similar benefits of rituximab plus chemotherapy and rituximab monotherapy when compared to observation (log-rank $p<0.001$). **CONCLUSIONS:** We found racial differences in the treatment utilization and comparative effectiveness of therapies in elderly FL patients. Some socio-demographic predictors may have an important role for treatment decisions. In this preliminary analysis it remains unclear if racial differences exist in the effectiveness of rituximab-based chemotherapy and monotherapy on cancer-specific and all-cause survival. Further analyses are planned to extend our analysis to all elderly indolent lymphoma patients.

PCN8

SPINAL SURGERY IN PATIENTS WITH MALIGNANT AND BENIGN BONE CANCER OF THE VERTEBRAL COLUMN – PREVALENCE AND RISK FACTORS

Corso KA[1], Holy CE[1], Walsh M[2], Pracyk JB[3], Lerner J[4]
[1]Johnson & Johnson, New Brunswick, NJ, USA, [2]Johnson & Johnson, Hingham, MA, USA, [3]Johnson & Johnson, Raynham, MA, USA, [4]DePuy Synthes, Inc., Raynham, MA, USA

OBJECTIVES: Spinal fusion (SF) is performed to address pain and loss of function. However, the frequency of SF and incidence of repeat SF for patients with benign or malignant bone tumors of the vertebral column (BTVC) is not well documented. **METHODS:** Using the Truven CCAE and Truven Medicare databases, patients with SF (International classification of disease (ICD-9): 81.0X or 81.61-4) from 2010 to 2014 were identified and all diagnoses concurrent to SF were analyzed. A patient subset that had ≥12-month enrollment pre- and post- SF and no prior spine surgery within 12 months of index SF were categorized for comorbidities at index. The presence of benign (ICD-9 213.2) or malignant (ICD-9 170.2) BTVC was documented. Comorbidities at surgery included diabetes (ICD-9 250.X), osteoporosis (ICD-9 733.0X) and obesity (ICD-9 V85.35-45; 278.00, 278.01). Occurrence of repeat SF (new or revision - for revision: ICD-9 81.3X) within the 12 months follow-up period was evaluated. **RESULTS:** 61% of patients who underwent SF had spinal stenosis, 41% had spondylolisthesis, 36% had DDD and less than 1% had malignant or benign BTVC. The study cohort included 122,589 patients, with a total 12-month rate of repeat SF of 4.86% (4.63%, 4.02% and 6.19% in the non-cancer, benign and malignant BTVC populations, respectively). Logistic regression indicated that risk of repeat SF was significantly associated with obesity (Odds ratio (OR): 1.273 – 95% Wald confidence interval (CI) 1.161-1.396), osteoporosis (OR: 1.192 – 95% CI: 1.087-1.307) and diabetes (OR: 1.086 – 95% CI: 1.002-1.177), but not with benign (OR: 0.876 – 95% CI: 0.539-1.424) or malignant BTVC (OR: 1.356 – 95% CI: 0.804-2.288) versus no BTVC. **CONCLUSIONS:** Risks for repeat SF in patients with BTVC are similar to those for patients without BTVC. Our results suggest that the risk of repeat SF is associated with baseline comorbidity status, rather than the presence of BTVC.

PCN9

COMORBIDITY MEASURES TO PREDICT OVERALL SURVIVAL TIME AMONG ELDERLY GYNECOLOGIC CANCER SURVIVORS IN THE US: AN ANALYSIS OF SEER-MEDICARE DATA

Park C[1], Lawson KA[1], Barner JC[2], Powers DA[1], Rascati KL[1], Wilson JP[1]
[1]The University of Texas at Austin, Austin, TX, USA, [2]The University of Texas at Austin, College of Pharmacy, Austin, TX, USA

OBJECTIVES: To examine relationships between different comorbidity indices and overall survival time, and to compare the performance of these indices in predicting survival time among elderly gynecologic cancer survivors. **METHODS:** This retrospective study used 2007-2010 Surveillance, Epidemiology, and End Results (SEER)-Medicare database. The primary independent variables were comorbidity indices, including diagnosis-based indices [Deyo-Charlson Comorbidity Index (CCI), Romano CCI, D'Hoore CCI, Original Elixhauser Comorbidity Index (EI), AHRQ EI, and National Cancer Institute comorbidity index] and medication-based indices [Chronic Disease Score (CDS)-1, CDS-2, and RxRisk]. The CCIs and EIs were included as both score and categorical/indicator variables. The dependent variable was overall survival time. Cox models with a time-dependent covariate were used to assess the relationships between comorbidity measures and survival time. The Akaike Information Criterion, Bayesian Information Criterion, and Likelihood ratio tests were used to compare the predictive ability of the indices. **RESULTS:** The mean age of the 4,063 gynecologic cancer survivors studied was 78.0 (SD=7.4) years; 27.6% died within one year after diagnosis. Uterine cancer was most common (48.5%), followed by ovarian cancer (30.0%). All diagnosis-based indices were significantly positively associated with risk of death, while none of the medication-based indices were associated with risk of death after controlling for covariates. Regarding predictive ability of comorbidity indices, the score versions of the diagnosis-based indices tended to outperform the categorical/indicator versions of the diagnosis- and medication-based indices. **CONCLUSIONS:** This study found meaningful associations between different comorbidity indices and overall survival among the elderly gynecologic cancer population in the US. Study findings suggest using the score versions of the diagnosis-based indices in predicting survival-related outcomes in this population. This study may help clinicians identify conditions where better treatment plans could improve health outcomes, and health scientists choose the better comorbidity indices to use in their epidemiologic research.

PCN10

IMPACT OF CRYOTHERAPY AND CONSERVATIVE MANAGEMENT ON DEPRESSION AND ANXIETY DISORDERS IN MEN WITH PROSTATE CANCER

Shah S, Cobran EK, Young HN
University of Georgia, Athens, GA, USA

OBJECTIVES: To compare rates of subsequently diagnosed mental health issues (MHI), and time to develop any MHI in men with localized prostate cancer who underwent conservative management (CM) or cryotherapy. **METHODS:** The Surveillance, Epidemiology and End Results (SEER)-Medicare linked data from 2000-2013 was used. Patients' aged 65 years or older with stage I and stage II cancer diagnosis and no prior MHI were included. Patients in the CM cohort were identified as those who did not receive any immediate treatment within 6 months of diagnosis of localized prostate cancer. Patients in the cryotherapy cohort were identified using ICD-9 procedure code, Healthcare Common Procedure Coding System (HCPCS) code/ Current Procedural Terminology (CPT) code. The diagnoses of any MHI (major depressive disorder, anxiety, depression-not otherwise specified (NOS), neurotic depression, and adjustment disorder with depressed mood) were identified using the ICD-9 codes. Rates of each of the MHI were assessed. A cox proportional hazard model was used to estimate time to develop MHI in the cohorts. All analyses were performed using SAS (version 9.4). **RESULTS:** There were 13,161 and 3,533 patients in the CM and cryotherapy cohort, respectively. Rates of MHI were lower in the CM compared to cryotherapy cohort: neurotic depression (0.25% and 0.42%, respectively); major depressive disorder (0.49% and 0.58%, respectively); anxiety disorders (2.38% and 2.69%, respectively), adjustment disorder with depressed mood (0.17% and 0.25%, respectively), and depression NOS (2.05% and 2.41%, respectively). Median time to develop any MHI in the CM and cryotherapy cohort were 62.9 months and 54 months, respectively, and the risk of being diagnosed was 16.5% higher in the cryotherapy cohort (hazard ratio [HR] = 1.17 [1.02 – 1.41]). **CONCLUSIONS:** Findings suggest that the burden of MHI is greater with cryotherapy treatment in comparison to CM. Patients who receive cryotherapy may need additional mental health monitoring and treatment to avoid negative outcomes.

PCN11

TREATMENT PATTERNS AND MEDICATION ADHERENCE AMONG PATIENTS DIAGNOSED WITH MULTIPLE MYELOMA AND TREATED WITH PANOBINOSTAT

Gilligan AM[1], Bhor M[2], Stetsovsky D[1], Varker H[3], Davis BM[4], Eldjerou LK[2], Urniasz A[2], Globe D[5], Bonafede MM[6]
[1]Truvan Health Analytics, Ann Arbor, MI, USA, [2]Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA, [3]Truven Health Analytics, Bethesda, MD, USA, [4]Truven Health Analytics, Ann Arbor, MI, USA, [5]Novartis Pharmaceuticals, East Hanover, NJ, USA, [6]Truven Health Analytics, Cambridge, MA, USA

OBJECTIVES: Examine treatment patterns and sequence, combinations, dosing, medication adherence, and persistence in adults with multiple myeloma (MM) treated with panobinostat in the US. **METHODS:** Using a nationwide administrative claims database, a cohort of MM patients aged ≥18 years treated with panobinostat from 02/01/2015-07/31/2016 was evaluated. Three months continuous enrollment was required prior to the first panobinostat claim (index date) and variable length post-index follow-up was used. Lines of therapy (LOT) were defined as the number of prior chemotherapeutic and/or immunotherapy regimens administered within 60 days. Adherence was measured using the medication possession ratio (MPR). Descriptive analyses were used to examine differences by LOT and treatment combination. **RESULTS:** Seventy-seven patients treated with panobinostat were included (mean age 61.4 (SD=9.1) years; 50.6% male). Patients had an average of 237.6 (SD=144.0, 25th-75th interquartile range [IQR]=140.8-335.2) days continuous enrollment following panobinostat. The majority of patients received panobinostat as the 4th (19.5%) or 5th (15.6%) LOT compared to the 2nd (10.4%) or 3rd LOT (11.7%). The most common treatment combinations were bortezomib/dexamethasone/panobinostat (33.8%), bortezomib/panobinostat (14.3%), and dexamethasone/panobinostat (9.1%). Most patients (71.4%) received the recommended dose of 20 mg at index. Approximately 77.9% of panobinostat users remained on a stable dose throughout follow-up. The average number of panobinostat cycles was 3.9 (SD=3.2) with an average duration of 97.5 days (SD=82.0). Medication adherence was high across 3, 6, and 9 month follow-up (MPR of 0.89, 0.89, and 0.88, respectively). Persistence among patients treated with panobinostat was approximately 75.3% with an average time to non-persistence of 94.1 days (SD=88.2). **CONCLUSIONS:** Panobinostat was most often used in fourth or fifth LOT. Most patients received the recommended dose at index and treatment regimen in combination with bortezomib and dexamethasone. Adherence was high among panobinostat users; however, the limited duration of follow-up may have affected the number of cycles observed in this population.

PCN12

EPIDEMIOLOGY OF METASTATIC MELANOMA AND FREQUENCY OF MUTATION TESTING IN THE U.S. MEDICARE POPULATION

Sheinin MY[1], Alkhateeb ZS[1], Kredlow I[1], Francis KM[1], Hadker N[1], Sanchez H[1], Steinberg IB[2]
[1]Trinity Partners, Waltham, MA, USA, [2]Array BioPharma, Cambridge, MA, USA

OBJECTIVES: To quantify the population of metastatic melanoma patients in the US Medicare population, and assess the frequency and timing of newly available mutation testing. **METHODS:** A retrospective claims study was conducted using the Medicare FFS Database. Patients included were aged ≥65 years with at least 2 claims for malignant melanoma in the identification period

1/1/2013 to 12/31/2014, and continuously enrolled in medical and hospital benefits from 1/1/2013 until 12/31/2015 or death. A newly metastatic cohort was further identified based on (1) having at least 2 claims for a metastatic disease on or following the date of the first melanoma claim; and (2) absence of any metastatic claims in the 12 months prior to the initial metastatic claim. For every patient defined as having metastatic melanoma, mutation testing claims were identified using the CPT codes for panel testing (81445, 81450, 81455) and BRAF single mutation testing (81210). **RESULTS:** 9,656 melanoma patients were identified as prevalent in 2014, 347 (3.6%) of whom were identified as newly metastatic in 2014. Among metastatic melanoma patients, 98 (28.2%) underwent diagnostic testing for mutations. Of these, 96 (98.0%) were administered a BRAF single mutation test. Of all 98 patients tested for mutations, 74 (75.5%) were tested after their diagnosis of metastases; the median time between mutation testing and diagnosis was 18.5 days. Majority of testing (78.4%) was done within the first 3 months of diagnosis of metastases. **CONCLUSIONS:** Despite the launch of multiple therapies targeting BRAF+ mutations since 2011, analysis of a large melanoma population suggests that diagnostic mutation testing rates remained low even in 2014. These findings raise important questions about why diagnostic tests to drive treatment decisions were not used or accessed more broadly, and merit additional research as new targeted therapies for metastatic melanoma are coming to market.

PCN13

COMPARATIVE COMPARISON OF CLINICAL AND ECONOMIC OUTCOMES OF HAND-ASSISTED LAPAROSCOPIC RECTAL RESECTION FOR RECTAL CANCER

Song C, Liu E
Intuitive Surgical, Sunnyvale, CA, USA

OBJECTIVES: Laparoscopic rectal cancer resection is a technically challenging surgery. Hand-assisted laparoscopic surgery(HALS) was common to avoid conversion to open surgery and potential intra-operative complications. This study aims to compare the clinical and economics outcomes of four surgical approaches for rectal cancer resection: HALS, non-HALS, convert-to-open surgery, and open surgery. **METHODS:** Rectal cancer patients underwent rectal resection from 01/2008-09/2015 in Premier Hospital Perspective® Database were included. HALS approach was defined by billing texts, and other surgical approaches were defined by ICD-9 procedure codes. Multivariate regression was used to examine the difference of postoperative complication rate, length of stay(LOS), operation-room(OR) time, hospitalization cost between HALS cases and patients with non-HALS, convert-to-open surgery, or open surgery, respectively. Further stratification analyses were performed by surgeon specialty or hospital teaching status. **RESULTS:** Among 25814 rectal cancer patients in study, 66.4% were open surgery, 7.59% were converted to open surgery, 17.35% were non-HALS, and 8.43% were HALS. After adjustment, compared with convert-to-open cases, HALS cases had lower odds of post-operative complications(OR 0.77, 95%CI[0.66-0.94]), shorter OR time (-36.71 mins, 95%CI[-52.81, -20.60]) and lower hospitalization cost ($-1394.977, 95%CI[-2684.51, -105.44]). Compared to open surgery, HALS cases had lower odds of post-operative complications(OR 0.89, 95%CI [0.90-0.99]), and shorter LOS (-0.44 days, 95%CI[-0.75, -0.14]). However, compared to non-HALS, HALS had longer LOS (0.69 days, 95%CI [0.33, 1.04]) and higher direct cost($805.54, 95%CI[204.16, 1406.91]) with shorter OR time (-22.48mins, 95%CI[-37.19, -7.76]). Similar trending was observed when stratifying by surgeon specialty and teaching hospital status. The gap of direct cost between HALS and non-HALS MIS were bigger among cases in teaching hospitals and colorectal surgeons, compared with community hospitals and non-colorectal surgeon. **CONCLUSIONS:** HALS approach is associated with lower complications and shorter LOS compared to convert-to-open and open approach, yet is associated with longer LOS and hospitalization costs when compared to non-HALS in rectal cancer resection.

PCN14

META-ANALYSIS ON MICROWAVE ABLATION IN CHINESE PATIENTS WITH LIVER CANCER >3CM

Yin C[1], Ghosh SK[2], Miles G[3], Metz L[1]
[1]*Johnson & Johnson Medical Asia Pacific, Singapore, Singapore,* [2]*Ethicon Inc, Cincinnati, OH, USA,* [3]*Costello Medical Singapore Pte Ltd, Singapore, Singapore*

OBJECTIVES: Percutaneous microwave ablation (pMWA) is a highly prevalent therapy to treat primary or metastatic liver cancer patients in China. However, the clinical safety and effectiveness of MWA in treating large liver lesions (LLL) >3cm are debatable. The objective of this meta-analysis was to retrospectively evaluate the clinical safety and effectiveness of pMWA for Chinese patients with LLL. **METHODS:** A systematic search of the MEDLINE, Embase, Cochrane library, CNKI and WanFang databases using relevant keywords for liver, hepatocellular, carcinoma, cancer, tumor, percutaneous, ablation and microwave was performed. Only studies on Chinese patients were included. Meta-analysis was conducted using non-comparative binary data in RevMan Software for the following variables: technical success rate (TSR), local recurrence rate (LRR) and 1-year survival (1YS). The data type was generic inverse variance, and random-effects model was used. All statistics are mean (95% CI). **RESULTS:** 14 studies, including 1,035 patients with primary or metastatic LLL, were analyzed. The TSR was 67% (50%-84%). Subgroup analysis showed a TSR of 96% (94%-99%) in patients with lesion size 3-5cm, while the rate was 60% (38%-83%) in patients with lesions>5cm. 29% (10%-47%) of patients with LLL had local recurrence. The LRR of patients with lesion 3-5cm and above 5cm were 27% (9%-64%) and 41% (22%-60%) respectively. The 1YS was 84% (77%-91%) with 89% (86%-93%) in the 3-5cm group and 62% (52%-71%) in the >5cm group. 8% (3%- 14%) of patients experienced major complications (e.g. liver abscess) post-operatively. The post-operative complication rate was 3% (1%-5%) in 3-5cm patients, and 12% (6%-18%) in the >5cm group. **CONCLUSIONS:** The clinical safety and effectiveness of pMWA drops significantly in the treatment of Chinese patients with primary or metastatic liver cancer when the size of lesion increases from 3–5cm to >5cm. New technology should address these unmet needs in large lesion ablation.

PCN15

EFFICACY OF TREATMENTS IN CHILDREN WITH RELAPSED/REFRACTORY ACUTE LYMPHOCYTIC LEUKEMIA (R/R ALL): A SYSTEMATIC LITERATURE REVIEW AND META-ANALYSIS

Martin AL[1], Thomas SK[2], Cota M[2], Hao Y[2], Zhang Y[3], Turner M[1]
[1]*Evidera, Waltham, MA, USA,* [2]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA,* [3]*Evidera, London, UK*

OBJECTIVES: Pediatric ALL is the most common childhood leukemia, with 20% of children experiencing relapse after initial complete response (CR) to first-line treatment. A systematic literature review (SLR) and meta-analysis (MA) were conducted to determine the effects of treatments for pediatric r/r ALL. **METHODS:** EMBASE, MEDLINE, and CENTRAL databases were searched from 01/01/2000-12/31/2016 using keywords for pediatric r/r ALL paired with terms for relevant treatments to identify studies reporting efficacy and safety data. Proceedings from recent oncology conferences were also searched. Statistical analysis was limited to studies with comparable populations and treatments. Random-effects MA of single-arm data were performed to determine 6- and 12-month OS rates, median OS, and CR rate (timepoint not reported) for pediatric r/r ALL patients treated with clofarabine + cyclophosphamide + etoposide (CCE). **RESULTS:** Studies included in the SLR were heterogeneous, only five of the 46 studies identified were sufficiently comparable for MA in terms of outcomes and populations (median age 8-14 years, median 2 prior lines of therapy). All five were single-arm studies in primarily B-cell immunophenotype evaluating CCE, a treatment with pooled 6-month OS of 43.5% (95% CI: 32.6%–55.1%), 1-year OS of 26.7% (95% CI: 17.5%–38.3%), and median OS of 5.2 (95% CI: 3.2–8.6) months. The CR rate was 43.2% (33.7%–53.3%) across the five studies (timepoint not reported). **CONCLUSIONS:** This is the first SLR and MA to be conducted on treatment of pediatric r/r ALL and evidence was heterogeneous. MA were only possible for single-arm trials examining CCE. Pediatric r/r ALL patients treated with CCE had poor survival, with a low 1-year OS rate of less than 30% and short OS duration (median 5.2 months). Lack of data on timepoint of assessment make the CR rate results difficult to interpret. New treatments are needed to better manage pediatric r/r ALL.

PCN16

A BAYESIAN NETWORK META-ANALYSIS (NMA) OF THERAPIES FOR TREATMENT-NAÏVE CHRONIC LYMPHOCYTIC LEUKEMIA (TN-CLL) PATIENTS INELIGIBLE FOR FULL-DOSE FLUDARABINE THERAPY

Xu Y[1], Fahrbach K[2], Dorman E[3], van Sanden S[4], Diels J[4], Cote S[5], Baculea S[5]
[1]*Evidera Inc., Waltham, MA, USA,* [2]*Evidera, Waltham, MA, USA,* [3]*Evidera, Bethesda, MD, USA,* [4]*Janssen-Cilag Ltd, Beerse, Belgium,* [5]*Janssen-Cilag, High Wycombe, Bucks, UK*

OBJECTIVES: RESONATE-2 showed that ibrutinib is a well-tolerated treatment and superior to chlorambucil (chl) for TN-CLL patients who are elderly or unfit for full-dose fludarabine therapy. However, no head-to-head comparisons exist of ibrutinib with other treatments in this population. An NMA was conducted to assess the efficacy of ibrutinib vs. regimens licensed for TN-CLL. **METHODS:** A systematic literature review identified randomized controlled trials (RCTs) in TN-CLL patients ineligible for full-dose fludarabine-based treatment. The feasibility of NMA was assessed by evaluating whether variability of trial design, population, treatment regimen, and outcome definition could affect the estimated relative treatment effects. Both random and fixed-effects Bayesian NMAs were conducted to assess (i) hazard ratios (HR) of overall survival (OS) and progression-free survival (PFS) and (ii) odds ratios (OR) for treatment discontinuation (TD) and TD due to adverse events (TDAEs). Sensitivity analyses of subgroup data were conducted to evaluate the impact of variations in patient characteristics. **RESULTS:** Five RCTs met all pre-defined NMA inclusion criteria and had populations comparable to RESONATE-2 with respect to key characteristics. Based on fixed-effects analyses, ibrutinib had favorable HRs and the highest pairwise probability of being the best treatment (P) in terms of OS and PFS versus bendamustine (HR=0.21/0.71; P=99.5%/84.8%; results for OS and PFS, respectively), rituximab+chl (HR=0.25/0.35, P=98.2%/99.9%); ofatumumab+chl (HR=0.18/0.28, P=99.6%/100%), obinutuzumab+chl (HR=0.40/0.85, P=91.1%/69.2%); and bendamustine+rituximab (HR=0.25/0.67, P=96.7%/85.2%). Ibrutinib had the highest probability of being the best treatment in the network in terms of OS (89.9%), PFS (62.7%), TD (99.4%), and TDAEs (78.9%). Sensitivity analyses confirmed that ibrutinib's treatment benefit persisted in subgroups of patients ≥65 years and patients without 17p deletion in all evaluable outcomes. **CONCLUSIONS:** This Bayesian analysis showed that ibrutinib has the highest probability of being the best treatment in terms of survival and tolerability outcomes versus existing treatments for elderly or unfit TN-CLL patients.

PCN17

CLINICAL RESPONSE AND TIME TO PROSTATE-SPECIFIC ANTIGEN (PSA) PROGRESSION IN PATIENTS WITH METASTATIC CASTRATION-RESISTANT PROSTATE CANCER (MCRPC) RECEIVING SECOND-LINE CHEMOTHERAPY VERSUS ALTERNATIVE ANDROGEN RECEPTOR-TARGETED AGENTS (ARTA) AFTER A LACK OF RESPONSE TO FIRST-LINE ARTA IN US COMMUNITY ONCOLOGY PRACTICES

Oh WK[1], Cheng WY[2], Miao R[3], Vekeman F[4], Gauthier-Loiselle M[4], Duh MS[2], Drea E[3], Szatrowski T[3]
[1]*The Tisch Cancer Institute, Icahn School of Medicine at Mount Sinai, New York, NY, USA,* [2]*Analysis Group, Inc., Boston, MA, USA,* [3]*Sanofi US, Bridgewater, NJ, USA,* [4]*Groupe d'analyse, Ltée, Montréal, QC, Canada*

OBJECTIVES: The relationship between treatment sequence and outcomes in mCRPC is unclear. This retrospective cohort study assessed if second-line taxane-based chemotherapy vs alternative ARTA is associated with improved clinical

response and time to PSA progression in patients with a lack of response to first-line ARTA in the US community oncology setting. **METHODS:** Using Altos electronic medical records, 345 mCRPC patients were identified who lacked response to first-line ARTA (abiraterone: N=289; enzalutamide: N=56) and received second-line chemotherapy (docetaxel: N=128; cabazitaxel: N=19), or alternative ARTA (enzalutamide: N=170; abiraterone: N=28) from 05/2011 to 10/2014. Outcomes were evaluated from second-line therapy initiation and compared between the two cohorts using one-sided tests. Clinical response (clinical note, ECOG performance status (PS) reduction by $\geq$1, $\geq$5% weight increase, or $\geq$2g/dl hemoglobin (Hb) increase over $\geq$3 months) and time to PSA progression ($\geq$25% increase over nadir concentration) were assessed using logistic and Cox regressions adjusted for year, age, metastases, opioid use, ECOG PS, PSA, Hb, alkaline phosphatase (ALP), lactate dehydrogenase (LDH) and albumin (Alb) levels. **RESULTS:** At start of second-line therapy, patients receiving chemotherapy vs ARTA were younger (median age, 74 vs 79 years) and had a poorer prognosis: higher mean PSA (439 vs 231 ng/mL), LDH (344 vs 234 µg/L) and ALP (241 vs 166 µ/L) levels, lower mean Hb levels (11 vs 12 g/dL), higher mean Halabi risk score (159 vs 137; JCO 2014:32;671–7), and more patients had Alb levels <lower limit of normal (25% vs 15%); all p <0.01. Patients in the chemotherapy vs ARTA cohort were more likely to have a clinical response (adjusted odds ratio=1.78, p=0.020) and longer time to PSA progression (adjusted hazard ratio=0.66, p=0.010). **CONCLUSIONS:** Second-line taxane-based chemotherapy vs second-line ARTA may be more suitable for patients with a lack of response to first-line ARTA and therefore should be further investigated in a prospective randomized trial.

PCN18

IMPACTS OF CONVERSION IN RECTAL RESECTION FOR RECTAL CANCER PATIENTS - DOES CONVERSION MATTERS?

Song C, Liu E
Intuitive Surgical, Sunnyvale, CA, USA

OBJECTIVES: Conversion to open surgery is an intra-operative outcome indicating failed to complete a planned minimally-invasive surgery (MIS). Conversion in rectal cancer resection is high yet the associated clinical and economic impacts of conversion are less understood. **METHODS:** Rectal cancer patients underwent rectal resection in Premier Hospital Perspective® Database were included. Conversion and surgical approaches were defined by ICD-9 . Multivariate regression was used to estimate the impacts of conversion through comparing converted vs. (1)non-converted cases; (2)open cases. Outcomes included post-operative complications, length of stay(LOS), operation-room time, and hospitalization cost. Stratification analyses were conducted by surgeon specialties and hospital teaching status. **RESULTS:** Among 25,814 rectal cancer patients with rectal resection, 33.4% were done with MIS and 22.8% of those MIS were converted to open surgery. Patients who converted to open surgery had significantly higher risk of postoperative complications(vs. non-converted: OR 1.47, 95%CI[1.29, 1.66]; vs. Open OR: 1.16 95%CI[1.04,1.29]), longer operation time (vs.non-converted: 21.26mins, 95%CI[6.15, 36.38]; vs. Open: 60.14mins, 95%CI[3.46,116.83]), and higher hospitalization cost (vs.non-converted: $2270.47, 95%CI[$11251.99, 3288.95]; vs. Open: $1942.48 95%CI[880.41, 3004.54]); LOS of converted cases is significantly longer than non-converted cases (0.85days, 95%CI[0.51-1.19]) after adjusted for covariates. Stratifying by community or teaching hospital, the converted cases in community hospital had significantly higher risk of postoperative complication, longer operation-room time and higher hospitalization cost compared with both non-converted and open cases; while in teaching hospital, the outcome differences between converted and open cases became insignificant. Similar results were found after stratification by non-colorectal or colorectal surgeon. **CONCLUSIONS:** Conversion to open surgery for rectal cancer resection is associated with higher risk of complications, longer LOS, operation-room time and higher hospitalization cost. The impacts of conversion vary in different types of surgeons and hospitals. Further research is warranted for prevention of conversion and how to tailor the prevention method to different archetypes of care providers.

PCN19

COMPARATIVE EFFECTIVENESS OF SURGICAL VERSUS NONSURGICAL THERAPY FOR LARYNGEAL AND OROPHARYNGEAL CANCER

Campolina AG, Lopez RV, Lopes EF, Hoff PM, Chammas R
[1]*Cancer Institute of the State of Sao Paulo, Sao Paulo, Brazil*

OBJECTIVES: The treatment of patients with laryngeal and oropharyngeal cancer includes surgery or concurrent chemoradiation (CRT). Although CRT has become more common in recent years, the effectiveness of complete CRT in improving survival over surgery is not clear. The aim of this study was to evaluate the impact of CRT on mortality rates for laryngeal and oropharyngeal cancer using a validated approach. **METHODS:** This was a hospital-based cancer registry (HBCR) study carried out at a referential cancer hospital in Sao Paulo, Brazil, between 2008-2012. Records were retrieved and information about patients with head and neck squamous cell carcinoma (oropharynx and larynx), over 18 years old, were included in the analysis. A propensity score-matched logistic regression analyses were conducted to compare overall mortality rates between treatment modalities, adjusting for patient sociodemographic and clinical characteristics (age, gender, year of diagnose, tumor site and clinical staging). Conditional logistic regression for vital status as outcome was performed after matched by propensity scores. **RESULTS:** Of the 694 patients in the study cohort, 34% underwent surgery and 66% underwent CRT. In traditional analysis, patients who underwent CRT had almost three-fold to die compared with patients in surgical treatment (OR [odds ratio] 2.9; 95%CI 1.9-4.3). Using propensity score approach, the odds for CRT was 3.6 (95%CI 1.8-6.9). **CONCLUSIONS:** Patients who underwent complete CRT were found to have overall mortality rates different to those of patients undergoing surgery. Although CRT provides organ preservation, the benefits and trade-offs of CRT and total laryngectomy should be discussed fully with patients.

PCN20

EFFICACY, EFFECTIVENESS, SAFETY AND COST-EFFECTIVENESS OF THE USE OF SORAFENIB IN DIFFERENTIATED THYROID CANCER. A SYSTEMATIC REVIEW

Miranda Machado P[1], Carrasquilla-Sotomayor M[2], Alvis-Zakzuk NJ[2], Alvis-Zakzuk JS[2], Gomez de la Rosa F[2], Alvis Guzman N[2]
[1]*Alzak Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia,* [2]*ALZAK Foundation, Cartagena, Colombia*

OBJECTIVES: Treatment options for patients with differentiated thyroid cancer (DTC) locally advanced or metastatic refractory to radioactive iodine (RAI) are limited. The aim of this study was to review the evidence on efficacy, effectiveness, safety and cost-effectiveness of sorafenib administered in radioiodine-refractory DTC patients. **METHODS:** A systematic review was conducted through a systematic search of indexed scientific literature in the main databases (PubMed and Embase). The search terms "thyroid cancer", "differentiated" and "sorafenib" were used to identify the relevant literature. Full-text articles published in the last 10 years that included patients >18 years were selected. No language restriction was performed. Clinical response (partial response, disease progression in patients with stable disease) and survival (mean progression-free survival and/or overall long-term survival) were the outcomes analyzed in the efficacy and effectiveness epidemiological analysis. For safety analysis, adverse events associated to sorafenib were evaluated. Treatment costs, years of life gained (YLG), incremental cost per year of life earned, incremental cost per disability adjusted life years (DALY), and quality-adjusted life-year (QALY) were analyzed in the economic analysis. **RESULTS:** We identified 597 studies (PubMed=133, Embase=464). 427 were excluded after screening. We full-text reviewed 54 studies (PubMed= 17, Embase= 37) after reviewing titles and abstracts. A total of four studies met the inclusion criteria and were included in the analysis (systematic reviews= 2, meta-analysis=1 and clinical trials=1). In the analyzed studies, sorafenib resulted to significantly increase the progression-free survival between 10-35 months in radioiodine-refractory DTC patients. Hand–foot syndrome (4-66%), fatigue (5.3-16%), hypertension (7.3-9.7%), diarrhea (5.8-6.8%), rash (4.8-6.8%) and weight loss (5.2-5.8%) were the most frequently reported severe adverse events caused by sorafenib. No cost-effectiveness studies related to DTC were found in the review. **CONCLUSIONS:** Our results suggest that sorafenib represents a new and effective treatment option for patients with progressive RAI-refractory DTC.

PCN21

THE TREATMENT EFFECT ON EARLY STAGE HEPATOCELLULAR CARCINOMA IN JAPANESE POPULATION: LITERATURE REVIEW

Seno A[1], Yin C[1], Metz L[1], Ghosh SK[2], Murata T[3], Kobayashi M[3]
[1]*Johnson & Johnson Medical Asia Pacific, Singapore, Singapore,* [2]*Ethicon Inc, Cincinnati, OH, USA,* [3]*CRECON Medical Assessment Inc., Tokyo, Japan*

OBJECTIVES: Liver resection (LR) is standard of care for Hepatocellular carcinoma (HCC) in Japan. Since 2004 Local-treatment for smaller HCC is covered under Japan's health insurance and literatures is now available. This study aimed to understand treatment effects of radiofrequency ablation (RFA), microwave coagulation (MW), LR and transcatheter arterial chemoembolization (TACE) for HCC from Japanese literatures. **METHODS:** The Ichushi-Web search was performed on 4th October 2016. Except case studies, all study design indicated short-term outcomes (Intra OR Bleeding, OR time, length of stay, Post OR complication) and long-term outcomes (survival rate, Relapse-free survival rate, etc.) of HCC patients excluding HCC with vessel invasion, recurrent or metastasis HCC, published in Japanese were searched. **RESULTS:** 32 literatures involving 15672 patients: 19 reported on LR, 9 on RFA, 3 on TACE, 1 on MW and TACE vs LR, 2 on RFA vs LR, with relevant outcomes were included. Seven studies reported the challenges in HCC: high rate of Cirrhosis population which increases risk in bleeding, recurrent rate in remittent-liver and decreased remittent-liver function, tumor location or low liver function limits eligibility of LR, complications include SSI is high in LR, and requiring frequent re-intervention. One study states that the current treatment guideline is not up to date with the technology improvement of coagulation therapy such as RFA and MW. 5 studies suggested that local ablation treatments (MW, RFA) was equivalently safe and effective to LR (in which, 2 studies suggest Laparoscopic RFA approach for tumors >2cm.) There are no record of Local therapy used for tumors size >3cm. **CONCLUSIONS:** In the tumors size <3cm, numbers of literatures are confirming safety and efficacy of Local-treatment. With the described characteristics of HCC and challenge in LR, the minimally invasive interventions such as RFA and MW are considered safe and effective, an important alternative to LR.

PCN22

RENAL CELL CARCINOMA REAL WORLD OUTCOMES WITHIN THE BRAZILIAN HEALTH CARE SETTING: A LONGITUDINAL PATIENT ANALYSIS BASED ON MEDICAL CLAIMS DATABASE (DATASUS)

Ballalai Ferraz AF, Campos DF, Rosim RP, Duva AS
QuintilesIMS, Sao Paulo, Brazil

OBJECTIVES: To evaluate clinical outcomes of renal cell carcinoma (RCC) patients within the Brazilian health public health care setting using secondary data from a real world longitudinal patient database (DataSUS) **METHODS:** Hospital (SIH) and ambulatory (SIA) information from Brazilian health care information system (DataSUS) were used to frame up a longitudinal patient database based on record linkage algorithms. The cohort for analysis is composed of de-identified patients with any ICD C64 records from 2008 to 2016. Surgery (STx), radiotherapy (RTx) and chemotherapy (CTx) are considered as treatments and clinical outcomes

calculated using longitudinal patient records timeframes. Time to treatment is considered the period from last diagnosis method and first treatment records. Also, overall survival (OS) consist of claims record gaps between a treatment line and patient death. **RESULTS:** The overall analysis cohort results 34,167 patients considering datasets intersection obtained through record linkage. On the period between jun/16 and jul/15, the average time to treatment was 5.8 months among 7,566 patients in treatment: 3,279 in STx, 600 in RTx and 1401 in CTx, being 246 on TKIs/mTORs/MAbs and 1,179 on another CTx regimen. Considering first line patients, overall OS was 19 months; carving up into disease staging results in stage I/II/III 34 and stage IV 8 months. Finally, considering CTx patients, 5.6% were prior exposed to RTx and 31.0% to STx and 3.1% to both. **CONCLUSIONS:** Framing patient-centric medical claim databases using record linkage algorithms provides a powerful asset for analyzing calculated clinical outcomes in oncology under the real world environment. Furthermore, both demographic and socioeconomic analysis can be shaped bring up a better understanding of RCC dynamics in Brazil.

PCN23

FULVESTRANT: A TREATMENT OPTION IN METASTATIC BREAST CANCER AFTER TWO LINES OF HORMONAL THERAPY, THE EXPERIENCE IN COSTA RICA

Castro Cordero JA, Marin Piva H, Ching Fung SM
Caja Costarricense de Seguro Social, San Jose, Costa Rica

OBJECTIVES: In Costa Rica, Caja Costarricense de Seguro Social (CCSS) doesn't include fulvestrant in its basic drug list, however it's authorized for individual cases of women with metastatic breast cancer after receiving two lines of hormone therapy. This study aims to assess the results obtained in patients that received treatment with fulvestrant in CCSS between 2012 and 2015, and the cost-effectiveness (efficiency) of intervention. **METHODS:** This is an observational, retrospective, descriptive study, that includes the patients that were authorized to receive treatment with fulvestrant, according to the data base of the Central Pharmacotherapy Committee, between January 2012 and December 2015. Clinical records were accessed to retrieve information on diagnosis, hormone receptors, ECOG, treatment duration, progression-free and overall survival, and cost of treatment. **RESULTS:** 26 clinical records were available for review. All patients that received fulvestrant were woman, average age was 67.8 years IC95% (63.9; 71.6). 77% (n=20) are dead. Hormone receptors were registered in 65% of patients, 50% (n=13) had both estrogen and progesterone and 15% (n=4) had positive estrogen and negative progesterone receptors. All patients received an initial dose of 500mg IM on day 1, 15 and 29, followed by 500mg each month. Median time of treatment was 6.5 months, IC95% (5.6; 7.4). Median progression-free survival was 6.5 months, IC95% (5.0; 8). Median overall survival was 13.8 months, IC95% (10.8; 16.7). Considering cost of treatment and the median time of treatment, we obtained a cost per patient of US $7.893, that if divided by the median overall survival (1.15 years) gives us a cost of US $6.881 per year gained, that represents the 65% of GDI per capita in 2015 for Costa Rica (approx. US$10.500). **CONCLUSIONS:** Giving treatment with fulvestrant in patients with metastatic breast cancer, progressive to two lines of hormone therapy is an efficient intervention in the context of Costa Rica's Social Security.

PCN24

RACE DIFFERENCES IN PATTERN OF CARE AND SURVIVAL IN MEN DIAGNOSED WITH PRIMARY PROSTATE CANCER

Awasthi S, Williams VL, Fink AK, Yamoah K
Moffitt Cancer Center, Tampa, FL, USA

OBJECTIVES: To understand the impact of race on shared decision-making on the first course of treatment in patients with newly diagnosed prostate cancer (PCa). This study explored the difference in treatment patterns and clinical outcome in PCa patients by race, risk categorization and clinico-pathologic characteristics. **METHODS:** This study consisted of a retrospective cohort of 1,545 patients, 141 African American Men (AAM), 1,404 Non-Hispanic white(NHW), who were newly diagnosed with adenocarcinoma of the prostate after calendar year 2006 at Moffitt Cancer Center (MCC) or elsewhere, and received all or part of first course treatment at MCC. Logistic regression was used to evaluate primary treatment choice by race. Survival Analysis was used to analyze the difference in PCa specific mortality (PCSM) and overall survival (OS). **RESULTS:** AAM had a higher preoperative Prostate Specific Antigen (PSA) compared to NHW ($p < 0.01$). There was a trend in high risk category as more AAM (24.8%) were at higher risk compared to NHW (20.6%) ($p = 0.1$). In bivariate analysis, 40.4% of AAM received radiation therapy compared to 31.2% of NHW ($p = 0.02$).Furthermore, surgery was a more favourable treatment modality among younger men (72.8%) compared to radiation (27.1%) ($p < 0.01$). In a logistic regression model AAM were more likely to choose radiation therapy as the primary treatment modality compared to surgery (OR=2.22, 95% CI: 1.38 to 3.55, $p < 0.01$). There was no significant difference in PCSM and OS by race. However, among the low grade PCa (Gleason 6 and 3+4), AAM had poor PCSM compared to NHW ($p = 0.03$). **CONCLUSIONS:** AAM men were more likely to choose radiation therapy as the primary treatment modality while younger men were more likely to have surgery. Decreased survival among AAM with low grade PCa may suggest biological differences in this patient population.

PCN25

EFFICACY AND SAFETY PROFILE OF COMBINED TARGETED THERAPY INHIBITING EGFR AND VEGF PATHWAYS IN PATIENTS WITH ADVANCED NON-SMALL-CELL LUNG CANCER: A SYSTEMATIC REVIEW AND META-ANALYSIS

Pagada A[1], Mishra RK[1], Mahendru K[2], Rai MK[2]
[1]*Tata Consultancy Services, Thane, India,* [2]*Tata Consultancy Services, Mumbai, India*

OBJECTIVES: The objective was to evaluate the clinical efficacy and safety of combined targeted therapy against epidermal growth factor receptor (EGFR) and vascular endothelial growth factor (VEGF) pathways in patients with advanced Non-small-cell lung cancer (NSCLC). **METHODS:** Literature searches were conducted in Embase, PubMed and The Cochrane library databases using relevant search strategies. Studies retrieved from the databases were screened and extracted by two independent reviewers. Discrepancy was resolved by third reviewer. Randomized controlled trials which compared combined targeted therapy with control groups (placebo, chemotherapy, single EGFR or VEGF inhibition therapy or a combination of them) for the treatment of advanced NSCLC were included in the meta-analysis. Outcomes assessed included, progression free survival (PFS), objective response rate (ORR), and adverse events (AEs). Data was analyzed using Review Manager (v5.3). **RESULTS:** Of the 608 studies identified, 12 studies with 5485 patients were included for meta-analysis. Overall, combined targeted therapy was resulted in better PFS (HR: 0.86 [95%CI: 0.71-1.04]; n=11) and ORR (RR: 1.09 [95%CI: 0.81-1.47]; n=11) compared with control groups. However, no improvement was seen in OS with combined therapy (HR: 0.98 [95%CI: 0.91-1.05]; n=10). The subgroup analysis based on treatment line showed that combined therapy significantly improved PFS (HR: 0.77 [95%CI: 0.66-0.89]; n=8), and ORR (RR: 1.39 [95%CI: 1.01-1.93]; n=7) in the second-line treatment of NSCLC. Compared with control therapy, combination therapy had significant risk for grade 3/4 rash (RR: 2.63 [95%CI: 1.31-5.30]; n=10), diarrhea (RR: 4.03[95%CI: 2.17-7.50]; n=10) and hypertension (RR: 2.44[95%CI: 0.77-7.78]; n=9). **CONCLUSIONS:** The combined inhibition therapy against EGFR and VEGF pathways can significantly improve PFS and ORR in the second-line treatment of NSCLC. However, combined therapy has increased risk for grade 3/4 adverse events such as rash and diarrhea. Further large-scale trials would be helpful to validate these findings.

PCN26

EFFICACY AND SAFETY OF BEVACIZUMAB PLUS CHEMOTHERAPY VERSUS CHEMOTHERAPY ALONE IN THE TREATMENT OF NON-SMALL-CELL LUNG CANCER IN ASIAN PATIENTS: A SYSTEMATIC REVIEW AND META-ANALYSIS

Hyderboini RK, Vsn M, Chidirala SR, Inuganti B, Chakrawarthy M, Belekar V, Dang A
MarksMan Healthcare Solutions LLP, Health Economics and Outcomes Research (HEOR) and RWE (Real World Evidence), Navi Mumbai, India

OBJECTIVES: Over the past few years, there have been considerable advances in the treatments available to patients with metastatic or locally advanced non-small cell lung cancer (NSCLC). The objective of this review is to evaluate the efficacy and safety of bevacizumab plus chemotherapy versus chemotherapy alone for the treatment of NSCLC in Asian patients. **METHODS:** All randomized controlled trials (RCTs) examining the efficacy and safety of bevacizumab plus chemotherapy in adult patients with histologically confirmed NSCLC in Asian patients were included. We looked into overall survival (OS) and progression free survival (PFS) as the primary outcomes. Secondary outcomes were response rate, complete response, partial response, stable disease, progressive disease, disease control, and adverse events. Literature searches were conducted in MEDLINE and the Cochrane Library. In addition, references of included studies and clinicaltrials.gov were searched for relevant studies. No language or date restrictions were imposed. Study quality of included trials were assessed using the Cochrane Risk of Bias Tool. Two authors independently selected papers, extracted data and assessed quality. **RESULTS:** Four RCTs involving a total of 652 patients were included in this meta-analysis. The combination of bevacizumab with carboplatin & paclitaxel (BCP regimen) showed improved response rate (RR=1.87, 95% CI 1.50 to 2.30) and improved clinical benefit (RR=1.16, 95% CI 0.96 to 1.39) when compared to CP regimen. Further, BCP regimen led to less disease progression as compared to CP (RR=0.22, 95% CI 0.09 to 0.53). Bevacizumab when combined with other chemotherapy also showed improved PFS and OS. Leukopenia and neutropenia were most common haematogical adverse events observed with bevaizumab. **CONCLUSIONS:** Bevacizumab plus chemotherapy is associated with significant improvement in OS, PFS, response rate and clinical benefit when compared to chemotherapy alone among patients with NSCLC.

PCN27

EFFICACY AND SAFETY OF OXALIPLATIN/CAPECITABINE BASED CHEMOTHERAPY PLUS BEVACIZUMAB AS FIRST-LINE TREATMENT FOR ADVANCED COLORECTAL CANCER: A SYSTEMATIC REVIEW AND META-ANALYSIS

Dang A, Likhar N, Vsn M, Hyderboini RK, Inuganti A, Thode R, Sirumalla Y, Sharma A, Ghosh S
MarksMan Healthcare Solutions LLP, Health Economics and Outcomes Research (HEOR) and RWE (Real World Evidence), Navi Mumbai, India

OBJECTIVES: Colorectal cancer (CRC) is the fourth most frequently diagnosed cancer and the second leading cause of neoplasm-related death in the United States. Over the past 10 years, various combinations of chemotherapy were investigated for the treatment of metastatic CRC. The objective of this review is to evaluate the efficacy and safety of oxaliplatin or capecitabine -based chemotherapy plus bevacizumab as first-line treatment for advanced CRC. **METHODS:** All randomized controlled trials (RCTs) examining the efficacy and safety of oxaliplatin/capecitabine based chemotherapy plus bevacizumab in adult patients with advanced CRC were included. Primary outcome that we looked into were overall survival (OS) and progression free survival (PFS). Secondary outcomes were response rate (RR), complete response (CR), partial response (PR), stable disease (SD), progressive disease (PD) and adverse events. Literature searches were conducted in MEDLINE, Embase and the Cochrane Library. In addition, references of included studies and clinicaltrials.gov were searched for relevant studies. No language or date restrictions were imposed. Study quality of included trials were assessed using the Cochrane Risk of Bias Tool. Two authors independently selected papers, extracted data and assessed quality. **RESULTS:** Three RCTs with 1902 patients were included in this meta-analysis. Oxaliplatin/

capecitabine based chemotherapy plus bevacizumab (OCB) regimen showed improvement in OS (odds ratio [OR]=1.14, 95% CI 0.68 to 1.92), which was not statistically significant, when compared to other chemotherapy. Further, the OCB regimen also showed higher RR, CR, PR and SD (OR=1.30, 95% CI 0.80 to 2.11, OR=1.99, 95% CI 0.49 to 8.05, OR=1.57, 95% CI 1.05 to 2.36 and OR=1.34, 95% CI 0.96 to 1.86) respectively. Most common adverse events reported with bevacizumab included bleeding, hypertension, and venous thromboembolic events. **CONCLUSIONS:** Bevacizumab plus Oxaliplatin/capecitabine based chemotherapy showed improvement in OS and RR as compared to other chemotherapy in patients with advanced CRC.

PCN28

EFFICACY AND COST-EFFECTIVENESS OF SECOND-LINE CHEMOTHERAPY IN ELDERLY PATIENTS WITH ADVANCED GASTRIC CANCER

Zhou K
Sichuan University, Chengdu, China

OBJECTIVES: Second-line chemotherapy has been shown to benefit patients with advanced gastric cancer (AGC), extending the overall survival (OS) and progression-free survival (PFS). This study aimed to assess the efficacy and cost-effectiveness of second-line treatment for elderly patients with AGC. **METHODS:** Medical records and follow-up information of elderly patients (≥70 years) with AGC who received second-line chemotherapy were collected. A Markov model comprising three health states PFS, progressive disease (PD), and death was developed to simulate the process of AGC. Cost was calculated from the perspective of Chinese society. Sensitivity analyses were applied to explore the impact of essential variables. **RESULTS:** Forty-three elderly patients with AGC receiving second-line chemotherapy were included in our study. The median OS was 6.0 months (95% confidence interval (CI), 3.90–8.10) and PFS was 3.1 months (95% CI, 1.38–4.82), respectively. Treatment with second-line chemotherapy was estimated to increase costs by $1,980.82 compared with best supportive care (BSC), with a gain of 0.103 quality adjusted life years (QALYs). Thus, the incremental cost-effective ratio was $19,231.21/QALY for second-line chemotherapy versus BSC, which was below the threshold of 3×the per capita GDP of China, $23,970.00. The Utility scores of PFD state and PD state were the most influential factors to the model. **CONCLUSIONS:** Second-line chemotherapy was an optimal strategy for elderly AGC patients in China from the efficacy and cost-effectiveness perspective.

PCN29

COMPARATIVE EFFECTIVENESS OF PLATINUM PLUS PACLITAXEL, PLATINUM PLUS LIPOSOMAL DOXORUBICIN, TOPOTECAN, AND LIPOSOMAL DOXORUBICIN FOR SECOND-LINE CHEMOTHERAPY AMONG PLATINUM-SENSITIVE PATIENTS WITH RECURRENT ADVANCED OVARIAN CANCER IN TAIWAN

Huang H[1], Tang C[1], Cheng W[2], You S[3], Chiang C[4], Chen Y[5]
[1]*Taipei Medical University, Taipei, Taiwan,* [2]*National Taiwan University Hospital, Taipei, Taiwan,* [3]*Fu-Jen Catholic University, Taipei, Taiwan,* [4]*National Taiwan University, Taipei, Taiwan,* [5]*Taiwan Blood Services Foundation, Taipei, Taiwan*

OBJECTIVES: This study aims to evaluate the comparative effectiveness of using platinum-based versus non-platinum-based regimens in treating patients with recurrent advanced ovarian cancer in Taiwan. **METHODS:** The data source was 2000-2013 National Health Insurance Research Database. The including criteria were patients who (1) received surgeries related to early stage ovarian cancer during 2000-2011; (2) received 6-9 cycles of platinum plus paclitaxel (PT) treatment within 60 days after the surgery as the first-line chemotherapy; and (3) had >=6 months of clinical remission before receiving the 2ndtreatment after disease relapse. Eligible patients were grouped into four treatment regimens according to their second line treatment: platinum plus paclitaxel (PT) (n=605), platinum plus liposomal doxorubicin (PD) (n=204), topotecan (n=109), and liposomal doxorubicin (n=120). The Kaplan-Meier method and the Cox proportion hazard model were used to estimate the overall survival (OS) and survival after recurrence (SR) among different treatments. **RESULTS:** When compared with PT, the adjusted HRs of the 5-year SR for PD, topotecan, and liposomal doxorubicin were 0.82 (95% CIs: 0.65-1.03), 1.47(95% CIs: 1.14-1.89), 1.64(95% CIs: 1.28-2.08), and the adjusted HRs of the 5-year OS were 0.88 (95% CIs: 0.68-1.13), 1.55(95% CIs: 1.18-2.03), 1.81(95% CIs: 1.40-2.34), respectively. **CONCLUSIONS:** When compared with non-platinum based regimens, platinum-based regimens significantly improve the treatment outcomes as the second line chemotherapy in terms of SR and OS for platinum-sensitive patients with recurrent advanced ovarian cancer.

PCN30

EFFECTIVENESS OF ABIRATERONE IN THE POST-DOCETAXEL SETTING ON THE SURVIVAL OF METASTATIC CASTRATION-RESISTANT PROSTATE CANCER PATIENTS IN QUEBEC

Rocha J, Aprikian A, Vanhuyse M, Cury F, Hu J, Prevost N, Dragomir A
McGill University Health Centre, Montreal, QC, Canada

OBJECTIVES: Abiraterone was introduced in Quebec in 2012 for metastatic castration-resistant prostate cancer (mCRPC) in the post-docetaxel setting. This study described abiraterone utilization in the early post-approval period and its clinical effectiveness in Quebec, for both post-chemotherapy patients and patients unfit for chemotherapy. **METHODS:** A retrospective cohort study was conducted using Quebec public healthcare administrative databases. Our cohort consisted of mCRPC patients receiving abiraterone from 2012-2013 (N=303). The abiraterone group was stratified into abiraterone post-chemotherapy (N=99) and abiraterone without chemotherapy (N=204, unfit for chemotherapy and qualified for abiraterone with the "exception patient" measure). Study outcomes included overall survival, abiraterone duration, and hospitalization days. Cox proportional hazard regression was used to estimate the effectiveness of abiraterone in the post-docetaxel setting adjusted for several covariates. **RESULTS:** Our cohort consisted of 303 mCRPC patients treated with abiraterone (abiraterone post-chemotherapy: 99 and abiraterone "exception patient": 204). The median age was 75.0 for the abiraterone post-chemotherapy group and 80.0 for the abiraterone "exception patient" group. Median duration of abiraterone was 6 months (abiraterone post-chemotherapy: 5.3 months, abiraterone "exception patient": 5.9 months). The corresponding median survivals were 12 and 14 months, respectively (log-rank test p-value=0.815). Risk of death was similar in the abiraterone post-chemotherapy and abiraterone "exception patient" groups (hazard ratio: 0.99; 95%CI 0.64-1.52). Hospitalization days were higher for abiraterone post-chemotherapy patients compared to abiraterone "exception patients" (13.7 vs 10.9 days, p-value=0.0096). **CONCLUSIONS:** Effectiveness of abiraterone in older patients who were chemotherapy ineligible was similar to that of patients with prior docetaxel exposure. Overall, real-world survival benefits of abiraterone were similar to the results of the COU-AA-301 trial.

PCN31

REAL-WORLD OUTCOMES AMONG PATIENTS WHO INITIATED PAZOPANIB OR SUNITINIB AS FIRST TARGETED THERAPY FOR ADVANCED RENAL CELL CARCINOMA (ARCC): A RETROSPECTIVE ANALYSIS OF MEDICARE DATA

Vogelzang NJ[1], Ghate SR[2], Li N[3], Swallow E[3], Peeples M[3], Zichlin ML[3], Meiselbach MK[3], Perez JR[2], Agarwal N[4]
[1]*Comprehensive Cancer Centers of Nevada, Las Vegas, NV, USA,* [2]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA,* [3]*Analysis Group, Inc., Boston, MA, USA,* [4]*University of Utah, Salt Lake City, UT, USA*

OBJECTIVES: This study assessed real-world overall survival (OS), time on treatment (TOT), and dose intensity among aRCC patients who initiated pazopanib or sunitinib, two commonly-used first targeted therapies (TT). **METHODS:** Patients aged ≥65 with aRCC who initiated pazopanib or sunitinib as first TT (index date) were identified from the 100% Medicare data + Part D linkage (1/1/2006-12/31/2014). Patients were stratified by first TT and matched 1:1 using propensity scores based on age, sex, race, year of RCC diagnosis, metastatic sites, and baseline comorbidities and costs (assessed 1 year before index date). OS was defined as the time from index date to death from any cause; TOT as the time from index date to the earliest of treatment discontinuation (a prescription gap of >90 days) or death from any cause. For both outcomes, patients were censored at the earliest of end of eligibility or data cut-off. Dose intensity was defined as the ratio of days that the patient had received drug supply to TOT. OS and TOT were compared between matched cohorts using Kaplan-Meier analyses and univariable Cox models; dose intensity was compared using Wilcoxon signed-rank tests. **RESULTS:** Before matching, the pazopanib cohort (N=526) was associated with higher outpatient visits and costs and lower pharmacy costs than the sunitinib cohort (N=1,185; all $p<0.05$). After matching, all baseline characteristics were balanced (N=522 for both). First TT with pazopanib was associated with significantly longer OS (median: 18.2 vs. 14.6 months, $p<0.05$; hazard ratio [HR]=0.83, 95% confidence interval [CI]: 0.72-0.97), similar TOT (median: 4.8 vs. 4.1 months, p=0.16; HR=0.90, 95% CI: 0.78-1.04), and lower dose intensity (mean: 0.91 vs. 0.94, $p<0.01$) compared with the sunitinib cohort. **CONCLUSIONS:** Among Medicare patients with aRCC, first TT with pazopanib compared to sunitinib was associated with significantly longer OS, similar TOT, and lower dose intensity.

PCN32

A META-ANALYSIS AND META-REGRESSION OF THE EFFICACY OF FRONT-LINE TREATMENT COMBINATIONS WITH PONATINIB VERSUS 1ST- AND 2ND-GENERATION TYROSINE KINASE INHIBITORS FOR PH+ ACUTE LYMPHOBLASTIC LEUKEMIA

Jabbour E[1], DerSarkissian M[2], Duh MS[2], McCormick N[2], Cheng WY[2], McGarry L[3], Souroutzidis A[2], Huang H[3], O'Brien S[4], Ravandi-Kashani F[1], Kantarjian HM[1]
[1]*The University of Texas MD Anderson Cancer Center, Houston, TX, USA,* [2]*Analysis Group, Inc., Boston, MA, USA,* [3]*ARIAD Pharmaceuticals, Inc., Cambridge, MA, USA,* [4]*University of California Irvine, Orange, CA*

OBJECTIVES: To compare the effectiveness, as measured by complete molecular response (CMR) and 2- and 3-year overall survival (OS), of ponatinib versus first- and second-generation TKIs (i.e., imatinib, dasatinib, and nilotinib) for treatment of de novo Philadelphia-positive acute lymphoblastic leukemia (Ph+ ALL). **METHODS:** Twenty-six studies of front-line Ph+ ALL treatment with a TKI in combination with chemotherapy or corticosteroids were identified from published targeted literature reviews and recently published trials. Study arms in which patients received chemotherapy or corticosteroids only, a single TKI agent, or autologous stem cell transplant exclusively, were excluded. The proportions of patients achieving CMR (no detectable BCR-ABL1 transcripts) and 2- and 3-year OS were extracted from all study arms and summarized by TKI group (ponatinib versus earlier-generation TKIs) using pooled estimates with 95% confidence intervals (CIs) from a random-effects meta-analysis. Multivariate logistic meta-regressions adjusting for age and gender estimated the association between TKI-treatment group and percent CMR, 2-year OS, and 3-year OS. Odds ratios (OR) and 95% CIs were reported. **RESULTS:** Thirty-two TKI treatment arms were analyzed. The pooled proportion of patients achieving CMR with ponatinib was higher than that with earlier-generation TKIs (79% versus 34%). The pooled estimates of 2- and 3-year OS were also higher with ponatinib than with earlier-generation TKIs (2-year: 83% versus 58%; 3-year: 79% versus 50%). The OR for ponatinib versus earlier-generation TKIs for CMR (N=25) was 6.09 (95% CI: 1.16-31.90, p=0.034); for 2-year OS (N=27) 3.70 (95% CI: 0.93-14.73, p=0.062); for 3-year OS (N=19) 4.49 (95% CI: 1.00-20.13, p=0.050). **CONCLUSIONS:** Compared to earlier-generation TKIs, ponatinib was associated with a >6-fold, >3-fold, and >4-fold increase in the odds of achieving CMR, 2-year OS, and 3-year OS, respectively. Ponatinib in combination with chemotherapy may represent an effective front-line treatment option in newly diagnosed Ph+ ALL compared with combination therapy with earlier-generation TKIs.

PCN33

AN OUTCOMES MODEL ASSESSING THE IMPACT OF EARLY DISCONTINUATION OF EVEROLIMUS (EVE) DUE TO STOMATITIS ON HEALTH AND PATIENT-REPORTED OUTCOMES IN POSTMENOPAUSAL WOMEN WITH HR+/HER2- ADVANCED BREAST CANCER (ABC) RECEIVING EVEROLIMUS-EXEMESTANE COMBINATION THERAPY (EVE-EXE)

Toram N[1], Mahjoubi R[2], Tang D[2]
[1]Novartis Healthcare Pvt. Ltd., Hyderabad, India, [2]Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA

OBJECTIVES: To explore the impact of early discontinuation of everolimus (EVE) due to stomatitis on health and patient-reported outcomes among everolimus-exemestane combination therapy (EVE-EXE) users with HR+/HER2- aBC. **METHODS:** The current model was adapted from a published cost-effectiveness model using a US third-party payer perspective comparing EVE-EXE with other endocrine therapies and focused on only the EVE-EXE arm. Specifically, efficacy data were obtained from a published clinical trial; utility and disutility data were obtained from published literature. The base case scenario were 61-year-old patients. The model time horizon was 10 years. A distinct patient subgroup – patients who prematurely discontinued everolimus due to stomatitis - was created from the overall intent-to-treat (ITT) EVE-EXE arm and the outcomes were compared with the ITT sample. As 90% of stomatitis events upon everolimus use occurred prior to 8 weeks, the average time to treatment discontinuation in the aforementioned subgroup was assumed to be 8 weeks. Exposure-outcome ratios were calculated to quantify the relationship between time on everolimus and outcomes. The outcomes of interest included progression free survival (PFS), overall survival (OS), and quality-adjusted life months (QALMs) gained. Deterministic sensitivity analyses were applied to understand the relative impact of different parameters to study findings. **RESULTS:** In the base-case scenario, relative to the ITT sample, patients who prematurely discontinued everolimus due to stomatitis on average was projected to experience 2.0 months (17.8 vs. 19.8 months), 1.3 months (37.4 vs. 38.8 months), and 1.2 (22.7 vs. 23.9) shorter PFS, OS, and QALM respectively. Deterministic sensitivity analyses showed that time on everolimus and exposure-outcomes ratio are the two major input parameters influencing study findings. **CONCLUSIONS:** Patients initiating EVE+EXE and discontinuing everolimus early due to stomatitis was projected to experience shorter PFS, OS, and QALMs compared with the ITT sample. There is a need to prevent stomatitis to ensure better patient outcomes.

PCN34

USE PATTERNS OF FIRST-LINE INHIBITORS OF TYROSINE KINASE AND TIME TO CHANGE TO SECOND-LINE THERAPY IN PATIENTS WITH CHRONIC MYELOID LEUKEMIA

Machado-Alba J[1], Machado-Duque M[2]
[1]Universidad Tecnológica de Pereira-Audifarma S.A., Pereira, Colombia, [2]Universidad Tecnológica de Pereira, Pereira, Colombia

OBJECTIVES: Chronic myeloid leukemia (CML) has a low incidence but a high burden of disease, and is treated with high-cost tyrosine kinase inhibitors (TKI). To determine the time from the start of a first-line TKI until it passes to second-line, and to establish the reasons for the change of therapy time. **METHODS:** Retrospective cohort study, in patients with Philadelphia-positive CML between January 1 2007 and July 31 2015 treated with some TKI. With information obtained from medical records, the time to change initial drugs to second-line therapy, and the reasons for change, were identified. Kaplan–Meier survival analysis was carried out. **RESULTS:** A total of 247 patients treated were found in 22 cities in Colombia with a mean age of 53.2 ± 15.2 years. The drug most used as initial therapy was imatinib; 53.8% of cases had to change to another TKI. Fifty percent of patients changed therapy in 42 months, the men in 24 months and women in 67 months (95%CI: 14.314–33.686; $p = 0.001$). Being male (OR: 2.23; 95%CI: 1.291–3.854; $p = 0.004$) and receiving hydroxyurea (OR: 3.65; 95%CI: 1.601–8.326; $p = 0.002$) were associated with a higher probability of switching to nilotinib or dasatinib, while receiving a new-generation TKI (OR: 0.15; 95%CI: 0.071–0.341; $p < 0.001$) reduced this risk. **CONCLUSIONS:** This cohort of CML patients were treated with drugs of high therapeutic value at recommended doses, but a high proportion needed to change to a second line with nilotinib and dasatinib management.

PCN35

CALCULATING EPIDEMIOLOGY ESTIMATES IN ACUTE MYELOID LEUKEMIA (AML) FOR AUSTRALIA, CANADA AND SWITZERLAND USING A TOP DOWN VS. BOTTOM UP APPROACH

Bosshard R[1], Chadda S[2], O'Reilly K[1], Upton CM[2], Bowe C[2]
[1]Otsuka Pharmaceutical Europe Ltd, Wexham, UK, [2]SIRIUS Market Access, London, UK

OBJECTIVES: To compare how the incidence rates of AML in Australia, Canada and Switzerland differ depending upon the calculation approach taken (detailed bottom up or top down). **METHODS:** A comprehensive literature review was undertaken to identify incidence data for AML; this included available databases, registries, clinical trials and research papers. Detailed bottom up studies were reviewed for sample size, date of data collection, breadth of geographic coverage and representation. The incidence of AML has been reported as between 32% - 33% of all leukemia cases, which was applied to a top down calculation using national reported leukemia rates. **RESULTS:** For Switzerland, in a bottom up calculation based on data from 128 medical records of adult patients (>16 years) diagnosed with de novo AML during the period 1984-2003, the incidence was 2.6/100,000. Swiss incidence of leukemia was 8/100,000 in 2012, and when the top down calculation rate of 32% (UK proportion) was applied, the incidence was 2.6/100,000. For Australia, the incidence of AML has been reported as 3.4/100,000 in a study from Western Australia for 898 patients diagnosed between 1991-2005. This aligned with the Australian cancer registry reported incidence of 3.8/100,000 (2012). In Canada, 3.7/100,000 people were diagnosed with AML in 2013, falling well below the draft guidelines for orphan designation of 5/10,000 people. In 2012, Canadian total leukemia incidence was 9.5/100,000. Applying the top down calculation based on 33% (US proportion) translated to an AML rate of 3.1/100,000. **CONCLUSIONS:** Variation in the incidence rates using a top down or bottom up approach for the three countries ranged between no difference and 0.6/100,000. Across all countries, regardless of approach the AML incidence numbers were well below the incidence rates required for orphan designation. Using both approaches serves to validate the numbers reported.

PCN36

BURDEN OF MERKEL CELL CARCINOMA: A TARGETED LITERATURE REVIEW

Narayanan S[1], Gala S[2]
[1]Market Access Solutions LLC, Raritan, NJ, USA, [2]Market Access Solutions, LLC, Raritan, NJ, USA

OBJECTIVES: Merkel Cell Carcinoma (MCC) is a rare, lethal cutaneous skin cancer with no approved drug therapies and limited treatment options. Our objective was to conduct a comprehensive review of MCC disease burden. **METHODS:** We conducted a targeted literature review of studies published from 2010 to 2016 to assess epidemiology, patient burden, and unmet needs associated with MCC. An article was retrieved for full review if the abstract met each of the following criteria: reported incidence, natural morbidity or mortality of MCC; derived from a peer-reviewed journal; and reported in English-language published since January 2010. **RESULTS:** The incidence of MCC (per 100,000 persons per year) is reported highest in Australia (0.82-1.60), followed by the US (0.6), Netherlands (0.35), Sweden (0.18-0.33), Finland (0.24-0.25), Spain (0.28), Denmark (0.22), South East Scotland (0.133), France (0.13). Inadequate data available from countries like Canada, UK, and Germany. Typically, stage I-II MCC is observed in approximately 60% - 75% patients, stage III in 10% - 30% patients, and stage IV (metastatic) in 2% - 16% patients. The 5-year and 10-year survival is 0% - 68%, and 21% - 65% respectively, based on factors such as disease stage and gender. Although less than 20% patients progress to advanced metastatic stage IV MCC, they experience the highest unmet need due to lack of effective therapeutic options. **CONCLUSIONS:** The current treatment options usually include a combination of surgery, radiotherapy, and chemotherapy, but there is a significant need of newer, better treatments which can increase the survival. No evidence is found in the literature that reports the humanistic and economic burden related to MCC. Future research is warranted to adequately quantify the burden-of-illness of MCC and assess comparative effectiveness of evolving treatment options to better inform patients, prescribers and payer organizations concerning optimal modalities of disease management.

PCN37

THE ROLE OF EPIDEMIOLOGY IN HEALTH ECONOMIC AND OUTCOMES RESEARCH: A THYROID CANCER, RETROSPECTIVE, POPULATION-BASED COHORT STUDY

Alyahya S[1], Seoane-Vazquez E[2], Eguale T[1]
[1]MCPHS University, Boston, MA, USA, [2]Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA

OBJECTIVES: Changes in-points in trends (joinpoint) of disease incidence and mortality inform decision makers to design health programs, determine the area where more research is needed and can also be used in health economics and outcomes research. This study goal was to detect change-points in trends (joinpoint) of thyroid cancer incidence and mortality in the period 1969-2013. **METHODS:** Surveillance, Epidemiology, and End Results (SEER18) and the National Center for Health Statistics (NCHS) databases were used to extract the data. A joinpoint regression and least square method was used to identify the best fit model. Sequences of permutation tests were used to determine the goodness of fit. **RESULTS:** The incidence of diagnosed malignant thyroid cancer reached 132,988 cases in the period 2000-2013. One joinpoint and two segments were identified based on the joinpoint (2000-2009 and 2009-2013). The annual percent change (APC) from 2000-2009 was 6.63, 6.09 and 6.80 for both genders, male and female, respectively. The APC from 2009-2013 significantly decreased to 2.45, 2.80 and 2.37, respectively. A total of 53,773 died from the thyroid cancer between 1969-2013. One jointpoint and two segments were determined (1969-1988 and 1988-2013) based on the number of change-points for both sex combined and for female with APCs= -2.12, 0.73, respectively, and APCs= -2.65, 0.38, also respectively. Two segments were specified for male (1969-1986 and 1986-2013) with APCs= -1.48, 1.29 respectively. **CONCLUSIONS:** The thyroid cancer incidence rate increased from 2000 to 2009 and then significantly decreased until 2013. The mortality rates decreased from 1969 until 1988 and then significantly increased until 2013. The results of the changes in joinpoints can be applied as inputs in economic models and in more accurate estimations of budget impact analyses.

PCN38

INCIDENCE OF LYMPHOMA IN TAIWAN, 1998-2012

Wen Y[1], Ko B[2], Huang H[2], Chen H[1], Hsiao F[3]
[1]Health Data Research Center, National Taiwan University, Taipei, Taiwan, [2]National Taiwan University Hospital, Taipei, Taiwan, [3]Graduate Institute of Clinical Pharmacy, College of Medicine, National Taiwan University, Taipei, Taiwan

OBJECTIVES: To estimate the annual incidence of lymphoma in Taiwan population. **METHODS:** We conducted a cross-sectional analysis using 1998-2012 Taiwan National Cancer Registry. Patients with the following 4 different types of lymphoma were identified: Hodgkin's lymphoma, aggressive or indolent B-cell lymphoid neoplasm, and T/NK-cell lymphoid neoplasm. Annual incidence was reported per 100,000 individuals as crude rate and age-standardized rate. Sex-specific incidence and age of diagnosis were also reported. **RESULTS:** The crude incidence rate of aggressive B-cell lymphoma was highest among all 4 lymphoma types, which was 2.02 per 100,000 persons in 1998 and surged to 5.68 per 100,000 persons in 2012.

Indolent B-cell lymphoma were less frequently occurred (crude incidence rate 0.66 per 100,000 persons in 1998 and 2.13 per 100,000 persons in 2012), followed by T/NK-cell lymphoma (crude incidence rate 0.34 per 100,000 persons in 1998 and 1.63 per 100,000 persons in 2012). As other countries, the incidence rate of Hodgkin's lymphoma was much lower than non-Hodgkin's lymphoma (crude incidence rate 0.38 per 100,000 persons in 1998 and 0.75 per 100,000 persons in 2012). The incidence trends during 1998-2012 were similar among men and women. However, the incidences of most lymphoma were higher in males then in females, especially for T/NK-cell lymphoma. Besides, Hodgkin's lymphoma tended to occur at a younger age of life than non-Hodgkin's lymphoma. **CONCLUSIONS:** The incidences of all 4 types of lymphoma yielded increasing trends during 1998-2012 among Taiwanese population and aggressive B-cell lymphoid neoplasms increased fastest.

PCN39

HERPES ZOSTER INCIDENCE, DISEASE BURDEN AND COST AMONG PATIENTS WITH SOLID TUMOR MALIGNANCY RECEIVING CHEMOTHERAPY 2010-2014 IN A LARGE, INSURED US POPULATION

Mao J[1], Mcpheeters JT[1], Finelli L[2]
[1]Optum, Eden Prairie, MN, USA, [2]Merck & Co, Kenilworth, NJ, USA

OBJECTIVES: Chemotherapy places patients with solid tumor malignancy (STMc) at risk for herpes zoster (HZ). HZ incidence among STMc patients is 23-48/1,000 person-years (PY) vs. 3-5/1,000 PY in the general population. We aimed to assess HZ incidence and HZ-associated healthcare resource utilization (HRU) and cost among STMc patients. **METHODS:** Claims were analyzed for adults aged ≥18 years with STMc between 01/2010—06/2014 in Optum Research and Impact National Benchmark Databases. Subjects with prior HZ or <18-month continuous enrollment, or hematological cancers or Zostavax were excluded. Incidence was calculated as HZ cases observed over accrued time-at-risk in PY. To assess all-cause HRU and costs, index date was HZ onset date for HZ cases, and an assigned date for controls. 3,004 cases and 15,020 controls were propensity-score matched at 1:5 ratio. HRU and per-patient-per-month (PPPM) costs were assessed from 21 days pre-index through up to 364 days post-index. Total 1-year cost was analyzed with Lin's regression to account for censor. **RESULTS:** There were 3,100 HZ cases among 155,480 STMc patients, yielding incidence of 14.90/1,000 PY (95% CI: 14.38-15.44). Females had significantly higher incidence than males (15.55 vs. vs 13.76 /1,000 PY). Incidence was higher for chemotherapy with moderate or high immunosuppression vs. low or no immunosuppression 17.06 (16.24-17.92) vs. 11.81 (11.10-12.55) /1,000 PY. Incidence rate varied across cancer type. HZ cases had greater HRU in all treatment settings. Mean unadjusted PPPM cost was significantly greater for cases ($5,258 (SD $9,184)) vs. controls ($4,203 (SD $8,005)) (P<0.001). The adjusted 1-year excess cost for cases was $6,432 ($3,481 -$9,383)(P<0.001). **CONCLUSIONS:** HZ incidence was significantly greater with increasing immunosuppression. HZ cases experienced significantly greater HRU and costs. A safe and effective HZ vaccine for STM patients receiving chemotherapy could be a useful prevention tool to improve outcomes and reduce costs.

PCN40

A REVIEW OF EPIDEMIOLOGY, PROGNOSIS, AND TREATMENT OPTIONS FOR RECURRENT OR METASTATIC HEAD AND NECK SQUAMOUS CELL CARCINOMAS (HNSCC)

Blieden M[1], Muszbek N[2], Chaudhary MA[3], Zhang Y[3]
[1]Evidera, Waltham, MA, USA, [2]Evidera, London, UK, [3]AstraZeneca, Gaithersburg, MD, USA

OBJECTIVES: To review the epidemiology, prognostic factors, and treatment guidelines for recurrent or metastatic HNSCC, to better understand and describe patient groups and the corresponding treatment options. **METHODS:** Targeted literature reviews of published epidemiology studies in the past five years and current clinical guidelines from Europe, North America, and Australia indexed in the National Guideline Clearinghouse or International Guideline Library were conducted. **RESULTS:** Of 265 hits, 25 epidemiology studies and 12 guidelines were selected. Global incidence and one-year prevalence rates in 2012 were 1.9 and 1.7 per 100,000 (oropharynx/hypopharynx), 2.1 and 2.2 (larynx), and 4.0 and 3.9 (lip/oral cavity), respectively. Changes in annual incidence rates (-3.7% to +5%) vary by tumor site, gender, and country. Risk factors for advanced HNSCC include age, gender, and alcohol or tobacco use, whereas risk factors for recurrence or death include tumor characteristics and treatment outcome. Five-year survival rates for metastatic HNSCC ranged widely between 3–36% across tumor sites and studies. In Europe and the United States, depending on tumor site, 2–16% of HNSCC are diagnosed at distant stages. Reportedly, 35% of regional cases develop distant metastases, including 25% of complete responders. Epidemiological data on recurrent vs. metastatic disease, or relapse vs. refractoriness to prior therapies is scarce, fragmented by tumor site/subsite, and limited to single study sites/countries. Newer guidelines recommend combined platinum/5-fluorouracil FU/cetuximab for recurrent/metastatic HNSCC. However, no recommendations are based on prior systemic therapy, nor differentiate recurrent and refractory disease. **CONCLUSIONS:** Epidemiological data on HNSCC sub-populations not amenable to curative treatment is scarce and fragmented by country and disease site, resulting in low generalizability. A more comprehensive systematic review or chart reviews may provide further informative epidemiological data. However, we can conclude that in non-curative disease, there remains high unmet need with limited systemic treatment options available and poor overall survival.

PCN41

ASSESSING VARIATION IN THE INCIDENCE OF ACUTE MYELOID LEUKEMIA (AML) FOR FRANCE, GERMANY, ITALY, SPAIN, UK AND CANADA

Bosshard R[1], Chadda S[2], O'Reilly K[1], Upton CM[2], Bowe C[2]
[1]Otsuka Pharmaceutical Europe Ltd, Wexham, UK, [2]SIRIUS Market Access, London, UK

OBJECTIVES: To compare how the incidence rates of AML vary across France, Germany, Italy, Spain, UK and Canada. **METHODS:** A comprehensive literature review was undertaken to identify incidence data for AML using databases, registries, clinical trials and publications. Detailed bottom up studies were reviewed for sample size, data collection dates, geographic coverage and representation. **RESULTS:** The highest rates of AML for target countries were for the UK where incidence was 4.1/100,000, in 2016. This was based on clinical and lab data from Yorkshire and Humber regions, and national health data. A study of patients from south east England between 1999-2000 reported 3.0/100,000. The lowest estimated rates were reported in France with 2.3 and 2.6/100,000 cases for males and females respectively in 2012. However, this data was sourced from registries which only cover ~20% of France. Italian rates were 3.7 and 2.6/100,000 for males and females respectively based on registry data covering 43% of Italy. In Germany, according to 11 population-based cancer registries, there were 13,810 new AML cases (≥15 years) during 2007–2011. AML rates were not retrieved, although crude rates could be calculated based on total population estimates. Coverage in Spain was limited to regional AML studies (north-east Catalonia) where incidence was 3.1/100,000. In Canada, 3.7/100,000 people were diagnosed with AML in 2013 based on registry data with almost complete national coverage. The annual crude incidence rate for Europe was reported as 3.7/100,000 based on the RARECARE project using patients diagnosed between 1995-2002. **CONCLUSIONS:** Rates were consistent across the target countries, ranging from 2.3-4.1/100,000. Robust data regarding the incidence of treatment naïve and relapsed or refractory patients was not identified, but would be expected to have a lower incidence than the overall AML population.

PCN42

PREVALENCE OF ANAPLASTIC LYMPHOMA KINASE POSITIVE NON-SMALL-CELL LUNG CANCER IN SELECTED POPULATION OF PATIENTS IN BULGARIA

Djambazov S[1], Slavchev G[2], Vekov T[1], Tosheva-Konteva L[1]
[1]Medical University Pleven, Pleven, Bulgaria, [2]Bulgarian Academy of Science, Sofia, Bulgaria

OBJECTIVES: Lung cancer is the most common cause of death from cancer worldwide with 1.8 million people diagnosed/year. The disease remains as the most common cancer in men worldwide. The purpose of the article is to evaluate the prevalence of ALK mutations in NSCLC patients in Bulgaria. **METHODS:** A systematic review of the published data on prevalence of ALK positive NSCLC conducted in other countries and compared to local data, were being carried out. Between January 2016 and June 2016, 132 patients with NSCLC, previously screened for EGFR mutation were selected for ALK mutation analysis. **RESULTS:** Data is available for 124 patients, for 8 patients tumor mass was insufficient for analysis. ALK mutation was confirmed in 5 patients, 119 patients were diagnosed with ALK wild type. From all ALK positive patients, 3 were with adenocarcinoma, 1 with squamous NSCLC and 1 with other type NSCLC. All ALK mutations were observed in non smoker and ex-smoker patients. ALK mutations were presented only in patients with stage III and IV NSCLC. Histologic examination showed that almost half of the patients were with stage IV NSCLC; 12.9% were with stage III NSCLS; one patient with stage IIa; one with stage IIb NSCLS and two patients with confirmed relapse. Most of the patients were with adenocarcinoma (82 patients), 11 patients were with squamous NSCLC and 2 patients were with other type of NSCLC. **CONCLUSIONS:** In our study we found that the prevalence of ALK mutation in EGFR negative NSCLC patients is 3.8%.

PCN43

RATES AND PREDICTORS OF POLYPHARMACY IN CANCER SURVIVORS IN THE UNITED STATES

Babcock Z, Vyas A, Kogut S
University of Rhode Island, Kingston, RI, USA

OBJECTIVES: Polypharmacy among individuals with cancer is an alarming issue. We aimed to determine the rates of polypharmacy and predictors among cancer survivors in the United States. **METHODS:** This cross-sectional analysis included responses to survey questions collected as part of the Medical Expenditures Panel Survey (MEPS) for the survey years 2008, 2010, 2012, and 2014. The total number of prescriptions per person/household response were determined by picking the panel with the most reported medications. Polypharmacy was defined as having five or more classes of medications. We chose to include only those cancer survivors who had a single tumor. Descriptive statistics were used to determine significant differences in characteristics among those with and without polypharmacy, and logistic regression was employed to identify predictors of polypharmacy in a multivariate framework. **RESULTS:** An estimated 46.5 million cancer survivors cumulative for the four years comprised our study sample. Of these, 49.3% met our definition of polypharmacy while 50.7% had four classes of medications or less. Older age (65+ vs. 18-39, adjusted odds ratio (AOR)= 1.62, confidence interval (CI): 1.15-2.29), female gender (AOR= 0.75, CI: 0.59-0.95), number of chronic conditions (1 vs none, AOR= 2.26, CI: 1.83-2.80 and 2+ vs none, AOR= 8.28 CI: 6.63-10.35), and increased number of total visits (10 to 19 visits compared to 0 to 4, AOR= 1.82, CI: 1.44-2.30 and 20+ visits compared to 0 to 4, AOR= 3.59 CI: 2.72-4.74) were significant predictors of polypharmacy. **CONCLUSIONS:** Polypharmacy is highly prevalent among cancer survivors in the United States, suggesting greater surveillance of adverse drug interactions among this vulnerable group.

PCN44

TARGETED LITERATURE REVIEW OF ADVANCED/METASTATIC TRIPLE-NEGATIVE BREAST CANCER BURDEN OF ILLNESS

Naidoo S[1], Friedman ML[2], Paly VF[2], Hansen R[3], Sidhu MK[2], Smith I[4]
[1]Astellas Pharma Europe, Ltd, Chertsey, UK, [2]ICON Health Economics, New York, NY, USA, [3]Balanced Outcome Research Associates, LLC, Seattle, WA, USA, [4]Astellas Pharma Ltd, Chertsey, UK

OBJECTIVES: To summarize literature on the burden of illness in patients with advanced or metastatic triple-negative breast cancer (TNBC) and identify information that may inform a cost-effectiveness analysis. **METHODS:** Searches of MEDLINE, Embase, EconLit, and the NHS Economic Evaluation Database were conducted to identify relevant literature describing the epidemiology (January 2006–July 2016), economic burden, quality-of-life (QoL) burden, and treatment guidelines (January 2011–July 2016) associated with TNBC. Search strategies included disease terms for breast cancer, advanced/metastatic disease, and hormone receptor/human epidermal growth factor receptor 2 status. Abstract review, full-text review, and data extraction were conducted by a single reviewer and validated by a second, independent reviewer. **RESULTS:** A total of 3140 publications were identified; following screening, 36 studies were selected for review (21 epidemiology, two economic, 13 guidelines). Across 11 studies, reported prevalence of the triple-negative (TN) subtype among advanced/metastatic breast cancer ranged from 1.3% to 25.6% (nine out of 14 patient groups had prevalence >15%). Incidence rates were reported to have a similar range (nine studies), and rates of the TN subtype were shown to be higher for younger patients and African-American patients. Among 10 studies reporting overall survival, all but one reported a median of <9 months. Economic evidence was limited (two studies), but indicated increased resource use and higher treatment costs compared with non-TNBC patients. No QoL studies were found for a TNBC population; supplemental searches identified two additional studies in a general metastatic breast cancer population to provide context. Disease progression has the largest impact on QoL in this population; chemotherapy-related adverse events also showed a significant QoL burden. Treatment guidelines generally recommended anthracycline- and taxane-based chemotherapy as initial treatment for TNBC. **CONCLUSIONS:** This review highlights the paucity of literature available to inform cost-effectiveness evaluations of advanced/metastatic TNBC, indicating a need for further research.

PCN45

INCIDENCE, PREVALENCE, AND SURVIVAL OF MALIGNANT PLEURAL MESOTHELIOMA (MPM) IN THE UNITED STATES

Kim A, Wong W
Genentech, Inc., South San Francisco, CA, USA

OBJECTIVES: Malignant Pleural Mesothelioma (MPM) is a rare, aggressive cancer with poor prognosis, currently accounting for 0.10% deaths annually in the United States (U.S.). The current treatment options are limited, including surgery and chemotherapy with pemetrexed, cisplatin, and bevacizumab. There is limited recent information on disease epidemiology and baseline estimates of occurrence and characteristics in a large U.S. cohort. Therefore, the objective of this analysis was to describe the long-term trends in incidence rates and survival in MPM. **METHODS:** The prevalence, incidence, and overall survival of MPM patients by sex, year of diagnosis, and geographical location for all races were evaluated using data from 18 cancer registries with SEER from 1973-2013 for MPM patients by ICD-O code 9050/3 and C38.4. Cancer-directed surgery and outcomes were also examined over time. **RESULTS:** The prevalence of MPM increased with age, but decreased over time. Age-adjusted incidence rates per 100,000 were higher in patients 65 years and older (3.0) vs 24-64 years old (0.1), and in males (0.9) vs females (0.2). Incidence rates were higher in geographical locations with higher asbestos exposure. The incidence of patients receiving surgery per 100,000 decreased over time, from 1.2 to 0.43. Observed survival was lower in patients greater than 65 years old, with a median survival of 1 year, and remained relatively unchanged after the FDA approval of pemetrexed in 2004. **CONCLUSIONS:** The trend in prevalence rates demonstrates a delay in disease onset from asbestos exposure to disease diagnosis. This decrease in prevalence over time is expected with stringent laws imposed around asbestos usage and removal. Very few patients received surgery, which suggests a higher usage of chemotherapy. There was minimal change in survival before and after the FDA approval of pemetrexed for MPM, demonstrating an unmet need for additional treatment options.

PCN46

ASSOCIATION BETWEEN ASTHMA AND RISK OF PROSTATE CANCER – A SYSTEMATIC REVIEW AND META-ANALYSIS

Huo N[1], Qian J[1], Hansen RA[2], Garza KB[1]
[1]*Auburn University Harrison School of Pharmacy, Auburn, AL, USA,* [2]*Harrison School of Pharmacy, Department of Health Outcomes Research and Policy, Auburn University, Auburn, AL, USA*

OBJECTIVES: Evidence indicates that systemic inflammatory response, not only prostate inflammation, contributes to prostate cancer etiology. Therefore, it is possible that males with long-term inflammatory responses such as asthma are at increased risk of prostate cancer. However, there are existing knowledge gaps in the association between comorbid asthma and prostate cancer. **METHODS:** A systematic review with meta-analysis was conducted to examine the association between asthma and risk of prostate cancer. An initial search of the bibliographic databases PsychINFO, CINAHL and Pubmed from January 1966 to January 2016 was completed by using a combined text word ("Asthma"[Mesh] OR Asthma*[tiab] AND "Prostatic Neoplasms"[Mesh] OR (Prostat*[tiab] AND (Cancer* [tiab]OR Neoplasm*[tiab])) and MESH/subject heading search strategy. The electronic search was restricted to studies written in English and carried out in human subjects. The meta-analysis was further limited to studies with reported quantitative effect estimates, expressed as an odds ratio, relative risk ratio (RR), standardized mortality ratio, or standardized incidence ratio. **RESULTS:** A total of 25 studies were included in the systematic review. Of these, 12 studies (including 12,866 individual participants) were considered eligible for meta-analysis, involving 4 case-control studies and 8 cohort studies. The summary of combined RR from the random effects model for developing prostate cancer was 1.02 (95% CI: 0.89-1.13) for asthma with high heterogeneity (94.4%). **CONCLUSIONS:** The present meta-analysis of observational studies indicates that there is no association between asthma and risk of prostate cancer. Further subgroup analysis in different patient characteristics needs to be investigated.

PCN47

REAL-WORLD OUTCOMES IN PATIENTS WITH METASTATIC MERKEL CELL CARCINOMA TREATED WITH FIRST-LINE CHEMOTHERAPY IN THE UNITED STATES: RESULTS FROM A RETROSPECTIVE ANALYSIS

Cowey CL[1], Mahnke L[2], Espirito J[3], Helwig C[4], Oksen D[4], Bharmal M[4]
[1]*Baylor University Medical Center, Sammons Cancer Center, Texas Oncology, P.A., Dallas, TX, USA,* [2]*EMD Serono, Billerica, Boston, MA, USA,* [3]*McKesson Specialty Health, The Woodlands, TX, USA,* [4]*Merck KGaA, Darmstadt, Germany*

OBJECTIVES: This retrospective study examined therapeutic outcomes to first-line (1L) chemotherapy in patients with distant metastatic Merkel cell carcinoma (mMCC). MCC is a rare, aggressive skin cancer associated with poor prognosis in patients with metastatic disease. Advanced MCC is typically treated with chemotherapy, but there is no approved standard-of-care treatment. **METHODS:** Data were obtained from the US Oncology Network/McKesson Specialty Health electronic health record database and medical charts. Qualifying patients were adults with distant mMCC who had received 1L chemotherapy between 11/2004 and 9/2014 with follow-up until 6/2015. Patients who received treatment with any drug targeting T-cell coregulatory proteins were excluded, among other eligibility criteria. Objective response rate (ORR) to 1L chemotherapy was assessed using RECIST v1.1 as a guide, and duration of response (DOR), time to treatment discontinuation (TTD), progression-free survival (PFS), and overall survival (OS) were estimated using Kaplan-Meier methodology. The primary analysis population was patients with immunocompetent status. **RESULTS:** Of 686 patients identified to have MCC, 67 qualified for analysis (76% immunocompetent/24% immunocompromised). In immunocompetent patients (n=51) at start of 1L chemotherapy, median age was 78 years, 84% were male, 49% had an ECOG performance status of 1, and 69% were diagnosed initially with stage I-III disease. The most common 1L regimen was carboplatin + etoposide (63%). ORR was 29.4% (95% CI, 17.5–43.8), median DOR was 6.7 mos (95% CI, 1.2–10.5; interquartile range, 2.3–12.1), median TTD was 2.4 mos (95% CI, 2.2–2.9), median PFS was 4.6 mos (95% CI, 2.8–7.7), and median OS was 10.5 mos (95% CI, 7.2–15.2). Results in the overall population were consistent with those in the immunocompetent population. **CONCLUSIONS:** In patients with distant mMCC treated with 1L chemotherapy, responses were of limited duration. The median survival was less than 1 year, highlighting the need for novel therapies.

PCN48

SURVIVAL ASSOCIATED WITH COPD AMONG SEER-MEDICARE BENEFICIARIES WITH NSCLC

Shah S[1], Blanchette CM[2], Arthur S[1], Coyle JP[1], Kowalkowski M[3], Howden R[1]
[1]*University of North Carolina at Charlotte, Charlotte, NC, USA,* [2]*Precision Health Economics, Davidson, NC, USA,* [3]*Levine Cancer Institute, Charlotte, NC, USA*

OBJECTIVES: Lung cancer and chronic obstructive pulmonary disease (COPD) are among leading causes of morbidity and mortality worldwide. We investigated the impact of pre-existing COPD and its subtypes, chronic bronchitis and emphysema, on overall survival among Medicare enrollees diagnosed with non-small cell lung cancer (NSCLC). **METHODS:** Using SEER-Medicare data, we included patients >= 66 years of age diagnosed with NSCLC at any disease stage between 2006 to 2010 and continuously enrolled in Medicare Parts A and B in the 12 months prior to diagnosis. Pre-existing COPD in patients with NSCLC were identified using ICD-9 codes. Kaplan-Meier method and log-rank tests were used to examine overall survival by COPD status and COPD subtype. Multivariable Cox Proportional Hazards models were fit to assess the risk of death after cancer diagnosis. **RESULTS:** We identified 66,963 lung cancer patients. Of these, 22,497 (33.60%) had documented COPD before NSCLC diagnosis. For each stage of NSCLC, median survival was shorter in the COPD compared to the Non-COPD group (stage I: 692 days vs 1130 days, P<0.0001; stage II: 473days vs 627 days, P<0.0001; stage III: 224 days vs 229 days; P<0.0001; stage IV: 106 days vs 112 days, P<0.0001). For COPD subtype, median survival for patients with pre-existing chronic bronchitis was shorter compared to emphysema across all stages of NSCLC (stage I: 672 days vs 811 days, P<0.0001; stage II 582 days vs 445 days, P<0.0001; stage III: 255 days vs 229 days, P< 0.0001; stage IV: 105 days vs 112 days, P<0.0001). In cox proportional hazard model, COPD patients exhibited 11% decreased time to death than Non-COPD patients (Hazard Ratio: 1.11, 95%Confidence Interval: 1.09—1.13). **CONCLUSIONS:** NSCLC patients with pre-existing COPD had shorter survival with marked differences in early stages of cancer. Chronic bronchitis demonstrated a greater association with time to death than emphysema.

PCN49

AGE DISPARITIES IN INFLAMMATORY BREAST CANCER SURVIVAL BY RACE AND HORMONAL RECEPTOR STATUS: AN ANALYSIS OF 1990-2013 SEER DATA

Djatche L[1], Mitchell E[2], Delgado D[1]
[1]*Thomas Jefferson University, Philadelphia, PA, USA,* [2]*Sidney Kimmel Cancer Center at Jefferson, Philadelphia, PA, USA*

OBJECTIVES: Inflammatory breast cancer (IBC) is a rare and aggressive form of cancer with poor outcomes. This study aims to assess age differences in IBC survival among all, white, black, estrogen receptor positive (ER+) and estrogen receptor negative (ER-) patients. **METHODS:** Using the Surveillance, Epidemiology,

and End Results (SEER) data, IBC female patients diagnosed between 1990 and 2013 were identified. Patients were divided into five groups according to their age at diagnosis: 18-34(younger patients), 35-49, 50-64, 65-74 and 75 and above (older patients). The 36-month inflammatory breast cancer-specific survival (IBCSS) was estimated using the Kaplan-Meier method and compared across groups using the log-rank test. Stratified multivariable Cox proportional hazard ratios (HRs) were used to assess the association between age and survival among all, white, black, ER+ and ER- patients after adjusting for patient and tumor characteristics. **RESULTS:** A total of 13,748 IBC patients were identified; 3.8% were diagnosed between the ages of 18-34, 25.0% between 35-49, 38.8% between 50-64, 16.9% between 65-74, and 15.5% aged 75 and above. The 36-month IBCSS Kaplan-Meier curves showed younger patients had a better crude survival compared to older patients among all (58% vs 52%), white (60% vs 52%), ER+ (76% vs 64%) and ER- (48% vs 41%) subgroups, and the same survival among the black subgroup (48% vs 48%). The adjusted HRs were higher for older versus younger patients for all, white, ER+ and ER- patients, but not for black patients. Compared to younger patients, the adjusted HRs for older patients were 1.28(95%CI:1.11-1.47), 1.32(95% CI:1.12-1.56), 1.07(95%CI:0.79-1.45), 1.28(95%CI:1.01-1.63) and 1.31(95%CI:1.06-1.61) for all, white, black, ER+ and ER- patients respectively. **CONCLUSIONS:** This study suggests increased age may be associated with poorer survival among all, white, ER+ or ER- patients, but not associated with poorer survival among black patients. Further research is needed to examine other variables that may affect these findings.

PCN50

THE EFFECT OF CACHEXIA ON SURVIVAL IN LUNG CANCER PATIENTS

Shah S[1], Noone JM[2], Blanchette CM[2], Arthur S[1]
[1]University of North Carolina at Charlotte, Charlotte, NC, USA, [2]Precision Health Economics, Davidson, NC, USA

OBJECTIVES: Lung cancer is the leading cause of cancer death in the United States. It is estimated that 60% of lung cancer patients are afflicted with cancer-cachexia and approximately 10% of these patients will die due to cancer-cachexia. We examined the impact of cachexia on survival among lung cancer elderly patients. **METHODS:** We conducted a retrospective study using SEER-Medicare data. Patients were included if diagnosed with first primary lung cancer between January 1, 2005 and December 31, 2010, at least 66 years of age, and continuously enrolled in Medicare Parts A and B in the 12 months prior to diagnosis. We identified cachexia in lung cancer patients using ICD-9 codes. Descriptive statistics were used to identify population characteristics. Propensity score (1:1 nearest neighbor) matching was performed between cachectic and non-cachectic lung cancer patients to compare survival. **RESULTS:** We identified 84,518 lung cancer patients. Of these, 2,536 (3%) developed cachexia after lung cancer diagnosis. The most common comorbid conditions among cachectic and non-cachectic groups were chronic obstructive pulmonary disease (50% versus 45.62%), congestive heart failure (8.56% versus 13.38%), diabetes (7.41% versus 14.75%), peripheral vascular disease (3.82% versus 6.85%), and renal disease (3.63% versus 6.14%). Adjustment for immortal time bias resulted in a cohort of 3734 matched patients. Eighty-eight percent of patients in the cachectic group died during the follow-up period compared to 78% in the non-cachectic group. Median survival time among non-cachectic lung cancer patients was significantly longer than cachectic lung cancer patients (log-rank $p<0.0001$). Specifically, median survival in non-cachectic patients was 201 days compared to 92 days among cachectic patients. **CONCLUSIONS:** The occurrence of cachexia is independently associated with a significant decrease in survival among lung cancer elderly patients. The results of this study may be useful for identifying healthcare burden and planning treatment modalities for this population.

PCN51

RE-DEFINING LONG-TERM SURVIVAL: SURVIVAL ENDPOINTS WITHIN HEMATOLOGICAL CANCERS – A TREND ANALYSIS OF THE PIPELINE PRODUCTS

Manansala K[1], Jain A[2], Bathija S[1]
[1]PAREXEL International, Horsham, PA, USA, [2]PAREXEL International, Chandigarh, India

OBJECTIVES: The long-term survival (LTS) benefits of candidate therapies is increasingly being assessed in clinical trials. As this data is generally not available for pivotal studies at time of pricing and reimbursement review it does not influence initial access decisions. We conducted a trend analysis of landmark survival endpoints, particularly LTS, in hematological cancer indications to inform considerations for future clinical trial designs and the potential impact on P&R reevaluations. **METHODS:** A targeted review using Citeline's Trialtrove database was conducted to extract landmark survival data ($\geq$3months) for progression free survival (PFS) and overall survival (OS) for products across leukemia, lymphoma, multiple myeloma (MM), and myelodysplastic syndromes (MDS) between June 2014 and June 2016. **RESULTS:** A total of 961 observations were extracted across phase I/II (n=265), phase II (n=552), phase II/III (n=20) and phase III (n=124) across MDS (n=105), MM (n=162), leukemia (n=346), and lymphoma (n=348). Overall, 53% (516/961) of trials included landmark OS and PFS across indications, 64% (329/516) included long-term endpoints of $\geq$1 year PFS and 66% (340/516) $\geq$1 year OS across immune oncologic (IO) (n=135) and non-IO (n=370) trials. The most commonly seen long-term endpoints across 516 trials were PFS at years 1 (10%,n=51), 2 (23%,n=117), 3 (11%,n=59) and 5 (10%,n=52), and OS at years 1 (17%,n=86), 2 (22%,n=115), 3 (17%, n=86) and 5 (11%,n=57), and the proportion did not differ significantly between IOs and non-IOs. Interestingly, 5% (n=27) of trials measured PFS between years 6 and 15, 8% (n=43) measured OS between years 6 and 16, and about 2% (n=11) trials measured PFS and/or OS until progression or death. **CONCLUSIONS:** LTS endpoints are becoming an increasingly frequent inclusion in hematologic cancer therapy trials. Future monitoring and primary research would be required to understand if newer drugs will be re-evaluated in light of long-term data becoming available.

PCN52

OVERALL SURVIVAL WITH NIVOLUMAB FOR PATIENTS WITH ADVANCED, PREVIOUSLY TREATED RENAL CELL CARCINOMA

Sullivan W[1], Lee D[1], Willis A[1], Doan J[2], Gooden K[2], Sowdani A[3]
[1]BresMed Health Solutions, Sheffield, UK, [2]Bristol-Myers Squibb, Princeton, NJ, USA, [3]Bristol-Myers Squibb, Uxbridge, UK

OBJECTIVES: Nivolumab was the first immunotherapy to demonstrate a significant overall survival benefit versus standard of care for previously treated patients with advanced or metastatic renal cell carcinoma (RCC) in a phase III trial setting. While conclusive phase III trial evidence for the immunotherapeutic benefit of nivolumab on overall survival beyond 3 years is not yet available for RCC, phase I/II data support a clinical rationale that some nivolumab patients will achieve long-term overall survival. Such benefit has also been seen in melanoma with other immunotherapy drugs. The objective of this research is to illustrate the importance of immunotherapeutic assumptions for long-term survival estimates and the potential impact on health technology appraisal decisions. **METHODS:** Alternative extrapolations of pivotal phase III (CheckMate 025) and supportive phase I (study 003) survival data for nivolumab in RCC were compared to illustrate the importance of long-term survival assumptions for value projections. **RESULTS:** Long-term survival projections vary depending on dataset and model choice, and whether clinical expectations based on key evidence and rationale are incorporated. For RCC patients treated with nivolumab who survive to 3 years, projected survival for an additional 10 years is 8% using the generalized gamma model extrapolation of CheckMate 025 data, versus 46% when quantified clinical expectations are incorporated into this projection, and 42% using the Gompertz model extrapolation of study 003 data. In England, these different survival assumptions cause the incremental cost-effectiveness ratio for nivolumab versus axitinib to range from below £25,000 to over £50,000, based on list price. **CONCLUSIONS:** Using clinical expert estimates to inform long-term survival projections is pertinent in the absence of long-term patient data. This approach becomes essential when the immunotherapeutic mechanism of action of a treatment and early evidence suggest a survival plateau that is not offered by other currently available treatments.

CONCEPTUALIZATION OF AN EXCEL-BASED INDICATION-SPECIFIC PRICING (ISP) MODEL TO ASSESS POTENTIAL SAVINGS TO A U.S. HEALTH PLAN

Black J, Ramesh V, Shao D, Shah S, Narayanan S
Market Access Solutions LLC, Raritan, NJ, USA

OBJECTIVES: Value based pricing has become a topic of increasing public attention and scrutiny. An Indication Specific Pricing (ISP) model allows price setting relative to the level of benefit provided in a given indication and patient population, with the potential for price to vary based on value in the concerned indication(s). We quantified the impact of deploying an ISP scheme on 5-year Afinitor (everolimus) expenditures for a hypothetical health plan of 5M covered lives in the U.S., taking into account three indications: HER2- breast cancer, renal cell carcinoma, and pancreatic cancer. **METHODS:** We constructed an Excel-based model to understand future expenditures on an annual basis utilizing an ISP scheme against a more traditional single contracted price. Key inputs for the model include price per pill (average selling price (ASP)), forecasted annual number of patients per indication (based on 5M covered lives), and compliance rate. Results from the Sloan Kettering "DrugAbacus" pricing project were leveraged to estimate indication-level prices based on their assessment of efficacy, tolerability, and unmet need for Afinitor in each of the indications; actual ISP prices originally used by Sloan Kettering in their model were reweighted and adjusted. **RESULTS:** As the DrugAbacus price calculated for each indication was lower than the current ASP for Afinitor, use of an ISP methodology resulted in a 9.3% decrease in five year expenditures for Afinitor ($136.9M for a traditional single price vs. $124.1M for an ISP model). **CONCLUSIONS:** US Payers could consider assessing the value a therapeutic intervention brings to each approved indication using ISP in an effort to lower total pharmaceutical-related healthcare costs. Drug manufacturers may benefit from considering relative product value in each potential indication to assess commercial attractiveness and focus evidence generation strategies on those indications seen as most valuable, to support price negotiations.

PCN54

BUDGET IMPACT ASSESSMENT (BIA) OF INTRAOPERATIVE RADIOTHERAPY (IORT) IN THE GERMAN EARLY BREAST CANCER PATIENTS

Vaidya A[1], Vaidya P[2], Both B[3]
[1]University of Alberta, Edmonton, AB, Canada, [2]O-Zone 2.0 HEOR Consultancy, Edmonton, AB, Canada, [3]Carl Zeiss Meditec AG, Oberkochen, Germany

OBJECTIVES: To evaluate the potential budget impact of early breast cancer treatment using IORT to inform the reimbursement policy decisions. The IORT (as definite dose or as boost) eliminates the need for numerous radiation center visits and minimizes radiation exposure to healthy tissue and organs. **METHODS:** An incidence-based budget impact model in MS Excel was developed over a five-year time horizon employing the German health care system perspective. Epidemiologic data were used to quantify the proportion of patients diagnosed with early breast cancer in Germany. Two scenarios were examined; one with progressive uptake of IORT over the time horizon and other with 100% uptake of IORT from the introduction year. Diagnosis Related Group based IORT base case cost was varied in a reasonable range for the sensitivity analysis. **RESULTS:** With the progressive introduction of IORT the total annual cost of treatment for early breast cancer patients in Germany gradually decline from

244 Million Euros in the first year to 189 Million Euros in the fifth year. Therefore, introduction of IORT in phasic manner could save 241 Million Euros over the next five years. In the alternative scenario, where all patients are treated with IORT from the introduction year, the annual cost saving for the payer would be 78 million Euros. Therefore, aggressive introduction of IORT would save 389 Million Euros over the tie horizon which translates to the additional cost saving of 148 Million Euros in comparison with the phasic introduction. **CONCLUSIONS:** IORT (boost and single treatment) is the cost saving treatment strategy for patients with early-stage breast cancer. The impact of IORT treatment decision extends beyond these model results as the implementation of this shorter radiation course could improve quality of life by sparing patients from the protracted course of conventional radiotherapy, improve compliance, prevent unnecessary mastectomies and save valuable health care resources.

PCN55

BUDGET IMPACT MODEL OF PEMBROLIZUMAB IN PREVIOUSLY TREATED ADVANCED PD-L1 NSCLC POSITIVE IN COLOMBIA

Huang M[1], Arunachalam A[1], Chandwani S[1], Monsanto H[2], Beltran C[3], Rojas M[3], Hinestrosa F[4], Restrepo M[5], Ordosgoitia A[4], Martinez I[4]
[1]*Merck & Co., Inc., North Wales, PA, USA,* [2]*Merck Sharp & Dhome IA LLC, Carolina, PR, PR,* [3]*Merck Sharp & Dhome, Bogota, Colombia,* [4]*Merck Sharp & Dhome, Bogota, Colombia,* [5]*Merck Sharp & Dhome, Bogota, Colombia*

OBJECTIVES: Lung cancer is the second leading cause of cancer-related death in Colombia. The aim of this Budget Impact Model (BIM) is to evaluate the impact of adding pembrolizumab for the treatment of PD-L1 positive advanced NSCLC with disease progression on or after platinum-containing chemotherapy in Colombia. **METHODS:** Based in the National Health Technology Agency (IETS), the perspective of the model is from the payer over a period of 3 years. Inputs are based on epidemiologic, market research, and cost data from Colombia. Comparators were nivolumab and other regimens recommended for use in the pembrolizumab-eligible population. The market share is based on local KOL's assumptions, and the market of pembrolizumab is based on a Merck model. Costs included drug acquisition, administration, prophylaxis, adverse event, and PDL-1 test. **RESULTS:** Considering Colombian population of 48,747,632 (1.3% annual growth rate), 3,042 advanced NSCLC patients will receive a PD-L1 test in year 1 (9,911 patients: 3 years), and 692 PD-L1 positive advanced NSCLC patients are expected to be eligible for pembrolizumab as 2L+ treatment in year 1 (2,256: 3 years). The total budget impact of pembrolizumab is estimated at US$22,865,707 over three years. In a second scenario comparing the population size treated with pembrolizumab vs. nivolumab (no test and treating all patients), and the total cost associated, the total cost impact to the healthcare payer is much lower for the pembrolizumab treatment approach (US$26,715,299) compared to nivolumab (US$ 47,586,330), a cost saving of approximately US$20,871,032. **CONCLUSIONS:** The addition of pembrolizumab to the National formulary may result in a moderate increase in current expenditures, which means an impact 3% less of the total expenditures in cancer drugs over 3 years. When compared to nivolumab, pembrolizumab will likely result in cost savings for the health system in Colombia, considering the optimization of resources by selecting patients.

PCN56

BRENTUXIMAB VEDOTIN (ADCETRIS®) ECONOMIC EVALUATION ON PATIENT'S TREATMENT WITH RELAPSE OR REFRACTORY HODGKIN LINFOMA

Soto Molina H[1], Díaz Martínez JP[2], Escobar Juárez Y[1], Rodriguez-Mendoza MM[3], Frias Gasga AE[4]
[1]*HS Estudios Farmacoeconómicos S.A. de C.V., Mexico City, Mexico,* [2]*HS Estudios Farmacoeconómicos, Mexico City, Mexico,* [3]*Independet consultant, Mexico, Mexico,* [4]*Takeda, Mexico City, Mexico*

OBJECTIVES: To assess the budget impact of brentuximab vedotin in patients with relapsed or refractory Hodgkin lymphoma (HL) from the perspective of México's National Healthcare System (NHS). **METHODS:** A budget impact analysis of brentuximab vedotin, an orphan drug for patients with relapsed or refractory HL, was conducted. The current treatment alternatives in Mexico include the following: 1) ICE (ifosfamide, carboplatin, etoposide), 2) MINE (mesna, Ifosfamide, mitoxantrone, etoposide) 3) ESHAP (etoposide, methylprednisolone, cytarabine, cisplatin), and 4) IGEV (ifosfamide, gemcitabine, vinorelbine). The analysis was performed from the institutional perspective, with a five year time horizon. Target population estimates were based on projections of the Mexican population reported by CONAPO (Consejo Nacional de Población) and HL incidence obtained from the literature. The direct costs were taken from institutional sources in 2016, primarily drug costs of the current treatment schemes of the NHS. The results are presented as the budget impact for the NHS and for each public healthcare institution (IMSS, ISSSTE, Seguro Popular, PEMEX, SEMAR, SEDENA). The results are also expressed as percentage of the total drug budget of the institutions. Finally, a univariate deterministic sensitivity analysis was conducted. **RESULTS:** The budget impact analysis shows that the incorporation of brentuximab vedotin to the NHS generates an incremental investment of $169,322 USD in 2016, reaching a total of $893,529 USD in 2020, with an average of 49 new patients annually. An annual average investment of $526,914 USD, or 0.016% of México NHS's drug budget in 2016, will be required. **CONCLUSIONS:** Given the high mortality of relapsed or refractory HL, there is a need for alternative treatments for patients in this setting. Brentuximab vedotin is a viable treatment option with a limited budget impact affordable to the Mexico NHS.

PCN57

BUDGET IMPACT OF COMPREHENSIVE GENOMIC PROFILING OF PATIENTS WITH ADVANCED LUNG CANCER IN EUROPE

Khorshid M, Roberts G
F. Hoffmann-La Roche AG, Basel, Switzerland

OBJECTIVES: To estimate the budget impact of comprehensive genomic profiling that interrogates the entire coding sequence of 315 cancer-related genes plus select introns from 28 genes to identify targeted treatment in patients with advanced lung carcinoma in Europe. **METHODS:** A 5 year budget impact model was developed to determine the financial implications of incorporating genomic profiling of biopsy samples in patients with advanced lung carcinoma. Costs included testing and associated costs and treatment costs. Testing results were obtained from in house data and also literature, costs were identified from technology assessment reports and literature. Sensitivity analyses were conducted on proportion of testing and costs. Results are compared with a mix of current testing including Polymerase Chain Reaction (PCR), Fluorescence in situ Hybridisation (FISH) and no testing. **RESULTS:** The incremental budget impact varied from between €0.20 to €0.80 per person within a population dependant on mix of type of testing and cost of drug treatments. Total budget impact (per person cost x population) was country dependant, for the UK the result was between £12.75 million and £42 million after 5 years. **CONCLUSIONS:** Comprehensive genetic profiling may be an affordable option to identify the most appropriate targeted therapy for an individual patient. Further research is warranted on the potential gain in survival outcomes when treatment is optimised. Furthermore health systems may need to move from a tumour type based treatment approach to a mutation specific based indication as recommended therapies may be approved for another tumour type and not the one tested.

PCN58

BUDGET IMPACT ANALYSIS OF AXITINIB IN THE TREATMENT OF METASTATIC RENAL CELL CARCINOMA AFTER THE FAILURE OF ONE PRIOR SYSTEMIC THERAPY IN THE BRAZILIAN PRIVATE HEALTH SYSTEM

Alexandre RF, Squiassi HB, Santana CF
Pfizer, São Paulo, Brazil

OBJECTIVES: To evaluate the budget impact of axitinib, an oral angiogenesis inhibitor1, in the second line treatment of metastatic renal cell carcinoma (mRCC) in the Brazilian private health system. **METHODS:** A budget-impact model comparing a world with vs world without axitinib [sorafenib, everolimus, sunitinib, temsirolimus, pazopanib or best supportive care (BSC)], was calculated based on published data on incidence estimate of RCC (0,009%2) and assumptions from estimate of new diagnosed cases of non-metastatic RCC (81%) [A], diagnosed non-metastatic RCC cases in progress to mRCC (40%) [A x 40% =B], new diagnosed cases of mRCC (19%) [Population estimate of RCC x 19%=C], mRCC cases receiving 1st line therapy (74%) [B+C=D] and eligible cases of 2nd line therapy (52%) [52% x D=population eligible for the analysis]. The Analysis was performed in a three year time horizon, from perspective of the Brazilian private health system, and included only direct costs of medicines. The estimates were applied considering a health plan with 2 million lives (based on average of top 10 largest Brazilian Private Health Plans). Medicines cost data were taken from MoH's price in November 20163. **RESULTS:** The total number of patients with RCC was 170 while the number of mRCC patients in 2nd line therapy was 34. Costs of treatment with axitinib were BRL 4,714,490, BRL 4,734,597 and BRL 4,877,913 in years 1, 2 and 3 versus BRL 4,475,391, BRL 4,047,948 and BRL 3,950,505 without axitinib, respectively. Over a three year time horizon, the incremental budget impact was BRL 1,853,156 (15% of RCC patients) or BRL 0.31 per member per year from total lives of the Brazilian Private Health Plan. **CONCLUSIONS:** Axitinib is a targeted anticancer agent to mRCC treatment in 2nd line. Considering only the costs of drug acquisition, the treatment with axitinib were associated with low budget impact to the Brazilian Private Health System.

PCN59

BUDGET IMPACT ANALYSIS OF CRIZOTINIB IN THE TREATMENT OF ALK-POSITIVE NON-SMALL CELL LUNG CANCER IN THE BRAZILIAN PRIVATE HEALTH SYSTEM

Alexandre RF, Squiassi HB, Santana CF
Pfizer, São Paulo, Brazil

OBJECTIVES: To evaluate the budget impact of crizotinib, an oral inhibitor of anaplastic lymphoma kinase (ALK), in the treatment of ALK-positive non-small cell lung cancer (ALK+NSCLC) in the Brazilian private health system. **METHODS:** A budget-impact model was developed to compare the cost of treatment with crizotinib in ALK+NSCLC patients to that of chemotherapy (bevacizumab, carboplatin, cisplatin, docetaxel, erlotinib, gefitinib, gemcitabine, paclitaxel, pemetrexed and vinorelbine). Analysis considered a three year time horizon from the perspective of the BPHS, and has included only direct costs of medicines. Based on published data, the incidence rates considered to the Brazilian population were 0,014% of lung cancer (LC), 89,5% of NSCLC, 70,6% of advanced NSCLC and 5% of ALK+NSCLC, applied considering a health plan with 2 million lives (based on average of top 10 largest Brazilian Private Health Plans). Was applied an annual population growth rate of 0,09% after first year. Medicines cost's data were taken from MoH's price in November 2016. **RESULTS:** The total numbers of patients with LC were 280, 305 and 333 while the numbers of ALK+NSCLC patients were 9, 10 and 11 in years 1, 2 and 3 respectively. Costs of treatments, including crizotinib were BRL 34.722.255, BRL 37.847.258 and BRL 41.253.511 at years 1, 2 and 3 versus BRL 32.986.119, BRL 35.954.870 and BRL 39.190.808 only with chemotherapy, resulting in an incremental budget impact of BRL 1,736,136, BRL 1,892,388 and BRL 2,062,703, respectively. Over a three year time horizon, the incremental budget impact was BRL 5,691,227 (5% of LC patients) or BRL 0.07 per member per month from total lives of the Brazilian private health plan. **CONCLUSIONS:** Crizotinib is a novel targeted anticancer agent that favors ALK+ NSCLC patients. Considering only the cost of drugs,

the treatment of ALK+NSCLC's patients with crizotinib were associated with low budget impact to the Brazilian private health system.

PCN60

LAWSUITS TO RECEIVE FREE DRUGS: FEDERAL EXPENDITURES FOR THE BRAZILIAN PUBLIC HEALTH SYSTEM (SUS)

Nogueira KP[1], Camargo EB[2]
[1]Ministry of Health of Brazil, Brasília, Brazil, [2]Fundação Oswaldo Cruz - FIOCRUZ/DIREB, Brasília, Brazil

OBJECTIVES: Due to the increasing demand for Lawsuits to receive free medication in Brazil, it is estimated that the increase in costs may compromise the sustainability of SUS. The aim of this works is to analyze Federal expenditures for the Brazilian Public Health System (SUS) with drugs obtained through lawsuits between the years 2011-2014. **METHODS:** Cross-sectional study, with descriptive and analytical characteristics. Data collected from the DW / COMPRASNET platform. **RESULTS:** In total 12,578 lawsuits were identified at the federal level and 15 drugs with the highest acquisition value were extracted. Of these, seven drugs corresponded to US$ 452.644.065.68 million dollars of the federal budget, which represented 87% of the total expenditure of the actions studied, most of them were oncologic and rare diseases drugs. Of the 15 drugs / year studied, 14.28% (n = 4) were registered at the National Brazilian Surveillance Agency (ANVISA), were incorporated by the National Commission for the Incorporation of Technologies in SUS (CONITEC) and were part of the List of essential drugs (RENAME); 46.42% (n = 13) were registered with ANVISA, but not incorporated by CONITEC and not members of RENAME; 3.57% (n = 1) registered in ANVISA, incorporated by CONITEC and non-RENAME members and 35.71% (n = 10) without ANVISA registration, not incorporated by CONITEC and not RENAME members. **CONCLUSIONS:** With the Lawsuits to receive free medication, the acquisitions are carried out without planning or establishing minimum criteria such as: the presence of registration at ANVISA, incorporation in SUS and presence in RENAME, may compromise SUS sustainability. It is urgent that the Judiciary approaches the Executive stakeholders to initiate a responsible commitment to the health rights of the Brazilian population.

PCN61

LAPATINIB WITH LETROZOLE AS A TREATMENT STRATEGY FOR PATIENTS WITH METASTATIC BREAST CANCER (HER2+) UNDER THE PERSPECTIVE OF BRAZILIAN PUBLIC HEALTHCARE SYSTEM: A BUDGET IMPACT ANALYSIS

Guimaraes JM[1], Fonseca MC[2], Costa DN[3], Aragao ES[3], Abreu GR[3], Nita ME[4]
[1]Federal University of Southern Bahia, Itabuna, Brazil, [2]State University of Feira de Santana, Feira de Santana, Brazil, [3]Federal University of Bahia, Salvador, Brazil, [4]USP and FIPE/HAOC, Sao Paulo, Brazil

OBJECTIVES: The goal of this study was to estimate the budget impact of lapatinib with letrozole as a therapy for metastatic breast cancer with HER2+ status into Brazilian Public healthcare system (SUS). **METHODS:** Epidemiological data were from Ferlay, et al., 2013. Drugs costs were from Health Price Bank (BPS) of Brazilian Ministry of Health (MOH), a public purchasing database. The analysis looked into 5 years under the perspective of MOH. Only drug costs were considered for analysis. We have also performed sensibility analyses, in parameters of prices (ex-factory, Maximum price for MOH, and negotiated prices) and taxes from different states perspectives. **RESULTS:** The budget impact was estimated to a population of 86,789, considering 50% limitation (43,395 and 38,293) of women for the 5th year, with ages from 50-64 years old, diagnosed with breast cancer HER2 +. The budget impact analysis under the reference case (market share of 100% of letrozol), in five years, would represent U$18 MI, allowing for an annual growth rate of the total number of patients. The adoption of the newer strategy, for the lapatinib and letrozol (3 alternative scenarios lapatinib + letrozol, scenario 1 (25% of market share), scenario 2 (45%) and scenario 3 (65%)), adjusted for the inflation, represent a budget impact of approximately, US$ 941 milhões. This increase of 307% would occur in the 5 years perspective. **CONCLUSIONS:** Under the perspective of Brazilian SUS the incorporation of lapatinib and letrozol is not recommended due to high budget impact to SUS. Further, cost effectiveness and budget impact studies can give stronger evidence to decision making.

PCN62

BUDGET IMPACT OF INCREASED UTILIZATION OF PALONOSETRON FOR THE CONTROL OF CHEMOTHERAPY INDUCED NAUSEA AND VOMITING IN MANAGED CARE

Knoth RL[1], Ortendahl JD[2], Copher R[1]
[1]Eisai Inc., Woodcliff Lake, NJ, USA, [2]Partnership for Health Analytic Research, LLC, Beverly Hills, CA, USA

OBJECTIVES: Currently, several branded and generic serotonoin-3 receptor antagonists (5HT3RAs) are indicated for chemotherapy induced nausea and vomiting (CINV). While these medications differ in efficacy and acquisition cost, palonosetron is a second generation 5HT3RA commonly recommended by treatment guidelines (e.g., NCCN, MASCC, ASCO). Using a decision analytic model, this study examined the financial impact of a 5% increase in the utilization of palonosetron vs. a generic 5HT3RA (ondansetron) in cancer treated with a highly (HEC) or moderately emetogenetic chemotherapy (MEC). The results illustrate the costs to manage CINV from a payer perspective. **METHODS:** The model generated outputs for a hypothetical one-million member healthplan. The eligible population was determined from national rates of cancer and chemotherapy. Antiemetic-specific rates of CINV were based on retrospective analyses defining CINV by ICD9 codes or use of rescue antiemetics. Other inputs included current 5HT3RA market share, medication acquisition costs, and per-patient costs to treat CINV. Model outputs predicted pharmacy and medical costs in the base year and following the 5% utilization increase. **RESULTS:** The model predicted a population of 968 patients, 282 (14.1%) treated with HEC and 686 (34.3%) with MEC. Increasing the utilization of palonosetron by 5% (59% to 64% in HEC, 51% to 56% in MEC) resulted in an increase in pharmacy acquisition costs from $1.00 million to $1.02 million. CINV treatment costs, however, would decrease from $2.41 to $2.35 million. Overall, net costs for the MCO decreased by $73.4K, or $0.01 PMPM. **CONCLUSIONS:** As expected, this model predicted an increase in pharmacy costs from the increased utilization of palonosetron relative to generic ondansetron. However, because the rate of CINV control associated with palonosetron was lower than with ondansetron, CINV treatment costs decreased. Increasing the utilization of palonosetron in MEC and HEC, then, may result in an overall net savings to a health plan.

PCN63

BUDGET IMPACT ANALYSIS OF RITUXIMAB IV VERSUS SC FROM PUBLIC BRAZILIAN HOSPITAL

Gomes G[1], Ho R[2], Rufino C[2], Alves M[2]
[1]Hospital Geral de Curitiba (HGEC), Curitiba, Brazil, [2]Roche Brazil, São Paulo, Brazil

OBJECTIVES: The analysis aimed to compare the total cost of rituximabe IV versus SC in both indications approved by ANVISA[i] for rituximab SC: follicular lymphoma (FL) first line and maintenance and diffuse large B-cell lymphoma (DLBCL) first line. **METHODS:** Budget impact analysis was conducted based on the direct cost of Hospital Geral de Curitiba (HGEC), active healthcare professional (HCP) time from a time and motion study,[ii]wage paid from Paraná, and the treatment cost of rituximab. In order to quantify the cost per professional involved in the administration and manipulation of the drugs, the wage paid and active HCP time were used to monetize labor. As HGEC has only pharmacists and nurses involved in the procedure, the time and motion study was adapted to HGEC scenario. The total cost of rituximab was calculated according to drug information leaflets, assuming 20 and 8 cycles for FL and DLBCL, respectively. The results were expressed as cost difference per patient between rituximab IV and SC and were calculated according to the puncture: peripheral or catheter. **RESULTS:** The saving generated by switching IV to SC was R$ 12.091,66 and R$ 12.960,91 per patient (peripheral and catheter, respectively) for FL; whereas for DLBCL the saving generated was R$ 4.454,82 and R$ 4.775,07 per patient (peripheral and catheter, respectively). **CONCLUSIONS:** Use of rituximab SC is less costly compared to rituximab IV, and switching IV to SC can bring resource savings to HGEC. Other institutions can also use this analysis as a model and quantify their savings from switching IV to SC. [i] Produtos Roche Químicos e Farmacêuticos S.A. MabThera IV e MabThera SC (rituximabe) [Bula]. 2016. p. 1–65. [ii] Cock, E., D., et. al., Time Savings with Rituximab Subcutaneous Injection verus Rituximab Intravenous Infusion: A Time and Motion Study in Eight Coutries.PLOS ONE. 2016; 11(6):e0157957. doi: 10.1371/journal.pone.0157957.

PCN64

COST-EFFECTIVENESS AND BUDGET IMPACT ANALYSIS OF IMATINIB AS FIRST-LINE TREATMENT OF CHRONIC MYELOID LEUKEMIA IN CHINA

Xu F[1], Chen W[1], Liu C[2]
[1]Fudan University, Shanghai, China, [2]Novartis Pharmaceuticals (China) Oncology, Beijing, China

OBJECTIVES: Nilotinib has been recently approved as the 1st-line treatment of chronic myeloid leukemia (CML) in China. This study aimed to evaluate the long-term cost-effectiveness and budget impact of nilotinib used as the 1st-line tyrosine kinase inhibitor (TKI) in China. **METHODS:** A two-part Markov model was designed to evaluate the lifetime cost and health outcomes of 1st-line nilotinib versus 1st-line imatinib in CML patients. A distinction was made between patients who were still on treatment and who discontinued treatment at the 12th month. Patient's response was assessed for those still on treatment, and the level of response was assumed as the predictor of long-term outcomes. Clinical effectiveness was obtained from ENESTnd trial. Costs were obtained from Chinese literature review and a panel of local clinical experts and only the direct medical cost was included. A budget impact model was used to calculate the change in CML-related expenditures from a single payer perspective after nilotinib was introduced as the 1st-line TKI, compared to imatinib as 1st-line TKI. A discounted rate of 3% was used for both effectiveness and cost. **RESULTS:** The results of cost-effectiveness analysis indicted that 1st-line nilotinib was associated with longer survival (1.78 discounted life years), more QALY (1.77 discounted QALYs) and higher costs (CNY66,317), compared to 1st-line imatinib. The increased cost-effectiveness ratio was CNY37,454 per QALY gained, which was less than the GDP per capita of China in 2015. The direct medical cost decreased in each of the 5 years after nilotinib was introduced as 1st-line treatment. The total budget of 5 years decreased by 1.99% compared to the current scenario. **CONCLUSIONS:** The introduction of nilotinib as 1st-line treatment of CML in China is a highly cost-effectiveness strategy compared to the current scenario. Meanwhile, the total budget for the payer decreased in a substantial rate.

PCN65

ASSESSMENT OF COSTS ASSOCIATED WITH ADVERSE EVENTS IN PATIENTS WITH CANCER

Cloutier M[1], Yim YM[2], Wong W[2], Gauthier-Loiselle M[3], Gagnon-Sanschagrin P[1], Kim A[2], Guerin A[1]
[1]Analysis Group, Inc., Montreal, QC, Canada, [2]Genentech, Inc., South San Francisco, CA, USA, [3]Groupe d'analyse, Ltée, Montréal, QC, Canada

OBJECTIVES: This study assessed the incremental costs associated with adverse events (AEs) in a range of malignancies. **METHODS:** Using Truven Health Analytics

MarketScan® databases (2000:Q1-2015:Q3), patient-level treatment episodes for breast, gastrointestinal, genitourinary, lung, hematologic, and skin cancers were identified. Based on current National Comprehensive Cancer Network Treatment Guidelines, 104 prescribing labels were reviewed to identify 36 AEs of interest. Episodes with a claim for an AE were matched with episodes without the AE on a 1:1 ratio based on demographics, insurance plan type, therapy line, treatment regimen, cancer characteristics, and episode duration. Healthcare costs (2015 USD) were compared between episodes with and without each AE using multivariate generalized linear regression models adjusting for the presence of other AEs. **RESULTS:** A total of 794,243 episodes were identified; mean patient age was 62.8 years; 58.1% were female; and 45.3% were first, 24.3% second, and 30.4% third or later line therapy following primary diagnosis. The number of matched episodes for each AE ranged from 878 to 115,754, with mean duration ranging from 4.7 to 16.4 months. The most prevalent AEs were pain (prevalence: 28.2%; incremental adjusted costs per episode: $4,576), hypertension (27.5%; $2,416), anemia/pallor (17.8%; $4,826), psychiatric disorders (13.9%; $3,458), and cough/upper respiratory infections (13.6%; $393); all $p<0.05$. The most costly AEs were central nervous system hemorrhage (0.2%; $26,904), sepsis/septicemia (2.5%; $25,562), gastrointestinal perforation (0.2%; $24,141), pancreatitis (0.1%; $17,987), and gastrointestinal fistula (0.1%; $15,881); all $p<0.05$. **CONCLUSIONS:** The prevalence and cost of AEs in patients with cancer tended to have an inverse relationship, with some of the most prevalent AEs being less costly and some of the most costly AEs being fairly rare. Treatment AEs may add a significant amount of cost to a treatment. Cancer therapies that are well tolerated are needed to further reduce the economic burden on patients and the health care system.

PCN69

COST OF IMMUNOTHERAPY TO TREAT LOCALLY ADVANCED OR METASTATIC UROTHELIAL CANCER (MUC) AND METASTATIC NON-SMALL CELL LUNG CANCER (MNSCLC)

Bilir SP[1], Munakata J[1], Yim YM[2], Ogale S[3]
[1]QuintilesIMS, San Francisco, CA, USA, [2]Genentech, Inc., South San Francisco, CA, USA, [3]Genentech, South San Francisco, CA, USA

OBJECTIVES: Immune checkpoint inhibitors represent important options for mUC and mNSCLC patients. Given increasing emphasis on economic value, this study examines cost differences when atezolizumab (ATEZO), nivolumab (NIVO) or pembrolizumab (PEMBRO) are used per label in these indications. **METHODS:** We calculated the cost of ATEZO (1200mg Q3W, 60min initial, 30min subsequent infusion), NIVO (240mg Q2W, 60min infusion), and PEMBRO (200mg Q3W, 30min infusion) based on 2017 wholesale acquisition costs (WAC) and CMS average sales price (ASP) payment rates. Dosing does not differ for the two indications. Infusion administration (ADMIN) costs were based on CMS Physician Fee Schedule ($136 for upto 60min). Since treatment durations from clinical trials have not been published, standardized costs are presented per month (30.44 days) and per 24 weeks. This analysis does not account for discounts/rebates, which is not publicly available information, and could affect the net cost to individual payers. **RESULTS:** Monthly costs were: ATEZO: WAC $12,449, ASP $12,427, ADMIN $198; NIVO: WAC $13,089, ASP $12,827, ADMIN $297; PEMBRO: WAC $12,895, ASP $12,733, ADMIN $198. Over 24-weeks, ATEZO patients have 4 fewer visits and 7.5 fewer infusion hours compared with NIVO; equal visits and 30min more infusion time for the first cycle compared with PEMBRO (equal after first infusion). Total (WAC+ADMIN) 24-week costs were $3,802 higher for NIVO and $2,184 higher for PEMBRO compared with ATEZO. ASP-based total 24-week costs (ASP+ADMIN) were $2,756 and $1,691 higher for NIVO and PEMBRO, respectively, compared with ATEZO. **CONCLUSIONS:** Immunotherapies are valuable in mUC and mNSCLC. This analysis suggests ATEZO may be less costly among cancer immunotherapies in these indications, with potential time savings for patients (fewer office visits and less infusion time vs. NIVO). Additional research is required to characterize real-world utilization and outcomes (including AEs) of immunotherapies, which might have an impact on the total cost of treatment.

PCN70

COST COMPARISON OF TREATMENT CHOICES FOR ADVANCED NON-SMALL CELL LUNG CANCER: AN OBSERVATIONAL STUDY

Gupta P, Nahata P, Sarangi SC, Malik PS, Gupta YK
AIIMS, Delhi, New Delhi, India

OBJECTIVES: Pharmacotherapy has improved survival for non-small cell lung cancer (NSCLC) but is limited by financial burden in resource poor settings. National list of essential medicines (NLEM) and drug price control in India intend to reduce this burden. This study was planned to compare costs among advanced NSCLC patients who get essential vs non-essential medicines. **METHODS:** Patients diagnosed with advanced NSCLC from July 2016 to January 2017 were enrolled in this prospective, observational study. Data on demography, quality of life and estimate of treatment related costs (direct and indirect) was collected. Group A patients received essential medicines (NLEM) and group B received medicines outside NLEM. Indian costs were converted to USD (per patient per month) and data is expressed as mean±SD/ median (range). **RESULTS:** Forty advanced NSCLC patients (age 55.4±10.5 years; 33% females; 38% nonsmokers; 25% local residents) were enrolled. Median treatment duration was 2.75 (0.33–14) months in group A (n=16) and 6.5 (0.5– 72) months in group B (n=24). Average cost incurred was 750.1 (235–5304) in group A and 541.1 (40–4258) in group B. Cost of medicines was 55.6 (0.5–2731) and 87.2 (3.6–2517) respectively. Cost of hospitalization did not differ significantly but cost of investigations was 103.3 (0–1175) and 69.1 (6.1–1468) respectively. Indirect costs were 398.9 (54.3–2564) and 234.3 (5.1–1777) respectively. Among these, transportation for outstation patients and work loss for young accounted for major expenditure. **CONCLUSIONS:** There has been a great emphasis on affordability of anticancer medicines in India. However, medicines accounted for only 1/5th costs in our study. Medical investigations and/or indirect costs substantially add to the overall financial burden. Additional measures such as judicious use of investigations and optimizing outpatient treatment are required to ensure treatment access in the absence of widespread medical insurance.

PCN71

THE COST OF OSTOMY CREATION DURING COLORECTAL RESECTION: ANALYSIS OF A NATIONAL HOSPITAL BILLING DATASET

Schiff A[1], Wei D[2], Yadalam S[3], Nagle D[4], Kalsekar I[3], Roy S[5]
[1]Johnson & Johnson (Ethicon), Cincinnati, OH, USA, [2]Johnson & Johnson, Raleigh, NC, USA, [3]Johnson & Johnson Co., New Brunswick, NJ, USA, [4]Johnson and Johnson, Cincinati, OH, USA, [5]Ethicon Inc, Somerville, NJ, USA

OBJECTIVES: Colorectal resection procedures often involve planned or unplanned creation of an ostomy that brings one end of the large/small intestine out through an opening made in the abdominal wall for passage of bowel contents. The study objective was to estimate the incremental hospital costs of patients undergoing ostomy formation in real world clinical practice. **METHODS:** We reviewed the Premier Perspective® Database containing billing data from over 600 hospitals in the U.S. Patients >18 years of age, undergoing a left hemicolectomy, sigmoidectomy, or lower anterior resection between 2008 through 2014 were included. Ostomy cases were identified using ICD-9 CM procedure codes for intestine exteriorization, colostomy, and ileostomy. Billing data were used to obtain hospital costs in 2014 US dollars. Multivariable Generalized Estimating Equation (GEE) models controlling for differences in patient, provider, and hospital characteristics were used to estimate the incremental hospital cost in patients with an ostomy compared to those who did not need an ostomy. Models accounted for clustering of hospitals; results were provided for the overall sample and by elective status. **RESULTS:** Of the 108,311 patients in the study, 30,625 (28%) had an ostomy. Results of the multivariate analysis indicated that the adjusted hospital costs were:$33,812[95% CI:$32,844-$34,809] for patients with ostomy and $19,501[95% CI:$19,026-$19,988] for patients without ostomy. This represented a 73.4% higher hospital cost ($14,311 higher) for patients with an ostomy ($p<0.01$). Breakdown of results by elective status showed that in patients undergoing elective colorectal surgery, the incremental cost of ostomy was 80.1% higher ($15,963 higher;$p<0.001$) and in non-elective surgeries, the incremental cost of ostomy was 34.4% higher ($ 11,701 higher;$p<0.01$). **CONCLUSIONS:** Nearly 30% of colorectal procedures involved an ostomy and the incremental impact on hospital costs was significant. Future research should include cost of reversal surgeries and the impact of these procedures on patient productivity and quality of life.

PCN72

TREE ANALYSIS OF FACTORS INFLUENCING THE COST OF SURGICAL RECTAL CANCER PATIENTS

Chen ZS[1], Leng JH[1], Gao GY[2], Liu Y[1], Zheng QW[1]
[1]Peking University Cancer Hospital, Beijing, China, [2]Capital Medical University, Beijing, China

OBJECTIVES: Colorectal cancer is one of the most common malignant gastrointestinal tumor in China,and rectal cancer accounts for about 70%.Rectal cancer has brought a great social burden in Beijing, but the economic burden still need to be identified.This study aimed to analyze the hospitalization expenses and fund reimbursements. **METHODS:** A retrospective analysis was conducted using the electronic database from Peking University Cancer Hospital.Patients (n=358) who were hospitalized for rectal cancer with surgery record during January 2014 to December 2015 were identified.The study applied Decision Tree Analysis to construct pivotal factors of hospitalization expenses and fund reimbursements. **RESULTS:** The average age was 62.28±12.06 years,the proportion of Urban Employee Basic Medical Insurance (UEBMI) was 94.97%,and the male accounted for 62.57%,the proportion of radical operation and fistula operation accounted for 91.34%,50.28%.According to the CN-DRGs,patients were mainly classified into GB25 group and GB23 group,and accounted for 53.91%,37.43%.The cost of per inpatient was 83206RMB,and there were no statistical differences in gender,age and medical insurance schemes,but there was a significant difference in operation radical or not ($P<0.001$);the cost of per inpatient with radical operation was 85102RMB,and the cost of per inpatient with palliative operation was 27876RMB.The fund reimbursement of per inpatient from government was 51675RMB,and there were significant differences in medical insurance schemes ($P=0.024$) and in operation fistula or not ($P=0.001$);the fund reimbursement of per inpatient with UEBMI and other insurance scheme was 52528,40057RMB respectively;and the fund reimbursement of per inpatient with operation fistula or not was 53699,50172 RMB respectively.Fitted by SPSS TREE model,the operation of the fistula or not and DRGs grouping were the main criteria for the patient's financial burden. **CONCLUSIONS:** Medical insurance schemes,types of surgical procedure and DRGs grouping affected the burden of patients;for tumor specialty, the government should give full play on the leverage role of health insurance,the medical institutions should refine the cost management strategies.

PCN73

EVALUATING THE ECONOMIC BURDEN AND HEALTH CARE UTILIZATION OF PROSTATE CANCER PATIENTS IN THE US DEPARTMENT OF DEFENSE POPULATION

Xie L[1], Vaidya N[1], Wang Y[1], Tan H[1], Baser O[2]
[1]STATinMED Research, Ann Arbor, MI, USA, [2]Columbia University and STATinMED Research, New York, NY, USA

OBJECTIVES: To examine the economic burden and health care utilization of Prostate Cancer (PC) in the US Department of Defense population.

METHODS: Patients diagnosed with PC (International Classification of Diseases, 9th Revision, Clinical Modification diagnosis code: 185) were identified using DoD data from 01OCT2010-31OCT2015. The first diagnosis date was designated as the index date. A comparison cohort was created for patients without PC but of the same age, gender, race, index year, and with similar baseline Charlson Comorbidity Index scores. The index date was chosen randomly for the comparison cohort to minimize selection bias. Patients in the disease and control cohorts were required to have continuous medical and pharmacy benefits for 1 year before and 1 year after the index date. Study outcomes, including health care costs and utilization, were compared between the disease and comparison cohorts using 1:1 propensity score matching (PSM) and were adjusted for baseline demographic and clinical characteristics. **RESULTS:** Eligible patients (N=14,428) with and without PC were identified. After 1:1 PSM matching, 6,378 patients were identified in each cohort; the baseline characteristics were well balanced. Patients with PC had a greater mean number of inpatient (0.48 vs 0.16; $p<0.001$), emergency room (ER) (0.63 vs 0.45, $p<0.001$), ambulatory (30.13 vs 14.88; $p<0.001$) and pharmacy (17.12 vs. 13.68, $p<0.001$) visits. Higher all-cause health care costs were also observed for PC patients, including mean inpatient ($6,275 vs $2,302; $p<0.001$), ER ($439 vs. $315; $p<0.001$), ambulatory ($14,376 vs $4,860; $p<0.001$), pharmacy ($1,095 vs. $1,036; $p=0.414$), and total costs ($22,185 vs $8,513; $p<0.001$). **CONCLUSIONS:** During a 12-month period, DoD beneficiaries diagnosed with PC had higher health care utilization and costs than their matched controls.

PCN74

REGULATORY APPROVAL AND PRICE ANALYSIS OF ANTI-ANDROGEN DRUGS MARKETED IN THE UNITED STATES AND USED IN HORMONAL THERAPY IN ADVANCED PROSTATE CANCER

Alsahali S[1], Alzarea AI[1], Seoane-Vazquez E[2], Al yahya S[1], Eguale T[1]
[1]*MCPHS University, Boston, MA, USA,* [2]*Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA*

OBJECTIVES: To assess the drug prices' and drug approval trends of Anti-androgen drugs approved for advanced prostate cancer until December 2016. **METHODS:** Luteinizing-hormone releasing hormone (LHRH) agonists, LHRH antagonists and Non-Steroidal Anti-Androgen drugs were included and information on approval of these drugs, approval date, type of review, active ingredient, route of administration, and indication were collected from Food and Drug Administration website. Drug prices were collected from Redbook issued by Truven Health Analytics. **RESULTS:** There are 4 medications of LHRH agonists in The US market and all of these medications are given parenterally. LHRH agonists' prices are based on frequency (Monthly, 2-months, 3-months, 4-months and 6-months) and route of administration (subcutaneous, intramuscular and subcutaneous implant). The price of Leuprolide given subcutaneously amount to only 37% of price of the drug given intramuscular for the same strength. Based on Defined Daily Dose, Histrlin has the lowest price of LHRH agonist (336 $/month) and is given by subcutaneous implant. There is only one drug from LHRH antagonist group in the US market (degarlix) (594 $/ month) after the discontinuation of abarelix in 2005 due to low sales. Non-Steroidal anti-androgen class includes 4 drugs taken orally and have more than 21 approved generics and represent about 53% of drugs approved for hormone therapy for prostate.**CONCLUSIONS:** The route of administration and frequency of taking medication may explain the variation in prices between LHRH agonists.Implant dosage form is the highest price over LHRH agonists, but its the lowest price based on defined daily dose per month. High number of generics approved may explain low price for non-steroidal anti-androgens compared to other groups of anti-androgen classes.

PCN75

A COST COMPARISON OF TREATMENT WITH ABIRATERONE ACETATE PLUS PREDNISONE IN THE PRE-CHEMOTHERAPY SETTING FOLLOWED BY ENZALUTAMIDE IN THE POST-CHEMOTHERAPY SETTING VERSUS THE OPPOSITE TREATMENT SEQUENCE IN METASTATIC CASTRATION RESISTANT PROSTATE CANCER PATIENTS WITH NON-VISCERAL METASTASES IN COLOMBIA

Gamboa O[1], Bonilla C[2], Varela R[2]
[1]*Instituto para la Evaluación de la Calidad y Atención en Salud-IECAS, Bogota, Colombia,* [2]*Instituto Nacional de Cancerología, Bogota, Colombia*

OBJECTIVES: To estimate and compare the costs associated with post androgen deprivation (post-ADT) therapy abiraterone acetate plus prednisone followed by post-chemotherapy enzalutamide ('AA+P→ENZ sequence') versus the opposite treatment sequence ('ENZ→AA+P sequence') in patients with non-visceral metastases. **METHODS:** A health-state transition cost consequence model was developed to assess patients with castration resistant prostate cancer who had non-visceral metastases. The model compares two treatment sequences: AA+P→ENZ versus ENZ→AA+P. Patients enter the model to receive AA+P or ENZ as post-ADT treatment. Those who discontinue treatment enter the active monitoring phase until they initiate docetaxel chemotherapy. Patients receiving chemotherapy are allowed to discontinue treatment and progress through active monitoring, post-chemotherapy ENZ or AA+P treatment, and palliative care states. Patients are subject to death at all times. The proportion of patients occupying a particular health state is assessed every month. Twenty years of time horizon was used to capture the whole life expectancy of patients. Costs and life-years were discounted at 3.5%. The payer's perspective was used. Drug acquisition costs, adverse events costs, drug administration costs, monitoring costs, and terminal care costs were taken into account. **RESULTS:** The total life time costs of the sequence AA+P→ENZ was less costly than sequence ENZ→AA+P; total savings per patient treated were USD$15,339.90 (Exchange rate USD $1 = COP$3,000). Most costs were generated during the post-ADT state (AA+P: USD$34,112.99 representing 69% of total life time costs; and ENZ: USD$52,368.60, representing 80%). Costs during doxetacel chemotherapy were USD$5,452.40 (11%) for AA+P and USD$5,791.40 (9%) for ENZ. Post-chemotherapy costs were USD$10,196.73 (20%) for AA+P→ENZ and USD$6,942.02 (11%) for ENZ→AA+P. **CONCLUSIONS:** Using currently available data and the presented modelling approach, the cost comparison treatment sequences suggests that starting treatment with AA+P may result in lower total life time costs than starting treatment with ENZ, and may yield to substantial savings per patient treated.

PCN76

COST THRESHOLD ANALYSIS OF GENOTYPE-GUIDED ASPIRIN USE FOR COLORECTAL CANCER PREVENTION

Biltaji E[1], Au T[1], Walker B[2], Ose J[3], Ulrich CM[3], Stenehjem D[1], Brixner D[4]
[1]*University of Utah, Pharmacotherapy Outcomes Research Center, Program in Personalized Health, Salt Lake City, UT, USA,* [2]*University of Utah, Pharmacotherapy Outcomes Research Center, Salt Lake City, UT, USA,* [3]*Huntsman Cancer Institute, Salt Lake City, UT, USA,* [4]*Personalized Health Care, University of Utah Health Sciences Center, Salt Lake City, MA, USA*

OBJECTIVES: Colonoscopy is the "gold standard" for colorectal cancer (CRC) screening. However, adherence rates are low and detection is not optimal. Concomitant aspirin chemoprevention is recommended by the US Preventive Task Force, but bleeding complications can be limiting. Variant genotypes in genes of aspirin metabolism can modify CRC and adenoma risk. Genotype-guided aspirin use can identify a targeted average risk population for maximal aspirin benefit, while minimizing adverse events rates compared to the general population. We conducted a cost threshold analysis of genotype-guided aspirin use for primary chemoprevention of CRC in healthy average risk individuals. **METHODS:** Our Markov de novo decision analytical model compared genotype-guided aspirin use to no intervention, and to colonoscopy ±general aspirin use. The model incorporated 5 possible health states based on the natural history of CRC progression; no cancer or polyps, adenoma, pre-clinical CRC, CRC, and death. Model probabilities for prevalence and likelihood of developing cancer were estimated using the SEER database and published literature. A microsimulation of 10,000 individuals aged 50-64 years was conducted to estimate the cost-effectiveness of genotype-guided ASA use for CRC prevention from a US payer perspective over a lifetime. **RESULTS:** When genetic testing costs were below $63, colonoscopy + genotype-guided aspirin use became the dominant strategy (i.e. lower cost and higher efficacy). When the costs for genetic testing were between $63-283, the costs of using genotype-guided aspirin per quality adjusted life year gained remained below $100,000, a commonly acceptable threshold for reimbursement in many countries. **CONCLUSIONS:** Genotype-guided aspirin use with colonoscopy can maximize benefit and decrease adverse event rates for preventing CRC compared to other screening strategies. The economic value of genotype-guided aspirin is dependent on the genetic testing costs.

PCN77

RELAPSED OVARIAN CANCER TREATMENT COSTS COMPARISON IN SPAIN

Fernandez jM, Garcia San Andrés B
Pharmamar, Colmenar Viejo, Spain

OBJECTIVES: To investigate, within the context of relapsed Ovarian Cancer's (OC) treatment, the associated costs to the Spanish National Healthcare System (NHS), using a patient segmentation based on platinum sensitivity: refractory/resistant (PR), partially Sensitive (PPS), fully sensitive (FPS); and the ones who are not suitable to receive further platinum treatments after previous relapse. Treatment ranks, based on cost-efficacy (CE) ratios, are then provided for all the above populations. **METHODS:** Survival data was collected from randomized controlled trials involving the main therapies approved on the relapsed OC setting. Acquisition and medical resource costs were sourced from the 2016 NHS price list. Health economics outcomes were the associated Incremental Cost Effectiveness Ratio (ICER) of every therapy compared to an appropiate reference by sensitivity. **RESULTS:** In PR patients, gemcitabine alone –followed by PLD- is the most cost-effective therapy, with an associated median cost of €47.1 per median survived month. In PPS patients, trabectedin plus DLP followed by a platinum based chemotherapy at relapse remains on top of the results, with an estimated ICER of €19,294 to €20,462 compared to DLP alone (with/out following platinum. Bevacizumab-based therapy rises to an ICER of €42,595; and the olaparib-based schema offers an estimated ICER of €24,841. Within the FPS stratum, carboplatin or paclitaxel plus PLD, are, by far, the cheapest treatment options, with estimated median costs per median survived month ranging from €84.1 to €166.7. Trabectedin plus PLD remains a cost-effective option for those with allergy or intolerance to platinum compounds-, with an estimated ICER of €46,095 vs. the reference therapy (PLD plus carboplatin). **CONCLUSIONS:** To our knowledge; this is the first study showing a comprehensive review on the relapsed OC treatment associated costs from the NHS perspective in Spain. Results assert the value of trabectedin plus PLD as therapy of choice for both OC PPS and intolerant to platinum patients.

PCN78

HEALTHCARE UTILIZATION AND COSTS AMONG POST-MENOPAUSAL WOMEN ON ADJUVANT ENDOCRINE THERAPY

Nduaguba SO[1], Chimah C[1], Barner JC[2], Schnur K[1]
[1]*The University of Texas at Austin, Austin, TX, USA,* [2]*The University of Texas at Austin, College of Pharmacy, Austin, TX, USA*

OBJECTIVES: Although aromatase inhibitors (AIs) have been shown to be more effective than tamoxifen (TMX) in delaying disease progression, reducing risk of recurrence, and improving survival among post-menopausal women with a history of breast cancer, both classes of drugs are recommended options for adjuvant endocrine therapy. We aimed to compare healthcare utilization and expenditures between the two drug classes. **METHODS:** This retrospective study

utilized 2010-2014 data from the Medical Expenditure Panel Survey and included women aged ≥55 years with a history of breast cancer who were treated with an AI or TMX within the past 5 years. Health care utilization and annual expenditures were compared between cohorts using linear and log-transformed regression. **RESULTS:** The cohorts contributed 221 patient-years (Weighted N = 2,610,777) with 182 (Weighted N=2,099,698) for AIs and 39 (Weighted N = 511,079) for TMX. In the unadjusted analysis, there was no statistical difference between both groups in overall annual expenditure ($16,030 (Standard error, SE= $1,931) vs $16,092 (SE=$1,573), $p>0.05$) and in mean number of events and expenditure for inpatient services, outpatient services, office-based visits, emergency room services, prescription drugs, and home health services ($p>0.05$). After adjusting for race/ethnicity, marital status, poverty category, smoking status, and comorbidities, the following expenditures were significantly ($p<0.001$) higher for women on AIs, compared to women on TMX: overall (62%; RR=1.62, 95% confidence interval (CI)=1.33-2.00) and for office-based visit expenditures (156%; RR=2.56, 95% CI=1.88-3.47), prescription drugs (75%; RR=1.75, 95% CI=1.33-2.32), and home health services (96%; RR=1.96, 95% CI=1.58-2.43). Number of office visits (35%; RR=1.35, 95% CI=1.17-1.56) and home health services use (19%; RR=1.19, 95% CI=1.13-1.26) were also higher for women on AIs compared to those on TMX ($p<0.001$). **CONCLUSIONS:** Among post-menopausal women with a history of breast cancer, being on an AI was associated with higher health-related expenditure, with office-based visits having the strongest influence.

PCN79

HEALTHCARE EXPENDITURES AMONG COMMUNITY-DWELLING ADULTS WITH THYROID CANCER IN THE UNITED STATES: A PROPENSITY SCORE MATCHED ANALYSIS

Bhattacharjee S[1], Khobrani M[1], Alrabiah Z[1], Bilal J[2], Riaz I[3]
[1]*The University of Arizona, Tucson, AZ, USA,* [2]*The University of Arizona, College of Medicine, Tucson, AZ, USA,* [3]*University of Arizona, Tucson, AZ, USA*

OBJECTIVES: This study assessed the excess healthcare expenditures and factors associated with it among community-dwelling adults with thyroid cancer compared to non-cancer controls in the United States (US). **METHODS:** We adopted a retrospective, cross-sectional, matched case-control study design by pooling Medical Expenditure Panel Survey (MEPS) data (2002-2012). The eligible study sample comprised of adults (age ≥ 21 years), who were alive during the calendar year and reported positive healthcare expenditure. We identified adults with thyroid cancer (cases) with Clinical Classification System code of "36". The control group consisted of adults who did not have any form of cancer. The case and control groups were matched on propensity score generated based on age, gender, race/ethnicity, smoking status and Body Mass Index. We conducted a series of Ordinary Least Square (OLS) regressions on log-transformed expenditures to elucidate the influence of different factors on healthcare expenditures (total, emergency room, inpatient, prescription, outpatient, home healthcare and other) among adults with thyroid cancer. We used semi-logarithmic equation ($e^{\beta}-1$) to calculate the percent difference in costs between cases and controls. **RESULTS:** The yearly average total healthcare expenditures among adults with thyroid cancer was significantly higher compared to propensity score matched controls ($9,734 vs. $6,329, $p<0.001$). Similar observations were found in terms of inpatient ($3,164 vs. 2,314, $p<0.05$), outpatient ($4,208 vs. 1,663, $p<0.001$), and prescription expenditures ($1,613 vs. 1,468, $p<0.001$). Functional status as well as comorbid conditions were significantly associated with excess expenditures among the case group compared to matched controls. For example, difference in total healthcare expenditures decreased from 182% to 90% when functional and health status and comorbidities were added to the OLS regressions. **CONCLUSIONS:** Our findings suggest that in this nationally representative sample of adults with thyroid cancer, functional and health status as well as comorbidities significantly influence the excess expenditures.

PCN80

ECONOMIC AND HUMANISTIC BURDEN OF HEPATOCELLULAR CARCINOMA IN THE UNITED STATES

Kohn CG[1], Miller JD[2], Sill B[3], Korytowsky B[4], Parikh N[5], Singh P[3]
[1]*University of Saint Joseph/Hartford Hospital Evidence-Based Practice Center, Hartford, CT, USA,* [2]*Truven Health Analytics, Cambridge, MA, USA,* [3]*Bristol-Myers Squibb, Plainsboro, NJ, USA,* [4]*Bristol-Myers Squibb, Princeton, NJ, USA,* [5]*University of MIchigan Health System, Ann Arbor, MI, USA*

OBJECTIVES: Hepatocellular carcinoma (HCC) has an increasing incidence in the US, with 29,000 new cases in 2016. To better understand the burden on the healthcare system, patients, and families/caregivers, published data were evaluated to document HCC-related economic and humanistic burden. **METHODS:** A targeted literature review was conducted, searching MEDLINE (2007-2016) as well as grey literature, public-use databases/websites, and conference proceedings; manual backward-citation tracking was also employed. Searches used disease-specific terms for HCC (any-stage) combined with terms for economic and humanistic burden. While the review focused on US studies, global studies were consulted where gaps existed. Costs are adjusted to 2016 US dollars. **RESULTS:** Initial search yielded 1,446 non-duplicate citations. Following title/abstract and full-text review, 43 studies met inclusion criteria. Patients receiving no proven treatments are common in the HCC population (39-60%) at all ages and levels of co-morbidity and liver dysfunction. One study reported 60% of patients were untreated, of which 23% were diagnosed with early disease, 13% with stage III, and 19% with metastatic disease. Quality of life (QoL) is notably worse in advanced-stage patients, with symptoms (particularly pain) associated with significant QoL decrement. Annual direct medical costs of HCC range from ~$40,000-70,000; with the highest costs reported in advanced disease (>$140,000 annualized). Indirect costs have been estimated at 10.8% of annual overall costs. Patients with advanced disease receiving no treatment incurred $27,067 in total medical expenses after diagnosis; this figure doubled for systemic chemotherapy and radiation, while patients treated with liver-directed therapies accumulated $79,136. **CONCLUSIONS:** These findings underscore the growing economic and humanistic burden of HCC. Patients diagnosed with advanced disease appear to have larger QoL decrements and incur significantly higher costs. To better guide treatment and reimbursement decision-making, additional research is needed to understand resource use, costs, and treatment consequences associated with advanced HCC.

PCN81

THE DIRECT COST OF BLADDER CANCER TO THE BRAZILIAN PUBLIC HEALTHCARE SYSTEM (SUS)

Rosim MP[1], Sarti FM[2], Riveros BS[3], Pedro GO[4], Lucchetta RC[3], Melo T[5], Volsi EC[6], Massaoka MH[6], Matsuo AL[6], Nita ME[7]
[1]*University of Sao Paulo, Sao Paulo, Brazil,* [2]*University of Sao Paulo, sao paulo, Brazil,* [3]*Federal University of Parana, Curitiba, Brazil,* [4]*SolVE, São Paulo, Brazil,* [5]*Heads in Health, Sao Paulo, Brazil,* [6]*AstraZeneca, Cotia, Brazil,* [7]*USP and FIPE/HAOC, Sao Paulo, Brazil*

OBJECTIVES: To identify direct costs of bladder cancer management in the Brazilian public health system. **METHODS:** Direct costs referring to inpatient and outpatient treatment for bladder cancer were obtained from national databases available at official information systems in 2014 (Hospital Information System, SIH/SUS and Outpatient Information System, SIA/SUS). Bladder cancer patients were identified using ICD-10 code. **RESULTS:** In 2014, 85,302 outpatient procedures were performed for bladder cancer treatment, resulting in direct outpatient costs of US$8,455,086. The Southeast region was responsible for major proportion of procedures performed in the country (45%). The intravesical chemotherapy was accounted for the highest share of total direct outpatient costs (more than US$4.8 million). Regarding inpatient procedures, there were 15,341 procedures performed, resulting in direct inpatient costs of US$21,424,079. The proportion of inpatient procedures among men was 2-3 higher than women. Of note, only US$6,231,257 of costs were related to treatment of female patients. The inpatient procedure performed more often was the resection of vesical lesion (more than 9,000 times); resulting in the highest share of direct inpatient costs (US$11,295,324). **CONCLUSIONS:** Considering the prevalence of bladder cancer in Brazil, the disease has significant economic impacts in the Brazilian public health system with a total direct medical cost of US$29,879,165. Although this amount corresponds to most of treatment cost, including for example chemotherapy, resection and radiotherapy, it is still underestimated by not including the costs related to adverse effects management. The results presented have potential to contribute to support strategic actions of public policies in health directed towards prevention and early diagnosis of bladder cancer.

PCN82

DIRECT NON-MEDICAL COSTS OF PATIENTS WITH TRACHEA, BRONCHUS AND LUNG CANCER IN RUSSIA

Gerasimova KV[1], Soshnikov S[1], Musina N[1], Nikitina A[2], Savilova A[3], Gorkavenko F[1]
[1]*I.M. Sechenov First Moscow State Medical University, Moscow, Russian Federation,* [2]*Center of Healthcare Quality Assesment and Control, Moscow, Russian Federation,* [3]*Moscow Institute of physics and technology (State University), Dolgoprudny, Russian Federation*

OBJECTIVES: The aim of the study was to assess the annual direct non-medical costs of patients with trachea, bronchus and lung (TBL) cancer in Russia in 2015 from the social perspective. **METHODS:** Direct non-medical costs were calculated for subgroups of TBL patients, stratified by the stages of cancer process using the cost-of-illness modeling. Total direct costs included disability pension and temporary social disability payments due to TBL cancer. Parameters of the model were obtained from the number of sources: National statistic surveillance system and National vital registration system (Federal State Statistics Service), National cancer registry, the Pension Fund of the Russian Federation, expert survey and metadata from the literature sources. The data was extracted according to the triangulation-combining method. The assessment of direct non-medical costs was made by the bottom-up costing approach. **RESULTS:** The total annual direct non-medical costs of patients with TBL cancer in Russia in 2015 were about $67.8 million ($506 per patient). Disability support pension payments were about $65.5 million (97% of direct non-medical costs), while temporary social disability payments were about $2.3 million (3% of direct non-medical costs). The total costs by newly diagnosed patients ($20.6 million) were in 2.3 times lower than for the patients diagnosed in previous years ($47.2 million). **CONCLUSIONS:** The results of the economic study demonstrate that TBL cancer impose a considerable economic burden on the economic system of Russian Federation. The support pension payments almost equal the total direct non-medical costs. These findings demonstrate the importance of further development and improving the TBL cancer treatment approaches and care of patients with disability due to TBL cancer.

PCN83

THE ECONOMIC BURDEN OF ILLNESS OF TREATING ADULT ACUTE LYMPHOBLASTIC LEUKEMIA IN CANADA

Nam J[1], Milenkovski RB[1], Yunger S[1], Geirnaert M[2], Seftel M[2]
[1]*Hoffmann-La Roche, Mississauga, ON, Canada,* [2]*CancerCare Manitoba, Winnipeg, MB, Canada*

OBJECTIVES: Acute lymphoblastic leukemia (ALL) is the most common malignant disease in pediatric patients, but is rare in adults. Thus, many adult treatment regimens and costing analyses are based on, or adapted from, pediatric protocols. This analysis aims to capture the costs of standard of care treatment regimens for adults who receive front-line therapy for Philadelphia chromosome-negative B-cell precursor ALL. **METHODS:** In Canada, HyperCVAD and Dana Farber Cancer Institute (DFCI) protocols represent the current standard of care regimens for adult ALL patients. This analysis collected drug, administration, physician services, laboratory tests and hospitalization costs. Resource use and costs were informed by published protocols, expert clinician experience, QuintilesIMS

DeltaPA, Ontario Case Costing Initiative and Ontario fee schedules. Costs were reported by treatment phase of each regimen. Uncertainty was explored through probabilistic and deterministic sensitivity analyses. **RESULTS:** The complete HyperCVAD and DFCI protocols are estimated to cost $51,863 and $35,036, respectively. Drug costs accounted for 18% of total costs in the HyperCVAD regimen as compared to 46% in the DFCI regimen; the remaining costs were driven by hospitalization ($31,965 vs. $13,770, respectively). Results were robust to the probabilistic sensitivity analysis. **CONCLUSIONS:** By using current cost data and recently modified chemotherapy regimens, this analysis represents the most up to date estimation of the cost of treating adult ALL patients. Both HyperCVAD and DFCI protocols pose considerable financial burden; the DFCI treatment protocol is estimated to cost the healthcare system more in drug costs but substantially less in hospitalization costs compared to the HyperCVAD protocol.

PCN84

INDIRECT COSTS AND BURDEN OF LUNG CANCER IN TERMS OF DISABILITY ADJUSTED LIFE YEARS DURING 2015 IN RUSSIA

Musina N[1], Nikitina A[2], Soshnikov S[1], Gorkavenko F[1], Savilova A[3]
[1]I.M. Sechenov First Moscow State Medical University, Moscow, Russian Federation, [2]Center of Healthcare Quality Assesment and Control, Moscow, Russian Federation, [3]Moscow Institute of physics and technology (State University), Dolgoprudny, Russian Federation

OBJECTIVES: The study was aimed to evaluate the total indirect costs of lung cancer (LC) and burden of disease during 2015 in Russia. This data could help to improve reimbursement processes and decision-making. **METHODS:** A systematic literature review was performed to obtain the following information: employment, length of hospital stay, average value of a statistical life, indicators of morbidity and mortality by age group and stage of LC. Finally, obtained data were used in cost-of-illness analysis. The total indirect costs of LC were calculated using two different approaches: the human-capital and friction-costs method. The cost of illness was calculated by a bottom-up approach. The global burden of LC was also assessed in terms of DALYs. The rate of discounting was 5%. **RESULTS:** In 2015, the indirect costs of LC were estimated at $1 689 million ($12 621 per patient) using human-capital method. The costs were more than six times higher in males than in females. Total annual indirect costs were evaluated at $14 million ($506 per patient) using friction-cost method. The DALYs burden for LC reached 1 307 837 years, including years of life lost due to premature mortality (14 744) and years lost due to disability (1 293 093). The cost in terms of DALYs was also estimated using the average cost of a statistical life, which was $73 484. The global burden of LC using DALYs and the average cost of a statistical life was estimated at $1 344 million. **CONCLUSIONS:** LC is a leading cause of cancer mortality and represents a significant burden of disease. The results suggest that LC deserve more attention from policymakers.

PCN85

REVIEW OF BURDEN OF ILLNESS DATA FOR FOLLICULAR LYMPHOMA AND MARGINAL ZONE LYMPHOMA

Monga N[1], Garside J[2], Quigley JM[3], O'Donovan P[3], Ward KE[3], Padhiar A[3], Parisi L[4], Tapprich C[5]
[1]Janssen Global Oncology, Toronto, ON, Canada, [2]Janssen, High Wycombe, UK, [3]ICON Health Economics & Epidemiology, Abingdon, UK, [4]Janssen Global Oncology, Raritan, NJ, USA, [5]Janssen Pharmaceuticals, Neuss, Germany

OBJECTIVES: Indolent Non-Hodgkin Lymphomas (NHL) including follicular lymphoma (FL) and marginal zone lymphoma (MZL) compromise approximately 12% of all NHLs worldwide. The aim of this review is to synthesize the global burden of disease for FL and MZL by characterizing the epidemiology, natural history, economic and societal impact of these indolent NHLs. **METHODS:** We ran searches in the EMBASE, Medline, NHSEED and ECONLit databases from January 2006 to November 2016. Outcomes of interest were incidence, prevalence, quality of life, costs and resource use, mortality and long-term prognosis. 1,946 potentially relevant abstracts were retrieved and reviewed. From this 54 full texts were reviewed, with 31 studies finally included in the review. **RESULTS:** We found that the age-standardised incidence rates of FL ranged from 2.1/100,000 to 4.3/100,000 while for MZL it varied geographically from 0.5/100,000 in Australia to 2.6/100,000 in the UK. The cumulative total direct health care costs for FL/MZL varied by whether patients experienced progressive disease (PD) or not, with a higher mean overall cost for PD patients compared to non-PD patients ($30,890 vs. $8,704 at 12 months). There was a clinically meaningful difference in quality of life between patients with PD and newly diagnosed patients (FACT-LYM total score 109.7 vs. 136.0 [score range 0-168]). Mortality rates of FL patients at 5 years differed according to age at diagnosis ($\leq$60 years: ranging 7.8-8.8%, $\geq$60 years: 17.9% and $>$80 years ranging 41.5-51.1%) and disease stage (21% at Ann Arbor stages 1-2 and 28% at Ann Arbor stages 3-4). Limited outcome data for MZL patients was identified. **CONCLUSIONS:** This comprehensive burden of illness review demonstrates that FL/MZL contribute significant burden on the health care systems and patients globally and delays in progression could lead to potential cost savings. New treatments are needed to improve patient outcomes and reduce the global burden of disease for FL/MZL patients.

PCN86

THE DIRECT COST OF HEAD AND NECK CANCER TO THE BRAZILIAN PUBLIC HEALTHCARE SYSTEM (SUS)

Rosim MP[1], Sarti FM[2], Riveros BS[3], Pedro GO[4], Lucchetta RC[3], Melo T[5], Volsi EC[6], Massaoka MH[6], Matsuo AL[6], Nita ME[7]
[1]University of Sao Paulo, Sao Paulo, Brazil, [2]University of Sao Paulo, sao paulo, Brazil, [3]Federal University of Parana, Curitiba, Brazil, [4]SolVE, São Paulo, Brazil, [5]Heads in Health, Sao Paulo, Brazil, [6]AstraZeneca, Cotia, Brazil, [7]USP and FIPE/HAOC, Sao Paulo, Brazil

OBJECTIVES: Since head and neck cancer (HNC) is known to have a high incidence and often demands invasive treatments, this study aimed to identify the direct costs of HNC management in the Brazilian public health system. **METHODS:** Inpatient and outpatient costs of HNC treatment in 2014 were obtained from databases available at official information systems in health (Hospital Information System, SIH / SUS and Outpatient Information System, SIA / SUS). HNC patients were identified by the ICD-10 code. **RESULTS:** In 2014, the treatment of HNC resulted in 41,386 inpatient procedures (approximately 30,000 patients), with a cost of US$39,697,795; from which 66% was attributed to male patients. Resection of tumors/lesion was performed 5,197 times, resulting in a cost of more than US$4 million and the admission for continuous administration chemotherapy resulted in add cost of almost US$2 million. Regarding outpatient care, US$18,972,113 were spent in a total of 59,545 procedures, in which 81% was spent with male patients. The most outpatient procedures were chemotherapy applied to sinuses/larynx/hypopharynx/ oropharynx/oral cavity, with a total of 21,724 events and US$8,405,026. **CONCLUSIONS:** As expected, HNC is a group of diseases associated with high costs and very invasive treatments, leading to a high economic and social burden. The total medical direct cost of HNC treatment in 2014 was US$58,669,908 for the Brazilian public healthcare system. However, this amount is still underestimated by not including costs with adverse effects management, since this is a hallmark of head and neck cancer.

PCN87

HEALTH INSURANCE COST OF BRAIN CANCER IN HUNGARY: A COST OF ILLNESS STUDY

Oberfrank F[1], Donka-Verebes É[2], Boncz I[3]
[1]Institute of Experimental Medicine, Budapest, Hungary, [2]Integra Consulting Zrt., Budapest, Hungary, [3]University of Pécs, Pécs, Hungary

OBJECTIVES: The aim of our study is to calculate the annual health insurance treatment cost of brain cancer in Hungary. **METHODS:** The data derive from the financial database of the Hungarian National Health Insurance Fund Administration (NHIFA), the only health care financing agency in Hungary. We analyzed the health insurance treatment cost and the number of patients for the year 2010. The following cost categories were included into the study: out-patient care, in-patient care, CT-MRI, PET, home care, transportation, general practitioner, drugs and medical devices. Brain cancer was identified with the following codes of the International Classification of Diseases 10threvision: C70-C72, D32-D33, D42-D43. **RESULTS:** The Hungarian National Health Insurance Fund Administration spent 3.071 billion Hungarian Forint (HUF) (14.758 million USD) for the treatment of patients with brain cancer. The annual average expenditure per patient was 145673 HUF (699.9 USD) while the average expenditure per one inhabitant was 307 HUF (1.7 USD). Major cost drivers were acute inpatient care (49.2 % of total health insurance costs), pharmaceuticals (35.7%) and CT-MRI examinations (8.5 %). The number of patients with brain cancer was 21.1 per 10000 populations. We found the highest patient number in outpatient care (21088 patients) general practitioners (8915 patients) and pharmaceuticals (6620 patients). **CONCLUSIONS:** Brain cancer represents a significant burden for the health insurance system. Reimbursement of acute inpatient care and pharmaceuticals are the major cost drivers for brain cancer in Hungary.

PCN88

COSTS OF BREAST CANCER RELATED CARE AMONG WOMEN IN THE UNITED STATES INSURED COMMERCIALLY, AND BY MEDICARE AND MEDICAID – A SYSTEMATIC REVIEW

Lingohr-Smith M, Deitelzweig C, Menges BL, Lin G
Novosys Health, Green Brook, NJ, USA

OBJECTIVES: Breast cancer is the second most common cancer among women in the US. The objectives of this study were to conduct a systematic review of recent publications that evaluated the costs of care of women with breast cancer in active treatment and stratify the costs by payer type. **METHODS:** A systematic review of PubMed from January 2010 to December 2016 was conducted to identify relevant publications. The initially identified abstracts were reviewed to select full text manuscripts containing details of breast cancer costs and cost estimating methodology. From the identified publications, cost data were extracted and reviewed by 2 independent researchers. The extracted data contained breast cancer related cost information during active cancer treatment among women with specific payer types. All retrieved cost data were inflation adjusted to 2016 USD. **RESULTS:** Of the studies included (n=15), 4 were from a commercial payer perspective, 8 were from a Medicare perspective (4 evaluated radiation therapy cost only), and 3 were from a Medicaid perspective. For commercial payers and Medicare, breast cancer related care costs during 12 months of active treatment averaged $61,420 per patient (standard deviation (SD): $7,166, median: $58,648) and $28,906 per patient (SD: $6,741, median: $27,760), respectively. Costs for outpatient care ($39,905 per patient, SD: $14,195, median: $38,448) contributed most to the overall costs of breast cancer related care for commercially-insured patients. Outpatient care was inconsistently defined across studies of Medicare-insured women, but reported radiation therapy costs averaged $12,482 per patient (SD: $4,444, median: $11,347). Cost data for breast cancer related care among Medicaid beneficiaries is limited. **CONCLUSIONS:** The cost of breast cancer related care varies across payer types, with commercial payers having the greatest burden per patient in the US. For more reliable cost estimates, especially from the perspective of Medicaid, further study is warranted.

PCN89

DIRECT MEDICAL COSTS FOR STAGE-SPECIFIC BREAST CANCER IN JORDAN

Alefan Q, Sa'deh A, Yaghan RJ
Jordan University of Science & Technology, Irbid, Jordan

OBJECTIVES: This study aimed to estimate the direct medical costs associated with the care of breast cancer patients by disease stage. **METHODS:** A retrospective analysis of a cohort of patients with BC treated for 12 months in 2015 in KAUH.

Demographic, clinical and economic data was collected. Statistical analysis will be performed using SPSSTMfor Windows and a p value of < 0.05 is defined as statistically significant. **RESULTS:** A total of 119 female patients with BC were identified. Their mean age was 50.82 ±10.22 years. The total cost for the sample was JD 1,393,325. Mean cost per patient from stage I to IV was JD 6,696; 9,183; 11,970 and 15,073; respectively. Medications (mainly chemotherapy) were the most expensive healthcare resource used, accounting for 75% of total cost, followed by laboratory and diagnostic test. **CONCLUSIONS:** This study is the first to examine the impact of breast cancer on health system resources in Jordan Direct medical costs associated with BC are substantial. The vast majority of the cost was devoted for medications. Stage IV was associated with the highest cost and the largest number of patients.

PCN90

ADHERENCE TO CANCER THERAPIES AND THE IMPACT ON HEALTHCARE COSTS AMONG PATIENTS WITH ADVANCED MELANOMA IN THE USA

Gupte-Singh K[1], Lin J[2], Lingohr-Smith M[2], Menges BL[2], Rao S[1]
[1]Bristol-Myers Squibb, Princeton, NJ, USA, [2]Novosys Health, Green Brook, NJ, USA

OBJECTIVES: To evaluate adherence to cancer therapies among patients with advanced melanoma and quantify the impact of drug adherence on healthcare costs. **METHODS:** Patients (≥18 years) with a diagnosis for stage III/IV melanoma who initiated cancer therapies were identified from the MarketScan Commercial and Medicare databases (1/1/2011-8/31/2015). Demographic and clinical characteristics were evaluated at baseline (12 months preindex). Medication adherence and persistence were examined during a variable length follow-up period for up to 24 months. Patients were grouped into 2 study cohorts: those with high adherence (medication possession ratio, MPR≥0.8) and those with low adherence (MPR<0.8) to the index cancer therapy. All-cause and melanoma-related costs were measured as per patient per month (PPPM, 2015 USD) at follow-up and compared among study cohorts. A multivariate generalized linear model was used to evaluate the impact of adherence status on healthcare costs, while controlling for key patient characteristics. **RESULTS:** In the overall study population (N=2,671), the mean[±SD] age of the patients was 60.9[±13.3] years, 63.6% were male, with a mean[±SD] Charlson comorbidity index score of 8.8[±2.0], and 85.5% had stage IV melanoma. 49.1% of the patients were on an immunotherapy and 94.7% of those patients recieved ipilimumab. The mean[±SD] MPR of patients decreased as the duration of follow-up increased, ranging from 0.75[±0.24] at 3 months to 0.44[±0.29] at 24 months of follow-up. Nearly three-fourths (72.4%) of the patients discontinued their index therapy within 3 months. After controlling for patient characteristics, those with high vs. low adherence had lower mean PPPM all-cause total cost ($41,830 vs. $51,991; p<0.001) and melanoma-related total cost ($37,549 vs. $48,263; p=0.006).**CONCLUSIONS:** A majority of patients with advanced melanoma have low adherence and discontinue therapy in ≤3 months. Patients with high adherence to cancer therapies have lower all-cause and melanoma-related total costs than patients with low adherence.

PCN91

COSTS OF MANAGING PATIENTS WITH RELAPSED OR REFRACTORY HODGKIN LYMPHOMA (RRHL) IN THE USA

Szabo SM[1], Johnston KM[1], Juarez-Garcia A[2], Connors JM[3]
[1]Broadstreet Health Economics & Outcomes Research, Vancouver, BC, Canada, [2]Bristol-Myers Squibb, Princeton, NJ, USA, [3]British Columbia Cancer Agency Centre for Lymphoid Cancer (BCCA CLC), Vancouver, BC, Canada

OBJECTIVES: Treatment options for RRHL patients post-autologous stem cell transplant (ASCT) are limited. Newer therapies including brentuximab vedotin (BV) may improve outcomes. Understanding contemporary use of these medications is important, as they may be costly. We identified costs of care for a cohort of RRHL patients treated with ASCT in the USA, according to timing of BV treatment. **METHODS:** We identified 401 adult RRHL patients treated with ASCT after failing first-line therapy between 2006–2015, using the Truven MarketScan databases. Line of therapy was classified based on dispensations and chemotherapy administration, and duration of line of therapy was considered from initiation of one therapy line until initiation of the next (or until censoring). All-cause healthcare resource use during each therapy line was used to estimate mean (standard deviation) per patient monthly and total costs, inflated to 2015 US dollars ($). **RESULTS:** Three hundred and seventy (92.3%) patients were BV-naïve, 8 (2.0%) had BV pre-ASCT, and 23 (5.7%) had BV post-ASCT. Mean monthly costs among BV-naïve patients were $28,580 (48,202) over a median follow-up of 77 weeks post-ASCT, $53,767 (51,272) for those with BV prior to ASCT over 51 weeks, and $27,976 (17,241) for those with BV after ASCT over 88 weeks. Mean monthly costs for BV-naïve patients increased with lines of therapy post-ASCT, but were relatively stable among those with BV post-ASCT. Total costs from time of ASCT to end of follow-up were $381,810 (388,888) for BV-naïve patients, $560,927 (295,827) for those with BV pre-ASCT, and $422,741 (184,194) for those with BV post-ASCT. **CONCLUSIONS:** Mean monthly costs for managing RRHL patients are approximately $28,000, and total costs are $380,000 per patient treated. Small samples and shorter follow-ups limit the relevance of estimates from those with BV pre-ASCT. These data highlight the high economic burden associated with managing RRHL patients.

PCN92

COMORBIDITY MEASURES TO PREDICT HEALTHCARE COSTS AMONG ELDERLY GYNECOLOGIC CANCER SURVIVORS IN THE US: AN ANALYSIS OF SEER-MEDICARE DATA

Park C[1], Lawson KA[1], Barner JC[2], Powers DA[1], Rascati KL[1], Wilson JP[1]
[1]The University of Texas at Austin, Austin, TX, USA, [2]The University of Texas at Austin, College of Pharmacy, Austin, TX, USA

OBJECTIVES: To examine relationships between different comorbidity indices and healthcare costs, and to compare the performance of these indices in predicting healthcare costs among elderly gynecologic cancer survivors. **METHODS:** This retrospective study used 2007-2010 Surveillance, Epidemiology, and End Results (SEER)-Medicare data. The primary independent variables were comorbidity indices [Charlson Comorbidity Index (CCI), Elixhauser Comorbidity Index (EI), National Cancer Institute (NCI) index, Chronic Disease Score (CDS) and RxRisk]. The dependent variables were costs for emergency room (ER)/inpatient visits, outpatient visits, office-based practitioner visits, prescriptions, and total healthcare. Gamma regressions with a log link were used for the analyses. The Akaike Information Criterion, Bayesian Information Criterion, and Likelihood ratio tests were used to compare the predictive ability of the indices. **RESULTS:** The mean total annual healthcare cost for the 4,063 survivors studied was $40,605 (SD=$34,014). In the unadjusted models, indices (except the CDS-2 and RxRisk) were positively significantly associated with ER/inpatient visit and total healthcare costs. In the adjusted models, CCI and CDS-1 scores and several EI indicators were positively significantly associated with higher ER/inpatient visit and total healthcare costs after controlling for covariates. None of the indices (except a few EI indicators) were associated with outpatient visit, office-based practitioner visit, or prescription costs in the models. CCI and CDS-1 scores outperformed other indices in predicting ER/inpatient visit and total healthcare costs. **CONCLUSIONS:** This study found meaningful associations between different comorbidity indices and ER/inpatient visit and total healthcare costs among elderly gynecologic cancer survivors in the US. Study findings suggest using the CCI and CDS-1 scores in predicting ER/inpatient visit and total healthcare costs in this population. This study may help payers in their budgeting by identifying comorbid conditions associated with higher costs, and health economists choose the better comorbidity indices to use in their research.

PCN93

HEALTHCARE RESOURCE UTILIZATION AND COSTS OF SKELETAL-RELATED EVENTS IN PATIENTS WITH MULTIPLE MYELOMA

Bhowmik D[1], Hines DM[2], Intorcia M[3], McGuiness CB[2], Wade RL[2]
[1]Amgen Inc., Thousand Oaks, CA, USA, [2]QuintilesIMS, Plymouth Meeting, PA, USA, [3]Amgen (Europe) GmbH, Zug, Switzerland

OBJECTIVES: Skeletal-Related Events (SREs) (defined as spinal cord compression, pathological fracture, radiation or surgery to bone) are common bone complications of patients with multiple myeloma (MM). Clinical guidelines recommend prophylactic management for prevention of SREs, as SREs can be debilitating, and are associated with poor clinical outcomes and high costs. This study estimated economic burden of SREs in MM. **METHODS:** In this retrospective cohort study, adults with ≥1 inpatient or ≥2 outpatient MM diagnoses between 01/01/2010 and 12/31/2014 were identified from the QuintilesIMS' PharmetricsPlus healthcare claims database. First SRE date on or after first MM diagnosis was the index date. All patients had ≥12-months of continuous enrollment pre-index and ≥1 month post-index. Patients with SRE(s) were propensity score matched 1:1 to MM patients without SREs (controls) using pre-index demographic, clinical characteristics, and costs. Patients were followed until the earliest of last enrollment date, or 12/31/2015. The average per-patient per-year (PPPY) healthcare resource utilization (HRU) and costs were measured during follow-up. McNemar's test and Wilcoxon test were conducted to assess HRU and cost. **RESULTS:** A total of 848 patients with SREs and 848 matched controls met the study criteria (mean age: 61 years; male: 57%; mean follow up: 22 months). SRE and control groups were well-matched. Compared to controls, SRE patients had significantly higher proportions and frequency of hospitalizations (72.4% vs. 41.2%; and 1.7 vs. 0.7, respectively), emergency room visits (55.5% vs. 42.9%; and 1.1 vs. 0.7, respectively), and higher all-cause total costs ($188,723 vs. $108,160) PPPY [p<0.0001]. Primary cost drivers were hospitalizations and outpatient ancillary costs, PPPY cost differences between matched cohorts were $36,775 and $16,646, respectively. **CONCLUSIONS:** Significant economic burden was observed with SREs in patients with MM (almost 2-fold more hospitalizations and $80K PPPY additional cost). This study demonstrates the importance of prophylactic management of SREs in MM.

PCN94

CLINICAL AND COST OUTCOMES ASSOCIATED WITH MULTIPLE OPEN SURGICAL PROCEDURES FOLLOWING PERCUTANEOUS BREAST BIOPSY

Nichols CI, Kimball CC, Vose JG
Medtronic Advanced Energy, Portsmouth, NH, USA

OBJECTIVES: This study estimated the proportion of patients requiring multiple open surgical procedures following percutaneous breast biopsy, including associated complications and incremental medical costs. **METHODS:** Healthcare claims data from the Truven Commercial Research database (2009 - 2014) was used to identify patients undergoing percutaneous biopsy in an outpatient setting for this retrospective database analysis. Patient selection criteria included: female; continuous health plan enrollment; no previous history of cancer, chemotherapy, radiation, or breast cancer surgery. Open procedures were defined as an open biopsy or lumpectomy. Study follow-up was defined as 90 days from initial percutaneous biopsy; or until the first date of chemotherapy, radiation, or mastectomy—to limit analysis to diagnosis-related costs. **RESULTS:** 143,771 patients were identified for analysis with mean age 47 to 54 years. Eighty-five percent of patients underwent only a percutaneous biopsy, 12.4% underwent one open procedure, and 2.5% had multiple open procedures. Incidence of any complication was significantly lower among those with no open procedure (9.3%) versus patients with one open (15.6%) or multiple open procedures (25.3%, P<0.001). Mean incremental breast-related medical costs were $14,257 greater among patients with one open procedure versus none ($18,828 vs. $4,571, P<0.001); and $4,982 greater among patients with multiple open procedures versus one ($23,811 vs. $18,828). In logistic regression, factors associated with multiple open procedures included: diagnosis of breast cancer, any complication, region, ages 41-50 (vs ≤ 40), initial percutaneous biopsy procedure setting, and

initial open procedure setting. **CONCLUSIONS:** This study demonstrates there are a proportion of women that require multiple open procedures following initial percutaneous biopsy for diagnosis of a suspicious lesion. There is a need for more patient-centered approaches for the diagnosis of suspicious lesions to minimize the use of open diagnosis-related procedures.

PCN95

REAL-WORLD TREATMENT PATTERNS AND COSTS IN MEDICARE BENEFICIARIES NEWLY DIAGNOSED WITH ACUTE MYELOID LEUKEMIA

Stein EM[1], Latremouille-Viau D[2], Guerin A[2], Shi S[2], Gagnon-Sanschagrin P[2], Briggs O[3], Bonifacio G[3], Joseph G[3]
[1]Memorial Sloan Kettering Cancer Center, New York, NY, USA, [2]Analysis Group, Inc., Montreal, QC, Canada, [3]Novartis Pharmaceuticals, East Hanover, NJ, USA

OBJECTIVES: Little is known on treatment patterns and costs of acute myeloid leukemia (AML) management in US clinical practice. This study describes induction therapy and consolidation cycles in terms of settings, duration, and costs of Medicare beneficiaries with AML who are candidates for standard chemotherapy. **METHODS:** Using the SEER-Medicare databases, Medicare beneficiaries newly diagnosed with AML from 2007-2011 who received standard induction chemotherapy in an inpatient setting were selected. Patients were observed from induction therapy initiation to the first event among hematopoietic stem cell transplant, death, end of Medicare coverage/data availability, or 180-days after the end of the induction episode. AML treatment episodes, including induction therapy and consolidation cycles, were identified using DRG/procedure codes. AML treatment episode settings, duration, and costs (USD2015, public payers' perspective) were analyzed. **RESULTS:** Of the 563 Medicare beneficiaries (mean age=66 years; 54% male) with a first induction episode, 193 (34%) patients had 2 cycles of induction therapy during this episode. The median duration of inpatient stays with 1 cycle of induction therapy was 28 days and mean costs were $64,680. The median duration of inpatient stays with 2 cycles of induction therapy was 47 days and mean costs were $126,096. Following induction therapy, 297 (53%) patients had ≥1 consolidation cycle, 231 (40%) ≥2, 148 (26%) ≥3, and 87 (15%) ≥4. 65% of consolidation cycles were administered in an inpatient setting and 35% in an outpatient setting. In the inpatient setting, the median duration per cycle was 6 days and mean costs were $28,843. In the outpatient setting, the median duration per cycle was 5 days and mean costs were $5,803. **CONCLUSIONS:** This is the first exploratory study reporting recent treatment patterns and costs of Medicare beneficiaries newly diagnosed with AML. These findings suggest that, there is substantial heterogeneity in the consolidation therapy setting and costs.

PCN96

HOSPITAL BURDEN FOR TREATING PROSTATE CANCER (PCA) WITH BONE METASTASIS (WBM) PATIENTS IN THE BRAZILIAN SUPPLEMENTARY HEALTH SYSTEM: RESULTS FROM A RETROSPECTIVE ANALYSIS OF AN ADMINISTRATIVE DATABASE

Tobaruella F[1], Rodrigues SR[2], Navarro S[1], Nakada C[1], Paiva EC[3], Paloni Ed[3]
[1]Bayer Pharmaceuticals, São Paulo, Brazil, [2]Universidade de São Paulo, São Paulo, Brazil, [3]Orizon, Barueri, Brazil

OBJECTIVES: Prostate cancer places a high economic burden on healthcare systems globally. International studies demonstrated significant impact to the health system, mainly due to increased hospitalization of advanced disease patients. In Brazil, a cohort study evaluated PCa medical-cost in an HMO resulting in R$4.640/year, with most of patients in earlier treatment stage. This study aims to evaluate medical-costs for the treatment of patients with PCa-wBM in the Brazilian Supplementary Health System (SHS). **METHODS:** This was designed as a retrospective database cohort study from an administrative database (Orizon) that covers part of the Brazilian SHS, during the period of Jan/2010-Dec/2015. The analysis focused on hospital costs and medical resources consumption of patients registered in the database with prostate cancer and bone metastasis according to selection criteria: ICD-10:C-61 register followed by ICD-10:C795 or M907 or register of bone-metastasis procedures; at least one PCa treatment and hospitalization or ambulatory admission. Study outcomes were: annualized overall hospital cost per patient, prostate cancer treatment types distribution, average hospital visits and Length of Stay(LOS).Currency rate:US$1=R$3,23. **RESULTS:** A cohort of 181 patients met the selection criteria for the study. During the follow-up period 21,5% of the patient cohort had exclusively one type of treatment, whereas 37,5% had Radiotherapy(RT), Hormonetherapy(HT) and Oncologic-therapy. Average cost/entrance was R$10.300, hospitalization and ambulatory costs was R$36.853 and R $5.627 respectively. Patient had entered the hospital 8,04-times per year, of which 4,20-times was hospitalized with an average LOS/hospitalization of 10,64-days. Annualized hospital cost/patient was R$128.607. Sub-group analysis had shown RT average cost/entrance of R$3.001 and oncologic-therapy of R$4.340. HT average cost/entrance was R$16.614, with disparity between ambulatory and hospitalization, R$4.538 and R$42.140 respectively. **CONCLUSIONS:** This cohort study showed high economic burden of hospital treatment of PCa wBM in the Brazilian SHS compared to previous study, mainly due to advanced disease stage that requires frequent hospital entrance and stay.

PCN97

UTILIZATION OF TARGETED THERAPIES WITH COMPANION DIAGNOSTICS IN MEDICARE CANCER PATIENTS 2011 - 2015

Wang Y, Stevens A
WG Group, New York, NY, USA

OBJECTIVES: Targeted therapy attacks specific types of cancer cells. Companion diagnostics (CDx) aid in the identification of candidates who may benefit from a targeted therapy. This analysis was conducted to understand the trend of targeted therapy/CDx utilization under Medicare, 2011-2015. **METHODS:** Therapies were selected based on FDA cleared/approved CDx. We analyzed Medicare Part D drug spending (2011-2015) published by CMS in 2016 for each therapy. Analysis was limited to therapies with a single cancer indication requiring CDx. Further analysis considering all targeted therapies with CDx were conducted to understand impacts of the therapy exclusion criteria. **RESULTS:** From 2011 to 2015, the number of targeted cancer therapy beneficiaries increased from 498 to 7,133. The Medicare spend increased from $9,547,737 to $293,607,643, also increasing as part of the overall Medicare Part D spend (0.01% to 0.21%). PMPM increased from $0.0163 to $0.4408. In 2011, the total spend as part of the overall spend on these included therapies was led by melanoma (61.24%), followed by non-small cell lung cancer (NSCLC) (33.76%) and colorectal cancer (CRC) (5.00%). This trend has changed and by 2015, there was increased utilization of targeted therapies for NSCLC (51.58%), followed by melanoma (36.32%), ovarian cancer (9.65%), breast cancer (2.03%) and CRC (0.42%). In 2015, the annual spend per beneficiary ranged from $15,919 (Gefitinib) to $70,967 (Crizotinib), and the cost sharing was 0.0045-0.5110% for beneficiaries who qualified for a Low Income Subsidy (LIS), and 5.1%-17.1% for those who do not qualify for LIS. Further analysis demonstrated a similar trend in the therapy utilization. **CONCLUSIONS:** The Medicare spend on targeted cancer therapies requiring CDx increased 2011-2015, and also increased as part of the overall Medicare Part D spend. It is expected that this trend may continue, driven by the increasing adoption of targeted therapies in clinical practice, and the target therapies currently under development.

PCN98

PRICE ANALYSIS OF THYROID CANCER- TYROSINE KINASE INHIBITOR DRUGS MARKETED IN THE US

Alyahya S[1], Alqahtani S[2], Eguale T[1], Seoane-Vazquez E[3]
[1]MCPHS University, Boston, MA, USA, [2]MCPHS, Boston, MA, USA, [3]Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA

OBJECTIVES: Tyrosine kinase inhibitor therapy (TKI) is a type of targeted therapy that inhibit signals needed for cancer cells to grow and divide. In this study we assessed the trends in average wholesale prices (AWP) at market entry for thyroid cancer – targeted therapy approved by the US Food and Drug Administration (FDA). **METHODS:** Regulatory information was derived from the FDA website. AWP per unit at market entry data were derived from the RedBook (Truven Health Analytics, Inc.). The AWP history was collected from year of approval to January 2017. The daily defined dosage (DDD) for adult patients was obtained from FDA approved labels. AWP per DDD and 30 DDD were computed. AWPs were adjusted to for inflation by using the consumer price index (CPI). Descriptive statistics were performed in this study. **RESULTS:** The FDA approved 6 tyrosine kinase inhibitor drugs for the indication of thyroid cancer in the period 2005-2016. The first TKI for thyroid cancer was approved in 2005 and the deactivated in January 2008 with and AWP of $174.90 per DDD, and then returned to the market on July 2008 with the same strength and package and with an AWP of $604.50 which represents a 246% increase in the previous price. The median AWP per DDD at market entry was $391.43. The FDA-approved TKIs typically increased their AWP prices twice a year. The AWP per DDD at market entry of the last approved TKI in 2015 was 552% higher than the AWP per DDD at market entry of the first approved TKI in 2005. The AWPs per DDD at market entry were $163.01, $372.96, $409.91, $1,358.58, $363.96, and $1,063.60 respectively during the time of study. **CONCLUSIONS:** The market entry prices of TKIs for thyroid cancer substantially increased over the period of study.

PCN99

DIRECT MEDICAL COSTS OF LUNG CANCER PATIENTS TREATED IN FIRST LINE WITH GEFITINIB OR ERLOTINIB IN THE BRAZILIAN PRIVATE HEALTHCARE SYSTEM

Matsuo AL[1], Custodio MG[1], Paloni Ed[2], Andreghetto FM[1]
[1]AstraZeneca, Cotia, Brazil, [2]Orizon, Barueri, Brazil

OBJECTIVES: To evaluate the direct medical costs (DMC) in patients with lung cancer treated with gefitinib or erlotinib in first line and subsequent therapies. **METHODS:** The Orizon is an administrative database containing over 18 million lives of the Brazilian Private System. Eligibility criteria were patients treated in first line with any TKI with ICD-10 code C34 from 2013 to 2015. Monthly DMC were calculated as the sum of medical claims for each patient during treatment and all results were represented by the mean values with an exchange rate of 1 USD = 3.23 BRL. **RESULTS:** A total of 55 patients were treated with any TKI in first line. Results of DMC in gefitinib group was USD 1,463.32 (BRL 4,726.54) per month, while the erlotinib group was USD 4,369.77 (R$ 14.114,37), resulting in an average cost increase of 2.9 times, mainly due to the higher erlotinib cost and hospitalizations. In terms of length of treatment (LOT) results were similar between both medicines, patients were on gefitinib therapy for 7.6 months and erlotinib for 7.9 months. We also evaluated 26 patients in second line, after TKI therapy, where the most common were pemetrexed monotherapy or in combination with other drugs resulting in a monthly DMC of USD 5,492.50 (R$ 17,740.78) with a LOT of 5.0 months and bevacizumab plus chemotherapy with a monthly DMC of USD 11,134.98 (R$ 35,966.01) and a LOT of 4.8 months. **CONCLUSIONS:** Monthly costs with patients treated in first line with gefitinib were lower than erlotinib and presented a similar mean length of treatment duration. It was noteworthy that monthly costs of precision medicine therapies were much lower than chemotherapy schemes in the Brazilian private setting.

PCN100

PALBOCICLIB DOSING, WASTAGE AND COSTS AMONG POST-MENOPAUSAL WOMEN WITH HORMONE RECEPTOR POSITIVE AND HUMAN EPIDERMAL GROWTH FACTOR RECEPTOR 2 NEGATIVE (HR+/HER2-) METASTATIC BREAST CANCER (MBC): A CLAIMS ANALYSIS

Princic N[1], Brouillette M[2], Tang D[3], Lanoue B[3], Barghout V[4]
[1]*Truven Health Analytics, an IBM company, Reading, MA, USA,* [2]*Truven Health Analytics, an IBM company, Cambridge, MA, USA,* [3]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA,* [4]*VEB Healthcare LLC., Morristown, NJ, USA*

OBJECTIVES: To examine dosing patterns among HR+/HER2- mBC patients treated with palbociclib during second or later lines of therapy in real-world medical practice. **METHODS:** Postmenopausal women with HR+/HER2- mBC treated with palbociclib-based second (2L), third (3L) or fourth (4L) lines of therapy were identified from MarketScan US claims databases during 1/1/2013- 7/31/2016 (earliest secondary malignancy diagnosis was index). Patients had continuous health plan enrollment for at least 6 months pre-/post-index and valid data for dose calculations. Dose modification was defined as a change in daily dose of $>$ 25 mg compared to the prior prescription. Patients with an overlap in supply preceding a modification were identified to estimate cost of potential drug wastage. Wastage costs were computed by applying wholesale acquisition costs (January 2017) to each day of overlap. **RESULTS:** Of 811 eligible mBC patients treated with palbociclib (mean age 58.8 + 11.5), there were 249, 172, and 102 with a 2L, 3L, and 4L of therapy respectively. Initial mean dose in mg was 94.8 + 13.9 during 2L, 96.5 + 13.1 during 3L, and 90.7 + 16.1 during 4L. The proportion of patients with dose modification was 41.8% (2L), 37.2% (3L) and 22.5 % (4L) driven by dose decreases (35.7% in 2L to 19.6% in 4L). Of patients with modification, 41-44% had an overlap in supply prior to the change (10.9 + 9.0 days in 2L to 14.2 + 7.7 days in 4L) which lead to $5,418 - $7,063 costs of potential drug wastage per patient during a median duration of 3.9 months for each line. **CONCLUSIONS:** This analysis found that 19.6%-35.7% of patients with palbociclib-based treatment during a second or later line of therapy had a dose reduction over a median time of 3.9 months resulting in potential drug wastage of $5,418-$7,063 per patient during each line.

PCN101

AN INVESTIGATION OF THE CORRELATION BETWEEN PRICE MIGRATION AND MOLECULE SIZE OF ONCOLOGY DRUGS AVAILABLE IN THE US

Dua D[1], Harris B[2]
[1]*GfK, Waltham, MA, USA,* [2]*GfK, New York, NY, USA*

OBJECTIVES: This study aims to evaluate if there is a correlation between the magnitude of cancer drug price increases and their molecule size (small molecule vs. mAb) **METHODS:** All oncology drugs approved by the FDA from January 1, 2004 to October 31, 2015 were included for analysis (N=72). The Wholesale Acquisition Cost (WAC) prices at launch, and subsequent price increases were extracted from AnalySource. We evaluated how the magnitude and frequency of price increases for each drug were impacted by different product characteristics like route of administration, launch date, molecule size, etc. **RESULTS:** The correlations between price migration and a number of different drug characteristics were studied, of which molecule size was found to have a distinctly strong impact on price increases. Of the 72 drugs studied, 58 were small molecules and 14 were monoclonal antibodies (mAbs). The average CAGR for small molecules was 6.1%, and that for mAbs was 1.4%. On average, annual price increases were also more frequent for small molecules compared to mAbs at 1.1 times and 0.6 times, respectively. When stratified by indication, the average CAGR of small molecules indicated for blood tumors was 6.0% compared to a 2.6% growth rate of mAbs. Within solid tumors, small molecules had 6.1% CAGR versus 0.9% for mAbs. For each tumor type, the magnitude and frequency of price increases were consistently higher for small molecules compared to mAbs with the exception of brentuximab, a mAb indicated for lymphoma, at 7.0% CAGR and 1.8 annual price increases, compared to 4.4% CAGR and 1.0 annual increases for small molecule lymphoma drugs. **CONCLUSIONS:** Small molecules appear to have larger and more frequent price increases than mAbs. Molecule size appears to be an important influencer on price for new drugs and should be introduced into the ongoing dialogue on cancer drug pricing.

PCN102

DIRECT MEDICAL COSTS OF MAINTENANCE THERAPY IN BRAZILIAN PLATINUM-SENSITIVE OVARIAN CANCER PATIENTS OF PRIVATE HEALTHCARE SYSTEM: RETROSPECTIVE ANALYSIS OF AN ADMINISTRATIVE DATABASE

Matsuo AL[1], Santi CS[1], Paloni Ed[2], Rocha ML[2], Andreghetto FM[1]
[1]*AstraZeneca, Cotia, Brazil,* [2]*Orizon, Barueri, Brazil*

OBJECTIVES: The aim of this study was to determine the direct medical costs (DMC) of maintenance therapy in brazilian platinum-sensitive ovarian cancer (PSOC) patients based on the Private Healthcare System. **METHODS:** The Orizon database, an administrative database containing inpatient and outpatient claims representing 34% of the total Private Health System, was evaluated from Jan/2011 to Dec/2015. Eligibility criteria were patients with ICD-10 code C56 that started treatment among Jan/2012 to Dec/2014, unresectable stages III or IV, treated in first line with any platinum scheme. Platinum sensitive patients were defined as relapse $\geq$6 months after first platinum-based chemotherapy. DMC of maintenance therapy were calculated as the sum of medical claims for each patient included in the analysis (conversion rate of 1 USD = 3.45 BRL). **RESULTS:** Of the 243 patients identified in the database, 62 (25,5%) did maintenance therapy where bevacizumab monotherapy was the most common of all schemes, corresponding to 96,6%. Total maintenance DMC in the subgroup (n = 64) was USD 4,035,872.72 (mean cost = USD 63,060.51/maintenance) and a mean monthly cost of USD 6,917.06. Medicines represented 95,4%, materials 3,1%, exams 0,5%, fees (expenses related to other medical costs) 0,4% and others 0,5% of total costs during the maintenance phase. **CONCLUSIONS:** The benefit of maintenance therapy in PSOC patients was already demonstrated in clinical trials. Understanding the local current maintenance costs will help payers in decision making specially when novel targeted agents are coming such as olaparib, an oral PARP inhibitor and selective for BRACm patients only, which is already registered and will soon be available in Brazil, not incurring in costs associated with in-clinic infusions.

PCN103

ROBOTIC-ASSISTED THORACOSCOPIC PULMONARY RESECTION VERSUS VIDEO-ASSISTED THORACOSCOPIC PULMONARY RESECTION FOR EARLY STAGE NON-SMALL CELL LUNG CANCER: A HEALTHCARE UTILIZATION ANALYSIS

Kaur M[1], Xie F[1], Shiwcharan A[2], Patterson L[2], Shargall Y[1], Finley C[1], Schieman C[3], Dalimonte T[4], Fahim C[1], Hanna W[1]
[1]*McMaster University, Hamilton, ON, Canada,* [2]*St Joseph Healthcare Hamilton, Hamilton, ON, Canada,* [3]*University of Calgary, Calgary, AB, Canada,* [4]*St. Joseph's Home Care, Hamilton, ON, Canada*

OBJECTIVES: The objective of this study was to compare robotic-assisted thoracoscopic (RATS) pulmonary resection to video-assisted thoracoscopic (VATS) pulmonary resection for early stage Non-Small Cell Lung Cancer (NSCLC) with respect to healthcare resource utilization. **METHODS:** Patients who underwent anatomic lung resections using the RATS (n=42) or VATS (n=96) technique for early stage NSCLC between April 2014 and March 2015 at a single institution were identified. Data on demographics, clinical characteristics, cancer stage, operative metrics, and morbidity were collected. **Patient-level case-costing data**(direct medical and non-medical) for hospital and homecare-associated resource variables were recorded. The economic evaluation adopted a health care payer perspective and 30-day post-hospital discharge/death time horizon. Parametric or non-parametric tests were used as appropriate and incremental cost difference using 10,000 bootstrap samples using bias corrected and accelerated method to generate 95% confidence intervals for total cost. **RESULTS:** Baseline demographic and clinical characteristics were comparable between the two groups. The median total hospital cost per patient was $15,247.79 (95% confidence interval, $15,643.87 to $18,945.28) in the RATS cohort, compared to $12,131.31 (95% confidence interval, $13,218.05 to $15,879.67) in the VATS cohort (n=96) ($p<0.001$). Longer operating times were the main cost-drivers for higher hospital costs for patients undergoing RATS pulmonary resections compared with the VATS group (p=0.000). Resource utilization and costs for the post-operative services were similar between the two groups. The operative and post-operative morbidity were also similar, however, VATS had a higher likelihood of conversion to thoracotomy (10/96, 10.4%) as compared to RATS (3/42, 7.1%). **CONCLUSIONS:** This is the **first micro-costing study** comparing the in-hospital and homecare-related resouce utilization and cost for the RATS and VATS pulmonary resection. The RATS pulmonary resection for early stage NSCLC was associated with higher healthcare resource dollars when compared to VATS, but offered similar perioperative outcomes. Multicenter cost-effectiveness studies are required to justify use of robotic surgery.

PCN104

THE ECONOMIC IMPACT OF DELAYING BRAIN METASTASES IN ALK-POSITIVE NON-SMALL CELL LUNG CANCER IN THE COMMERCIALLY INSURED US POPULATION

Wong W[1], Burudpakdee C[2], Seetasith A[2], Corvino F[3], Yeh D[1], Gubens M[4]
[1]*Genentech, Inc., South San Francisco, CA, USA,* [2]*QuintilesIMS, Fairfax, VA, USA,* [3]*Genesis Research, Hoboken, NJ, USA,* [4]*University of California, San Francisco, San Francisco, CA, USA*

OBJECTIVES: To describe the occurrence of brain metastases (BMet) and cost offsets of delaying or preventing BMets in ALK+ non-small cell lung cancer (NSCLC) patients in the US. **METHODS:** Patients with ALK+ NSCLC were identified from a stacked database of PharMetrics Plus and MarketScan claims data from Jan 2008 to Mar 2016 and Dec 2015, respectively. Early BMet was defined as a BMet within 6 months after the first lung cancer diagnosis (index date). The occurrence of a BMet after 6 months was defined as a delayed BMet. Patients with an ALK inhibitor, $\geq$18 years old, with $\geq$6 months preindex and $\geq$30 days follow up were included. ALK+ NSCLC patients were categorized into cohorts of no BMet, early BMet, and delayed BMet. Costs were measured for each BMet category over 12 months, and standardized to per patient per month. **RESULTS:** The study included 207 (48.7%) patients with no BMet and 218 (51.3%) with BMet. Baseline demographics were similar for age (57 and 54), gender (50% male), and Charlson comorbidity index (mean 1.1). The mean time to a BMet was 210 days (median 39). Among patients with BMet, 140 (64.2%) had early BMet, and 78 (35.8%) had delayed BMet. On average, healthcare costs per month in patients with a BMet was $4,390 higher (median $3,844) compared to no BMet. Among patients with a BMet, the cost of delayed BMet was $12,395 lower per month (median $7,692) than early BMet. **CONCLUSIONS:** BMet is an important indicator of poor prognosis, and is associated with substantial economic burden. The majority of NSCLC patients are diagnosed early with BMet. Delaying the occurrence of BMet in patients may substantially reduce healthcare cost. This study demonstrates an unmet need for therapies that may prevent or delay the occurrence of BMet in ALK+ NSCLC patients.

PCN105

EVALUATION OF A PATIENT ASSISTANCE PROGRAM FOR PEMETREXED AS A MAINTENANCE THERAPY FOR NSCLC IN CHINA

Lu YJ[1], Cheng J[2], Chen Y[2], Lin Z[1], Xuan J[3]
[1]*Shanghai Centennial Scientific Co.,Ltd, Shanghai, China,* [2]*China Primary Health Care Foundation, Shanghai, China,* [3]*Sun Yat-Sen University, Guangzhou, China*

OBJECTIVES: The study is to evaluate the costs, clinical and social benefits of a patient assistance program (PAP) implemented by the China Primary Health Care

Foundation for the use of pemetrexed in first-line non-squamous non-small cell lung cancer (NSCLC) maintenance therapy in China. **METHODS:** A survival analysis was conducted on the clinical data of 1,366 patients who participated the PAP and treated with pemetrexed from January 1, 2015 to June 30, 2016. The progression free survival (PFS) and median maintenance treatment cycle of pemetrexed were analyzed. A 36-month Markov model from a payer's perspective was constructed to analyze the cost and effectiveness associated with the PAP for pemetrexed. The inputs of the model were sourced from the PAP clinical data and published literatures. The study estimated the incremental quality adjusted life-years (QALYs) (pemetrexed plus best supportive care (BSC) vs. BSC only), the cost saving of the PAP, and the impact on the percentage of catastrophic medical expenditures (CHE) and poverty headcount ratio (HCR). **RESULTS:** The median of PFS and treatment cycles were 187 days and 5 cycles (total 9 cycles, which included 4 cycles of induction therapy), respectively. The pemetrexed plus BSC treatment with PAP resulted in an additional 0.16 QALYs over BSC only (0.78 QALYs vs. 0.62 QALYs). The total cost was $56,180 and $79,043 for the patients who have or have not joined the PAP, respectively. Compared to patients without PAP, the percentage of CHE and HCR of PAP was reduced from 95.17% to 71.34% and 80.38% to 44.17%, respectively, indicating that the PAP decreases the number of patients who fall into poverty due to NSCLC treatment. **CONCLUSIONS:** To conclude, pemetrexed PAP is resulted significant clinical and economic benefits to society, and to increase patients' compliance with chemo protocols by allowing patients, for whom the pemetrexed treatment was unaffordable, to continue receive it.

PCN106

COST PER RESPONDER OF BIOLOGIC DRUGS FOR RHEUMATOID ARTHRITIS

Alexandre RF[1], Santana CF[1], Squiassi HB[1], Riveros BS[2], Nita ME[3], Pedro GO[4], Freitas MG[4]
[1]*Pfizer, São Paulo, Brazil*, [2]*Federal University of Parana, Curitiba, Brazil*, [3]*Hospital Alemão Osvaldo Cruz, São Paulo, Brazil*, [4]*SolVE, São Paulo, Brazil*

OBJECTIVES: Evaluate the estimated time to achieve breakeven point in a pneumonia vaccination campaign using 13-valent conjugate vaccine in a Brazilian Private Healthcare System (BPHS). **METHODS:** A model developed to measure the time to achieve the breakeven point in a vaccination campaign. For this analysis where taken in consideration pneumococcal diseases epidemiologic data (DATASUS); mortality rates, demographic data (IBGE) and vaccine effectiveness, in a cohort of 2 million lives (based on average of top 10 largest Brazilian Private Health Plans). Were considered direct costs regarding patient treatment and indirect costs such as loss working day. For comparison were produced two scenarios: Scenario 1 the campaign was financed in 50% by the healthcare plan and scenario 2, where the cost is 100% with no cost for the patient. **RESULTS:** Applying the demographic rate of age groups were obtained the target population to be vaccinated (N=455,600). The total investment cost of the vaccination campaign for scenario 1 was BRL 30.2 million, and approximately BRL 60.5 million in scenario 2. The total cost of the pneumococcal diseases events were BLR 179.9 million direct expenses; including indirect costs were BLR 255.7 million. The breakeven point of investment in scenario 1 was under 2 years considering only direct costs and approximately 1 year, when including indirect costs. For scenario 2 the point was reached in approximately 3.5 years considering only the direct costs and approximately 2.5 years when including the indirect costs. **CONCLUSIONS:** The vaccination campaign using the 13-valent conjugate vaccine may represent an alternative medium-term investment improving overall health of the policyholder's portfolio, reducing the number of claims. Vaccine properties of immunological memory guarantee that a greater investment is needed only once, at the outset, requiring a lower maintenance cost for new entrants.

PCN107

COST-EFFECTIVENESS OF DRUGS TO TREAT RELAPSE/REFRACTORY MULTIPLE MYELOMA IN THE U.S

Carlson JJ[1], Guzauskas GF[1], Chapman RH[2], Synnott P[2], Pearson SD[2], Brouwer E[1], Ollendorf D[2]
[1]*University of Washington, Seattle, WA, USA*, [2]*Institute for Clinical and Economic Review, Boston, MA, USA*

OBJECTIVES: New three-drug regimens have been developed and approved to treat multiple myeloma (MM). The absence of direct comparative data and the high cost of treatment support the need to assess the relative clinical and economic outcomes across all approved regimens. Our objective was to evaluate the cost-effectiveness of treatments for relapsed refractory MM from a U.S. health sector perspective. **METHODS:** We developed a partition survival model with three health states, progression-free, progression, and death. 2nd line regimens included lenalidomide (LEN) + dexamethazone (DEX), Carfilzomib (CAR)+ LEN+DEX, elotuzumab (ELO)+LEN+DEX, ixazomib (IX)+LEN+DEX, and daratumumab (DAR)+LEN+DEX, bortezomib (BOR)+DEX, and DAR+BOR+DEX. 3rd line regimens included the above plus panobinostat (PAN)+BOR+DEX. To estimate relative treatment effects, we developed a network meta-analysis and applied progression free survival (PFS) hazard ratios to baseline parametric PFS functions derived from pooled data on LEN+DEX. We estimated overall survival using data on the relationship between PFS and OS from a large meta-analysis of MM patients. Modeled costs included those related to drug treatment, administration, monitoring, adverse events and progression. Utilities were from manufacturer and publicly available data. **RESULTS:** Model results showed regimens containing DAR yielded the highest expected life years and QALYs, with DAR+BOR+DEX (2nd line) and PAN+BOR+DEX (3rd line) being the most cost-effective options. The PAN+BOR+DEX results were subject to data limitations and if removed, DAR+BOR+DEX becomes the most cost-effective option. Model results were most sensitive to the PFS hazard ratios, followed by the estimated link between PFS and OS, and drug costs. In the probabilistic sensitivity analysis, DAR+BOR+DEX and PAN+BOR+DEX had an 89% and 87% probability of being cost-effective at the $150,000/QALY threshold, respectively. **CONCLUSIONS:** The new three-drug regimens appear to improve clinical outcomes relative to standard options, however only the addition of DAR or PAN to BOR+DEX may be considered cost-effective at commonly used willingness-to-pay thresholds.

PCN108

COST-EFFECTIVENESS ANALYSIS OF AFATINIB VERSUS GEFITINIB AS FIRST LINE TREATMENT IN PATIENTS WITH LOCALLY ADVANCED OR METASTATIC EPIDERMAL GROWTH FACTOR RECEPTOR MUTATION-POSITIVE NON-SMALL CELL LUNG CANCER IN THE BRAZILIAN PRIVATE HEALTHCARE SYSTEM

Santoni NB[1], Melo TG[1], Aguirre AR[1], Veiga DL[1], Souza CP[2]
[1]*Boehringer Ingelheim, Sao Paulo, Brazil*, [2]*Sense Company, Rio de Janeiro, Brazil*

OBJECTIVES: To compare costs and effectiveness of afatinib versus gefitinib, as first line treatment of patients with locally advanced or metastatic epidermal growth factor receptor mutation-positive (EGFR+) non-small cell lung cancer (NSCLC) in the Brazilian private healthcare system. **METHODS:** A disease cohort model was used to estimate 7-year progression-free life years (PFLY), life years (LY), Quality-adjusted life years (QALY) and clinical outcomes of afatinib versus gefitinib in the Brazilian setting. The model was fit using partitioned survival data from the LUX-Lung 1, 3 and 6 trials, safety data from the LUX-Lung 1 and 3 trials, and utilities from the LUX-Lung 6 and LUCEOR trials. Comparative effectiveness versus control was estimated using Bayesian indirect treatment comparison. Resource use was estimated by an expert panel consisting of Brazilian oncologists and parameterized using cost estimates from official Brazilian databases. Indirect costs were not considered in this evaluation. Costs and benefits were discounted at a 5% annual rate. **RESULTS:** Base case analysis showed that afatinib was associated with increased progression free survival (0.53 PFLY), increased survival (0.37 LY) and higher quality of life (0.34 QALY) and increased cost (BRL 24,890; 1USD = BRL3,483) versus gefitinib, resulting in an incremental cost-effectiveness ratio of BRL 46,709/PFLY, BRL 67,548/LY and BRL 73,757/QALY. Considering 3 PIB per capita as a threshold (BRL 86,628 per PFLY, LY or QALY), afatinib is a cost-effective technology versus gefitinib. Sensitivity analyses indicated that the conclusion was robust across relevant scenarios. **CONCLUSIONS:** Findings suggest that afatinib is a cost-effective option versus gefitinib as first line treatment in EGFR+ NSCLC patients under the Brazilian private healthcare system.

PCN109

COST-EFFECTIVENESS ANALYSIS OF TRANSCATHETER ARTERIAL CHEMOEMBOLIZATION WITH OR WITHOUT SORAFENIB FOR THE TREATMENT OF UNRESECTABLE HEPATOCELLULAR CARCINOMA

Zhao R, Zhou J, Li B
Sichuan University, Chengdu, China

OBJECTIVES: Transcatheter arterial chemoembolization (TACE) and TACE in combination with sorafenib (TACE-sorafenib) have shown a significant survival benefit for the treatment of unresectable hepatocellular carcinoma (HCC). Adopting either as a first-line therapy carries major cost and resource implications. The objective of this study was to estimate the relative cost-effectiveness of TACE against TACE-sorafenib for unresectable HCC using a decision analytic model. **METHODS:** A Markov cohort model was developed to compare TACE and TACE-sorafenib. Transition probabilities and utilities were obtained from systematic literature reviews, and costs were obtained from West China Hospital, Sichuan University, China. Survival benefits were reported in quality-adjusted life-years (QALYs). The incremental cost-effectiveness ratio (ICER) was calculated. Sensitive analysis was performed by varying potentially modifiable parameters of the model. **RESULTS:** The base-case analysis showed that TACE cost $26,950.90 and yielded survival of 0.71 QALYs, and TACE-sorafenib cost $44,541.70 and yielded survival of 1.01 QALYs in the entire treatment. The ICER of TACE-sorafenib versus TACE was $57,459.13 per QALY gained, which was above threshold for cost-effectiveness in China. Sensitivity analysis revealed that the major driver of ICER was the cost post TACE-sorafenib therapy with stable state. **CONCLUSIONS:** TACE is a more cost-effective strategy than TACE-sorafenib for the treatment of unresectable HCC.

PCN110

TIMING OF COST-EFFECTIVENESS ANALYSIS IN BREAST CANCER: AN ANALYSIS OF PEER-REVIEWED LITERATURE

van den Broek R, Lam NH, Lukose A, Yoruk B
Excerpta Medica, Amsterdam, The Netherlands

OBJECTIVES: To review the time frame between drug approval dates and their cost-effectiveness analysis publications in breast cancer treatment from a US and European perspective. **METHODS:** A literature analysis was performed using EMBASE to identify cost-effectiveness analyses published from January 2000-December 2016 in breast cancer using the following search criteria: "original articles", "English", "human", "breast cancer", "cost effectiveness analysis" and "drug therapy". The following information was extracted from the identified publications: publication date, type and phase of tumor, type of therapy, country, primary drug, and pharmaceutical sponsor. Drug approval dates were retrieved from Citeline and the regulatory bodies' websites. The time frame between the drug approval date and the publication date of the cost-effectiveness analysis (i.e. delay period) was calculated. **RESULTS:** The initial search yielded 16 publications from the US and 33 from Europe. The most common tumor types were HER2 positive (13/49) and HR positive (7/49); 24 publications did not specify the tumor type. Among the 21 drugs identified in these publications, trastuzumab was the

most common (11/49), followed by anastrazole (5/49) and exemestane (5/49). Twenty-three sponsored (10 US-based, 13 Europe-based), 16 non-sponsored (6 US-based, 10-Europe-based), and 1 publication with unknown sponsorship status were eligible for calculating the delay period. A mean delay of 40.5 months between drug approval and their cost-effectiveness analysis publication dates (SD = 37.4) was found for industry sponsored publications and 33.0 months (SD=28.0) for non-industry sponsored publications. A trend of shorter delay for US publications (29.1 months, SD = 42.4) compared to European publications (43.2 months, SD = 35.3) was observed, regardless of sponsorship. **CONCLUSIONS:** Many healthcare decision makers depend on the peer-reviewed cost-effectiveness analysis literature to make informed value-based decisions. With scarce information available, there is a need for more and timely publications, which could improve drug therapy appraisal of breast cancer treatment.

PCN111

THE COST-EFFECTIVENESS OF PRECISION MEDICINE TREATMENT STRATEGIES FOR DIFFUSE LARGE B-CELL LYMPHOMA

Chen Q[1], Staton AD[2], Ayer T[3], Goldstein DA[4], Koff JL[5], Flowers CR[2]
[1]Massachusetts General Hospital, Boston, MA, USA, [2]Emory University, Atlanta, GA, USA, [3]Georgia Institute of Technology, Atlanta, GA, USA, [4]Rabin Medical Center, Petach-Tikva, Israel, [5]Emory University, Altanta, GA, USA

OBJECTIVES: Diffuse large B cell lymphoma (DLBCL) is comprised of germinal center B cell-like (GCB) and activated B cell-like (ABC) subtypes; the latter is associated with worse survival with standard rituximab, cyclophosphamide, doxorubicin, vincristine, and prednisone (RCHOP) therapy. Preliminary evidence suggests that novel agents can improve ABC DLBCL survival when added to RCHOP, which motivates the implementation of precision medicine treatment strategies stratified by subtype. Our objective was to project the cost-effectiveness of subtype-based treatment strategies from a US payers' perspective. **METHODS:** We developed micro-simulation models to compare three first-line treatment strategies for DLBCL: (1) standard treatment with RCHOP; (2) lenalidomide+RCHOP (R2CHOP); and (3) subtype-based treatment with subtype testing using immunohistochemistry (IHC) algorithms followed by RCHOP for GCB and R2CHOP for ABC (or non-GCB) DLBCL. Relapsed patients received salvage chemotherapy followed by autologous stem cell transplant as the current standard of care. Subtype-specific survival data were drawn from published clinical studies, and drug and administration costs were based on average wholesale price and Medicare physician fee schedule. We performed one-way and probabilistic sensitivity analyses to assess model robustness. **RESULTS:** RCHOP on average provided 6.2 QALYs (8.1 LYs) at a cost of $65,700; and subtype-based treatment improved health outcomes by providing 7.9 QALYs (10.2 LYs) at a cost of $86,400, leading to an incremental cost-effectiveness ratio of $12,500/QALY ($9,600/LY). R2CHOP provided 7.8 QALYs (10.5 LYs) at the highest cost of $123,300, which is dominated by subtype-based treatment. Sensitivity analyses demonstrated that our findings were robust with variations in model parameters. **CONCLUSIONS:** We demonstrated that subtype-based treatment has the potential to be cost-effective across variations in survival benefit and additional cost for the novel treatment. Data from randomized trials are needed to validate the cost-effectiveness profile and to guide the optimal use of standard and novel therapies for DLBCL in clinical practice.

PCN112

COST-EFFECTIVENESS OF PEDIATRIC-INSPIRED VS HYPER-CVAD PROTOCOLS FOR FIRST-LINE TREATMENT OF ADOLESCENT AND YOUNG ADULT (AYA) PATIENTS WITH PHILADELPHIA-NEGATIVE ACUTE LYMPHOBLASTIC LEUKEMIA (ALL)

Lin PL, Hu X, Hooper E
Shire Pharmaceuticals, Cambridge, MA, USA

OBJECTIVES: Different protocols exist for 1st-line treatment of adolescents and young adult (AYA; 16-39 years) patients with acute lymphoblastic leukemia (ALL). Recent evidence suggests that pediatric-inspired treatment protocols for ALL–which include asparaginase in combination with chemotherapy–are associated with improved clinical outcomes, especially when compared to conventional regimens such as Hyper-CVAD (hyperfractionated cyclophosphamide, vincristine, doxorubicin, dexamethasone)1. Evidence is, however, limited regarding the cost-effectiveness of pediatric-inspired protocols versus Hyper-CVAD in AYA patients. This analysis estimates the cost-effectiveness of a pediatric-inspired protocol vs. Hyper-CVAD for the first-line treatment of AYA patients with Philadelphia-negative (Ph-) ALL from the US payer perspective. **METHODS:** A 6-state Markov model was developed to estimate expected overall survival, treatment-related costs, and quality-adjusted life years (QALYs) in the 1st-line treatment of ALL over a lifetime horizon. Modeled health states were: no first complete remission, first complete remission, first relapse, second complete remission, second relapse, and death. Model inputs for survival, adverse events, health utility, and costs were obtained from literature. Cost-effectiveness was measured by the incremental cost-effectiveness ratio (ICER; incremental costs/QALY gained). Deterministic and probabilistic sensitivity analyses were performed to evaluate uncertainty around model input values. **RESULTS:** The base-case analysis suggested that, compared with Hyper-CVAD, the pediatric-inspired protocol resulted in increased QALYs and reduced costs (total QALYs gained, 2.05; total cost savings, $41,685). Sensitivity analysis indicated that the key driver of cost-effectiveness was the probability of stem cell transplantation at second complete remission. At a willingness-to-pay threshold of $50,000/QALY, the probability of the pediatric-inspired protocol being cost-effective relative to Hyper-CVAD was 92%. **CONCLUSIONS:** A pediatric-inspired protocol including asparaginase for the first-line treatment of AYA patients with Ph- ALL is cost-effective compared to Hyper-CVAD. Cost should not be a barrier to the use of a pediatric-inspired protocol in AYA patients. **Ref:**1. Ram R., et al. Am J Hematol. 2012.

PCN113

NUMBER NEEDED TO TREAT AND ASSOCIATED INCREMENTAL COSTS OF TREATMENT WITH ENZALUTAMIDE VERSUS ABIRATERONE ACETATE PLUS PREDNISONE IN CHEMOTHERAPY-NAÏVE PATIENTS WITH METASTATIC CASTRATION-RESISTANT PROSTATE CANCER IN SPAIN AND THE UNITED KINGDOM

Duran A[1], Watt M[1], Flanders S[2], Schultz NM[2]
[1]Astellas Pharma Europe Ltd, Chertsey, UK, [2]Astellas Pharma, Inc., Northbrook, IL, USA

OBJECTIVES: A number-needed-to-treat (NNT) analysis comparing treatment with enzalutamide (ENZ) with abiraterone acetate plus prednisone (ABI+P) for chemotherapy-naïve metastatic castration-resistant prostate cancer (mCRPC) concluded that ENZA is cost-effective compared with ABI+P in a US setting. The analysis utilized the payer perspective and explored the incremental costs to achieve one additional patient free of radiographic progression, chemotherapy, or death over a 1-year time horizon. The analysis was adapted to Spain and the UK and estimated the difference in costs between therapies, respectively. **METHODS:** Differences in treatment patterns between countries were adjusted using locally sourced data from reimbursement and treatment guidelines; US unit costs were replaced with 2016 country-specific costs. Also, NNT and clinical outcomes were based on ENZ and ABI+P clinical trial data included in the original US analysis (Massoudi 2016). **RESULTS:** Total cost per treated patient for ENZ was lower than for ABI+P in both Spain (€34,610 versus €36,631) and the UK (£32,531 versus £32,669). Compared with ABI+P, treating 14 patients with ENZ resulted in one additional patient free of progression/death over 1 year at a cost saving of €28,879 (Spain) or £1962 (UK), treating 26 patients with ENZ resulted in one additional patient with chemotherapy delayed over 1 year (cost saving: Spain €53,199; UK £3615), and treating 91 patients with ENZ resulted in one additional patient surviving over 1 year (cost saving: Spain €183,777; UK £12,487). Thus, ENZ is less costly and more effective for all three outcomes. The models' results suggest that ENZ potentially decreases the risk of disease progression and death and delays chemotherapy initiation in chemotherapy-naïve patients. Results were confirmed among multiple sensitivity analyses. **CONCLUSIONS:** Consistent with the original US analysis, results modeled here for Spanish and UK contexts also suggest that ENZ is cost-effective versus ABI+P for treating chemotherapy-naïve patients with mCRPC.

PCN114

COST-EFFECTIVENESS ANALYSIS OF ENZALUTAMIDE FOR PATIENTS WITH CHEMOTHERAPY-NAÏVE METASTATIC CASTRATION-RESISTANT PROSTATE CANCER IN JAPAN

Okumura H[1], Inoue S[2], Naidoo S[3], Holmstrom S[4], Akaza H[5]
[1]Astellas, Medical Affairs, Tokyo, Japan, [2]CRECON Medical Assessment Inc., Tokyo, Japan, [3]Astellas Pharma Europe, Ltd, Chertsey, UK, [4]Astellas Medical Affairs Global, Leiden, The Netherlands, [5]The University of Tokyo, Tokyo, Japan

OBJECTIVES: To evaluate the cost-effectiveness of enzalutamide in chemotherapy-naïve metastatic castration-resistant prostate cancer (mCRPC) patients in the Japanese healthcare setting. **METHODS:** A Markov model was developed to capture time spent by patients in various health states: stable, progression, and death. Abiraterone acetate plus prednisone and docetaxel were set as active comparators. Clinical outcomes were obtained from the PREVAIL, COU-AA-302, and TAX327 trials. Treatment sequence, concomitant drugs in each treatment regimen, and therapies for both palliative care and adverse events were estimated from responses to a survey for medical resource consumption by 14 prostate cancer experts. Analytic perspective was public healthcare payer and the time horizon was 10 years. Incremental cost-effectiveness ratio (ICER) was estimated from quality-adjusted life years (QALY) and Japanese public healthcare costs. Both costs and outcomes were discounted by 2%. Probabilistic sensitivity analysis was performed to assess the robustness of the findings. **RESULTS:** According to the survey, the most common treatment sequences (first→second→third) were as follows: 1) enzalutamide→docetaxel→cabazitaxel, 2) abiraterone→enzalutamide→docetaxel, 3) docetaxel→enzalutamide→cabazitaxel. The following sequence was included in a scenario analysis as an alternative sequence of 1: 4) enzalutamide→abiraterone→docetaxel. In the base-case analysis, sequence 1 saved JPY 1.74 million compared with sequence 2, with a 0.129 utility gain (dominant). Sequence 1 had a cost increase of JPY 4.44 million over sequence 3, with a 0.371 utility gain. The ICER of sequence 1 versus sequence 3 was estimated as JPY 11.95 million/QALY gained. Similar results were obtained by the replacement of sequence 1 with sequence 4. Probabilistic sensitivity analysis demonstrated that, compared with sequence 2, the probability of sequence 1 being dominant was 87.4%. **CONCLUSIONS:** The results modeled in the present study suggest that the enzalutamide-first sequencing (1 and 4) is more cost-effective than the abiraterone-first sequencing, but less cost-effective than the docetaxel-first sequencing, for chemotherapy-naïve patients with mCRPC.

PCN115

COMPARISON OF VALUE EVALUATIONS USING DRUG ABACUS AND TRADITIONAL COST-EFFECTIVENESS ANALYSIS FOR AN IMMUNO-ONCOLOGY DRUG IN AN ORPHAN INDICATION

Garmo V[1], Lanitis T[2], Ambavane A[2], Kongnakorn T[2], Phatak H[1]
[1]EMD Serono, Inc., Rockland, MA, USA, [2]Evidera, London, UK

OBJECTIVES: Extensive research has been conducted to optimally estimate the value of a drug. The Memorial Sloan Kettering Cancer Center (MSKCC)-proposed Drug Abacus and incremental cost effectiveness ratio (ICER) frameworks attempt to estimate the value of oncology drugs, with the latter particularly useful in population medicine. The utility of these frameworks in assessing value of an immune-oncology (IO) agent in an ultra-orphan tumor is not well-documented. **METHODS:** A survival partition model was developed to compare

costs, life years and QALYs for an IO drug vs chemotherapy over the patient's lifetime. A threshold of $156,000 per QALY and per life year gained was used for the ICER and MSKCC frameworks, respectively. User-modifiable premiums for each dimension for Drug Abacus were varied from 1-3, whilst allowing corresponding variation in the thresholds from $84,000 to $226,000 per life year or QALY gained. Conservative assumptions (e.g. no premium for Research and Development) were employed throughout the analyses. **RESULTS:** The monthly value of the drug using the ICER framework ranged from $4,033-$14,978 when only survival was considered. Incorporating quality of life decreased the value by $1,315-$3,537, whilst the inclusion of toxicity increased the value by $1,687. Using Drug Abacus the value of the drug related to survival and strength of evidence ranged from $4,129-$11,209. Incorporating each of novelty, rarity, population health burden, unmet need and prognosis dimensions were estimated to increase the value by up to a maximum of $7,669, $15,338, $1,534, $15,338 and $12,599, respectively. **CONCLUSIONS:** For an ultra-orphan tumor, the additional value dimensions related to disease and drug-specific factors influence the value assessment. Overall, holistic assessment is needed to capture true value of a new IO therapy in rare diseases.

PCN116

COST-EFFECTIVENESS ANALYSIS OF ADDITIONAL BEVACIZUMAB TO CHEMOTHERAPY AS INDUCTION AND MAINTENANCE THERAPY IN METASTATIC NONSQUAMOUS NON-SMALL-CELL LUNG CANCE

Zheng H[1], Wen F[2], Zhan M[1], Xu T[3]
[1]West China Hospital of Sichuan University, chengdu, China, [2]West China Hospital, Sichuan University, chengdu, China, [3]West China Hospital of Sichuan University, Chengdu, China

OBJECTIVES: According to the BEYOND trial, the addition of bevacizumab(B) to paclitaxel-carboplatin (PC) chemotherapy provided a significant clinically benefit in Chinese patients with metastatic nonsquamous non-small cell lung cancer (NSCLC).This study aimed to evaluate the cost-effectiveness of additional B to first-line induction and continuation maintenance therapy from Chinese perspective. **METHODS:** A Markov model was developed to estimate the cost and effectiveness of B plus PC in the induction and maintenance therapy for patients with metastatic nonsquamous NSCLC. Costs were calculated in the Chinese setting and health outcomes derived from the BEYOND trial were measured as quality-adjusted life year (QALY). A one-way sensitive analysis was conducted to explore the impact of parameters in the study. **RESULTS:** The B plus PC group was more costly ($112,950.19 versus $32,182.19) and more effective (1.07 QALYs versus 0.80 QALYs) compared with the PC group. Adding B to the PC regimen for nonsquamous NSCLC results an incremental cost-effectiveness ratio $299,140.78 per QALY, which exceed the accepted societal willingness to pay threshold ($23,970.00) of China. In the sensitive analysis, duration of progression-free survival (PFS) state for B+PC group, cost of PFS state for B+PC group and the price of B were considered to be the most sensitive factor on the model considered to be the most influential factor. **CONCLUSIONS:** The addition of B to the first-line PC induction and maintenance therapy is not assessed to be a cost-effective strategy for metastatic nonsquamous NSCLC in China, even an assistant program was provided.

PCN117

COST-EFFECTIVENESS OF OLARATUMAB IN COMBINATION WITH DOXORUBICIN FOR THE TREATMENT OF LOCALLY ADVANCED OR METASTATIC SOFT TISSUE SARCOMA IN THE UNITED STATES

Zuluaga S[1], Hess LM[2], Wolowacz S[1], Dyachkova Y[3], Hawe E[1], Vickers AD[1], Kaye JA[4], Bertwistle D[5]
[1]RTI Health Solutions, Manchester, UK, [2]Eli Lilly and Company, Indianapolis, IN, USA, [3]Eli Lilly and Company, Vienna, Austria, [4]RTI Health Solutions, Waltham, MA, USA, [5]Eli Lilly and Company Limited, Windlesham, UK

OBJECTIVES: Soft tissue sarcomas (STSs) are rare cancers with poor outcomes for patients with advanced disease (median overall survival [OS] is 12 – 16 months) for which the standard first-line treatment has changed little in 40 years. Recently, the United States (US) Food and Drug Administration conditionally approved olaratumab in combination with doxorubicin (OlaDox) based on a randomized, phase 2 trial in 133 patients (JGDG) that reported a significant OS benefit over single-agent doxorubicin (Dox). We investigated the cost-effectiveness of OlaDox versus Dox and five other standard-of-care regimens for patients with advanced or metastatic STS, from a US payer perspective. **METHODS:** A partitioned survival model comprising three health states (Progression-free, Progressed, and Dead) was developed to estimate costs and outcomes over patients' lifetimes. Efficacy data were based on the JGDG study and a network meta-analysis. Adverse-event rates and costs were from published sources. Progression-free survival was estimated from Kaplan-Meier curves. OS was estimated using parametric functions and age-specific mortality adjusted for STS, assuming no treatment-effect after trial follow-up. One-way sensitivity analyses (OWSAs), probabilistic sensitivity analyses, and scenario analyses were performed to evaluate the uncertainty in all model parameters. Costs and outcomes were discounted at 3% per annum. **RESULTS:** The incremental cost-effectiveness ratio (ICER) estimate for OlaDox versus Dox was $105,408 per life-year (LY) saved (95% credible interval: $62,501-$245,354). Mean costs and LYs for OlaDox increased by $133,653 and 1.27, respectively. In a fully incremental analysis, all other regimens were dominated or extendedly dominated. In OWSAs and scenario analyses, the ICER per LY saved ranged from $78,669 to $190,662. **CONCLUSIONS:** Results suggested a substantial improvement in OS with OlaDox (1.27 LYs versus Dox), and an ICER of $105,408 per LY. Analyses were based on a small phase 2 trial; an ongoing phase 3 trial is expected to reduce uncertainty in future estimates.

PCN118

COST-EFFECTIVENESS OF IBRUTINIB AS FRONTLINE TREATMENT FOR ADULT PATIENTS WITH CHRONIC LYMPHOCYTIC LEUKEMIA IN BELGIUM

Smet A[1], Peng S[2], Dorman E[2], Deger K[2], Sorensen S[2], Baculae S[3], Cote S[3]
[1]Janssen-Cilag NV, Beerse, Belgium, [2]Evidera, Bethesda, MD, USA, [3]Janssen-Cilag, High Wycombe, Bucks, UK

OBJECTIVES: This study aimed to assess the cost-effectiveness of ibrutinib vs. current frontline treatments for elderly/unfit patients with chronic lymphocytic leukemia (CLL), from a Belgian healthcare payer perspective. **METHODS:** A state transition model with three health states (progression-free survival [PFS], post-progression, and death) was used to capture ibrutinib's benefits and costs over patient lifetime. Ibrutinib was compared to chlorambucil monotherapy; chlorambucil + obinutuzumab; bendamustine + rituximab; and physician's choice (PC), a mix of the above treatments, as used in Belgian clinical practice. Data sources for efficacy outcomes included the RESONATE-2 trial (Burger et al. 2015) and results of a network meta-analysis which estimated treatments' relative efficacy based on data from a systematic literature review (SLR). Long-term health outcomes were extrapolated based on trial data; utilities were based on EQ-5D-5L data collected in RESONATE-2 whenever possible, and supplemented by data identified in an SLR; Belgium-specific costs for drugs, administration, monitoring, resource use, and adverse events were used to estimate the incremental cost-effectiveness ratio (ICER). **RESULTS:** Ibrutinib showed incremental health gains of up to 7.13 life years (LYs) and 4.74 quality-adjusted LYs (QALYs). Ibrutinib was also associated with higher costs, largely driven by ibrutinib's superior PFS, which led to longer time on treatment. The resulting ICER was €65,760/QALY gained versus PC and ranged between €51,641 and €76,451/QALY gained versus other comparators. The ICER versus PC was €42,540/LY gained and ranged from €34,361 to €49,424/LY gained versus other treatments. Sensitivity analyses showed that results were influenced by a few drivers, including discount rates for health and cost outcomes, and ibrutinib treatment duration. **CONCLUSIONS:** Results of our analysis indicate that ibrutinib offers a pronounced benefit over comparators for frontline CLL. ICERs are in line with general willingness-to-pay thresholds, demonstrating that ibrutinib represents a cost-effective use of resources for elderly/unfit frontline CLL patients.

PCN119

COST-EFFECTIVENESS OF SUNITINIB VS. PAZOPANIB IN METASTATIC RENAL CELL CARCINOMA (MRCC) IN CANADA USING REAL-WORLD DATA

Nazha S, Vanhuyse M, Tanguay S, Dragomir A, Prevost N
McGill University Health Centre, Montreal, QC, Canada

OBJECTIVES: Outside of controlled clinical studies, the understanding of the effectiveness and cost associated with targeted therapies for mRCC is limited in Canada. The purpose of this study was to assess the cost-effectiveness of targeted therapies for clear-cell mRCC patients using real-world data from a Canadian database. **METHODS:** First and second-line TTT (time to treatment termination) was determined from the time of initiation of the therapy until discontinuation of therapy. Survival curves (Kaplan-Meier and direct adjusted survival curves) were used to estimate the overall survival by treatment. Cox regression was used to examine the effect of treatment controlling for variables. The costs of drugs were estimated by using the average duration of treatment in each line of therapy based on results from the database. Incremental cost-effectiveness ratio (ICER) was obtained by dividing the difference between the cost of sunitinib and pazopanib and the difference between the mean survivals of sunitinib compared to pazopanib. **RESULTS:** As of June 2016, there were 4314 patients entered in the database as prospective patients with kidney cancer. 376 patients received targeted treatment as part of the management of their disease and were included in the final analysis. 83% of patients were treated with sunitinib and 17% with pazopanib. The median TTT in first line for sunitinib and pazopanib patients was 7.7 and 5.9 months respectively (p=0.0027). The adjusted OS with sunitinib was 33 months compared to 24 months with pazopanib, but there was not a statistically significant difference between the 2 groups (p=0.08). The median cost of therapy for sunitinib and pazopanib was $57,792 (95%CI : 23,063-119,456) and $47,872 (95%CI: 28,039-89,041) respectively. The ICER of sunitinib is $11,905/Life-year gained compared to pazopanib. **CONCLUSIONS:** This incremental survival is linked to a $11,905/Life-year gained. Based on our real-world evidence, sunitinib is a cost-effective option compared to pazopanib in Canada.

PCN120

COST-EFFECTIVENESS ANALYSIS OF COMPARING GEFITINIB VERSUS CARBOPLATIN–PACLITAXEL AS FIRST-LINE THERAPY FOR ADVANCED NON-SMALL CELL LUNG CANCER WITH SENSITIVE EGFR GENE MUTATIONS FROM A CHINESE PERSPECTIVE

Zhan M, Zheng H, Xu T
West China Hospital of Sichuan University, Chengdu, China

BACKGROUND: Lung cancer is the leading cause of cancer death. Non-small cell Lung cancer (NSCLC) is the most common type of lung cancer, responsible for about 85% of the cases. EGFR tyrosine kinase inhibitors such as gefitinib improved survival for patients with NSCLC, but inevitably increased monetary burden. The people's Republic of China National Health and Family Planning Commission announced the results of the first batch of national drug price negotiations in 2016, the price of gefitinib cut over 50%. **OBJECTIVES:** To evaluate the cost-effectiveness of gefitinib versus carboplatin–paclitaxel as first-Line therapy for advanced NSCLC with sensitive epidermal growth factor receptor (EGFR) gene mutations after cost reconciliation in china. **METHODS:** A Markov decision tree based on NEJ002 study was created, comparing gefitinib to carboplatin–paclitaxel in as the first-line treatment for NSCLC harboring an EGFR mutations. Three health states (progression-free survival, progressive disease and death) were analyzed in a Markov model. The costs were calculated from the Chinese societal perspective. Results were reported in Quality-adjusted life year (QALY) and incremental cost-effectiveness ratios (ICERs). **RESULTS:**

Gefitinib was estimated to increase the cost by $4757.02, with a gain of 0.26 QALY. Gefitinib came at an ICER of $18296.23 per QALY, which are less than the accepted willingness-to-pay (WTP) threshold of $23970.00 per QALY in China. **CONCLUSIONS:** Gefitinib is a cost-effective first-line treatment for NSCLC with mutated EGFR when compared with carboplatin–paclitaxel in China.

THE COST EFFECTIVENESS ANALYSIS OF CAPOX VERSUS FOLFOX-4 REGIMENS WITH OR WITHOUT BEVACIZUMAB IN THE FIRST LINE MANAGEMENT OF METASTATIC COLORECTAL CANCER (MCRC) IN HONG KONG

Lee VW[1], Cheng F[1], Wan KP[2], Chik J[2], Chan D[3], Cheng A[3], Wong KH[2]
[1]The Chinese University of Hong Kong, Shatin, Hong Kong, [2]Queen Elizabeth Hospital, Kowloon, Hong Kong, [3]Princess Margaret Hospital, Kwai Chung, Hong Kong

OBJECTIVES: This study aimed to investigate if the addition of bevacizumab to CAPOX/FOFLOX4 was cost-effective as a first-line treatment of MCRC in Hong Kong. **METHODS:** This was a retrospective observational study conducted in two public hospitals in Hong Kong. Patients received either CAPOX or FOLFOX4 with or without bevacizumab from Jan 2011 to Dec 2014 as first-line treatment were included. Direct medical costs were estimated based on Hong Kong Gazette and internal systems in both hospitals. Cost analysis was performed from the healthcare-payer perspective. All costs were expressed in Hong Kong dollar (1US$=7.8HK$) and 2014 was the base year. QALY were calculated by the product of utility scores from previous literature and PFSD from the medical records. Probabilistic sensitivity analysis was conducted to estimate the most cost-effective treatment. **RESULTS:** A total of 105 patients were included. Base case analysis revealed that the total cost for CAPOX and CAPOX with bevacizumab were HKD103,961.35 and HKD180,386.56 respectively while the PFSD were 155.5 days and 199.5 days. The total cost of FOLFOX4 was HKD137,105.81 and HKD322,608.76 for FOLFOX4 with bevacizumab whereas the PFSD is 85 days and 259.5 days respectively. The ICER is HKD1,074,545/QALY when comparing CAPOX with or without bevacizumab and HKD732,103/QALY for FOLFOX4 counterpart. PSA revealed that there are a 28% and 22% chance for bevacizumab to be cost effective when added to CAPOX and FOLFOX4 respectively at a willingness-to-pay of HKD935,505, which is three times the GDP per capita of Hong Kong in 2014. **CONCLUSIONS:** The current study demonstrated that adding bevacizumab to FOLFOX4 was cost-effective but not to CAPOX. However, further studies are required in view of the different limitations encountered in the current study.

PCN122

PATIENT-BASED COST-EFFECTIVENESS ANALYSIS OF FOLFIRI VERSUS FOLFOX7 FOR ADVANCED GASTRIC ADENOCARCINOMA IN CHINA: A FOUR-YEAR PROSPECTIVE RANDOMIZED PHASE II STUDY

Wen F[1], Zheng H[2], Zhang P[1], Zhou J[3], Chen H[1], Zhou K[1], Bi F[1], Li Q[1]
[1]West China Hospital, Sichuan University, Chengdu, China, [2]West China Hospital of Sichuan University, Chengdu, China, [3]Sichuan University, Chengdu, China

OBJECTIVES: According to the four-year follow-up results of an open, randomized, phase II study, this patient-based cost-effectiveness analysis compares mFOLFIRI (irinotecan, 5-fluorouracil and leucovorin, IRI arm) with mFOLFOX7 (oxaliplatin, 5-fluorouracil and leucovorin, OXA arm) as first-line treatments in patients with locally advanced gastric adenocarcinoma(GC). **METHODS:** A Markov model was created based on previous results reported on 2016 Gastrointestinal Cancers Symposium to evaluate mFOLFIRI and mFOLFOX7 for advanced GC. Quality-adjusted life years (QALY) and incremental cost-effectiveness ratios (ICERs) were examined as the primary outcomes. **RESULTS:** For evaluable 128 patients, treatment efficacy was 0.59 QALYs for IRI arm and 0.70 QALYs for OXA arm, with a total cost of $13,861.34 for IRI arm and $14,127.30 for OXA arm. Hence, OXA arm had lower cost per QALY compared with IRI arm contributing to an ICER of $2,417.82 per QALY for OXA arm, which was below the threshold of 3× per capita GDP of China. For subgroup analysis of those receiving mFOLFIRI followed by mFOLFOX7 (IRI arm) and the reverse (OXA arm), OXA arm gained 0.44 more QALYs compared with IRI arm with a total cost of $28,890.09 for IRI arm and $31,147.30 for OXA arm. However, the cost per QALY was also lower for OXA arm compared with IRI arm, leading to an ICER of $5,129.55 per QALY for OXA arm, which was also below the threshold. **CONCLUSIONS:** Both mFOLFIRI and mFOLFOX7 are affordable for the first-line treatments of advanced GC, but mFOLFOX7 is more cost-effective. Additionally, mFOLFOX7 followed by mFOLFIRI was an optimal sequence with more effectiveness and acceptable cost.

PCN123

COST-EFFECTIVENESS ANALYSIS OF AFATINIB VERSUS ERLOTINIB AS FIRST LINE TREATMENT IN PATIENTS WITH LOCALLY ADVANCED OR METASTATIC EPIDERMAL GROWTH FACTOR RECEPTOR MUTATION-POSITIVE (EGFR+) NON-SMALL CELL LUNG CANCER IN THE BRAZILIAN PRIVATE HEALTHCARE SYSTEM

Santoni NB[1], Melo TG[1], Aguirre AR[1], Veiga DL[1], Souza CP[2]
[1]Boehringer Ingelheim, Sao Paulo, Brazil, [2]Sense Company, Rio de Janeiro, Brazil

OBJECTIVES: To compare costs and effectiveness of afatinib versus erlotinib, as first line treatment of patients with locally advanced or metastatic epidermal growth factor receptor mutation-positive (EGFR+) non-small cell lung cancer (NSCLC) in the Brazilian private healthcare system. **METHODS:** A disease cohort model was used to estimate 7-year progression-free life years (PFLY), life years (LY), Quality-adjusted life years (QALY) and clinical outcomes of afatinib versus erlotinib in the Brazilian setting. The model was fit using partitioned survival data from the LUX-Lung 1, 3 and 6 trials, safety data from the LUX-Lung 1 and 3 trials, and utilities from the LUX-Lung 6 and LUCEOR trials. Comparative effectiveness versus control was estimated using Bayesian indirect treatment comparison. Resource use was estimated by an expert panel consisting of Brazilian oncologists and parameterized using cost estimates from official Brazilian databases. Indirect costs were not considered in this evaluation. Costs and benefits were discounted at a 5% annual rate. **RESULTS:** Afatinib was associated with additional progression free survival (0.46 PFLY), longer survival (0.13 LY) and increased quality of life (0.20 QALYs) with lower total cost (- BRL21,327; 1USD = BRL3,483) versus erlotinib, therefore, afatinib is dominant versus erlotinib. Sensitivity analyses indicated that the conclusion was robust across relevant scenarios. **CONCLUSIONS:** Findings suggest that afatinib is a cost-saving option versus erlotinib as first line treatment in EGFR+ NSCLC patients in the Brazilian private healthcare system.

PCN124

COST-EFFECTIVENESS ANALYSIS OF THE DRUGS REIMBURSED BY THE MEXICAN PUBLIC HEALTH SYSTEM (MPHS) FOR THE SECOND-LINE TREATMENT OF PD-L1 POSITIVE, ADVANCED NON-SMALL-CELL LUNG CANCER (NSCLC)

Murra Anton ZA, Baptista C
Brown University, Providence, RI, USA

OBJECTIVES: This study sought to determine which of the drugs reimbursed by the Mexican Public Health System (MPHS) for the second-line (post platinum-containing chemotherapy) treatment of PD-L1 positive, advanced Non Small-Cell Lung Cancer (NSCLC, target population) is the most efficient, according to health technologies assessment literature. **METHODS:** Through expert consultation, international/national guidelines of treatment review, and Mexican National Formulary assessment, it was determined that the relevant drugs for the analysis were Docetaxel, Pemetrexed and Gemcitabine. A systematic review of the literature was performed to identify relevant phase-III Randomized Controlled Trials (RCTs) and meta-analyses. Fourteen published articles were identified and a random-effects meta-analysis was performed using WINBUGS. A three-state Markov Model (Stable Disease, Progressing Disease and Death) was developed using a parametric fitting of Survival Curves, through a Constant Hazard-Ratio Model. The costs included were cost of the drug (CoD), administration/monitoring, grade 3/4 adverse events attention and Best Supportive Care (BSC) for progressed patients. Costs were obtained from published sources from Mexican government, except for BSC, which was obtained from a modified-Delphi expert panel. The time horizon was 2 years. A Public Payer's perspective was considered. Health outcome assessed was Life Years (LY). Discount rate was 5% for health and costs outcomes. A probabilistic sensitivity analysis (PSA) through Montecarlo simulations was performed. **RESULTS:** The total cost of Treatment (CoT, in USD) for Docetaxel, Pemetrexed and Gemcitabine was $10,590, $16,500 and $9,850, respectively, where 21%, 37% and 4% was associated with the CoD. The number of LY for Docetaxel, Pemetrexed and Gemcitabine was 0.79, 0.87 and 0.91 respectively. These results were statistically-significant only for costs in the PSA. **CONCLUSIONS:** Gemcitabine is a dominant, thus efficient strategy for the second-line treatment of PD-L1 positive advanced NSCLC from the MPHS perspective. Even under uncertainty, gemcitabine is a cost-saving alternative compared to Docetaxel and Pemetrexed.

PCN125

COST-EFFECTIVENESS OF AFATINIB VERSUS PEMETREXED PLUS CISPLATIN AS FIRST LINE TREATMENT IN PATIENTS WITH LOCALLY ADVANCED OR METASTATIC EPIDERMAL GROWTH FACTOR RECEPTOR MUTATION-POSITIVE (EFGR+) NON-SMALL CELL LUNG CANCER (NSCLC) IN THE BRAZILIAN PRIVATE HEALTHCARE SYSTEM

Santoni NB[1], Melo TG[1], Aguirre AR[1], Veiga DL[1], Souza CP[2]
[1]Boehringer Ingelheim, Sao Paulo, Brazil, [2]Sense Company, Rio de Janeiro, Brazil

OBJECTIVES: To compare costs and effectiveness of afatinib versus pemetrexed plus cisplatin, as first line treatment in patients with locally advanced or metastatic epidermal growth factor receptor EGFR mutation-positive (EGFR+) non-small cell lung cancer (NSCLC) in the Brazilian private healthcare system. **METHODS:** A disease cohort model was used to estimate 7-year progression-free life years (PFLY), life years (LY), Quality-adjusted life years (QALY) and clinical outcomes of afatinib versus pemetrexed plus cisplatin in the Brazilian setting. The model was fit using partitioned survival data from the LUX-Lung 1, 3 and 6 trials, safety data from the LUX-Lung 1 and 3 trials, and utilities from the LUX-Lung 6 and LUCEOR trials. Resource use was estimated by an expert panel consisting of Brazilian oncologists and parameterized using cost estimates from officialBrazilian databases. Indirect costs were not considered in this evaluation. Costs and benefits were discounted at a 5% annual rate. **RESULTS:** Afatinib was associated with increased progression free survival (0.41 PFLY), increased survival (0.16 LY) and increased quality of life (0.22 QALY) with and incremental increase in cost (BRL8,549; 1 USD = BRL 3,483), resulting in an incremental cost-effectiveness ratio of BRL 20.639/PFLY, BRL 53.280/LY and BRL39.162/QALY. Considering 3 PIB per capita as a threshold (BRL 86,628 per PFLY, LY or QALY), afatinib is a cost-effective technology versus chemotherapy. Sensitivity analyses indicated that the conclusion was robust across relevant scenarios. **CONCLUSIONS:** Findings suggest that afatinib is a cost-effective option as first line treatment for patients with EGFR+ NSCLC versus pemetrexed plus cisplatin in the Brazilian private healthcare system.

PCN126

VALUE DEMONSTRATION OF IMMUNO-ONCOLOGY THERAPIES IN A RARE TUMOR COMPARING ASCO, NCCN, AND TRADITIONAL COST-EFFECTIVENESS ANALYSIS

Garmo V[1], Ambavane A[2], Lanitis T[2], Kongnakorn T[2], Phatak H[1]
[1]EMD Serono, Inc., Rockland, MA, USA, [2]Evidera, London, UK

OBJECTIVES: Assessing drug "value" is typically based on the trade-off between its clinical benefit using quality-adjusted life-years (QALYs) relative to cost.

Recently, the American Society of Clinical Oncology (ASCO) and the National Comprehensive Cancer Network (NCCN) have proposed alternative frameworks to evaluate the value of oncology drugs. This analysis applies these frameworks vs traditional cost-effectiveness analysis to compare a new immuno-oncology (IO) therapy to chemotherapy in an ultra-rare tumor. **METHODS:** A survival partition model was developed using the approach proposed by the Institute for Clinical and Economic Review (ICER). Under the ASCO framework, net health benefit (NHB) scores between the IO agent vs chemotherapy were compared using survival, toxicity, and bonus points. NCCN Evidence Blocks of efficacy (E), safety (S), consistency (C), quality (Q) of evidence, and affordability (A) were assessed based on benchmarking to IO therapies in other indications and other therapies in the same indication. **RESULTS:** Under ICER, incremental life-years were estimated to be 0.74, with a corresponding increase in QALYs of 0.59, with most gains associated with pre-progression improvement in life-expectancy. Under ASCO, the incremental NHB was estimated to be 189, comprising 157 clinical benefit points, 12 toxicity points, and 20 bonus points for improved survival at the tail of the curve. Efficacy contributed to 94% of the NHB. Under NCCN, the IO therapy scored (E:5, S:4, Q:3, C:2, A:4). Chemotherapy scored lower on all domains apart from affordability (E:1, S:2, Q:2, C:3, A:4). **CONCLUSIONS:** ASCO and NCCN include oncology-specific measures important to patients, whereas ICER is payer focused. Overall, multiple or more holistic value assessments should be considered to capture the true value of an IO therapy in a rare disease space.

PCN128

CAN DOSE ALTERNATING OF SUNITINIB REGIMEN ENHANCE PATIENT'S OUTCOMES AS A FIRST LINE TREATMENT FOR METASTATIC RENAL CELL CARCINOMA?

Abotaleb A
World health organization (WHO), cairo, Egypt

OBJECTIVES: Using Sunitinib for treating metastatic renal cell carcinoma (m RCC) is often associated with toxicity necessitating dose reduction. Maintaining adequate dosing &drug levels are essential for optimizing clinical efficacy and these toxicity has negative impact on patient's outcomes and resources which raise a question how Alternative dosing of Sunitinib regimen can enhance patient's outcomes & utilize resources? The main objective for conducting this study is to evaluate the impact of changing Sunitinib regimen to 50 mg once daily, two weeks on and one week off against continuous pazopanib 800 mg once daily For enhance patient's outcomes &resources utilization for metastatic renal cell carcinoma .over a time horizon of five years . Cost effectiveness study was conducted for measuring and evaluating outcomes **METHODS:** Markov chain model was applied with three health states. Quality of life data were incorporated. Costs were that of the fund list. Results presented in term of ICER and QALYs. One-dimensional sensitivity analyses were employed. **RESULTS:** During the five-year time horizon, the total cumulative cost for sunitinib 50 mg is 134,079 EGP (exchange with a 1.85 cumulative QALY gained. The total cost for pazopanib was 136,214 EGP with a 1.81 QALY gained. The difference is -2,135 EGP in cost and 0.04 in QALY. The calculated ICER is -55,448. Sensitivity analyses found the results to be most sensitive to utility values during treatment, the progression free survival data and the cost of both Sunitinib and pazopanib **CONCLUSIONS:** Introducing Sunitinib regimen to 50 mg once daily, two weeks on and one week off as a first line for treatment of metastatic renal cell carcinoma was likely to be cost saving . With significant positive impact on patient outcome including

PCN129

COST-EFFECTIVENESS ANALYSIS OF APATINIB COMPARED WITH BEST SUPPORTIVE CARE IN CHEMOTHERAPY-REFRACTORY ADVANCED OR METASTATIC GASTRIC CANCER IN CHINA

Qin S[1], Li J[2], Yang L[3]
[1]*81st Hospital of People's Liberation Army, Nanjing, China,* [2]*Shanghai East Hospital, Tongji University, Shanghai, China,* [3]*Peking University, Beijing, China*

OBJECTIVES: Gastric cancer is the second most common cancer and the second leading cause of cancer-related death in China. It is estimated that approximately half of the new cases are in China. Apatinib, a novel vascular endothelial growth factor receptor 2 tyrosine kinase inhibitor, shows survival benefits in treating chemotherapy-refractory advanced or metastatic gastric or gastroesophageal junction adenocarcinoma in the phase III trial. The objective of this study was to evaluate the cost-effectiveness of apatinib from a Chinese payer's perspective. **METHODS:** A Markov model was developed to simulate disease progression and determine costs and outcomes over a 5-year time horizon. Incremental cost-effectiveness ratio (ICER) of apatinib to best supportive care (BSC) was calculated. Current apatinib patient assistance program (PAP) that offers donation after 3 cycles of treatment is available in China and therefore was taken into consideration in the present analysis. Data of BSC was collected from direct medical record. The model parameters and utilities were derived from previously published trials or literatures, and costs data were obtained from public sources. A 5% annual discount rate was applied to both costs and outcomes. **RESULTS:** Compared with BSC, the improvement following apatinib PAP in life-years (LYs), progression-free life-years (PFLYs), and quality-adjusted life years (QALYs) were 0.303, 0.193 and 0.237 years, respectively. The incremental cost with apatinib was $4868, yielding the ICER of $20,540 per QALY gained, which was lower than the willingness-to-pay threshold of $24,000 per QALY gained. Sensitivity analysis showed that the major drivers of cost effectiveness were treatment-related utility and cost of apatinib. **CONCLUSIONS:** The present analysis suggests that apatinib therapy is cost-effective alternative for patients with advanced or metastatic gastric or gastroesophageal junction adenocarcinoma who failed at least two lines of prior chemotherapy in China.

PCN131

TRABECTEDIN-BASED VERSUS PLATINUM-BASED TREATMENT ON RELAPSED, PARTIALLY PLATINUM SENSITIVE OVARIAN CANCER: AN INDIRECT, ADJUSTED SURVIVAL COMPARISON

Fernandez jM, Garcia San Andrés B
Pharmamar, Colmenar Viejo, Spain

OBJECTIVES: To demonstrate that, on relapsed ovarian cancer (ROC) patients with partially platinum sensitive (PPS) tumors; a non-platinum based treatment - trabectedin plus PEGylated liposomal doxorubicin (T-PLD) - is, at least, as clinically efficacious as a platinum-based strategy (C-PLD), **METHODS:** We performed a MAIC to adjust for differences in baseline characteristics between two phase-III randomized trials involving ROC, PPS patients: IPD was obtained from OVA-301 (T-PLD) whilst aggregated data from CALYPSO (c-PLD). A survival analysis followed, in order to analyze adjusted Overall Survival and Progression Free Survival; ultimately leading towards an adjusted Cox-proportional hazards model to test the non-inferiority hypothesis of T-PLD versus a platinum based therapy. **RESULTS:** After performing the MAIC methodology, T-PLD was found to be, at least, as efficacious when compared to C-PLD as treatment of choice following first progression: adjusted Cox proportional HR for overall survival was 0.90 (95% CI: 0.72-1.14) and for Progression Free Survival 1.18 (95% CI: 0.82-1.26). The adjusted median overall survival values were 25.6 and 23.4 months for T-PLD and C-PLD, respectively. In one particular key subset of patients - those treated with a further platinum-based line after T-PLD- ; benefit was more pronounced: with an adjusted median survival of 29.6 months, T-PLD would provide a median life extension of 6.2 months versus C-PLD; whilst still the non-inferiority hyphotesis was met (adjusted overall survival HR= 0.85, $p > 0.05$). **CONCLUSIONS:** Awaiting results from ongoing head to head trials (INOVATYON), this study strongly points out to a trend towards a significant survival improvement -within the PPS stratum- when a non-platinum combo (T-PLD) is prescribed. The incremental survival -more than 6 months- is an encouraging data for future research, given the poor prognosis and clinical management difficulties observed in this population.

PCN132

HEALTH ECONOMIC EVAUATIONS OF TARGETED THERAPIES FOR METASTATIC RENAL CELL CARCINOMA – A SYSTEMATIC REVIEW

Kale HP, Carroll NV
Virginia Commonwealth University, Richmond, VA, USA

OBJECTIVES: The availability of several targeted therapies (TTs) since 2005 has improved survival among metastatic renal cell carcinoma (mRCC) patients. However, their high cost imposes a significant burden on patients and healthcare systems. In order to provide an overview of economic value of TTs, we systematically reviewed cost-effectiveness studies of TTs in the U.S and other countries. **METHODS:** We searched Medline/PubMed and CINAHL databases using search terms, MeSH and CINAHL headings related to economic analysis and TTs in mRCC. We included original research published in English from the 2005 to 2016. While screening abstracts, we excluded studies unrelated to economic analysis and studies not comparing TTs to a comparator. We reviewed full texts to exclude commentaries, reviews, resource utilization and cost of illness studies. Study quality was assessed using Quality of Health Economic Studies (QHES) instrument. **RESULTS:** Of 228 studies found during the initial search, we reviewed 15 that met pre-defined selection criteria. Eight studies assessed first-line and 7 assessed second-line therapies. Two of four studies, which compared first-line TTs to cytokine therapy, found TTs to be cost effective (CE) over cytokine therapy. Three studies had direct comparisons of first-line therapies. Sunitinib was CE compared with bevacizumab and sorafenib in U.S and Sweden while pazopanib dominated sunitinib in the U.S and Canada. Five studies compared TTs to best supportive care (BSC). Only sunitinib was CE compared to BSC. Among second-line direct comparisons, everolimus (in the U.S) and axitinib (in Cyprus) were CE compared with sorafenib. Of 15 studies, 12 were good quality studies (QHES-score $\geq$ 75 of 100) with mean score of 81.8 (SD: $\pm$ 10.1). **CONCLUSIONS:** No drug was CE consistently across all studies. Evidence varied by country and accepted willingness to pay thresholds. Few direct comparisons of first and second-line therapies are available to draw conclusions among targeted therapies.

PCN133

COST-UTILITY OF OBINUTUZUMAB IN PREVIOUSLY UNTREATED FOLLICULAR LYMPHOMA

Sun LA, Carlson JJ
University of Washington, Seattle, WA, USA

OBJECTIVES: Follicular lymphoma (FL) is the most common subtype of indolent non-Hodgkin lymphoma, typically treated with a rituximab-containing immunochemotherapy regimen. The randomized, phase 3 GALLIUM trial showed an increase in progression-free survival (PFS) for patients with previously untreated FL when receiving obinutuzumab plus chemotherapy (G-chemo) compared to rituximab plus chemotherapy (R-chemo). The objective of this study is to assess the cost-effectiveness of G-chemo versus R-chemo for previously untreated FL from a US payer perspective. **METHODS:** A three-state partition survival model was developed using GALLIUM PFS and overall survival (OS) data to model long-term outcomes over a 30-year time frame. CDC life tables were used to inform background mortality rates for patients with FL. Adverse event frequencies were obtained from trial data, and costs were calculated using Average Sales Price (ASP) and Medicare reimbursement rates. Utility estimates for pre-progressive and post-progressive states were obtained from literature. **RESULTS:** Treatment with G-chemo resulted in an incremental gain of 0.84 life-years, or 0.68 quality-adjusted life years (QALYs) compared to R-chemo. The total costs over a 30-year horizon were $308,527 for G-chemo and $293,356 for R-chemo, resulting in an incremental cost of $15,171. Treatment with G-chemo was associated with higher treatment costs, which were offset somewhat by lower post-progression costs. Adverse event frequencies and costs were also higher for G-chemo. The incremental cost-effectiveness ratio (ICER) for G-chemo versus R-chemo

was $22,161 per QALY gained, which is cost-effective at a $50,000 per QALY threshold. The one-way sensitivity analysis showed that model results were most sensitive to PFS parameters for G-chemo and R-chemo, followed by drug costs and patient utilities. **CONCLUSIONS:** Treatment with G-chemo is likely cost-effective compared to R-chemo from a US payer perspective in the setting of previously untreated FL. The higher treatment costs of G-chemo are offset by gains in QALYs and delayed progression of disease.

PCN134

COST-EFFECTIVENESS OF RITUXIMAB IN ADDITION TO STANDARD OF CARE CHEMOTHERAPY FOR ADULT PATIENTS WITH ACUTE LYMPHOBLASTIC LEUKEMIA

Nam J[1], Milenkovski RB[1], Yunger S[1], Geirnaert M[2], Seftel M[2]
[1]Hoffmann-La Roche, Mississauga, ON, Canada, [2]CancerCare Manitoba, Winnipeg, MB, Canada

OBJECTIVES: Acute lymphoblastic leukemia (ALL) is an aggressive but potentially curable form of leukemia. Rituximab, an anti-CD20 monoclonal antibody, in addition to standard chemotherapy represents a novel therapeutic option for adults with the Philadelphia chromosome-negative, CD20-positive, B-cell precursor ALL sub-type (CD20+ Ph- BCP-ALL). The objective of this analysis is to determine the economic impact to the Canadian public provincial healthcare payer of rituximab in addition to standard of care (SOC) chemotherapy vs. SOC alone in newly diagnosed CD20+ Ph- BCP-ALL **METHODS:** A decision analytic model included the following health states over a 15-year time-horizon: event-free survival, relapsed/resistant disease, cure and death. SOC was with the two most widely used chemotherapy regimens in Canada: Hyper-CVAD or Dana Farber Cancer Institute (DFCI). Both regimens contained multiple treatment phases. Event-free survival, overall survival and serious adverse event (SAE) rates were taken from a recent major randomized controlled trial. Costs of the model included: first-, second- and third-line treatment and administration; disease management; palliative care; and SAE-related treatments. Model inputs were sourced from public data, literature and cancer agency input. **RESULTS:** Rituximab in addition to SOC resulted in 1.33 greater life-years, 1.16 greater quality-adjusted life-years (QALYs) and $51,679 incremental costs. The resulting mean ICER was $39,563/QALY. At a willingness-to-pay threshold of $100,000/QALY, the probability of being cost-effective was 96%. Decision outcomes were robust to the probabilistic and deterministic sensitivity analyses. **CONCLUSIONS:** For adults with CD20+ Ph-BCP-ALL, rituximab in addition to SOC was found to be a cost-effective intervention, compared to SOC alone from a Canadian public payer perspective.

PCN135

AN ECONOMIC EVALUATION OF CABOZANTINIB VS. EVEROLIMUS IN THE SECOND-LINE TREATMENT OF ADVANCED RENAL CELL CARCINOMA

Hart LA, Carlson JJ
University of Washington, Seattle, WA, USA

OBJECTIVES: The objective of this economic evaluation was to determine the cost-effectiveness of cabozantinib versus everolimus in the treatment of advanced renal cell carcinoma using a United States payer perspective. **METHODS:** A partitioned survival model was developed that contained three health states: 1) Stable (progression-free), 2) Progressed, and 3) Death. Data for the model with regard to survival, costs, and utilities was gathered via a variety of sources, including the METEOR trial, national databases, and existing literature. Methods described by Hoyle and Henley et al. were used to derive parametric survival functions from the available Kaplan-Meier curves. Model outcomes included total life-years, quality-adjusted life-years (QALYs), total costs, cost per life-year gained and cost per QALY gained. Sensitivity analyses were performed to evalute the impact of parameter uncertainty on model results. **RESULTS:** Individuals treated with cabozantinib gained on average an additional 0.44 LYs compared to those treated with everolimus. In addition, individuals treated with cabozantinib gained on average an additional 0.32 QALYs compared to those treated with everolimus. However, treatment with cabozantinib was associated with a greater cost of $49,811 compared to treatment with everolimus. This resulted in incremental cost effectiveness ratios of $112,318/LY and $154,194/QALY. Model results were most sensitive to cabozantinib cost, everolimus cost, utility for the stable (progression-free) state, utility for the progressed state, and cost associated with the progressed state. **CONCLUSIONS:** These results suggest that cabozantinib may not represent a cost-effective option in the second-line treatment of advanced renal cell carcinoma compared to the standard-of-care option everolimus based on common willingness-to-pay thresholds.

PCN136

MOLECULAR PROFILE SELECTION IN ADVANCED HEAD AND NECK CANCER: A COST-EFFECTIVENESS ANALYSIS

Rognoni C[1], Bossi P[2], Licitra L[2], Quaglini S[3]
[1]Centre for Research on Health and Social Care Management (CERGAS), Bocconi University, Milan, Italy, [2]Head and Neck Medical Oncology, Fondazione IRCCS - Istituto Nazionale Dei Tumori, Milan, Italy, [3]Department of Electrical, Computer and Biomedical Engineering, University of Pavia, Pavia, Italy

OBJECTIVES: Relapsed/metastatic head and neck squamous cell cancer patients are offered a combination of platinum-based chemotherapy (PF, cisplatin-fluorouracil) plus cetuximab regimen (PF+C) according to results of the Extreme trial. However, two economic evaluations showed that addition of cetuximab was not cost effective. This study aims at evaluating the cost-effectiveness of a putative predictive molecular test (MT) to identify and treat only patients potentially responsive to cetuximab when added to PF. **METHODS:** A Markov model was developed to compare both health and economic outcomes of PF+C regimen administered to all patients (PF+C ALL) versus the regimen administered only to MT-positive patients (PF+C POS). The model considered partial/complete response with or without mild/severe adverse events (AEs), progression and death. Rates of progression and survival, response rates to systemic treatment and adverse events were retrieved from the Extreme trial. Baseline utility coefficients for disease control and progression were retrieved from the literature (0.67 and 0.52, respectively). Only direct costs estimated from the Italian Health Service perspective were included (tariffs and DRGs reimbursements). The model was evaluated according to a cut-off of MT sensitivity at 85% and specificity at 70%. A 3 years horizon was chosen. Life expectancy, QALYs and costs were discounted at 3.5% annually. **RESULTS:** Applying the WHO cost-effectiveness threshold of 3 times the gross domestic product for Italy (66,402€), PF+C POS resulted a cost-effective choice in comparison to PF+C ALL for a MT cost lower than 5,750€. **CONCLUSIONS:** Adding cetuximab to PF only to patients positive to a predictive test may be cost-effective. Efforts should be spent to build such a test upon existing evidences in order to save resources for the health systems and spare unnecessary toxicities to patients.

PCN137

A REVIEW OF GLOBAL COST-EFFECTIVENESS STUDIES IN RENAL CELL CARCINOMA FOR AXITINIB

Wang BC[1], Ren H[2], Furnback W[1], Guzauskas GF[1]
[1]Elysia Group Ltd, Taipei, Taiwan, [2]Pfizer China, Shanghai, China

OBJECTIVES: Renal cell carcinoma (RCC) is a kidney cancer with an estimated worldwide incidence of 338,000. Five year survival for patients diagnosed with late-stage RCC is estimated to be < 10%. This study reviewed the literature to find studies estimating the cost-effectiveness of axitinib globally. **METHODS:** A search of the literature was conducting using PubMed, the Tufts CEA Registry, and the ASCO and ISPOR abstract databases. The search string in PubMed was: "Renal Cell Carcinoma[title] AND Cost-Effectiveness[title]". The Tufts CEA Registry was searched using only: "Renal Cell Carcinoma". Both conference abstract databases were queried using: "Renal Cell Carcinoma[title] AND Cost-Effectiveness[title]". Studies returned in the searches were then reviewed by two independent researchers for inclusion into our study. Included studies were examined and the indication, setting, sponsor, perspective, model type, discount rate, comparators, and results were extracted. **RESULTS:** A total of 6 cost-effectiveness studies were included. Two studies focused on the United States, while the other four examined the cost-effectiveness in Colombia, the Czech Republic, the United Kingdom, and Cyprus. Five of the six studies were funded by the pharmaceutical industry (Novartis, Pfizer, and Bayer), and one was an academic study. All studies examined axitinib as a second-line therapy. Axitinib was compared to everolimus in three studies and sorafenib in three studies. When compared to everolimus, axitinib was dominant in one study (Czech Republic) and dominated in the other two studies (Colombia and UK). When compared to sorafenib, axitinib had higher costs and higher health outcomes in all three studies. ICERs ranged from 87,936 euros per QALY (Cypress) to $683,209 USD per life year (U.S.). **CONCLUSIONS:** Axitinib had higher incremental health outcomes in four of six studies. The cost-effectiveness of axitinib is dependent on the study setting, perspective, and comparator.

PCN138

PHARMACOECONOMIC EVALUATION OF NILOTINIB VERSUS IMATINIB IN THE FIRST-LINE TREATMENT OF CHRONIC MYELOID LEUKEMIA: A SYSTEMATIC REVIEW

Nguyen TT[1], Nguyen TT[1], Nguyen TB[2]
[1]University of Medicine and Pharmacy in HCMC, Ho Chi Minh City, Vietnam, [2]Hanoi University of Pharmacy, Ha Hoi, Viet Nam

OBJECTIVES: To give an overview of available evidence on cost-effectiveness of nilotinib (NL) versus imatinib (IM) for the first-line treatment of chronic myeloid leukemia (CML) as well as the quality of these studies. **METHODS:** All studies were searched in 3 electronic databases (Pubmeb, Sciencedirect and Cochrane) with key words through the MeSH tool. After searching, screening identified studies with inclusion and exclusion criteria, data extraction and summary of results into pre-specified information table were undertaken. The studies were included if they were an original economic evaluation of NL versus IM in the first-line treatment of CML, written in English and conducted in the newly diagnosed patients. Abstracts of citations found that met the specified inclusion criteria were also reviewed. To compare and overview the results of studies, all currency values were transferred into $USD in 2015 based on Consumer Price Index. The report's quality of the studies was evaluated by 3 blinded reviewers based on the Quality of Health Economic Studies (QHES) tool with 16 questions. **RESULTS:** From a total 159 detected papers, 10 studies were extracted data and 3 studies were selected to evaluate the quality. Cost-effectiveness analysis, Markov model and sensitivity analysis were mostly used methods in these studies. Most researches used direct costs and used QALY as outcome. The converted ICUR/QALY of studies reached $866,436/QALY. Based on WTP threshold, 8/10 studies concluded that NL was cost-effectiveness compared with IM in the first-line of CML. Using QHES it has been shown the high quality of these studies with the mean score of 97 (1.73) on a scale of 100. **CONCLUSIONS:** Most studies suggested that NL was cost-effective compared with IM in the first-line treatment of CML patients and the report's quality of studies was very high.

PCN139

A RETROSPECTIVE ANALYSIS OF GENOMIC RISK STRATIFICATION ASSAYS FOR COLON CANCER

Chaudhari VS, Issa AM
University of the Sciences, Philadelphia, PA, USA

OBJECTIVES: Multi-gene assays and microarray technologies are being used increasingly for risk stratification of stage II colon cancer patients to predict disease relapse and guide adjuvant therapy decisions. Our objective was to

evaluate the outcomes and cost-effectiveness of using ColoPrint (Agendia Inc., Irvine, CA) as compared with Oncotype DX Colon Cancer Assay (Genomic Health Inc., Redwood City, CA) in the treatment of stage II colon cancer patients. **METHODS:** As part of a larger study to develop a Markov model, we conducted a review of the literature from January 2005 to December 2016 to assess data on risk classification; recurrence rates, transition probabilities, utilities and costs used for GEP assays in patients with stage II colon cancer. We investigated outcomes in three stages - no recurrence, recurrence, and death. For costs, we considered gene test costs; the costs of adjuvant chemotherapy, costs associated with adverse events and treatment, the cost of treating recurrence, and end-of-life care costs. **RESULTS:** A retrospective data analysis of 6,064 patients for both multigene assays in stage II or III colon cancer was conducted. We found that the recurrence score (RS) and microsatellite (MSI) status are the most reliable factors for prognosis of stage II colon cancer patients. For 5,307 patients using Oncotype DX, we found RS of 780 patients (14.69%) were in the low risk group, 990 patients (18.65%) in the intermediate risk group and 950 patients (17.90%) in the high-risk group. For 757 patients using ColoPrint, we found that the MSI status of 485 patients (64.06%) was in the low risk group and 272 patients were (35.93%) in the high-risk group. **CONCLUSIONS:** Multi-gene assays can predict the development of distant metastasis of patients with stage II colon cancer and may improve prognostic accuracy for safe therapeutic management of patients in treatment decisions about chemotherapy.

PCN140

COST-EFFICACY ANALYSIS OF THE PHARMACOGENETICS TEST FOR THE TPMT IN ACUTE LYMPHOBLASTIC LEUKEMIA

García Gil S[1], Ramos Díaz R[2], Casañas Sánchez V[2], Yanes Sánchez P[3], González de la Fuente G[1], Nazco Casariego GJ[1], Viña Romero MM[4], Calzado Gómez G[1], Ramos Rodríguez J[1], González Perera I[1], Gutiérrez Nicolás F[1]

[1]*Complejo Hospitalario Universitario de canarias, San Cristobal de La Laguna, Spain,* [2]*FUNCANIS, San Cristóbal de La Laguna, Spain,* [3]*Universidad de La Laguna, San Cristóbal de La Laguna, Spain,* [4]*Hospital Universitario Nuestra Señora de La Candelaria, Santa Cruz de Tenerife, Spain*

OBJECTIVES: The potential impact of pharmacogenetics on healthcare are still uncertain. Toxicities derived from the use of 6-mercaptopurine can be prevented by the genotyping of the thiopurine-methyltransferase (TPMT) enzyme. The aim of this study is to elaborate a cost-efficacy analysis for the determination of TPMT genotype in children with Acute Lymphoblastic Leukemia(ALL) using an economic and simple method for the pharmacogenetic determination. **METHODS:** We perform this anlaysis using the Ramos(2015) method from a dried blood drop deposited in collection cards for the genomic-DNA extraction. Genetic variants of TPMT analyzed were: 2*,3A*,3B*,3C* and 4*. Polymorphisms determination was performed by PCR using fluorescent probe. The sensitivity of our method is 99% (data not show). The cost of each genetic determination was 1.16€. Therefore the genotyping of a patient was 4.64€.Leucopenia is the most severe adverse event(AE) associated with thiopurine treatment. For the economic analysis we considered that the frequency of occurrence of AE would be 3% (Sanderson-2004), and 1/3 of this AE are related to TPMT decreased activity (Marra (2002)). 2/3 of patients suffering significant leucopenia could be managed as out-patients, requiring two additional visits (132€). The mean hospital stay of a child with ALL with severe myelosuppression is 10 days (480€/day). The healht-costs were taken from the Official Bulletin of Canary-Islands, 2015. The cost-efficacy analysis was done for a hypothetical cohort of 2.000 children with ALL. **RESULTS:** For the study population are estimated 60 patients will develop severe myelosuppression. In 20 patients this AE are related to TPMT deficiency with a cost asociated: 7 hospitalized patients (70 days/33.600 €), 13 out-patients (1.716€).The TPMT genotyping costs for 2000 patients will be 9.280€. So the cost saving will be 26.036€. **CONCLUSIONS:** Our analysis indicates that TPMT genotyping could be considered as an integral part of healthcare prior to the initiation of therapy with thiopurine drugs.

PCN141

A COST MINIMIZATION ANALYSIS OF ORAL VINORELBINE VERSUS IV CHEMOTHERAPIES FOR THE TREATMENT OF NON-SMALL CELL LUNG CANCER AND METASTATIC BREAST CANCER FROM CHINESE SOCIETAL PERSPECTIVE

Zhang L[1], Liu J[2], Berdeaux G[3], Zheng H[4], Xuan J[2]

[1]*Shanghai Centennial Scientific Ltd., Shanghai, China,* [2]*Sun Yat-Sen University, Guangzhou, China,* [3]*Pierre Fabre Medicament, Boulogne-Billancourt, France,* [4]*Shanghai Market Access Medicament Technology Developing Co.,Ltd, Shanghai, China*

OBJECTIVES: Consideration of medical costs as well as effectiveness and adverse events is becoming an important factor in the selection of chemotherapy regimens. Oral vinorelbine is recently approved for use of advanced non-small cell lung cancer (NSCLC) and metastatic breast cancer (mBC) in China. We conducted a cost minimization analysis for oral vinorelbine versus selected IV chemotherapies in treating advanced NSCLC and MBC from Chinese societal perspective for the purpose of facilitating evidence-based decision-making process. **METHODS:** Literature review indicated a comparable clinical efficacy between oral vinorelbine and its IV comparators (pemetrexed, gemcitabine and docetaxel in NSCLC; paclitaxel, gemcitabine and docetaxel in mBC). Thus, a cost-minimization analysis that assumes the same efficacy was conducted. Total costs for oral vinorelbine included drug acquisition price, adverse events (AEs) treatment cost, travel/delivery expense, medical examination cost, premedication and other costs. Total costs for IV comparators included drug acquisition price, AEs cost, travel expense, medical examination cost, hospitalization bed fee/ IV chair fee, medical supplies, premedication, patients' productivity loss and HCP labor cost. Cost information were retrieved from a previously completed time and motion analysis as well as a KOL survey. The model simulated total costs for four cycles of treatment. Only single-agent chemotherapy was considered. **RESULTS:** In NSCLC, the total treatment costs per treatment (four cycles)for oral vinorelbine, pemetrexed, gemcitabine and docetaxel were ¥61,848.68, ¥117,864.87, ¥71,060.94, and ¥64,162.87 respectively. Oral vinorelbine achieved cost reduction of ¥56,016.19, ¥9,212.26 and ¥2,314.19 respectively. In mBC, the total treatment costs per treatment for oral vinorelbine, paclitaxel, gemcitabine and docetaxel were ¥61,848.68, ¥66,509.64, ¥68,077.14, and ¥62,600.67 respectively. Oral vinorelbine achieved cost reduction of ¥4,660.96, ¥6,228.46 and ¥751.99 respectively. **CONCLUSIONS:** Oral vinorelbine leads to a much lower total cost compared with pemetrexed, gemcitabine, docetaxel and paclitaxel in treating NSCLC and mBC from Chinese societal perspective.

PCN142

ROBOT-ASSISTED RADICAL PROSTATECTOMY: A COST-UTILITY ANALYSIS

Xie X, Li C, Wang M, Higgins C, Sikich N, Dhalla I, Ng V

Health Quality Ontario, Toronto, ON, Canada

OBJECTIVES: Use of the robotic surgical system for radical prostatectomy (also called Robot-assisted radical prostatectomy (RARP)) is rapidly diffusing as an alternate to open radical prostatectomy (ORP). We assessed the economic implications of RARP compared with ORP in patients with localized prostate cancer. **METHODS:** We conducted a cost-utility analysis with a one-year time horizon from the perspective of the public payer in Ontario, Canada. Cost and utility parameters were mainly based on a recently published randomized controlled trial comparing the perioperative, functional, and oncological outcomes of patients receiving RARP or ORP at early 12 week follow-up. Potential long-term effects of RARP were evaluated in a scenario analysis using a 10-year Markov model. Budget impact was assessed assuming an increased RARP uptake in the next 5 years. **RESULTS:** Compared with ORP, RARP was associated with higher costs ($6,234 CAD) and small gains in quality-adjusted life years (QALYs) (0.0012), resulting in a base case incremental cost-effectiveness ratio (ICER) of $5.2 million/QALY gained. Key variables that influenced the ICER included post-surgery utilities, the service life of the robotic surgical system and the costs of disposables for the RARP. Results from the probabilistic sensitivity analysis were consistent with the base case. If RARP was assumed to have substantially better functional and oncological outcomes in the long term, the ICER could decrease below $100,000/QALY. The annual budget increase was estimated to be $0.8 million to $3.4 million CAD over the next five years, assuming an increased uptake of RARP (40% to 60% in Year 1 to 5 respectively versus current uptake rate of 34%). **CONCLUSIONS:** The robotic surgical system is not likely to be cost-effective for radical prostatectomy compared with ORP. If the diffusion rate of RARP continues to increase, it would lead to a considerable budget increase if this device was publicly funded.

PCN143

COST-UTILITY ANALYSIS OF GEFITINIB AND EGFR MUTATION TESTING AS THE FIRST-LINE TREATMENT FOR NON-SMALL CELL LUNG CANCER IN VIETNAM

Tran TT

University of Tsukuba, Tsukuba, Japan

OBJECTIVES: Gefitinib is an orally administered epidermal growth factor receptor tyrosine kinase inhibitor (EGFR-TKI). The combination of gefitinib and EGFR mutation testing was approved as a standard first-line therapy for non-small cell lung cancer (NSCLC) patients. This research evaluated the cost-utility of this targeted therapy to standard chemotherapy in Vietnam. **METHODS:** A three-state Markov model was developed based on the perspective of the insurance organization to achieve objectives. The quality-adjusted life year (QALY), direct medical cost, incremental cost-utility ratio (ICUR) were estimated. One-way sensitivity analysis was performed to evaluate uncertainties of parameters. **RESULTS:** The combination of EGFR mutation testing and gefitinib saved 43.5% cost of treatment compared to that of standard chemotherapy (111.34 millions VND and 196.94 millions VND, respectively). Patients treated with gefitinib-contained regimen gained more 0.3 QALY than those with standard chemotherapy (8.66 QALY and 8.36 QALY, respectively). These results suggested that gefitinib and EGFR mutation testing was totally cost-effective compared with standard chemotherapy in Vietnam. These results were supported by the one-way probabilistic sensitivity analysis. **CONCLUSIONS:** Based on the analysis, the combination of gefitinib and EGFR mutation testing was considered a cost-effective first-line therapy compared to standard chemotherapy such as paclitaxel plus carboplatin for NSCLC in Vietnam.

PCN144

COST-UTILITY OF NIVOLUMAB AGAINST DOCETAXEL FOR THE TREATMENT OF ADVANCED NON-SQUAMOUS NON-SMALL CELL LUNG CANCER (NSCLC) IN UNITED ARAB EMIRATES (UAE)

Garrido Lecca S[1], Alhammad A[2], Dawood S[3]

[1]*Bristol-Myers Squibb, Dubai, United Arab Emirates,* [2]*King Abdulaziz Medical City, Riyadh, Saudi Arabia,* [3]*Mediclinic City Hospital, Dubai, United Arab Emirates*

OBJECTIVES: This study aims to evaluate the cost-utility of nivolumab after prior chemotherapy compared with docetaxel in patients with locally advanced or metastatic non-squamous NSCLC from a UAE healthcare payer perspective. **METHODS:** A partitioned survival analysis model with 1-week cycle length was developed to simulate patients flowing through three main health-states: 'Progression-free', 'Progressive-disease', and 'death'. Survival, clinical and utilities input data for the comparison of nivolumab and docetaxel were derived from CheckMate-057 clinical trial. Local cost and resource utilization were estimated based on local institutions price indices and expert opinion Delphi exercise. A 20-year time-horizon and discount rates of 5% for costs and 3.5% for outcomes were used. **RESULTS:** In the base case analysis, the model estimates nivolumab to

provide 1.59 QALYs and 2.25 LYG vs. 0.76 QALYs and 1.04 LYG by docetaxel. A higher proportion of patients in the nivolumab cohort were estimated to be alive at years 1 and 2 compared with the docetaxel cohort; 48% at year 1 and 29% at year 2 on nivolumab vs. 41% and 13% on docetaxel, respectively. Total cost of the nivolumab cohort was estimated at AED 399,792 vs. AED 134,403 for docetaxel; which resulted in an estimated ICER at AED 318,653/QALY. Assuming a UAE willingness-to-pay threshold of AED 445,231/QALY (3GDP per capita) gained, nivolumab would be considered cost-effective against docetaxel. The results were robust to all parameters tested in sensitivity analysis with the discount rate of outcomes and average body weight being the main influential variables. Probabilistic sensitivity analysis indicated that nivolumab had a 92% chance of being cost-effective against docetaxel at the assumed willingness-to-pay threshold. **CONCLUSIONS:** Given the substantial improvement in clinical efficacy and a favorable ICER, nivolumab constitutes a cost-effective second line treatment option when compared to docetaxel from a UAE healthcare payer perspectives under the current model assumptions.

PCN146

PRODUCTIVITY LOSS AMONG PATIENTS WITH NEWLY DIAGNOSED MULTIPLE MYELOMA IN THE UNITED STATES

Merola D[1], Seal B[2], Yong C[2], Noga SJ[2], Shermock KM[3]
[1]*Shenandoah University, Winchester, VA, USA,* [2]*Millennium Pharmaceuticals, Inc., a wholly owned subsidiary of Takeda Pharmaceutical Company Limited, Cambridge, MA, USA,* [3]*The Johns Hopkins Medical Institutions, Baltimore, MD, USA*

OBJECTIVES: To evaluate workplace productivity loss among U.S. adult patients in the six months following an initial diagnosis with multiple myeloma (MM) who were treated with MM-directed drug therapies alone (DT) versus with autologous stem cell transplant (SCT). **METHODS:** A retrospective analysis was conducted using the Truven Health Analytics MarketScan Commercial Claims and Encounters (CCAE) and Health and Productivity Management (HPM) databases. Employed patients with six months of continuous enrollment in their medical benefits plan and for disability benefits (long term disability (LTD), short term disability (STD), workplace absenteeism (WAB)) were included in the analysis. **RESULTS:** 698 patients (mean age=52.8 years) met inclusion/exclusion criteria and were included in the study cohort. Of these, 323 patients (46%) used some form of disability benefit in the 6 months after initial diagnosis, compared to 193 (28%) in the six months prior to diagnosis (RR: 1.7, 95% CI: 1.4-1.9, $p<0.001$). Patients who used any disability benefit after diagnosis used a median of 18.5 disability days. Workplace absenteeism after initial diagnosis was the most common disability benefit used (85% of patients with absenteeism eligibility), followed by short term disability (14% of eligible patients), and long term disability (4% of eligible patients). The median number of disability days was higher among patients receiving SCT vs. DT (138.5 vs. 105.5 days, p=0.5 by Kruskal Wallis test). In sensitivity analysis using a cohort with 12 months follow-up after diagnosis, patients receiving SCT had significantly more disability days versus DT (145 vs. 112 days, p=0.01 by Kruskal Wallis test). **CONCLUSIONS:** Diagnosis of multiple myeloma is associated with significant productivity loss, as measured by use of disability benefits. Nearly half of all patients diagnosed with MM experience productivity loss. Both SCT and drug treatment are associated with productivity loss. Future work will assess the economic impact of this productivity loss.

PCN147

ECONOMIC BURDEN AND SURVIVAL ANALYSIS OF RELAPSE FOLLOWING HLA IDENTICAL ALLOGENEIC HEMATOPOIETIC STEM CELL TRANSPLANTATION FOR THE MANAGEMENT OF ACUTE LEUKEMIA AND MYELODYSPLASTIC SYNDROME

Bibeau J[1], Lachance S[2], Ladjemil DN[3], Lachaine J[3]
[1]*PeriPharm Inc., Montreal, QC, Canada,* [2]*Maisonneuve-Rosemont Hospital, Montreal, QC, Canada,* [3]*Université de Montréal, Montreal, QC, Canada*

OBJECTIVES: Relapse following allogenic hematopoietic stem cell transplant (aHSCT) is usually associated with poor outcomes. The impact of treatment choice on costs and survival remains unknown. The objective of this study was to measure the economic burden associated with the management of relapse following aHSCT and the impact of treatment on survival and healthcare costs. **METHODS:** A retrospective medical chart review was conducted in a HSCT specialized center in Montreal (Canada). Eligible patients were diagnosed with acute leukemia (AL) or myelodysplastic syndrome (MDS) and relapsed following a human leukocyte antigen (HLA) identical aHSCT between January 2011 and December 2014. Patients and disease characteristics as well as relapse-related healthcare resources were collected from date of relapse until death or last follow-up. Canadian unit costs for each resource were obtained from literature and governmental publications. **RESULTS:** A total of 36 patients were included in the analysis. Of these, 4 were diagnosed with MDS and 32 with AL. Treatment approaches following aHSCT relapse were divided in three groups: group 1 received supportive care (n=9), group 2 received chemotherapy or tyrosine kinase inhibitors (n=21) and group 3 received a cellular based therapy, either donor lymphocyte infusion or a second aHSCT (n=6). The mean cost per patient per month was C$20,239 (SD=17,079). The mean survival following relapse was 12.4 months (SD=2.8). For group 1, 2 and 3, the mean cost per patient per month was C $17,436 (SD=16,447), C$22,914 (SD=18,474), C$15,082 (SD=12,954), respectively. For group 1, 2 and 3, the mean survival was 4.0 months (SD=2.0), 7.2 months (SD=1.6), and 44.6 months (SD=8.4), respectively. **CONCLUSIONS:** Results demonstrate that compared to other treatments, cellular therapy following aHSCT is associated with a prolonged survival at a similar cost per patient per month and appear cost effective. Further studies with larger sample sizes are needed to confirm these findings.

PCN148

CAN SURGICAL TECHNIQUE IMPACT LENGTH OF STAY AND POST-OPERATIVE OUTCOMES IN BREAST RECONSTRUCTION?

Gabriel A[1], Sigalove S[2], Storm-Dickerson T[3], Sigalove N[4], Griffin L[5], Parekh MH[6], Macarios D[7], Maxwell GP[8]
[1]*PeaceHealth Medical Group, Vancouver, WA, USA,* [2]*DuPage Medical Group/ DMG Aesthetics, Glen Ellyn, IL, USA,* [3]*Compass Oncology, Vancouver, WA, USA,* [4]*Central DuPage Hospital/ Northwestern Medicine, Winfield, IL, USA,* [5]*Acelity, San Antonio, TX, USA,* [6]*LifeCell, an Acelity company, Bridgewater, NJ, USA,* [7]*LifeCell, an Acelity Company, Bridgewater, NJ, USA,* [8]*Loma Linda University Medical Center, Loma Linda, CA, USA*

OBJECTIVES: Pre-pectoral breast reconstruction is a less invasive technique compared to dual plane technique and shows promise in improving patient outcomes. This study compares hospital length of stay (LOS) and post-operative outcomes of pre-pectoral (PP) and dual plane (DP) techniques of breast reconstruction. **METHODS:** This single-site, retrospective cohort study included data from breast reconstruction procedures from June 2013 to March 2016. Data collected included demographics, chemotherapy/radiation exposure, surgical technique, LOS, drain usage, post-operative incision care and 90 day post-operative complications. Two-sided T-test and Chi-square or Fisher's Exact tests were performed at $\alpha = 0.05$. **RESULTS:** The study included data on 176 patients (DP=117, PP=59) and 335 breasts (DP=225, PP=110). The PP group had a higher BMI (29.5 vs. 26.3 kg/m2; p=0.0017), and a significantly higher proportion of patients with diabetes (13.6% vs. 2.6%; p=0.0073), hypertension (35.6% vs. 17.1%; p=0.0061), and prior breast surgery (36.8% vs. 22.2%; p=0.0415). A higher proportion of PP patients received ciNPT (57.6% vs. 25.6%; $p<0.0001$) compared to the DP group. There were no differences in complication rates between the two groups. The PP group had a significantly lower LOS compared to DP (mean: 1.1 vs. 1.8 days, $p<0.0001$). Nearly 95% of PP patients were discharged after 1 hospital day compared to only 25.6% of the DP patients ($p<0.0001$). Results of multiple regression models were similar to the univariate analyses after controlling for effects of age, BMI, ciNPT use, diabetes, hypertension and prior breast surgery. **CONCLUSIONS:** This study demonstrated a significantly lower hospital LOS in the PP group compared to DP technique. Complication rates were similar between the two groups even though the PP group was more complex. Studies with a long-term follow up will be critical in understanding the true differences between surgical technique and clinical outcomes.

PCN149

ANALYSES OF HEALTHCARE RESOURCE UTILIZATION (HCRU) IN CHECKMATE 141, A PHASE 3 STUDY OF NIVOLUMAB VERSUS INVESTIGATOR'S CHOICE (IC) IN PATIENTS WITH RECURRENT OR METASTATIC (R/M) PLATINUM-REFRACTORY SQUAMOUS CELL CARCINOMA OF THE HEAD AND NECK (SCCHN)

DeRosa M[1], Cocks K[2], Taylor F[1], Bobiak S[3], Juarez Garcia A[3], Shaw JW[3]
[1]*Adelphi Values, Boston, MA, USA,* [2]*Adelphi Mill, Bollington, UK,* [3]*Bristol-Myers Squibb, Princeton, NJ, USA*

OBJECTIVES: In CheckMate 141 (NCT02105636), nivolumab was shown to have survival and health-related quality-of-life benefits versus IC of single-agent therapy (methotrexate, docetaxel, or cetuximab) in patients with platinum-refractory R/M SCCHN. Using data from CheckMate 141, we assessed the impact of treating platinum-refractory R/M SCCHN with nivolumab versus IC on HCRU and associated costs. **METHODS:** Using non–protocol-specified hospitalization and medical visit data from CheckMate 141, the number of HCRU events and percentage of patients who experienced those events were compared between treatment arms from baseline through end of safety follow-up. Negative binomial regression adjusting for patient differences in length of study follow-up was used to examine differences in HCRU by treatment arm, with coefficients transformed to incidence rate ratios (IRRs). Using a US perspective, economic burden of HCRU was extrapolated by attaching unit costs from the Medical Expenditure Panel Survey to per-patient average numbers of events. Costs were calibrated to 2011 values (USD). **RESULTS:** Nivolumab-treated patients had a 29% lower rate of hospitalization than those treated with IC (IRR=0.71 [95% confidence interval (CI): 0.50-0.99]; P=0.046). Rates for emergency department visits (IRR=0.72 [95% CI: 0.24-2.13]), hospital outpatient visits (IRR=0.87 [95% CI: 0.38-1.99]), and other visits (IRR=0.86 [95% CI: 0.39-1.91]) were qualitatively lower for nivolumab versus IC. Using the United States as a base case, average per-patient costs for nivolumab versus IC were lower for all forms of HCRU except physician office visits. The total per-patient HCRU cost for nivolumab ($21,779) was 13% lower than that for IC ($24,961). **CONCLUSIONS:** In CheckMate 141, nivolumab-treated patients had a lower rate of hospitalization than IC-treated patients. Differences in rates of hospitalization and other events translated into substantial differences in estimated costs of care. The full economic implications of these differences should be interpreted carefully as not all potentially related costs were assessed.

PCN150

TREATMENT PATTERNS, HEALTH CARE RESOURCE UTILIZATION AND COST ASSOCIATED WITH THE MANAGEMENT OF RELAPSED/REFRACTORY INDOLENT NON-HODGKIN LYMPHOMA

Lambert-Obry V[1], Van der jagt R[2], Hamm C[3], Fleury I[4], Gouault Laliberté A[5], Castonguay A[5], Toltl L[6], Lachaine J[1]
[1]*Université de Montréal, Montreal, QC, Canada,* [2]*The Ottawa Hospital, Ottawa, ON, Canada,* [3]*Windsor Regional Cancer Centre, Windsor, ON, Canada,* [4]*Maisonneuve-Rosemont Hospital, Montreal, QC, Canada,* [5]*PeriPharm Inc., Montreal, QC, Canada,* [6]*Gilead Sciences Canada, Mississauga, ON, Canada*

OBJECTIVES: Indolent non-Hodgkin lymphoma (iNHL) is a hematologic malignancy characterized by slow progression. Although response rates to first-line therapy are

high, patients often relapse repeatedly. There are no guidelines for the treatment of relapsed/refractory iNHL and the economic impact in Canada is unknown. The objective of this study was to understand treatment patterns, health care resource utilization and cost for the management relapsed/refractory iNHL in Canada. **METHODS:** A retrospective chart review was conducted in 3 Canadian Oncology centers. Patients included were ≥18 years, diagnosed with follicular lymphoma, small lymphocytic lymphoma, lymphoplasmacytic lymphoma or marginal zone lymphoma, received prior treatment with ≥2 chemotherapy- or immunotherapy-based regimens and were refractory to rituximab and an alkylating agent. Data were collected from iNHL diagnosis until end of study (i.e. death, loss to follow-up or March 31, 2015), with the index date defined as the date at which patients met all eligibility criteria. Mean monthly cost per patient was calculated from index date to end of study. Canadian unit costs were obtained from the literature and government publications. **RESULTS:** A total of 40 iNHL patients met the eligibility criteria. Of these, 24 (60%) had a diagnosis of follicular lymphoma. The median age at index date was 64 years. With each line of treatment, the proportion of unique regimens administered increased while the number of patients receiving therapy decreased. Furthermore, the median time to relapsed/refractory diagnosis decreased with each subsequent line of treatment. Mean monthly cost per patient was C$5,420 including hospitalizations (43%), treatments (38%), medical procedures (17%) and medical visits (1%). **CONCLUSIONS:** This study demonstrates that the management of relapsed/refractory iNHL becomes increasingly challenging throughout the course of the disease and generates considerable costs. Patients become less responsive to therapies over time and there is no consistent standard of care for relapsed/refractory iNHL patients.

PCN151

RESOURCE USE FOLLOWING GENE EXPRESSION PROFILE TESTING IN UVEAL MELANOMA PATIENTS: A U.S. PRIVATE PAYOR MODEL

Middlebrook B, Cook RW, Manning N, Schafer G, Monzon F, Maetzold D
Castle Biosciences, Inc., United States, TX, USA

OBJECTIVES: Early detection of metastases is crucial in uveal melanoma patients, as nearly 50% metastasize within five years, primarily to the liver. However, <3% of all patients present with metastases at diagnosis. DecisionDx-UM is a validated prognostic gene expression profile test that categorizes a patient's metastatic risk as low, medium or high, allowing them to be followed with a surveillance program of corresponding intensity and minimizing over- or under-treatment. U.S. private payors cover more than half of uveal melanoma patients; we developed a decision tree model to assess the impact of DecisionDx-UM on resource utilization in this population. **METHODS:** Surveillance costs (outpatient visits, liver function testing, and imaging) were compared for the previous framework in which 80% of patients received high-intensity surveillance regimens, and the current scenario in which patients are tested with DecisionDx-UM and receive a low-, medium- or high-intensity regimen based on their individual risk. Regimens and model structure were based on literature review and U.S. clinical practice; cost inputs were based on 2016 private payor rates. The model assumes 1,650 diagnoses per year and survival rates for each risk group based on results of the first Collaborative Ocular Oncology Group study. Model predictions included the number and cost of surveillance procedures. **RESULTS:** Based on this model, DecisionDx-UM was associated with a 50% reduction in the number of surveillance procedures performed at two years compared to the previous framework (14,459 procedures with DecisionDx-UM vs. 28,846 without), with an overall 60% reduction at five years (29,158 procedures with DecisionDx-UM vs. 72,155 without). Overall cost savings per patient was $3,733 per patient per year with total cost savings of $20,164,682 at five years. **CONCLUSIONS:** DecisionDx-UM allows clinicians to tailor surveillance programs based on each individual patient's risk, greatly reducing resource utilization and resulting in meaningful cost savings for private payors.

PCN152

CLINICAL UTILITY, COVERAGE, AND REIMBURSEMENT FOR NEXT-GENERATION SEQUENCING IN PEDIATRIC ONCOLOGY PRACTICE

Oberg JA[1], Sireci AN[1], Hsiao SJ[1], Pendrick D[1], Turk AT[1], Chung WK[1], Mansukhani MM[1], Sulis ML[1], Kung AL[2], Glade Bender JL[1]
[1]*Columbia University, New York, NY, USA,* [2]*Memorial Sloan Kettering Cancer Center, New York, NY, USA*

OBJECTIVES: Next-generation sequencing (NGS) has the potential to transform the paradigm for diagnosing and treating cancer. Widespread adoption is predicated on demonstrating the clinical utility/clinical impact of NGS and developing evidence-based reimbursement policies. A review of clinical utility, coverage and reimbursement from third-party payers was conducted in a cohort of pediatric oncology patients as part of a clinical NGS program. **METHODS:** NGS was performed in a CLIA-certified laboratory at Columbia University Medical Center. Testing included whole-exome sequencing (WES) of matched tumor-normal tissue, transcriptome analysis and copy number variation. WES of patient-parent DNA was performed when a constitutionally encoded disease or syndrome was suspected. Targeted sequencing of 48 or 467 cancer-associated genes was used when tumor tissue was limited. **RESULTS:** 105 patients received NGS (WES: n=82, 78%; targeted panels: n=23, 22%). Clinical utility/clinical impact was demonstrated in 62/105 patients (59%); druggable targets (17/62), diagnostic/prognostic (26/62); other clinically-impactful findings (19/62). WES identified 54/62 (87%) of the clinically-impactful findings. 78 patients (74%) received partial reimbursement. In 16/27 patients denied coverage (59%), a clinically-actionable result was found. Reimbursement was provided by commercial plans to 35/52 patients (67%) and to 43/50 patients (86%) by managed-government plans. Government plans provided no coverage for 3 patients. Insurers without a specific coverage plan or considered NGS "experimental", denied coverage for all or part of testing. On average, insurers reimbursed 33% of the total NGS service charges: 30% (range, 0-89%) from commercial plans; 37% (range, 0-61%) from managed-government plans. The average reimbursement was: $3,426 (range, $750-$7,227) for WES; $837 (range, $82-$1,399) for targeted 48-gene panel sequencing; and $2,586 (range, $444-$4,149) for targeted 467-gene panel sequencing. **CONCLUSIONS:** NGS provided clinically-impactful information for 59% of patients but only one-third of charges for testing were reimbursed by insurers. Evidence-based reimbursement policies are needed to promote the adoption of NGS technologies that benefits patients into clinical practice.

CANCER – Patient-Reported Outcomes & Patient Preference Studies

PCN153

THE EFFECT OF DEPRESSION ON ADHERENCE TO HORMONE THERAPY IN BREAST CANCER PATIENTS

Noxon V
University of South Carolina, Columbia, SC, USA

OBJECTIVES: Breast cancer patients with depression before or after their diagnosis have been shown to have increased cost, shorter survival time and reduced adherence to hormone therapy. Currently, no study has determined the association of concurrent depression while adjusting for a history of depression with adherence to hormone therapy. The objective of this study is to determine the association of concurrent depression with adherence to hormone therapy adjusting for a history of depression. **METHODS:** Breast cancer patients with hormone receptor positive cancers diagnosed from 2006 to 2009 were identified in the linked SEER-Medicare dataset. Patients must have started hormone therapy within a year of cancer diagnosis to be included and have at least 1 year and up to 4 years of follow up. Patients who had an ICD-9 code for depression within a year of cancer diagnosis were classified as currently depressed. Adherence was measured using percent days covered (PDC) and was calculated for each quarter during follow up. A generalized linear model with repeated measures was used to determine the association of concurrent depression with adherence to hormone therapy. **RESULTS:** 10,471 hormone receptor positive breast cancer patients who took hormone therapy were identified. Of these, 10% were currently depressed. Those with depression consistently had lower PDC values for each quarter during follow up. Current depression was associated with a 19% reduction ($p<.01$) in the odds of adhering to hormone therapy after adjusting for a prior history of depression in addition to other confounders. A prior history of depression was also associated with a 15% reduction ($p<.01$) in the odds of adhering to hormone therapy after adjustment. **CONCLUSIONS:** Concurrent depression is associated with significantly reduced adherence to hormone therapy in breast cancer patients.

PCN154

KNOWLEDGE OF WOMEN ON HUMAN PAPILLOMA VIRUS

Vajda R[1], Rasztik R[1], Pakai A[2], Gyuró M[1], Csákvári T[2], Danku N[1], Horváthné Kívés Z[1], Endrei D[1], Boncz I[1]
[1]*University of Pécs, Pécs, Hungary,* [2]*University of Pécs, Zalaegerszeg, Hungary*

OBJECTIVES: The main objective of our study was to assess the knowledge of women in Siklós and its region about the human papillomavirus and also learn their attitudes about the vaccine. **METHODS:** A quantitative, cross-sectional survey was carried out in 2016 by using non-random sample selection method in Siklós and its region. 180 questionnaires were distributed, of which 166 proved to be evaluable. The questionnaire included the following groups of questions: socio-demographic profile, knowledge on human papilloma virus and willingness to vaccination. Data were processed by SPSS 22.0 program, using descriptive statistical analysis, $\chi 2$-test, Mann-Whintey-test and Logistic regression ($p<0.05$). **RESULTS:** 81.9% of the women knew the meaning of the acronym, HPV. Significantly more women with higher education ($\chi 2=24.960$; $p<0.001$), with health education ($\chi 2=16.738$; $p<0.001$), and with knowledge of the acronym, HPV ($\chi 2=16.427$; $p=0.001$) knew the promoting factors of the infection. Women giving birth later in life were likely to give a wrong answer on diseases caused by HPV (ß=0.167; OR= 1.182; 95% CI[1.032;1.353]). Women with health education (Mann-Whitney U=1005.500; $p<0.001$) had a significantly higher level of knowledge than those without it. In total, 33.7% of the women could be considered as persons with high level of knowledge on HPV. Women with higher education significantly knew more on HPV ($\chi 2=35.111$; $p<0.001$). 81.9% of the respondents had some knowledge on HPV vaccination and 4.2% of them received vaccination.30.7% of them may have vaccination later, especially those who consider their states of health good ($\chi 2=20.120$; $p<0.001$) or those who attend cervical screening regularly ($\chi 2=15.147$; $p=0.019$) in a higher rate. **CONCLUSIONS:** To enhance knowledge is the best way to express the importance of infection. Acquired knowledge may determine the participation in screening and willingness to vaccination.

PCN155

GASTROINTESTINAL SYMPTOMS AND NUTRITIONAL CHALLENGES OF PATIENTS (PTS) AFTER TREATMENT FOR GASTRIC OR GASTROESOPHAGEAL JUNCTION (GEJ) CANCERS

Barghout V[1], Hutchinson J[1], Bogush M[1], DuPree B[2], Lacy B[3]
[1]*Viver Health LLC, Morristown, NJ, USA,* [2]*Holy Redeemer Health System, South Hampton, PA, USA,* [3]*Geisel School of Medicine at Dartmouth, Hanover, NH, USA*

OBJECTIVES: Patients with gastric or GEJ cancers frequently experience gastrointestinal symptoms and face nutritional challenges, particularly during and immediately after treatment. We sought to identify these symptoms and challenges, and obtain insight about how patients consequently adapted their eating. **METHODS:** Patients

with gastric or GEJ cancer were systematically interviewed about their medical history (diagnosis, treatment[s], medications, comorbidities, deficiencies, and receipt of dietary recommendations); symptoms; elimination patterns; impact of certain foods and beverages, including aversions, triggers, and avoidances; and daily food and beverage intake. **RESULTS:** Patients (4 men, 5 women; 34-70 years old) had diagnoses ranging from stage I to IV gastric±GEJ cancer and had undergone various treatments (partial esophagectomy±partial/total gastrectomy±chemotherapy± radiation). Some but not all patients received meaningful dietary advice during or immediately after treatment. No patient tolerated commonly recommended nutritional shakes. Most patients experienced dumping syndrome/diarrhea, particularly after consuming liquids with solids, and most had ≥1 (mainly vitamin B12) deficiency. Patients occasionally experienced constipation. In general, patients used a trial-and-error approach to identify optimal eating parameters (eg, timing, volume, and palatable, non-symptom-evoking foods and beverages). All patients ate frequent, small meals that included a protein; drank frequent, small volumes of liquid; did not co-consume solids and liquids; introduced new foods and beverages slowly and repeatedly; and increased consumption volumes over time. Frequent symptom triggers were high-sugar and/or carbonated beverages, raw vegetables, and high-sugar, spicy, high-fat, and fried foods, and variable triggers were caffeinated beverages, alcohol, and red meat. **CONCLUSIONS:** Patients are concerned about subpar nutrition after treatment for gastric or GEJ cancers. Though foods and beverages impact patients differently, commonalities exist. Providing behavior and healthy dietary recommendations can help manage patients' expectations and optimize nutritional intake. Diet and consequent nutritional intake, which may impact medication compliance and/or adherence, should be considered within clinical trials.

PCN156

HEALTH UTILITIES IN ACUTE MYELOID LEUKEMIA: A COMPREHENSIVE LITERATURE REVIEW

Retzler J[1], Smith AB[1], Chung KC[2]
[1]York Health Economics Consortium Ltd, York, UK, [2]Jazz Pharmaceuticals, Palo Alto, CA, USA

OBJECTIVES: Acute myeloid leukemia (AML) is a rare hematologic malignancy characterized by proliferation of myeloid blasts which is associated with poor outcomes (25.8%, 5-year survival; SEER, 2016). While AML treatment has not changed meaningfully in the past four decades, new therapies in advanced development have the potential to improve outcomes in AML. Health utilities are an important component in economic evaluation to assess the value of new treatment options. This literature review aims to identify health state utility values in adult patients with AML. **METHODS:** A literature search strategy for AML and health state utility values was implemented across MEDLINE, PubMed, EMBASE, PsycINFO, HTA databases, NHS Economic Evaluation Database, Cochrane Central Register of Controlled Trials, Database of Abstracts of Reviews of Effects, Cost-Effectiveness Analysis Registry, ScHARRHUD, EQ-5D database, ISPOR Scientific Presentations Database, and ISOQOL conference abstracts. 2284 records were identified. Following exclusion of records based on title and abstract, two researchers independently assessed the 52 full texts of selected articles and extracted data for eligible studies. **RESULTS:** Eighteen studies met the eligibility criteria. Of the studies assessed, four reported values for descriptive analyses of HRQoL, one was a review of utilities in different leukemia types, and the remaining publications used utility values in economics models. Utilities were derived from multiple methods, including proxies from other health conditions (e.g., CML, MDS; n=5), mapping (n=2), EQ-5D (n=5), physician visual analog scale ratings (n=2), reference to other publications (n=2), or was not specified (n=2). Overall, utility values for AML health states varied widely by publication: baseline AML 0.52-0.77; remission 0.74-0.99; relapse 0.3-0.8. **CONCLUSIONS:** Overall, this review indicates that there is a scarcity of robust utility data in AML patients. Further studies are needed to delineate better defined AML health utilities to inform the economic value of AML treatment strategies.

PCN157

ASSESSMENT OF UTILITY VALUES FOR TREATMENT-RELATED HEALTH STATES OF ACUTE MYELOID LEUKEMIA IN THE UNITED KINGDOM

Hensen M[1], Joshi N[2], Xu W[1], Patel S[3], Bal V[4], Lasch K[5]
[1]Pharmerit International, Rotterdam, The Netherlands, [2]Pharmerit International, Bethesda, MD, USA, [3]Novartis Pharmaceuticals UK Limited, Camberley, Surrey, UK, [4]Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA, [5]Pharmerit International, Newton, MA, USA

OBJECTIVES: Acute myeloid leukemia (AML) is a genetically heterogeneous hematologic malignancy associated with reduced quality of life (QOL) among patients. Considering the morbidity and mortality associated with AML treatment, improvement in QOL is critical in establishing the non-survival benefits of AML therapies. Information on AML health-state utilities is currently limited. This study assessed how members of the general public in the United Kingdom (UK) value AML health states. **METHODS:** A Time Trade Off (TTO) approach was used in this study, which has been widely used to obtain utility values for use in the economic evaluation of health technologies. Health state descriptions were developed based on the literature, which included elements of symptoms and aspects of physical, functional, and emotional well-being, as well as key adverse events of AML treatment. Ten health states included in the study were: newly diagnosed AML, induction, consolidation, maintenance, long-term follow-up, relapsed/refractory, stem cell transplant (SCT) procedure, SCT recovery, SCT long-term follow-up with and without complications. Descriptions were validated by haematologists and nurse specialists for clinical accuracy and completeness. Subsequently, 210 members of the general UK public participated in the main TTO interviews. Descriptive statistics were used to analyse the utility values. **RESULTS:** One hundred and twenty-nine (61.4%) participants were female. Mean age of the participants was 44.0 years (SD 14.9, range 18 to 81 years). The following utility values were obtained: newly diagnosed AML 0.63; induction 0.16; consolidation 0.57; maintenance 0.89; long-term follow-up 0.89; relapsed/refractory 0.51; SCT procedure -0.21; SCT recovery 0.75; SCT long-term follow-up with and without complications 0.37 and 0.94, respectively. **CONCLUSIONS:** The utility value is low, as expected, for the health states induction and SCT procedure. The TTO methodology can be employed to elicit utilities for AML health states which can be used in cost-effectiveness models of AML treatments for HTA submissions.

PCN158

HEALTH STATE UTILITY VALUES FOR HER2+ METASTATIC BREAST CANCER

Paracha N[1], Thuresson P[2], Ray J[3]
[1]F. Hoffman-La Roche, Basel, Switzerland, [2]F. Hoffmann-La Roche Ltd., Basel, Switzerland, [3]F. Hoffmann-La Roche, Basel, Switzerland

OBJECTIVES: Health state utility values (HSUV) are commonly used to derive quality adjusted life years in economic evaluations. The objective of this study was to estimate health utilities for HER2+ metastatic breast cancer patients who have failed on least two regimens of HER2 directed therapies. **METHODS:** We analysed data from a large (n=602), repeated measure (3,767 observations), EQ-5D-3L dataset from the TH3RESA trial to estimate utility values. The EQ-5D was converted into utility value using the UK tariff. A mixed (random-slope) models using unstructured covariance structure were fitted to predict utility values according to baseline patient characteristics and key clinical outcomes. The set of variables considered for the model included: treatment allocation, disease progression, hospitalisation due to adverse event (AE), baseline age, baseline ECOG, sex, baseline BMI, number of prior regimen (<=3 or >3), visceral disease, and patient proximity to death. Final set of variables were selected using clinical opinion. **RESULTS:** The median number of follow up visit was 7 (range: 0-27). Time was included as a random effect. Included variables demonstrated evidence of an important association with HRQoL outcomes based on magnitude and significance of effect ($p<0.1$). Visceral disease and number of prior regimen was forced into the model to make HSUV more generalisable. Our model showed a substantial statistically significant utility decrement of 0.33 in the 14 weeks leading to patient's death. Lastly, hospitalisation due to AEs and disease progression was associated with utility decrement of 0.06 and 0.04, respectively. **CONCLUSIONS:** An event based analysis using a mixed model better explained variation in EQ-5D data according to key clinical outcomes and patient characteristics.

PCN159

A TRIAL-BASED EUROQOL EQ-5D HEALTH UTILITY ANALYSIS IN PATIENTS WITH PREVIOUSLY UNTREATED METASTATIC NSCLC

Huang M[1], Pellissier J[1], Kong F[2]
[1]Merck & Co., Inc., North Wales, PA, USA, [2]Merck & Co., INC, North Wales, PA, USA

OBJECTIVES: This study evaluated health-related quality of life utility in previously untreated non-small cell lung cancer (NSCLC) patients. **METHODS:** This study examined the EQ-5D-3L data collected from patients enrolled in the KEYNOTE-024 trial, a multicenter, worldwide, randomized Phase III trial comparing pembrolizumab to standard-of-care platinum-based chemotherapy (SoC) in patients with previously untreated metastatic NSCLC with PD-L1 positive (Tumor Proportion Score [TPS]>=50%) tumors. Two approaches of defining health states are considered in analysing utility: time-to-death reflecting decline in cancer patient's quality of life as they approach death, and progression-based health states. Generic health statuses assessed from the EQ-5D-3L questionnaire were converted to population-based utility values using published algorithms. The utility scores from the pooled treatment groups are reported. **RESULTS:** Data came from 283 patients who had at least one evaluable EQ-5D record. Mean utility score for patients in progression-free and progressive disease state is 0.78 (95% CI 0.77, 0.79) and 0.69 (95% CI 0.66, 0.72), respectively. Mean utility showed a decrease on disease progression of 0.09, which is considered as clinically meaningful. Patients were split into four groups based on their time to death after the EQ-5D questionnaire was taken - over 360 days, 180–360 days, 30–180 days, and under 30 days. Mean utility in each time-to-death category is 0.81(95% CI 0.77, 0.84), 0.73 (95% CI 0.68, 0.77), 0.63(95% CI 0.59, 0.67), and 0.54 (95% CI 0.43, 0.65). The results showed a large decrease in utility by time to death category. **CONCLUSIONS:** The results showed that quality of life for metastatic NSCLC patients rapidly deteriorates during the end of life period. Considerable deterioration of utility in NSCLC patients is associated with disease progression and time to death. The utility values estimated from the study will inform economic evaluations of treatments in previously untreated metastatic NSCLC.

PCN160

HEALTH UTILITY IN MYELOFIBROSIS PATIENTS AND COMPARISON BETWEEN HEALTH UTILITY VALUES MEASURED BY TIME TRADE OFF AND VISUAL ANALOGUE SCALE

Lee YJ, Lee S, Song S, Lee S, Suh D
Chung-Ang University, Seoul, South Korea

OBJECTIVES: To elicit utility for health states of myelofibrosis patients and calculate mean differences and correlation between health outcomes measured by time trade off (TTO) method and visual analogue scale (VAS). The effects of socio-demographic characteristics on TTO ratings were also explored. **METHODS:** Four health states of myelofibrosis were created: early disease state without treatment (HS1); late disease state without treatment (HS2); treatment with best available therapy (BAT) (HS3); and off BAT (HS4). Detailed health state descriptions were developed based on literature searches for myelofibrosis and the

health states were assessed using TTO and VAS. Based on a stratification sampling method, participants were selected to represent the population of South Korea. Paired t-tests and correlation were used to compare VAS and TTO. A generalized linear model was used to find the demographic factors influencing TTO values. **RESULTS:** A total of 126 participants, with an average age of 46.7 (±10.8) and of which 49.2% were women, were interviewed. The mean utility values using TTO were: 0.90(±0.08) for HS1; 0.22(±0.24) for HS2; 0.41(±0.26) for HS3; and 0.36(±0.26) for HS4. Significant mean value differences between TTO and VAS were found in HS2, HS3, and HS4; 0.108, 0.107 and 0.125 ($p<0.000$), respectively. Correlations between TTO and VAS were found in HS1, HS3 and HS4; $r=0.244$($p<0.01$), $r=0.263$($p<0.01$) and $r=0.189$($p<0.05$), respectively. Small variances in TTO were explained by VAS in HS1 (6%), HS3 (7%) and HS4 (4%). Demographic factors did not significantly affect TTO utility values. **CONCLUSIONS:** This study found that there were differences in myelofibrosis patient's utility values according to four different health states. Values measured by TTO and VAS were significantly different in HS2 through HS4, and weak correlations were found in HS1, HS3 and HS4. The findings could serve as a valuable resource for future research when comparing the impacts of previous and/or new treatments.

PCN161

CLINICIAN PREFERENCES FOR CANCER TREATMENT OUTCOMES: DOES PERSONALITY INFLUENCE CHOICE?

Law EH[1], Jiang R[1], Kaczynski A[2], Muhlbacher AC[2], Pickard AS[1]
[1]*University of Illinois at Chicago, Chicago, IL, USA,* [2]*Hochschule Neubrandenburg, Neubrandenburg, Germany*

OBJECTIVES: To (1) determine whether Conscientiousness or Agreeableness was associated with different treatment outcome preferences and (2) examine whether the choice between Dead and moderate or severe health differed by levels of personality traits. **METHODS:** An online survey was administered to a convenience sample of doctoral pharmacy students. Respondents completed a personality inventory to measure levels of Big Five personality traits (Extraversion, Agreeableness, Conscientiousness, Emotional Stability, and Openness to Experience), then categorized by tertiles (low, moderate, high) for each trait. Treatment outcome preferences were quantified using profile-based (case 2) best-worst scaling (BWS) where profiles were described using the EQ-5D-Y descriptive system and framed with a hypothetical cancer scenario. In two additional items, respondents were asked to choose between Dead and moderate and severe health states. Count analysis obtained preference scores for each treatment outcome. Analysis of variance (ANOVA) and Kruskal-Wallis test (KWT) examined preference differences across Conscientiousness and Agreeableness tertiles. Logistic regression models evaluated the association between higher levels of Conscientiousness and Agreeableness and choosing Dead over the moderate and severe health states. **RESULTS:** A total of 185 respondents were recruited. Preferences were significantly different across Conscientiousness tertiles for "no problems" in Usual Activities (ANOVA $p=0.03$, KWT $p=0.06$), Pain/Discomfort, and "a lot of problems" in Pain/Discomfort (p-values <0.05). No differences in treatment preferences were observed across Agreeableness tertiles. Higher levels of personality traits were not significantly associated with choosing Dead over moderate health (Conscientiousness: odds ratio [OR] 3.9, 95%CI 0.4-34.7; Agreeableness: OR=0.2, 95%CI 0.02-1.7); nor severe health (Conscientiousness: OR 0.8, 95%CI 0.4-1.6; Agreeableness: OR 0.7, 95%CI 0.3-1.3). **CONCLUSIONS:** Conscientiousness appears to be a factor in treatment outcome preferences among future pharmacists. Conscientiousness and Agreeableness may impact choosing Dead over health states based on the effect magnitude; however, larger studies are needed to confirm this association.

PCN162

STATED PREFERENCES FOR LUNG CANCER TREATMENT: A SYSTEMATIC REVIEW

Monteiro A, Magliano CA, Correia I, Fontes LS, Santos M
Instituto Nacional de Cardiologia, Rio de Janeiro, Brazil

OBJECTIVES: The selection of therapeutic schemes for advanced stages of lung cancer patients often involves weighing beneficial and deleterious outcomes of each available alternative, as well as their costs. Patients and relatives preferences about established therapeutic options and innovative medical solutions may be a key information to support decision-making across its multiple spheres. This study aims to identify stated-preferences studies that elicited lung cancer patient's preferences regarding treatment and outcomes. **METHODS:** The search was performed using MEDLINE, EMBASE, Econlit and RePEc. In addition, the references of articles that meet the inclusion criteria were scanned in an effort to identify further relevant literary production. Articles published until June 2016 were included in this systematic review. Studies that reported stated preferences experiments, on the topic of lung cancer therapies and/or outcomes were included. Reports of any variation of stated preferences experiments were considered eligible (e.g. Choice-based conjoint, willingness-to-pay (WTP)). **RESULTS:** Ten out of 1,155 references retrieved met the inclusion criteria. The total sample size was composed by 1,302 patients. Studies were conducted in the USA (4) and Europe (4), Asia (1) and Australia (1). The studies used choice-based conjoint (4), willingness-to-pay (5) and time trade-off (1). WTP studies explored how much patients were willing to pay to avoid one single side effect or to be cured of the disease. The remaining studies looked at the valuation of health outcomes or at the trade-off between health outcomes and processual attributes. Overall, relief of symptoms related to secondary effects of chemotherapy and to the tumor appeared to be more important than processual attributes. When included, disease-free survival or overall survival were considered the most important attributes. **CONCLUSIONS:** The identified literature found that the cost, efficacy and symptom relief are important drivers of choice.

PCN163

DEVELOPING ATTRIBUTES AND ATTRIBUTE-LEVELS FOR A DISCRETE CHOICE EXPERIMENT ON LUNG CANCER PATIENT'S PREFERENCES FOR DRUG THERAPIES

Monteiro A, Santos M, Fontes LS
Instituto Nacional de Cardiologia, Rio de Janeiro, Brazil

OBJECTIVES: Stated preferences experiments validity depends largely on the proper specifications of attributes and levels. Hence, patients and physicians engagement is critical to assure that the information being valued on the experiment is both important to patients and decision-relevant. This study reports the systematic approach undertaken targeting the definition of attributes and attribute levels for a discrete choice experiment created to elicit lung cancer patient's preferences for drug therapies. **METHODS:** A literature review was undertaken aiming to identify conceptual attributes and attribute-levels. The finding of this review helped to define the qualitative component. The qualitative component included 3 focus groups, on which 8 patients and 3 oncologists were engaged on discussions aiming to identify context specific attributes. All interviews were recorded, transcribed and analyzed by the research team. The resulting draft-proposal of attributes and attribute-levels was thoroughly discussed and further developed by a group of experts. **RESULTS:** The first round of results derived 10 attributes. Attribute-levels were defined according with the literature, the results from the qualitative component and experts opinions. After a round of discussion with experts on the field three attributes were discarded. The final proposal consists in seven attributes that were defined as follows: Fatigue/tiredness, diarrhea, skin rash, risk of hospitalization, mode of administration (route of drugs administration), access and overall survival. **CONCLUSIONS:** The results reported in this manuscript will add to the body of knowledge on the application of qualitative methods to derive attributes and attribute-levels for a stated preferences experiment.

PCN164

EXPLORING CANCER SURVIVOR PERSPECTIVES ON THE VALUE OF LIFE AND TIME POST-DIAGNOSIS

Hinkel JM
McGivney Global Advisors, Wayne, PA, USA

OBJECTIVES: The objectives of this study were to explore cancer survivors' perspectives on the value of life and time and to gather preliminary data to guide future research through a pilot survey. **METHODS:** A convenience sample of survivors was reached with an online survey instrument via sharing a link on two US cancer survivor Facebook groups. A dataset was downloaded for analysis after 48 hours of collection. **RESULTS:** 104 individuals responded, and 99 complete responses were analyzed. Year of cancer diagnosis were 1975 to 2015. Tumor types included breast cancer (25%), leukemia (15%), Hodgkin lymphoma (13%) and many others. The majority of respondents had completed active treatment (81%). A majority (76%) rated post-diagnosis years as having more value than years prior to diagnosis. (23% assigned same value, 2% less value). When asked about the value of time pre- and post-diagnosis, 81% of all respondents agreed with: "Time is more valuable now because of my experience" as opposed to less valuable, or no change in perspective. 26 respondents (26%) rated post-diagnosis years as more valuable even though they are now partially limited (n=22) or significantly limited (n=4) in what they are able to do. **CONCLUSIONS:** Cancer survivors' perspectives on the value of time and years post-diagnosis have not been heavily researched. Common methods in health economic evaluation use metrics such as the Quality Adjusted Life Year (QALY) that place a value on life years based as a function of time and Health Related Quality of Life (HRQoL). Data from this survey suggests that the outputs of QALY functions, which reflect lower values for post-diagnosis years, may not accurately reflect survivor perspectives, which could place greater value on post-diagnosis years even when physical limitations are present. As value is increasingly emphasized in oncology policy, these patient perspectives merit further investigation and attempts at quantification.

PCN165

COMPARING CANCER-SPECIFIC PREFERENCE-BASED OUTCOME MEASURES: THE SAME BUT DIFFERENT

Lorgelly P[1], Norman R[2]
[1]*Office of Health Economics, London, UK,* [2]*Curtin University, Perth, Australia*

OBJECTIVES: Disease-specific outcome measures for use in economic evaluations are growing in popularity. Within cancer there are now two preference-based measures, the EORTC-8D and the QLU-C10D. Both map responses from the EORTC QLQ-C30, a questionnaire which measures the quality-of-life of cancer patients. They share some commonalities in the C30 items that they draw from and the analytical approach applied in selecting their item dimensions, but they differ in other areas (the clinical characteristics of the patient group within which they conducted their analysis and the valuation approach). This is the first analysis comparing the two measures in an external dataset. **METHODS:** Cancer 2015, a longitudinal prospective population-based cancer genomic cohort, was utilised in the analysis. Both the EQ-5D-3L and the EORTC QLQ-C30 were asked at baseline (diagnosis) and at various follow-up points (3, 6, 12 months). The respective algorithms were applied to generate health state values for the EORTC-8D and the QLU-C10D. Cancer-specific baseline values were evaluated and compared. Quality adjusted life-years (QALYs) were estimated and assessed. Validity, ceiling effects, agreement and sensitivity in the instruments were also evaluated. **RESULTS:** Complete case analysis of 1663 patients found that the EORTC-8D and QLU-C10D are highly correlated (0.947), yet the EORTC-8D values at baseline were significantly higher than the QLU-C10D values (0.830 vs 0.736, $p<0.001$). There is strong agreement between the instruments at baseline (ICC=0.770). EORTC-8D QALY estimates were significantly higher than

QLU-C10D QALYs (0.911 vs 0.821, $p<0.001$). Differences in QALY estimates appear to be sensitive to the site of the cancer. **CONCLUSIONS:** It is well known that generic preference-based measures often produce different conclusions, this analysis confirms that disease-specific measures also suffer from the same variability, even when drawn from the same quality-of-life instrument. Further research is required to understand the reasons for the variability, particularly if recommendations for reimbursement change in light of using one instrument over another.

PCN166

SQUAMOUS CELL CARCINOMA OF THE HEAD AND NECK (SCCHN) PATIENT REPORTED SATISFACTION WITH CANCER THERAPY

Byrne K[1], Hallworth P[1], Zanotti G[2]
[1]Adelphi Real World, Bollington, UK, [2]Pfizer, Inc., New York, NY, USA

OBJECTIVES: To understand SCCHN patient satisfaction with cancer therapy. **METHODS:** Real world data was gathered using Adelphi's Disease-Specific Programme (DSP) - a cross-sectional survey administered to physicians and patients in the USA, France, Germany and the UK (April - September 2016). 182 physicians (54 US, 128 EU) provided data on consulting SCCHN patients regarding treatment patterns and staging. 373 current stage IV SCCHN patients (60 US, 313 EU) completed the Cancer Therapy Satisfaction Questionnaire (CTSQ), a 16-attribute tool assessing patient satisfaction with and preference for treatment. Summary statistics were reported and differences between sub-groups assessed using chi-square tests. **RESULTS:** Overall 44% of patients stated satisfaction (very/satisfied) with their most recent cancer therapy. No notable difference was observed based on current stage (%sat) – stage IVA/B (47%) vs. stage IVC (41%), or current regimen (%sat) – platinum-based (50%) vs. cetuximab-based (46%). Further analysis of side effects being as expected (%somewhat/much worse) also sees no marked difference between those on platinum-based (29%) vs. cetuximab-based (28%) regimens. The only difference in platinum-based vs. cetuximab-based scores is in how worthwhile (%very) patients feel cancer therapy has been (22% vs. 16% ($p=0.0108$)). A notable overall satisfaction difference (%sat) was observed between those currently receiving 1st line drug therapy (51%) vs. 2nd line (38%) ($p=0.0224$). Differences were also seen between the cohorts in terms of whether therapy has been as difficult as expected (% much/somewhat more difficult – 1st line 36%, 2nd line 48% ($p=0.0265$)) and whether the benefits of therapy have met expectations (% somewhat/much worse than expectations – 1st line 16%, 2nd line 30% ($p=0.0025$)). No difference was seen in side effects scores (%somewhat/much worse – 1st line 27%, 2nd line 32%). **CONCLUSIONS:** Patients on 2nd line SCCHN drug therapy have lower satisfaction than those on 1st line, highlighting a need for improved drug treatments at later lines.

PCN167

CHEMOPREVENTION RATES AMONG WOMEN WITH HIGH RISK OF BREAST CANCER: A SYSTEMATIC REVIEW

Bhansali A[1], Sansgiry SS[2]
[1]University of Houston College of Pharmacy, Houston, TX, USA, [2]College of Pharmacy, University of Houston, Houston, TX, USA

OBJECTIVES: This study summarizes the uptake rates of chemoprevention drugs among postmenopausal women at high risk of being diagnosed with breast cancer. **METHODS:** A systematic literature review was conducted for articles published between January 1996 and October 2016, using databases Medline (Ovid), and PubMed (NLM). Chemoprevention was defined as the use of tamoxifen or raloxifene or exemestane. The eligibility criteria considered in this study were, post-menopausal women at a high risk of breast cancer. Only articles published in English from peer reviewed journals were included in this review. Two reviewers independently screened a random sample of 25 titles and abstracts. A moderate agreement (Cohen's $\kappa = 0.65$) was obtained. The elements of PICOS were reviewed within each article. **RESULTS:** A total of 10 full text articles were included in this review. The overall decision to initiate chemoprevention ranged from 4.7% - 47.0% affirmative in the articles included in the review. An average of 70% women declined chemoprevention. Only one study measured the uptake of chemoprevention immediately after an intervention, while nine studies measured the uptake after a follow up of 3-14 months. The presence of a control group indicates a stronger study design and only three studies had a control group. The chemoprevention uptake rates were about 10% on an average in the target population. The most common reasons for refusal of chemoprevention were chemoprevention side effect profile and the duration of therapy. **CONCLUSIONS:** Chemoprevention uptake rates were low among post-menopausal women with high risk of breast cancer. Since risk of adverse events and duration of therapy were the most cited reasons of low chemoprevention uptake, appropriate patient counselling with focus on chemoprevention risk-benefit profile may be designed and implemented.

PCN168

IDENTIFYING PREFERENCES FOR APPROACHES TO BREAST CANCER SURGICAL TREATMENT BEYOND TRADITIONAL CLINICAL BENCHMARKS OF SURVIVAL

Storm-Dickerson T[1], Gabriel A[2], Das L[3], Farias JM[3], Gitlin M[3], Macarios D[4]
[1]Compass Oncology, Vancouver, WA, USA, [2]PeaceHealth Medical Group, Vancouver, WA, USA, [3]BluePath Solutions, Los Angeles, CA, USA, [4]LifeCell, an Acelity company, Bridgewater, NJ, USA

OBJECTIVES: To identify preferences for breast cancer surgical treatments. **METHODS:** A computerized adaptive choice-based conjoint survey was administered in December 2016 to a sample of healthy women ≥ 18 years old from the Army of Women registry. The survey quantified the importance of clinical and humanistic outcomes and surgical treatment characteristics using a hierarchical Bayes model. Preferences for each treatment attribute were ranked by importance and part-worth utilities were used to perform a simulation of preference for treatment options including breast conservation surgery with radiation and uni- and bi-lateral mastectomy with or without reconstruction. **RESULTS:** A total of 522 subjects returned the survey. Age ranges were 0.2%, 20.3%, 49.6% and 29.9% for those 18-25, 26-44, 45-64, and ≥ 65 years old, respectively with majority being Caucasian (96.7%). Mean (± standard deviation) ranking of surgical treatment attribute importance, in decreasing order, were physician recommendation, 21.4 (± 13.6); 20-year survival, 20.5 (± 9.8); number of surgeries and recovery time, 14.3 (± 10.6); 10-year recurrence, 14 (± 7.3); out of pocket (OOP) costs, 8.7 (± 5.5); nipple preservation and sensitivity, 7.8 (± 6.5); breast look relative to before surgery, 6.1 (± 4.4); radiation use, 5.2 (± 4.8) and annual following imagining requirements, 2.2 (± 1.8). Simulation results when testing common surgical approaches (equal survival and physician recommendation), showed that 65.07% of simulation resulted in preference for bilateral mastectomy (22.2% without reconstruct, 42.9% with reconstruction). **CONCLUSIONS:** The findings validate that survival is a key driver, but ~80% of the decision was based on other factors including doctor's recommendation, the risk of recurrence, cost burden, OOP costs and aesthetic related factors. The majority of subjects preferred bilateral mastectomy with reconstruction when comparting preferences among 5 possible surgical intervention approaches. Understanding preferences may help focus education material and physician approaches to information sharing and decision making.

PCN169

PATIENT PREFERENCES REGARDING TRADEOFFS BETWEEN EFFICACY AND ADVERSE EVENTS FOR METASTATIC COLORECTAL CANCER TREATMENTS

Gonzalez JM[1], Christodoulopoulou A[2], Hechmati G[2], Mange B[1], Garawin T[2]
[1]RTI Health Solutions, Research Triangle Park, NC, USA, [2]Amgen Inc., Thousand Oaks, CA, USA

OBJECTIVES: To evaluate patient preferences and their willingness to accept risks of specific adverse events (AEs) associated with metastatic colorectal cancer (mCRC) treatments for expected survival benefits associated with these treatments. **METHODS:** We administered an online questionnaire to 100 patients with CRC and 150 with mCRC, which asked each respondent nine discrete choice experiment (DCE) questions. Each question was designed to elicit relative preferences for clinically relevant levels of four attributes of treatments for mCRC—the chance of living at least 3 years after starting therapy, the risk of severe skin rash, the risk of any gastrointestinal (GI) bleeding, and the risk of any other bleeding problems. Preference weights for the levels of these attributes were elicited using a random-parameters logit model. These preference weights were used to calculate the maximum acceptable risk (MAR) of each AE that patients were willing to accept for a 10% increase in 3-year survival. **RESULTS:** Results from a chi-square test identified no statistically significant differences in the preferences of patients with metastatic and nonmetastatic disease. Thus, a single preference model was used with both groups for the analysis. For an increase from 24% to 34% in the chance of 3-year survival with treatment, the MARs (95% confidence interval—CI) were as follows—severe skin rash, 77.3% (62.0%–92.6%); any GI bleeding, 49.4% (39.5%–59.4%); and any other bleeding problems, 40.9% (27.8%–54.0%). **CONCLUSIONS:** Patients were willing to accept a higher risk of developing a severe skin rash than suffering from any GI bleeding or any other bleeding problems for a given increase in survival benefit. This research shows substantial differences in patient preferences for treatment-specific AEs, making patient preference an important factor in the choice of mCRC treatment.

PCN170

PATIENT PREFERENCE AND SATISFACTION WITH ORAL ONCOLYTICS: A REVIEW OF AVAILABLE INSTRUMENTS AND THEIR PSYCHOMETRIC PERFORMANCE

Vadagam P[1], Heidari E[1], Cauley B[1], Kamal KM[2]
[1]Duquesne University, PITTSBURGH, PA, USA, [2]Duquesne University Mylan School of Pharmacy, Pittsburgh, PA, USA

OBJECTIVES: An increasing number of patients now take oral therapies to treat cancer, thereby highlighting the importance of patient preference and satisfaction with these therapies. As key outcomes in the oncology quality framework, there is a need to identify preference and satisfaction-related instruments in oral oncolytics and report their psychometric properties. **METHODS:** A literature search was conducted according to PRISMA guidelines using PubMed database to identify relevant articles in English up until October, 2016. Non English studies, case reports and other review articles were excluded. Controlled search terminology included oral oncolytic therapy names in combination with satisfaction, preference and related terms. Psychometric properties of the instruments were extracted for qualitative synthesis. **RESULTS:** Among 803 articles identified, 46 studies were included in the final review, of which, 18 had used validated instruments. The population ranged from 18 to 95 years and was being predominantly treated for breast and colorectal cancers. Most studies indicated that convenience and outcomes compared to intravenous drugs promoted the use of oral oncolytics whereas high cost and medication adherence were potential barriers influencing patient preference and satisfaction. A total of 15 standardized instruments (11 satisfaction and 4 preference) were reported. The most commonly used were Cancer Therapy Satisfaction Questionnaire (CTSQ) which evaluated 7 domains (expectations of cancer therapy, feelings about side effects, oral cancer therapy adherence, convenience, satisfaction with cancer therapy, stopping cancer therapy, and reasons for nonadherence) and Therapy Preference Questionnaire which evaluated 2 domains (characteristics interfering with daily activities and factors influencing treatment preference). These instruments also reported good psychometric properties. **CONCLUSIONS:** Patient preference and satisfaction are crucial variables in medication adherence and are valuable when comparing treatments. With oral oncolytics being increasingly prescribed, it will be important to include validated preference and satisfaction instruments to document the changes in outcomes, thereby influencing treatment decisions in oncology care.

PCN171

HOW CAN WE ASSESS THE IMPACT OF COST ON PATIENT TREATMENT PREFERENCES IN CLL TREATMENT?

Mansfield CA[1], Boeri M[2], Reyes C[3], Masaquel AS[3], Sutphin J[1], Li J[3]
[1]RTI Health Solutions, Research Triangle Park, NC, USA, [2]RTI Health Solutions, Belfast, UK, [3]Genentech, Inc., South San Francisco, CA, USA

OBJECTIVES: To develop a method to assess the impact of cost on patient preferences in chronic lymphocytic leukemia (CLL) treatment. **METHODS:** Assessing the impact of cost on treatment preferences in a discrete-choice experiment (DCE) can be difficult, especially for drugs with long treatment durations. When costs are high, respondents may either ignore the cost attribute or focus only on cost, reducing the value of the study. As an alternative, we first administered a DCE that did not include cost as an attribute. After the DCE, respondents answered one additional question where cost was added as attribute to predefined Medicines A and B. Respondents were randomly assigned to the high-cost version ($400 per month difference in cost between the medicines) and the low-cost version ($75 per month difference in cost between the medicines). Using the DCE results, we computed posterior preferences for each individual conditional on the pattern of observed choices and based on Bayes' theorem without cost and forecast the share who would choose each of the two medicines. The forecast was compared to the percent who selected Medicine A or B in the two cost questions. **RESULTS:** 384 patients with self-reported CLL took a DCE survey on treatments for CLL (mean age 65 years, 23% first line, 39% relapse, 53% received financial aid to pay for treatments). Using the method described above, we forecasted that 91% of the sample would prefer the medicine with the longest PFS when cost was not included, compared to 50% and 26% who actually selected that option for the low-cost and high-cost follow-up questions, respectively. **CONCLUSIONS:** The fixed follow-up questions including cost provided preference information when high costs were not feasible as a DCE attribute. Respondents were very sensitive to modest changes in treatment cost, pointing to the importance of gathering this information.

PCN172

WOMEN'S PREFERENCES AND WILLINGNESS-TO-PAY FOR SINGLE NUCLEOTIDE POLYMORPHISMS GENE TESTING IN A MULTI-ETHNIC ASIAN POPULATION

Wong XY[1], Groothuis-Oudshoorn CG[2], van Til JA[3], Tan CS[4], Cook AR[4], Hartman M[5], Chong KJ[5], Wee HL[4]
[1]National University of Singapore, Singapore, Singapore, [2]MIRA institute for Biomedical Technology and Technical Medicine, University of Twente, Enschede, The Netherlands, [3]University of Twente, Enschede, The Netherlands, [4]Saw Swee Hock School of Public Health, National University of Singapore, Singapore, Singapore, [5]National University Hospital, Singapore, Singapore

OBJECTIVES: Single Nucleotide Polymorphisms (SNPs) gene tests have demonstrated potential for stratifying women into distinct breast cancer risk categories, thereby facilitating personalised screening regimens. We studied screening-age women preferences and willingness-to-pay for SNPs gene testing in Singapore. **METHODS:** English-speaking Singaporean women aged 40 to 69 years old without history of breast cancer were enrolled via door-to-door recruitment with quota sampling by age and ethnicity to participate in a discrete choice experiment (DCE). DCE comprises: (i) sample type (buccal swab, dried blood spot), (ii) person conducting pre-test discussion (nurse educator, non-specialist doctor, specialist doctor), (iii) test location (private family clinic, public primary-care clinic, hospital) and (iv) out-of-pocket cost (approximately US$35, US$125, US$210). Conditional Logit (CL) and Hierarchical Bayes (HB) were used to estimate preference weights and willingness-to-pay. Associations between sociodemographic characteristics and attribute levels were studied by including interaction terms in CL model. **RESULTS:** 300 women aged 52.6 ± 7.6 years completed the survey (100 Chinese, Malay and Indian women respectively). Using HB, relative attribute importance is highest for cost (75.6%), followed by pre-test discussion (14.6%), test location (5.5%) and sample type (4.4%). Using CL, cost and pre-test discussion appeared to be significant (p-value < 0.0001 for both). Interaction effect between ethnicity and test location was significant (p-value $= 0.0001$). As compared to Chinese, Malays and Indians attached smaller disutility to taking the test at public primary-care clinic. Women were willing to pay the most to discuss with specialist doctor instead of non-specialist doctor (approximately US$34; 95% CI: US$24 to US$44), and the least to switch from dried blood spot to buccal swab (about US$0.44; 95% CI: US$-5.38 to US$6.25). **CONCLUSIONS:** Test cost was the main determinant of preferences, while sample type was of least concern. To promote uptake, the design of personalized breast cancer screening programmes may be tailored accordingly to these preferences.

PCN173

DISCORDANCE OF ACUTE MYELOID LEUKEMIA SYMPTOMS REPORTED BY US PHYSICIANS AND PATIENTS

Pandya BJ[1], Wilson S[1], Hadfield A[2], Horvath LE[1], Medeiros BC[3], Mueller CJ[1], Bailey T[2], Flanders SC[1], Pike J[2]
[1]Astellas Pharmaceuticals, Northbrook, IL, USA, [2]Adelphi Real World, Manchester, UK, [3]Stanford University, Stanford, CA, USA

OBJECTIVES: Little is known about the level of agreement between physician- and patient-reported symptoms in the acute myeloid leukemia (AML) population. The objective of this analysis was to assess the level of agreement on reported AML symptoms between treating physician and AML patients. **METHODS:** Data from an Adelphi AML Disease Specific Programme, a real-world, cross-sectional survey involving 61 US hematologists/hemato-oncologists and their AML patients were analyzed. The survey, conducted between February–May 2015, covered population characteristics and treatment regimens with both physician- and patient-reported data captured at the same time. Physicians provided information on patients' current symptomatology from a symptom list and invited their patients to complete a questionnaire containing the FACT-LEU tool. Patient-reported symptomatology was taken from the 'Additional Concerns' section, where the level of importance informed whether the symptom was experienced (3 [Quite a bit], 4 [Very much]) or was not experienced (0 [Not at all], 1 [A little bit], 2 [Somewhat]). The kappa-statistic measure of inter-rater agreement (adjusting for random agreement) was calculated for the presence of key AML symptoms. Kappa values near 0 indicate low agreement, while values approaching 1 indicate high agreement. **RESULTS:** For the 82 patients included in the analysis, most of whom were receiving first-line treatment (n=56), approximately a third (n=26) were reported as asymptomatic by their physician. Kappa analysis indicated low agreement between physician and patient on the presence of 6 key reported symptoms: (loss of appetite [agreement=29.3%; kappa=-0.02], fatigue/tiredness [agreement=62.2%; kappa=0.08], weight loss [agreement=70.7%; kappa=0.08], bruising [agreement=70.7%; kappa=0.13], bleeding [agreement=76.8%; kappa=0.02], and fever [agreement=87.8%; kappa=0.31]). **CONCLUSIONS:** Disagreement was observed between physician- and AML patient-reported symptoms, with patients being considerably more likely to report experiencing symptoms to some degree. Shared decision making tools that can facilitate improved communication between physicians and AML patients about their symptoms may lead to more effective management.

PCN174

TREATMENT SATISFACTION AND BURDEN OF ILLNESS (BOI) WITH ORAL VS INJECTABLE MULTIPLE MYELOMA THERAPY IN PATIENTS WITH RELAPSED OR REFRACTORY DISEASE

Romanus D[1], DasMahapatra P[2], Hoole M[2], Lowe M[2], Curran C[2], Campbell S[1], Bell J[3]
[1]Takeda Pharmaceuticals International Co, Cambridge, MA, USA, [2]PatientsLikeMe, Cambridge, MA, USA, [3]Millennium Pharmaceuticals, Inc., a wholly owned subsidiary of Takeda Pharmaceutical Company Limited, Cambridge, MA, USA

OBJECTIVES: Compare patient-reported satisfaction and BOI with oral vs. injectable therapy for multiple myeloma (MM) among patients with relapsed/refractory (RR) disease. **METHODS:** Patients within the patient-powered research network, PatientsLikeMe (PLM; www.patientslikeme.com) were surveyed about their treatment experience and BOI. Eligible patients were ≥ 18 years, resided in the USA, and were currently on a treatment regimen comprised of either an all-oral therapy (oral users) or injectable therapy with or without oral medication (injectable users). Those with concomitant amyloidosis or other cancers in the past 5 years were excluded. Patients were classified as RR if they ever changed treatment due to disease progression or recurrence. Patients completed a web based self-administered survey using the Treatment Satisfaction Questionnaire for Medication (TSQM) and BOI questions related to MM. Outcomes of interest were compared in univariate analyses between oral and injectable users. **RESULTS:** In this interim analysis, among 32 respondents, mean age was 60 years (SD: 9), 86% were Caucasian, 15% were Hispanic, and 57% and 25% had an ECOG PS 0-1 and 2, respectively. Current use of an all-oral regimen was 44% (n=14/32), whereas 56% (n=18/32) were on an injectable regimen. Oral users tended to report better mean effectiveness (70 vs. 65, $p = 0.465$) and global satisfaction (56 vs. 51, $p = 0.386$), and significantly greater convenience (83 vs. 64, $p < 0.01$) with therapy than injectable users. Oral users had fewer provider treatment visits in the past 30-days (median: 1 vs. 3) and less time spent per visit (median: 68 vs. 120 minutes) compared with injectable users. **CONCLUSIONS:** Emerging data suggests that an all-oral regimen is associated with a higher level of convenience and a trend towards greater treatment satisfaction and lower healthcare resource use than an injectable regimen in RRMM. Patient productivity will be reported in the final analysis.

PCN175

EVALUATING PATTERNS OF COGNITION, DEPRESSION AND FATIGUE AMONG CHILDREN WITH CANCER

Lai J, Beaumont JL, Segawa E
Northwestern University, Chicago, IL, USA

OBJECTIVES: Cognitive dysfunction is a common late effect for children with brain tumor or who received neurotoxic treatments. Cognition reported by parents (PCF-p) and/or children with cancer (PCF-c) have been used by clinicians to refer children for further cognitive testing. Since PCF-c has been suggested to be related to fatigue and depression, clinicians have tended to rely more on PCF-p. The current study explored the relationship among cognition reported by parents and children and fatigue and depression in children with cancer. **METHODS:** 515 patients (53% BT; 47% non-BT) aged 7-21 (mean=14 yrs; 56% males) were recruited. 34% received radiation therapy, 72% chemotherapy, 71% surgery. Years since last treatment (mean=3.3) was divided into: <1 year (n=34.3%), 1-2 years (12%), and >2 years (53.4%). PCF was measured using a validated 43-item pediatric PCF item bank (pedsPCF-p and pedsPCF-c). Patients also completed NeuroQOL Depression, PedsQL Fatigue, and neuropsychological tests. Z-scores were created for all scales (mean=0; SD=1) for ease of comparisons. Latent class analysis was used to classify patients based on depression, fatigue, pedsPCF-p and pedsPCF-c. Higher scores meant better PCF, more fatigue and more depressed. Logistic regression was used to identify significant predictors of these classes. **RESULTS:** Three latent classes were identified: 1) normal PCF-p (z=0.194), PCF-c (z=0.139), non-fatigue (z=-0.296) and non-depression (z=-0.451); 2) mild PCF-p (-0.968) and PCF-c (z=-0.696), moderate fatigue (z=1.331), and severe depression (z=3.141); 3) mild PCF-p (z=-0.565), normal PCF-c (z=-0.373), mild fatigue (z=0.909) and moderate depression (z=1.118). Working memory, gender, parent-reported QOL of the child, and Hispanic origin were significant predictors of class membership. **CONCLUSIONS:** This study identified three classes among patterns of cognition, fatigue, and depression and identified predictors of class membership. Future studies should be done to explore clinical implications of these results.

PCN176

EFFECT OF ENZALUTAMIDE ON SPECIFIC SYMPTOMS AND FUNCTIONAL AREAS IN METASTATIC CASTRATION-RESISTANT PROSTATE CANCER: A NOVEL ANALYTIC APPROACH

Naidoo S[1], Paty J[2], Turnbull J[2], Gwaltney C[3], Hawryluk E[2], Ivanescu C[4], Holmstrom S[5]
[1]Astellas Pharma Europe, Ltd, Chertsey, UK, [2]QuintilesIMS, New York, NY, USA, [3]QuintilesIMS, Cambridge, MA, USA, [4]QuintilesIMS, Hoofddorp, The Netherlands, [5]Astellas Medical Affairs Global, Leiden, The Netherlands

OBJECTIVES: Enzalutamide has a positive impact on outcomes assessed by the Functional Assessment of Cancer Therapy-Prostate (FACT-P) instrument, including slower overall decline in total FACT-P scores among patients with metastatic castration-resistant prostate cancer (mCRPC). This research aimed to describe specific benefits of enzalutamide through novel exploratory analyses of individual symptom and functioning items of FACT-P in mCRPC clinical trials. **METHODS:** FACT-P was administered at baseline and every 12 weeks during placebo-controlled trials of enzalutamide in chemotherapy-treated (AFFIRM) and chemotherapy-naïve (PREVAIL) mCRPC patients. Scores on FACT-P 0–4 scales were transformed to 0–100% to facilitate interpretation; higher scores indicated reduced symptoms and better functioning. Descriptive analyses were performed on change from baseline scores. **RESULTS:** In both trials, the impact of enzalutamide on items related to pain was relatively robust compared with other symptom items. In AFFIRM, at week 25, men receiving enzalutamide reported a median decrease (deterioration) of 3% across all FACT-P pain items, compared with a 16% decrease in those receiving placebo. Throughout both studies, enzalutamide delayed worsening in various aspects of social, physical, and emotional functioning versus placebo, including ability to work and enjoy life, worrying about dying, and feeling sad. Throughout both trials, there was little impact of enzalutamide on symptom and functioning items assessing urinary and sexual symptoms compared with placebo. **CONCLUSIONS:** The exploratory analysis indicates enzalutamide preserves mCPRC patients' level of symptomatology and physical functioning, supporting overall health-related quality-of-life scores previously reported. The analyses suggest enzalutamide may prevent a progression in pain and preserve patients' standard of living, ability to work, and emotional views of their disease. Given a lack of decline in the context of a chronic condition, patients may deem these effects as positive. Analyses of individual items are an innovative and valuable approach to interpreting treatment effects from broad patient-reported outcome measures.

PCN177

UNDERSTANDING KEY SYMPTOMS, SIDE EFFECTS AND IMPACTS OF HR+ AND HER2- ADVANCED BREAST CANCER: LITERATURE REVIEW AND EXPERT INTERVIEWS

Krohe M[1], Tolley C[2], Higgins S[1], Cella D[3], Revicki DA[4], Small T[3], Tang D[5]
[1]Adelphi Values, Boston, MA, USA, [2]Adelphi Values Ltd, Bollington, UK, [3]Northwestern University, Chicago, IL, USA, [4]Evidera, Bethesda, MD, USA, [5]Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA

OBJECTIVES: While patients with HR+/HER2- advanced breast cancer experience a wide range of disease-related symptoms, side effects, and impacts, identifying the most important and relevant concepts of interest can allow for generalization of the patient experience. This study sought to describe these commonalities based on a review of the literature and interviews with therapeutic experts. **METHODS:** Literature reviews were conducted in MEDLINE®, Embase, and PsycINFO® to identify articles relevant to study goals (search terms included "breast cancer," "metastatic," "advanced," and "symptoms OR side effects OR impacts"; articles published from March 2005 to February 2016 were considered for inclusion). Individual telephone interviews were conducted with five US-based breast cancer oncologists. **RESULTS:** Literature reviews identified 13 eligible studies. Disease-related symptoms were described for six metastatic sites. Six treatment types and their side effects were described. Nausea/vomiting, pain, weight changes, and diarrhea were reported in at least half of these treatments. Emotional and physical impacts of cancer and treatment were reported most frequently. Interviews with experts identified disease-related symptoms for 10 metastatic sites. Pain, fatigue, loss of appetite, and nausea were reported as symptoms generalizable to all HR+/HER2- breast cancer patients, regardless of location of metastasis. Pain and fatigue were reported by three experts as both the most severe and most bothersome disease-related symptoms. Four types of treatment were discussed. Fatigue was reported by three experts as generalizable to all metastatic sites discussed, and relevant to all treatments discussed. The majority of reported impacts focused on physical functioning. **CONCLUSIONS:** Literature and expert perspectives suggest that patients with HR+/HER2- advanced breast cancer commonly experience pain and fatigue as disease-related symptoms; nausea/vomiting, pain, weight changes, diarrhea, and fatigue as treatment-related side effects; and impacts on physical functioning, regardless of the location of their metastases.

PCN178

EXPERIENCES OF TREATMENT-RELATED SIDE EFFECTS AND SUPPORTIVE CARE WITH KOREAN MEDICINE IN WOMEN WITH BREAST CANCER - A FOCUS GROUP STUDY

Han S[1], Jang B[2], Hwang DS[2], Suh HS[1]
[1]Pusan National University, Busan, South Korea, [2]Kyung Hee University, Seoul, South Korea

OBJECTIVES: In some countries, clinical practice guidelines have included acupuncture as supportive care for breast cancer survivors (BCS). This study aimed to explore experiences of treatment-related side effects and supportive care among Korean BCS. **METHODS:** Focus group interview was conducted with six Korean women with breast cancer at stage I-III. Participants were recruited through snowballing. Interview was audio-recorded and transcribed verbatim. NVivo-11 was used to code the data into themes. **RESULTS:** Two major themes were identified: (1) experiences of the Western-medicine, including side effects, communication with doctors, and costs; (2) experiences of Korean-medicine, including the same as above. Participants had mean age of 48.7 (SD 6.8) years and had survived for 1-7 years without recurrence. All participants experienced Western-medicine in treatment phase and reported impairment of physical, emotional, and social functioning during and after Western-medicine treatment. Korean-medicine was used after treatments ended. The negative responses from Western-medicine doctors were the most important factor keeping participants from accessing Korean-medicine when treatment-related side effects occurred. For this reason, some participants used Korean-medicine without disclosure. Participants usually acquired information about Korean-medicine from online community or other BCS, which was another important factor because it raised concerns about side effects and credibility of Korean-medicine. High cost of Korean-medicine was also reported as barrier in using Korean-medicine. When getting the cancer treatment, participants tended to endure their treatment-related side effects rather than to resolve them or express needs. Needs of information about effective and economical supportive care were identified. **CONCLUSIONS:** Korean BCS may be at risk of greater physical or emotional distress during treatment period. Findings suggest that there is a high need for supportive care to relieve treatment-related side effects and improve patients' quality-of-life. Furthermore, developing a systematic guidance or credible information sources is warranted to help patients find the best supportive care options.

PCN179

IMPUTING MISSING VALUES TO ESTIMATE HEALTH-RELATED QUALITY OF LIFE (HR-QOL) IN METASTATIC PANCREATIC CANCER (MPC) TREATED WITH 5-FLUOROURACIL AND LEUCOVORIN, WITH AND WITHOUT LIPOSOMAL IRINOTECAN (NAL-IRI)

Amzal B[1], Sénécal M[2], de Jong FA[3], Mamlouk K[4], Becker CC[4]
[1]Laser Analytica, Apris, France, [2]Laser Analytica, Montréal, QC, Canada, [3]Shire GmbH, Glattpark-Opfikon, Switzerland, [4]Merrimack Pharmaceuticals, Inc., Cambridge, MA, USA

OBJECTIVES: The survival benefits of nal-IRI+5-fluorouracil/leucovorin vs fluorouracil/leucovorin in mPC patients who progressed after prior gemcitabine-based therapy were demonstrated in a phase 3 study (NAPOLI-1); preplanned analyses of QoL demonstrated no differences between treatment groups. Post hoc analysis of NAPOLI-1 EORTC-QLQ-C30 questionnaire results showed that HR-QoL change was improved with nal-IRI+5-fluorouracil/leucovorin. However, about half of randomized patients had missing scores. We investigated how imputation of missing values would affect initial findings. **METHODS:** A principal component (PC) analysis was performed on EORTC-QLQ-C30 scales week-6 changes. For patients with missing information, clinical data-based imputation was performed using either regression predictors or median value of study population-matched controls. **RESULTS:** Of 266 randomized patients, 122 had baseline and week-6 EORTC-QLQ-C30 scale measures and were used for PC analysis and imputation model development. Four PCs explaining 59% of variance were retained. With positive weights on Global Health Status/Quality of Life (GHS/QL) and functioning scales and negative weights on financial difficulties and symptoms scales, the first PC (PC1: variance explained 34%) reflected general HR-QoL. Prior to imputation, patients treated with nal-IRI+5-fluorouracil/leucovorin had better HR-QoL PC score week-6 increments vs 5-fluorouracil/leucovorin (PC1: +0.45 vs –0.34, P=0.0478; 4-PC multivariate comparison: P=0.0051). The baseline predictors included in the imputation model were Karnofsky performance status ≥90, albumin ≥4g/dL, CA19-9 ≥40U/mL, stage IV cancer at diagnosis, presence of liver metastases, and ≥40 days since prior anticancer therapy. The population was matched using these predictors, excluding CA 19-9 (94% patients with ≥1 match). Comparable results were found using either predictive model (PC1: +0.30 vs –0.14, P=0.0214; 4-PC multivariate comparison: P=0.0015) or population-matched values (PC1: +0.34 vs –0.10, P=0.0271; 4-PC multivariate comparison: P=0.0007). **CONCLUSIONS:** The improvement in HR-QoL with nal-IRI+5-fluorouracil/leucovorin observed in the post hoc analysis of NAPOLI-1 results remained comparable after imputation of missing values in this imputation exercise.

PCN180

NON-PROGRESSION ON TREATMENT WITH AVELUMAB CONTRIBUTES TO GAINS IN HEALTH UTILITY SCORES IN PATIENTS WITH METASTATIC MERKEL CELL CARCINOMA

Kaufman H[1], Hunger M[2], Mahnke L[3], Schlichting M[4], Bharmal M[4]
[1]Rutgers Cancer Institute of New Jersey, New Brunswick, NJ, USA, [2]Mapi Group, Munich, Germany, [3]EMD Serono, Billerica, Boston, MA, USA, [4]Merck KGaA, Darmstadt, Germany

OBJECTIVES: Patient-reported outcomes are an important component of drug benefit/risk and reimbursement evaluation, but limited data are available from patients with rare tumors, such as Merkel cell carcinoma (MCC). This study aimed to assess differences in health utility scores between non-progressing and progressing patients with metastatic MCC treated with anti–PD-L1 avelumab. **METHODS:** EQ-5D data collected from a phase 2 single-arm trial (NCT02155647) of 88 patients with chemotherapy-treated metastatic MCC were analyzed. The EQ-5D was assessed at baseline, week 7, every 6 weeks thereafter, and at the end-of-treatment visit. At each assessment, tumor response was determined by radiologically by an independent review committee per RECIST v1.1 performed within approximately 7 days of the EQ-5D assessment. EQ-5D utilities were calculated based on US and UK value sets. Linear mixed models were fitted to EQ-5D data, including progressive disease (vs complete response/partial response/stable disease) as a single time-varying covariate. In sensitivity analyses, estimates were adjusted for grade 3-4 adverse events (AEs) ongoing at EQ-5D assessment and treatment-related AEs of any grade. **RESULTS:** Among 70 evaluable patients, 247 observations were analyzed. Utility based on the US (UK) value sets was 0.8058 (0.8327) in the non-progression health state and 0.7120 (0.7130) in the

progression health state. Differences between health states were statistically significant ($p<0.0001$) and clinically relevant. Adjusting for the presence of AEs had minimal impact. Parameter estimates of dis-utilities associated with experiencing ≥1 grade 3-4 AE based on US (UK) value sets were –0.02191 (–0.02439). Dis-utilities for treatment-related AEs of any grade were smaller (–0.00532 and –0.01028 for US and UK value sets). **CONCLUSIONS:** In patients with metastatic MCC, non-progression during treatment with avelumab contributed to gains in health utility scores. The dis-utility impact of AEs during treatment with avelumab was minimal, suggesting a manageable safety profile from a patient perspective.

PCN181

ASSOCIATION OF PATIENT-PHYSICIAN COMMUNICATION WITH FINANCIAL BURDEN AND QUALITY OF LIFE OF CANCER PATIENTS

Parab PN, Nadpara PA, Carroll NV
Virginia Commonwealth University, Richmond, VA, USA

OBJECTIVES: Cancer is one of the most prevalent diseases in the United States. Approximately 39% of men and women are diagnosed with cancer based on 2011-2013 data. The objective of our study is to compare the quality of life (QOL) and financial burden of cancer patients who had good patient-physician communication to patients who had poor/no communication. **METHODS:** This was a retrospective study using 2011 Medical Expenditure Panel Survey (MEPS) data. The full year consolidated file was used. The sample consisted of all individuals who experienced cancer after the age of 18. The QOL and financial burden of cancer patients who reported having detailed discussions with their physician were compared with those with brief/no discussions. Chi-square tests were used for all comparisons. **RESULTS:** The sample consisted of 1592 cancer patients. Of these, 58.86% were females, 54.71% were married, 49.75% were in the 65-85 years' age group, with a typical cancer patient having a median total income of $21334 (Interquartile range = 31681). Of those patients with higher QOL, a higher percentage (65.20% vs. 8.77%) reported good patient-physician communication as compared to those who had no communication. A larger percentage (66.84% vs. 8.05%) of patients with no financial burden had good patient-physician communication as compared to those with no communication. All results were statistically significant at $p<0.05$. **CONCLUSIONS:** Patients with good communication with their doctors were more likely to have lower financial burden and a better quality of life.

PCN182

MULTIVARIATE ANALYSIS OF HEALTH-RELATED QUALITY OF LIFE (HR-QOL) IN METASTATIC PANCREATIC CANCER (MPC) TREATED WITH 5- FLUOROURACIL AND LEUCOVORIN, WITH AND WITHOUT LIPOSOMAL IRINOTECAN (NAL-IRI)

Becker CC[1], Amzal B[2], de Jong FA[3], Sénécal M[4], Mamlouk K[1]
[1]*Merrimack Pharmaceuticals, Inc., Cambridge, MA, USA,* [2]*Laser Analytica, Apris, France,* [3]*Shire GmbH, Glattpark-Opfikon, Switzerland,* [4]*Laser Analytica, Montréal, QC, Canada*

OBJECTIVES: The survival benefits of nal-IRI+5-fluorouracil/leucovorin vs 5-fluorouracil/leucovorin in mPC patients who progressed after prior gemcitabine-based therapy were demonstrated in a phase 3 study (NAPOLI-1); preplanned analyses of QoL demonstrated no differences between treatment groups. While chemotherapy causes toxicities that impair HR-QoL, its clinical benefits may improve HR-QoL. We conducted a post hoc analysis of NAPOLI-1 EORTC-QLQ-C30 questionnaire measures to compare overall HR-QoL change. **METHODS:** A principal component (PC) analysis was performed on the EORTC-QLQ-C30 scales week-6 changes. PC scores were compared between groups, and correlations between EORTC-QLQ-C30 scale increments examined. **RESULTS:** Of 266 randomized patients, 122 had baseline and week-6 EORTC-QLQ-C30 scale measures and were included in the analysis. EORTC-QLQ-C30 increments in pain (–8.0 vs +9.0; P=0.0060), insomnia (–10.3 vs +9.5; P=0.0023), role functioning (–0.3 vs –11.7; P=0.0346), and Global Health Status/Quality of Life (GHS/QL; +0.6 vs –8.2; P=0.0318) favored patients receiving nal-IRI+5-fluorouracil/leucovorin vs 5-fluorouracil/leucovorin alone. No differences favored patients receiving 5-fluorouracil/leucovorin (P-values ≥0.1039), although diarrhea scores were numerically lower (+15.4 vs +6.7). GHS/QL increments were not correlated with diarrhea (P=0.8487), nausea/vomiting (P=0.3787), constipation (P=0.3255), or dyspnea (P=0.3253); pain ($P<0.0001$), fatigue ($P<0.0001$), insomnia ($P<0.0002$), and appetite loss ($P<0.0002$) were. Role functioning change had the strongest positive correlation with GHS/QL increment (+0.39, $P<0.0001$). Multivariate comparison of the first 4 EORTC-QLQ-C30 scales changes PCs (variance explained: 59%) found treatment groups to be different (P=0.0051). With positive weights on functioning and GHS/QL scales, and negative weights on symptoms and financial difficulties scales, the first PC (explained variance: 34%) reflected general HR-QoL. nal-IRI+5-fluorouracil/leucovorin patients (vs. 5-fluorouracil/leucovorin) had higher first PC score (P=0.0478). **CONCLUSIONS:** Results of this post hoc analysis suggest that nal-IRI+5-fluorouracil/leucovorin improves HR-QoL vs 5-fluorouracil/leucovorin alone, and that certain chemotherapy adverse effects are not associated with HR-QoL detriments.

PCN183

QUALITATIVE INTERVIEWS TO UNDERSTAND THE PATIENT EXPERIENCE OF SQUAMOUS CELL CARCINOMA OF THE HEAD AND NECK AND EXPLORE THE CONTENT OF PATIENT REPORTED OUTCOME MEASURES

Degboe A[1], Shingler SL[2], Halling K[3], Trigg A[4], Al-Zubeidi T[2], Aldhouse NV[4], Kitchen H[4]
[1]*AstraZeneca, Gaithersburg, MD, USA,* [2]*DRG Abacus, Oxfordshire, UK,* [3]*AstraZeneca, Molndal, Sweden,* [4]*DRG Abacus, Manchester, UK*

OBJECTIVES: To understand the patient experience of squamous cell carcinoma of the head and neck (SCCHN) and guide selection of relevant measurement concepts for clinical trials. Patient reported outcome (PRO) instruments (EORTC QLQ-C30 and H&N-35) were also assessed for their suitability in this population. **METHODS:** A literature review and clinician interviews were conducted to inform in-depth semi-structured telephone interviews with patients who had received treatment in the past 12 months for metastatic and/or recurrent SCCHN. Interview transcripts were analysed thematically in ATLAS.ti v7; patient quotes were coded to identify concepts and themes to develop a conceptual model of SCCHN experience. **RESULTS:** Thirteen patients were interviewed (77% male, aged 35-84); the majority diagnosed for >1 year. Patients reported few symptoms pre-diagnosis; commonly a neck lump/swelling (n=7) and/or difficulty swallowing (n=3). Treatment generally comprised of surgery and chemotherapy and/or radiotherapy. Key side effects included pain (n=8), fatigue (n=8), and weight loss (n=8). These impaired health-related quality of life (HRQoL) including work (n=6), socializing (n=7), and emotional wellbeing (n=11). Tumour location, surgery and radiation particularly affected difficulty speaking (n=7) and difficulty eating/drinking (n=9). This was most severe in patients who had a feeding tube in-situ. Patients generally found the QLQ-C30 and H&N-35 content to be understandable and conceptually relevant; some additions were suggested including excessive mucous production and neuropathic symptoms. Patient data generally corroborated with the clinician interview and the literature review findings. **CONCLUSIONS:** SCCHN diagnosis, symptoms, and treatment impacts patients' physical functioning, emotional wellbeing, and overall HRQoL. PRO instruments included in clinical trials should assess the effect of novel therapies on fatigue, pain and oral problems including swallowing. The QLQ-C30 and H&N-35 appeared generally relevant and suitable to capture symptoms and impacts associated with SCCHN. However, some items could be amended/added to ensure conceptual comprehensiveness.

PCN184

EVALUATING CLINICALLY MEANINGFUL CHANGE OF THE EORTC QLQ-C30 IN PATIENTS WITH NSCLC

Lenderking WR[1], Speck RM[2], Huang JT[3], Huang H[3], Kerstein D[3], Reichmann W[3], Langer CJ[4]
[1]*Evidera, Waltham, MA, USA,* [2]*Evidera, Seattle, MA, USA,* [3]*Ariad, Cambridge, MA, USA,* [4]*University of Pennsylvania Hospital, Philadelphia, PA, USA*

OBJECTIVES: The EORTC QLQ-C30 has been extensively validated in cancer patients, but its responsiveness to individual changes in clinical outcomes in anaplastic lymphoma kinase (ALK+) non-small cell lung cancer (NSCLC) was not previously evaluated. The ALK in Lung Cancer Trial of brigatinib (ALTA trial; NCT02094573), an open-label, Phase 2, randomized, multicenter, international study, evaluated the efficacy and safety of brigatinib (Arm A: 90 mg qd and Arm B: 180 mg qd with a 7-day lead-in at 90 mg) in patients (pts) with locally advanced or metastatic ALK+ NSCLC whose disease had progressed on prior therapy with crizotinib. To interpret meaningful change in patient-reported outcomes (PROs), the responder definition (RD) threshold for the minimum individual pt change representing treatment benefit was established. **METHODS:** PRO data collection included the EORTC QLQ-C30 at baseline and first day of each cycle. The RD of the Global Health Status (GHS)/QOL scale of the QLQ-C30 was examined with anchor and distribution-based methods. Anchors included time point response per RECIST v.1.1 criteria and ECOG performance status. **RESULTS:** Of 222 randomized pts, 208 (94%) completed PRO data at baseline and at least one subsequent on treatment visit. The ANCOVA adjusted (sex and age) mean group difference between pts with stable disease (n=76) vs. complete or partial response (n=99) in change from baseline to cycle 3 in GHS/QOL was 9.8. Distribution-based estimates of the RD were 5.04, 12.6 and 17.6 (0.2 SD, 0.5, SD, and 1.0 SEM). A change of 8.33 (1 point on the raw scale, the minimum change possible) was selected as the RD threshold for GHS/QOL based on corresponding changes in response at cycle 3. **CONCLUSIONS:** A change of 8.33 points from baseline to cycle 3 can be interpreted as a meaningful score change in GHS/QOL indicative of treatment benefit for an individual patient with ALK+ NSCLC.

PCN185

PATIENT REPORTED HRQOL IN PATIENTS WITH STAGE IV SQUAMOUS CELL CARCINOMA OF THE HEAD AND NECK (SCCHN)

Byrne K[1], Hallworth P[1], Zanotti G[2]
[1]*Adelphi Real World, Bollington, UK,* [2]*Pfizer, Inc., New York, NY, USA*

OBJECTIVES: To evaluate the quality of life (QoL) reported by stage IV SCCHN patients. **METHODS:** Real world data was gathered using Adelphi's Disease-Specific Programme (DSP) - a cross-sectional survey administered to physicians and patients in the USA, France, Germany and the UK (April - September 2016). 182 physicians (54 US, 128 EU) provided data on consulting SCCHN patients regarding treatment patterns and staging. 373 current stage IV SCCHN patients (60 US, 313 EU) completed the European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire (EORTC QLQ-C30), SCCHN-specific module (QLQ-HN35) and EQ-5D. Summary statistics were reported and differences between sub-groups assessed using pairwise t-tests. **RESULTS:** Patient global QoL, indicated by the EORTC QLQ-C30 global health scale, was poor with a (mean) score of 46.9. Some difference was observed between stage IVA/B and IVC patients (48.6 vs. 45.0 (p=0.0997)), most notably in physical function scores (69.4 vs. 63.8 (p=0.0150)). The most commonly reported symptoms were weight loss (61.3), less sexuality (54.9) and trouble with social eating (42.9). EORTC QLQ-C30 global QoL scores based on primary tumour site showed differentiation (mean) - floor of mouth (38.9), larynx (42.4), lip/tongue/gum (47.3), hypopharynx (49.4) and oropharynx (52.4). This was seen again in social function scores - floor of mouth (50.6), larynx (54.2), lip/tongue/gum (53.0), hypopharynx (61.0) and oropharynx (61.9). The reported EQ-5D score (mean) also showed low QoL (0.57), with no difference between stage IVC (0.57) and stage IVA/B patients (0.57). Some differences were seen based on primary tumour site (mean) – floor of mouth (0.46), larynx (0.51), lip/tongue/gum (0.58), hypopharynx (0.60) and oropharynx (0.64). **CONCLUSIONS:** Overall QoL for stage IV SCCHN patients is low, although not significantly lower for stage IVC vs. IVA/B patients.

Primary tumour site impacts QoL, most notably for patients with a floor of the mouth tumour.

PCN186

UNDERSTANDING THE SYMPTOMS, IMPACTS, AND TREATMENT SIDE-EFFECTS OF ADVANCED BLADDER CANCER FROM THE PERSPECTIVE OF THE LITERATURE, CLINICIANS, AND PATIENTS

Degboe A[1], Banderas BF[2], Halling K[3], Mazar I[2], Mann E[2]
[1]AstraZeneca, Gaithersburg, MD, USA, [2]Adelphi Values, Boston, MA, USA, [3]AstraZeneca, Molndal, Sweden

OBJECTIVES: The primary objective was to identify, define and substantiate concepts of measurement that reflect the symptoms, impacts and treatment side-effects of advanced bladder cancer (BC) from the literature, clinician, and patient perspective. **METHODS:** Symptoms, impacts, and treatment side-effects of advanced BC were elicited through a literature review and interviews with clinicians and patients. Articles were identified via OvidSP and results were summarized in extraction tables. Clinicians were identified using literature and peer recommendations. Patients were recruited via agencies and clinical sites. Patient study materials were approved by an Ethics Committee. Each interview (clinician/patient) was audio-recorded, transcribed, anonymized, and analyzed quantitatively and qualitatively. Concepts identified across research stages were organized into a disease conceptual model and compared to PRO measures for conceptual coverage. **RESULTS:** Of the twelve articles reviewed, 12 signs/symptoms of advanced BC, 33 side-effects, and 33 impacts were identified across seven domains. Five clinicians elicited 15 signs/symptoms, 31 side-effects, and 25 impacts across seven domains. Ten patients with advanced BC (mean age: 72.1 years and 60.0% male) primarily receiving chemotherapy (n=5, 50%) reported 22 BC symptoms, 19 treatment-related side-effects, and 27 BC or treatment-related impacts across nine domains. The most frequently reported symptom across the BC experience was blood in urine (n=8, 80.0%). The most frequently reported side-effect was fatigue/tiredness (n=5, 50.0%) attributed to various treatments. The most frequently reported BC or treatment-related impact domain was activities of daily living (n=9, 90.0%). **CONCLUSIONS:** Results demonstrate the deleterious burden of advanced BC and treatment. Although no one PRO measure captures the multiple symptoms, impacts and side-effects of the disease, the EORTC QLQ-BLM30, FACT-G, FACT-BL, and NFBISI-18 might be considered for assessing symptoms and impacts, and the PRO-CTCAE for assessing side-effects. This research underscores the importance of capturing patients' experience of symptoms, tolerability, and impacts when evaluating new treatment options.

PCN187

THE EFFECTS OF DISEASE AND TREATMENT-ASSOCIATED CANCER SYMPTOMS ON HEALTH-RELATED QUALITY-OF-LIFE: THE MEDIATING EFFECT OF FATIGUE IN NON-SMALL CELL LUNG CANCER AND METASTATIC BREAST CANCER

Stull DE[1], Houghton K[2], Ainsworth C[3], Price GL[4], Boye ME[4]
[1]RTI Health Solutions, Durham, NC, USA, [2]RTI Health Solutions, Research Triangle Park, NC, USA, [3]RTI Health Solutions, Manchester, UK, [4]Eli Lilly and Company, Indianapolis, IN, USA

OBJECTIVES: Recent research has shown complex and indirect associations of disease and treatment-associated cancer symptoms with health-related quality-of-life (HRQoL) constructs (e.g., functioning and QoL). Evident from this work are the causal cascades of symptoms flowing to distal HRQoL outcomes, and that these pathways are often mediated by patient-reported fatigue. We developed models and tested their correspondence in 1st line non-small cell lung cancer (NSCLC) and 3rd line or greater metastatic breast cancer (mBC) settings. **METHODS:** Data come from two randomized clinical trials (RCTs) of 1st line locally advanced or metastatic NSCLC and a single one-arm clinical trial of 3rd line or greater mBC. Structural equation modeling (SEM) of direct and indirect symptom effects on distal HRQoL outcomes was conducted using questionnaires included in these trials; the EORTC QLQ-C30 was supplemented with the EORTC QLQ-LC13 in the NSCLC RCTs and with the Brief Pain Inventory short form (mBPI-sf) in the mBC clinical trial. We ran and interpreted goodness-of-fit tests to evaluate the extent that hypothesized conceptual models corresponded with the observed data. Estimates of standardized direct, indirect, and total effects of symptom on HRQoL showed the relative strengths of the cascade path components. **RESULTS:** There was a logical and consistent ordering, and effect magnitudes, of the causal cascade path components across the NSCLC and mBC trials. Specifically, the effects of symptoms (e.g., pain, dyspnea, and appetite loss) on HRQoL (i.e., physical, role, cognitive, emotional, and social functioning as well as QoL) were mediated by fatigue. **CONCLUSIONS:** Corroborating across-trial and across-tumor results demonstrate the consistent mediating effect of fatigue which links disease and treatment-associated cancer symptoms to HRQoL. Evaluating only direct effects of symptoms on HRQoL will underestimate the patient symptom burden. Interpretation of causal cascades will better inform patients, families, and clinicians about the HRQoL consequences of the disease and treatment.

PCN188

STRESS-RELATED COMORBIDITIES AND LOSS OF PRODUCTIVITY ASSOCIATED WITH PROVIDING CARE TO ADULTS WITH MULTIPLE MYELOMA

Gupta S[1], Parikh K[2], Liebert R[1], Ung B[2], Abouzaid S[2], Rosenberg A[3]
[1]Kantar Health, New York, NY, USA, [2]Celgene Corporation, Summit, NJ, USA, [3]University of California Davis Comprehensive Cancer Center, Sacramento, CA, USA

OBJECTIVES: Little is known about the effect of caregiving for people with multiple myeloma (MM) on work productivity, activity impairment, depression and anxiety. This study examined the burden on caregivers providing care to adults with MM. **METHODS:** A cross-sectional survey of 145 MM caregivers recruited through the Light Speed Research panel was conducted. The IRB-approved survey assessed patient and caregiver demographic characteristics, hours of provider care, and MM treatment. The study assessed caregiver burden using validated instruments including, the Work Productivity and Activity Impairment (WPAI) questionnaire, the Patient Health Questionniare-9 (PHQ-9; range 0-27, higher scores indicate greater depression severity) and Generalized Anxiety Disorder-7 (GAD-7; range 0-21, higher scores indicate greater anxiety severity). The results are summarized using descriptive statistics. **RESULTS:** Among the 145 caregiver respondents, 60.7% (n=88) were female and the mean age was 51.9 (SD=12.6) years. Of these, 72.4% were White, 78.6% married, and 65.5% employed. Caregivers, on average, had been providing care to the MM patients for 4.1 years (range=0.2-27.5), and reported providing 31.5 (SD=35.8) hours of care per week. Patient characteristics were as follows: Diagnosed 5.1 (SD=6.6) years prior to study enrollment, 44.8% female, 59.9 (SD=13.9) years old, on a multiple-drug regimen (1.9 drugs (SD=1.0)) for MM. A total of 30.3% were on their third or later treatment regimen. In univariate analyses, caregivers reported a mean (SD) absenteeism from work due to impairment of 14.5% (14.3%), impairment while at work (presenteeism) of 47.0% (31.7%), overall work impairment of 51.5% (33.1%), and activity impairment of 44.4% (31.3%) in the past 7 days. Mean (SD) scores on the GAD-7 and PHQ-9 were 6.6 (4.9) and 7.6 (5.9) respectively. **CONCLUSIONS:** There is a significant caregiver burden associated with caring for a person with MM, impacting productivity and daily activities. Caregivers also experience mild depression and anxiety symptoms.

PCN189

PSYCHOMETRIC VALIDATION OF THE FACT-M QUESTIONNAIRE IN PATIENTS WITH MERKEL CELL CARCINOMA

Bharmal M[1], Fofana F[2], Dias Barbosa C[3], Mahnke L[4], Schlichting M[1]
[1]Merck KGaA, Darmstadt, Germany, [2]Mapi Group, Patient-Centered Outcomes, Lyon, France, [3]Mapi Group, Lyon, France, [4]EMD Serono, Billerica, Boston, MA, USA

OBJECTIVES: Assessment of patient-reported outcomes in oncology clinical trials is required to demonstrate treatment benefit from a patient's perspective. No validated tools exist to capture health-related quality of life (HRQoL) in patients with Merkel cell carcinoma (MCC), an ultra-rare skin cancer. The objective of this research was to assess the reliability and validity of the Functional Assessment of Cancer Therapy-Melanoma (FACT-M) questionnaire in patients with MCC. **METHODS:** Patients with stage IV chemotherapy-refractory MCC completed the FACT-M in a single-arm, open-label, multicenter, international phase 2 trial (NCT02155647). Internal consistency reliability and construct validity of the FACT-M were assessed at baseline and the ability to detect change in tumor size was assessed from baseline to week 7. Minimal important differences (MID) were computed using distribution and anchor-based methods. **RESULTS:** Baseline assessments were available in 70 patients (mean age: 70 years; 74.3% male). FACT-M domains showed acceptable psychometric properties: high internal consistency reliability (Cronbach's alpha: 0.81 – 0.96) and good convergent validity (correlations above 0.4 were observed for 88% of items of the melanoma surgery scale, 75% of items of the melanoma scale and 100% of items of the other FACT-M domains). Higher scores (better HRQoL) on all FACT-M domains were observed in patients with better functioning (assessed by ECOG performance score), with statistically significant difference in physical well-being score (p=0.0221) supporting clinical validity. Despite the small sample for responsiveness analysis (n=37), the majority of FACT-M scores showed sensitivity to changes in tumor size at week 7 with small to moderate effect sizes. Some evidence of floor/ceiling effects and potential mismatch between items and domains (discriminant validity) was found. MIDs were consistent with previously reported values in the literature for FACT-M domains. **CONCLUSIONS:** The FACT-M demonstrated acceptable psychometric properties in MCC patients, thus making it a potential candidate for assessing HRQoL in MCC trials.

PCN190

ASSESSMENT OF THE ASSOCIATION BETWEEN THE BURDEN OF CARCINOID SYNDROME SYMPTOMS AND THE QUALITY OF LIFE AMONG PATIENTS WITH CARCINOID SYNDROME IN THE UNITED STATES BASED ON THE FACT-G INSTRUMENT

Huynh L[1], Totev T[1], Cai B[2], Beaumont JL[3], Halperin DM[4], Neary MP[2], Bhak R[1], Vekeman F[5], Duh MS[1], Cella D[3]
[1]Analysis Group, Inc., Boston, MA, USA, [2]Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA, [3]Northwestern University, Chicago, IL, USA, [4]University of Texas MD Anderson Cancer Center, Houston, TX, USA, [5]Groupe d'analyse, Ltée, Montréal, QC, Canada

OBJECTIVES: To assess the association between the burden of carcinoid syndrome symptoms (CSS) and quality of life (QoL) among patients with carcinoid syndrome using the validated Functional Assessment of Cancer Therapy-General (FACT-G) instrument. **METHODS:** Patients with CSS in the US were recruited via Neuroendocrine Cancer Awareness Network for an online, anonymous survey between July and October 2016. Eligible patients were at least 18 years old with CSS and received either somatostatin analogs (SSA) or non-SSA treatments for CSS control. The survey consisted of demographic, clinical, and QoL questions, including FACT-G questionnaire. Descriptive and multivariable regression analyses, adjusting for demographic and clinical characteristics, were performed to assess the association between CSS and total FACT-G score. **RESULTS:** Among 117 patients with CSS, who completed the survey, 76.9% were female and 87.2% were Caucasian with a mean age of 58.0 years. Patients reported experiencing up to 6 CSS (mean±SD: 3.0±1.1) after diagnosis with neuroendocrine tumor. Carcinoid diarrhea (97.4%) and flushing (90.6%) were the most common CSS. Majority of patients (98.3%) reported receiving SSAs in the past month, and the mean±SD FACT-G total score was 67.6±20.0 (possible range: 0-108), which is lower than the general US population (80.1±18.1). Descriptive analysis suggested that FACT-G total score and subdomain scores were negatively associated with CSS burden. Multivariable models revealed that the FACT-G total score was decreased by 3.4 points (P=0.034) for each additional CSS, ≥4 bowel movements/day was associated with a 7.1 point decrease in FACT-G total score as compared to having <4 bowel movements/day (P=0.043), and that reduced activity levels (bed rest at

<50% or ≥50% of the day, compared to normal activity) decreased the FACT-G total score by 25.4 and 35.5 points, respectively (both P<0.001). **CONCLUSIONS:** This study suggests that CSS burden and impaired activity level are associated with lower QoL among patients with carcinoid syndrome.

PCN191

HEALTH-RELATED QUALITY OF LIFE AMONG CANCER SURVIVORS STRATIFIED BY OPIOID EXPOSURE IN THE UNITED STATES

Desai A, Kelton CM, Boone J, Cavanaugh T, Lin A, Penm J, Heaton PC
University of Cincinnati, Cincinnati, OH, USA

OBJECTIVES: Health-Related Quality of Life (HRQoL) is critical to cancer patients in terms of care, making treatment decisions and survival. This study aims to measure HRQoL among cancer survivors stratified by opioid exposure in the United States. **METHODS:** Data were obtained annually from 2008-2013 using Medical Expenditure Panel Survey (MEPS). Cancer survivors were identified using survey questions and clinical classification codes excluding non-melanoma skin cancer. The HRQoL was measured in terms of physical component summary (PCS) and mental component summary (MCS) scores using Short Form-12. The HRQoL among cancer survivors with opioid exposure were reported for the following classes: (a) with any opioid use (opioids, narcotic analgesic combinations), (b) no opioid use but at least one prescription for other pain medication (adjuvant analgesics and non-opioids such as NSAIDs, salicylates, non-narcotic analgesic combinations) and (c) without pain medication. Data were analyzed using appropriate statistical procedures for the MEPS with its unique sampling design. **RESULTS:** A total of 23.1 million cancer survivors and 193.5 million individuals without cancer history were identified. The cancer survivors had significantly (p<0.001) lower PCS and MCS scores, 43.9(SE=0.20) and 50.2(SE=0.16) compared to individuals who never had cancer, 50.0(SE=0.07) and 51.2(SE=0.05) respectively. Among cancer survivors, 35.0% had at least one prescription claim for opioids, 18.4% had no prescription for opioids but at least one claim for other pain medication and 46.6% had no prescription for a pain medication. For these three groups the PCS and MCS scores were 39.2(SE=0.31), 43.1(SE=0.42), 47.7 (SE=0.23) and 48.1(SE=0.27), 49.7(SE=0.35), 52.0(SE=0.18) respectively. **CONCLUSIONS:** A high percentage of cancer survivors take opioids for the disease or for treatment. The lower HRQoL scores indicate cancer survivors are in pain and need to be screened appropriately for their physical and psychological concern.

PCN192

HUMANISTIC BURDEN OF DISEASE IN EARLIER STAGE METASTATIC (IIIB/C-IVM1A) VERSUS LATE STAGE METASTATIC (IVM1B/C) MELANOMA PATIENTS IN A REAL WORLD SETTING IN THE US

Buchanan J[1], Murugappan S[2], Moon R[3], Roughley A[3], Rider A[3]
[1]*Amgen, South San Francisco, CA, USA,* [2]*Amgen, Thousand Oaks, CA, USA,* [3]*Adelphi Real World, Cheshire, UK*

OBJECTIVES: To assess melanoma specific health-related quality of life (HRQoL) and health states in patients with earlier stage metastatic (IIIb/c-IVM1a) versus late stage metastatic (IVM1b/c) melanoma. **METHODS:** Data were collected from the Adelphi Real World Advanced Melanoma Disease-Specific Programme©, a cross-sectional survey of 112 physicians and their patients (N=666). Data were collected between March and July 2016 in the US. A subset of 183 patients completed the Functional Assessment of Cancer Therapy Melanoma (FACT-M) and EuroQol-5D (EQ-5D) one time. Patients were classified by stage of melanoma at time of consultation. Descriptive analyses of HRQoL scores between earlier and late stage metastatic melanoma were assessed using Mann-Whitney U tests. **RESULTS:** The mean age of the earlier stage and late stage metastatic patients was 62 and 64 respectively. More earlier stage metastatic patients had an ECOG status of 0 or 1 versus late stage metastatic patients (85%, 75% respectively). A total of 31% of late stage metastatic patients required caregiver support and had a median time since primary diagnosis of 5.0 months whereas earlier stage metastatic patients reported 14% and 5.2 months respectively. Patients with earlier stage metastatic melanoma had better mean EQ-5D index scores versus late stage metastatic melanoma patients (0.81 (n=84), 0.76 (n=93); p=0.0103). Higher scores indicating better HRQoL were observed between earlier stage metastatic versus late stage metastatic melanoma patients for the FACT-M (120.7 (n=81), 107.4 (n=91); p=0.0017) and subscales (except Social Well Being). Clinically meaningful differences between groups using published minimal important differences (MIDs) were observed in in 6/7 FACT-M subscales and EQ-5D VAS. **CONCLUSIONS:** Differences in HRQoL and health states were observed between earlier stage metastatic and late stage metastatic melanoma populations, highlighting the detrimental effect of developing metastatic disease. These results suggest that treatments that delay progression of the disease are important to conserve patients HRQoL.

PCN193

RELATIONSHIP BETWEEN RECEIPT OF A WRITTEN SURVIVORSHIP CARE PLAN AND HEALTH-RELATED QUALITY OF LIFE: AN ANALYSIS OF THE NATIONAL HEALTH INTERVIEW SURVEY

Hinyard L, Wirth LS
Saint Louis University Center for Health Outcomes Research (SLUCOR), Saint Louis, MO, USA

OBJECTIVES: Little is known about the relationship between cancer survivorship care planning and quality of life outcomes of survivors. The purpose of this study was to examine the association between receipt of written documentation of advice for follow up care or documentation of all cancer treatments on Health Related Quality of Life (HRQoL). **METHODS:** Adults aged 18+ years with a history of cancer were identified from the 2010 National Health Interview Survey. Patients currently receiving cancer treatment and those who were diagnosed with cancer prior to age 18 were excluded (final sample 2,329). Logistic regression was used to assess the association between receiving advice from a health care professional about routine cancer check-ups after completing cancer treatment in a written format (WA) (n=1327) and receiving a written documentation of all cancer treatments (WTx) (n=1783) and general HRQoL, physical health status, and mental health status. Analyses were adjusted for SES variables, cancer status, and participation in counseling or support groups. The general HRQoL outcome was dichotomized (excellent or very good or good vs fair or poor). All analyses were weighted to account for the sampling scheme. **RESULTS:** Neither WA nor WTx was associated with HRQoL (OR = 1.16, 95% CI 0.74, 1.81; OR = 1.24, 95% CI 0.81, 1.90 respectively). WTx was not associated with mental health status (OR = 1.28 & 95% CI 0.83, 1.98), but WA was associated with a 38% decreased odds of reporting excellent or very good mental health (OR = 0.62, 95% CI 0.40-0.97). Neither WA nor WTx was associated with physical health status (OR = 0.89, 95% CI 0.64-1.24 and OR = 0.78, 95% CI 0.56-1.10, respectively). **CONCLUSIONS:** Receipt of WA is associated with decreased odds of reporting excellent or very good mental health. Future work should investigate this relationship.

PCN194

HUMANISTIC BURDEN OF DISEASE IN EARLIER STAGE METASTATIC (IIIB/C-IVM1A) VERSUS LATE STAGE METASTATIC (IVM1B/C) MELANOMA PATIENTS IN A REAL WORLD SETTING IN 5 EU COUNTRIES

Buchanan J[1], Murugappan S[2], Moon R[3], Roughley A[3], Rider A[3]
[1]*Amgen, South San Francisco, CA, USA,* [2]*Amgen, Thousand Oaks, CA, USA,* [3]*Adelphi Real World, Cheshire, UK*

OBJECTIVES: To assess melanoma specific health-related quality of life (HRQoL) and health states in patients with earlier stage metastatic (IIIb/c-IVM1a) and late stage metastatic (IVM1b/c) melanoma **METHODS:** Data were collected from the Adelphi Real World Advanced Melanoma Disease-Specific Programme©, a cross-sectional survey of 243 physicians and their patients (n=1881). Data were collected between March and July 2016 in 5 major European countries (FR, GE, SP, IT & UK). A subset of 660 patients completed the Functional Assessment of Cancer Therapy Melanoma (FACT-M) and EuroQol-5D (EQ-5D) one time. Patients were classified by stage of melanoma at time of consultation. Descriptive analyses of HRQoL scores between groups were assessed using Mann-Whitney U tests **RESULTS:** The mean age of the earlier and late stage metastatic patients sampled was 57 and 59 respectively. More earlier stage metastatic patients had an ECOG status of 0 or 1 versus late stage metastatic patients (80%, 75% respectively). A greater proportion of late stage metastatic patients required caregiver support (42%) and had a longer median time since primary diagnosis (6 months) versus earlier stage patients (30% and 5 months). Patients with earlier stage metastatic melanoma had better mean EQ-5D index scores versus late stage (0.75 (n=325), 0.67 (n=324); p=0.0120). Higher scores indicating better HRQoL were observed between the earlier and late stage metastatic melanoma patients for the FACT-M (116.4 (n=315), 108.8 (n=307); p=0.0014) and subscales (except Emotional Well Being). Clinically meaningful differences between groups using published minimal important differences (MIDs) were observed for 3/7 FACT-M subscales and the EQ-5D index score. **CONCLUSIONS:** Differences in HRQoL and health states were observed between earlier stage and late stage metastatic melanoma populations, highlighting the detrimental effect of developing late stage metastatic disease. These results suggest that treatments that delay progression of the disease are important to conserve patients HRQoL.

PCN195

QUANTIFYING THE ASSOCIATION BETWEEN HEALTH-RELATED QUALITY OF LIFE (HRQL) SCORES AND WORK-RELATED OUTCOMES IN ONCOLOGY

Rendas-Baum R[1], Bayliss M[1], Bal V[2], DAlessio DL[2], Bjorner JB[3]
[1]*Optum, Lincoln, RI, USA,* [2]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA,* [3]*Optum Outcomes, Lincoln, RI, USA*

OBJECTIVES: The impact of health-related quality of life (HRQL) on work-outcomes, such as absenteeism and presenteeism, has been examined; however, this impact has not been clearly quantified specifically in samples of oncology patients. This study quantified the association between differences in SF-12v2® Health Survey (SF-12v2) physical or mental component scores (PCS and MCS) scores and work-related outcomes among patients with cancer not in remission. **METHODS:** Data came from adult participants in the Medical Expenditure Panel Survey who completed at least one SF-12v2 questionnaire and reported a diagnosis of cancer not in remission (n=548). Generalized linear mixed models were used with absenteeism (percentage of lost days of paid and unpaid work) and presenteeism (serious cognitive limitations) as the outcome. Predictors included SF-12v2 PCS and MCS with sociodemographic factors as covariates. Analyses examined these effects in the entire sample and specifically among employed patients. **RESULTS:** A five-point greater (more favorable) PCS and MCS score was associated with 9% and 20% lower odds, respectively, of having lost work days. Among employed subjects, a 5-point greater PCS and MCS score was associated with 20% and 24% lower odds of missing work days, respectively. A five-point greater PCS and MCS was also associated with 24% and 33% decline, respectively, in the odds of experiencing serious cognitive limitations; among employed subjects, the decline in the odds of experiencing cognitive limitations were 12% and 38%, for a 5-point greater PCS and MCS, respectively. **CONCLUSIONS:** Better PCS and MCS scores were associated with lower odds of missing work days and experiencing serious cognitive difficulties, suggesting a close link between improved HRQL scores and declines in absenteeism and presenteeism. These findings can be a potential guide in evaluation of outcomes in oncology. Future research should explore whether these US based results can be generalized to an international oncology population.

PCN196

EORTC-8D UTILITY VALUES IN PATIENTS WITH PHILADELPHIA NEGATIVE (PH-) RELAPSED/REFRACTORY (R/R) B-CELL PRECURSOR ACUTE LYMPHOBLASTIC LEUKEMIA (B-CELL ALL) RECEIVING BLINATUMOMAB VERSUS STANDARD OF CARE (SOC) CHEMOTHERAPY IN A RANDOMIZED, OPEN-LABEL PHASE 3 STUDY (TOWER)

Hagiwara M[1], Delea TE[1], Cong Z[2], Franklin J[2], Zimmerman Z[2]
[1]Policy Analysis Inc. (PAI), Brookline, MA, USA, [2]Amgen, Inc., Thousand Oaks, CA, USA

OBJECTIVES: The TOWER trial demonstrated improved survival and beneficial effects on health-related quality of life (HRQoL) for blinatumomab compared with SOC chemotherapy in patients with Ph- R/R B-cell ALL (Topp, 2016). To inform economic evaluations of blinatumomab in this setting, a post-hoc analysis was conducted to estimate utility values for patients with Ph- R/R B-cell ALL receiving blinatumomab and SOC chemotherapy in TOWER. **METHODS:** Utility values were estimated using the EORTC-8D, a cancer-specific preference-based measure of HRQoL derived from the EORTC QLQ-C30 (Rowen 2011). Utility values were classified into four health states (baseline, initial [post-baseline and pre assessment of response], response, and refractory), and by time to death ($\leq$1 vs. $>$1 month). Because of small numbers, post-relapse assessments were excluded. GLM/GEE regression was employed with covariates for health states interacting with treatment assignment and time to death. **RESULTS:** Among patients randomized to blinatumomab (N=271) and SOC (N=134), 260 blinatumomab and 105 SOC patients had valid EORTC-8D utility values for one or more assessment for the states of interest (total number of valid assessments=1421 for blinatumomab and 376 for SOC). Baseline utility values were similar for blinatumomab vs. SOC (Mean [SE] 0.750 [0.009] vs. 0.746 [0.014], p=0.824). Utility values were higher for blinatumomab vs. SOC for the initial state (0.766 [0.009] vs. 0.688 [0.018], p$<$0.001), response state (0.814 [0.011] vs. 0.747 [0.020], p=0.003), and refractory state (0.742 [0.014] vs. 0.673 [0.017], p=0.001). There was a nominal decrement in mean [SE] utility during the one month before death (-0.027 [0.015], p=0.083), independent of treatment. **CONCLUSIONS:** EORTC-8D utility values in TOWER were higher for patients receiving blinatumomab than SOC chemotherapy for all post-baseline health states. These findings are consistent with the benefits of blinatumomab vs. SOC on survival, response, and HRQoL observed in TOWER.

PCN197

WORK PRODUCTIVITY AND ACTIVITY IMPAIRMENT IN WOMEN WITH HR+/HER2- ADVANCED/ METASTATIC BREAST CANCER

Wood R[1], Mitra D[2], DeCourcy J[1], Iyer S[2]
[1]Adelphi Real World, Bollington, UK, [2]Pfizer, Inc., New York, NY, USA

OBJECTIVES: To assess work productivity and activity impairment among women with HR+/HER2- advanced/metastatic breast cancer (ABC/MBC) in a real world setting. **METHODS:** Women with HR+/HER2- ABC/MBC in the US and 5 major EU countries (N=739) were recruited as part of a multicenter study and completed the 6 item Work Productivity and Activity Impairment (WPAI:SHP) questionnaire. For employed patients, the instrument measures work time missed, impairment at work, and overall impairment/ productivity loss. Activity impairment is calculated for employed and unemployed patients. Higher scores indicate greater impairment and less productivity. Results were stratified and compared by receipt of chemotherapy vs. endocrine therapy. Significance was assessed using Kruskal-Wallis tests. **RESULTS:** Patients had mean (SD) age of 65.2 (10.6) and 85% were white/ Caucasian. 83% of patients were in metastatic stage and 17% had locally advanced disease. Of the metastatic patients, 61% had visceral disease. Only 11.4% (n=83) of patients were employed at the time of completion of the WPAI. Mean (SD) number of hours missed due to breast cancer (BC) was 8.7 (13.0) while for other reasons it was 2.8 (8.3) hours. Patients missed 26.7% of their work time on average due to BC. When subset to those receiving chemotherapy alone (n=305) or endocrine therapy alone (n=293), chemotherapy patients (11.9% employed) missed a greater percentage of work time (25.7% vs. 16.0%, p=0696) compared to endocrine therapy patients (9.7% employed). Similarly, impairment at work was 28.8% (35.4% chemotherapy vs. 21% endocrine therapy, p=0.0121). Overall work impairment was 34.9% (44.2% chemotherapy vs. 25.8% endocrine therapy, p=0.0107). Among both employed and unemployed patients, activity impairment was 36.8% (37.8% chemotherapy vs. 34.3% endocrine therapy, p=0.0343). **CONCLUSIONS:** Women with HR+/ HER2- ABC/ MBC have low rates of employment, and among those employed, there is considerable negative impact on productivity and overall activity. Patients receiving chemotherapy had greater negative impact compared to those receiving endocrine therapy.

CANCER – Health Care Use & Policy Studies

PCN198

LOWER ANTERIOR RESECTION (LAR) PROCEDURES AND IMPACT OF KEY COMPLICATIONS ON DIAGNOSIS RELATED GROUP (DRG) SEVERITY LEVELS: A REAL-WORLD DATABASE STUDY

Goldstein LJ[1], Roy S[2], Wei D[3], Nagle D[4], Kalsekar I[3]
[1]Johnson & Johnson, Markham, ON, Canada, [2]Ethicon Inc, Somerville, NJ, USA, [3]Johnson & Johnson Co., New Brunswick, NJ, USA, [4]Johnson and Johnson, Cincinati, OH, USA

OBJECTIVES: Diagnosis Related Groups (DRG) for hospitalizations have varying levels of severity that impact hospital reimbursement. This study assesses the distribution of DRG severity levels in lower anterior resection (LAR) procedures among colorectal cancer patients and explores the association of specific complications [bleeding, infection and anastomotic leak (AL)] and DRG severity category of a major comorbidity or complication (MCC). **METHODS:** We reviewed the Premier Perspective® Database containing billing data from over 600 hospitals in the U.S. Included patients were $>$18 years of age, had a diagnosis of colorectal cancer and underwent an elective LAR between 2008 and 2014. AL, bleeding and infection were identified using ICD-9 diagnosis codes. Multivariable models were used to estimate the association of each major complication on receiving MCC DRG classification, adjusting for differences in patient, hospital, and surgical characteristics; separate models were run for each complication. **RESULTS:** A total of 8,790 patients underwent elective LAR with a cancer diagnosis during the study period. Of these, 3,450 (39%) were coded as having no complications/comorbidity, 4,465 (51%) were classified into complication or comorbidity (CC) category, and 875 (10%) were classified as the most severe MCC category. Incidence of AL, bleeding and infection was 12.9%, 9.5% and 5.8%, respectively in the overall sample. These complications were disproportionally higher in the MCC category (AL=35.3%, bleeding=24.2% and infection=41.7%). Results of the multivariable models showed that AL, bleeding and infection were associated with higher odds of receiving an MCC classification [AL:Odds Ratio(OR) =4.12;CI:3.42-5.0;Bleeding: OR= 2.56,CI:2.08-3.16;Infection:OR=38.19;CI:29.53-49.39). **CONCLUSIONS:** This study demonstrates that a majority of elective LAR procedures among cancer patients fall under the CC or MCC DRG categorization. Incidence of complications such as AL, bleeding and infection are associated with a greater likelihood of falling under the MCC DRG category and would likely lead to a greater economic burden.

PCN199

EFFECTS OF SCREENING AND TARGETED THERAPIES USE ON COLORECTAL CANCER DIAGNOSIS AND TREATMENT IN TAIWAN

Hsu JC, Lin J
National Cheng Kung University, Tainan, Taiwan

OBJECTIVES: For early diagnosis, colorectal cancer screening (Fecal Immunochemical Testing) has been promoted and implemented on a large scale by Health Promotion Administration in Taiwan since 2010. Besides, targeted therapies (bevacizumab, cetuximab, panitumumab, regorafenib) have gradually become available for better treatment since 2005. This study aims to explore the effects of large-scale colorectal cancer screening on incidence and diagnosis of colorectal cancer in Taiwan overtime. We also examined the influences of availability of targeted therapies on clinical outcomes of colorectal cancer overtime. **METHODS:** 1994-2013 (20 years) colorectal cancer-related data from Taiwan Cancer Registry Database was accessed. Using an interrupted time series design and segmented regression, we estimated changes in age-standardized incidence rate, proportion of early/late diagnostic stage, five-year survival rates and age-standardized mortality rate of colorectal cancer following the above interventions. **RESULTS:** After the large-scale colorectal cancer screening in 2010, the incidence rate of colorectal cancer increased suddenly but decreased later on. There was a relative decrease of 1.85% in incidence rate at 3 years following the screening. Proportion of early diagnostic stage did not significantly increase as expected, while proportion of late diagnostic stage substantially reduced 15.32% (C.I.: -21.69%, -8.96%) at 3 years after the screening. Following the first targeted therapy (bevacizumab) became available in 2005, the five-year survival rate relatively increased 6.49% (C.I.: 4.59%, 8.39%), however, mortality rate also increased 8.79% (C.I.: 2.28%, 15.30%) at 3 years after the use of targeted therapies. **CONCLUSIONS:** The study found that the implementation of large-scale colorectal cancer screening was helpful to decrease the proportion of late diagnostic stage, no significant increasing of proportion of early diagnostic stage was found though. Despite targeted therapies were beneficial for increasing survival rate, the overall mortality did not reduce. Better use of targeted therapies is needed to be considered in Taiwan.

PCN200

CLINICAL AND ECONOMIC ASSESSMENT OF DIFFUSE LARGE B-CELL LYMPHOMA (DLBCL) THERAPIES USING A PROPRIETARY VALUE ASSESSMENT PLATFORM

Ramesh V[1], Shao D[2], Narayanan S[1]
[1]Market Access Solutions LLC, Raritan, NJ, USA, [2]Market Access Solutions, LLC, Raritan, NJ, USA

OBJECTIVES: To assess clinical and economic value of current and pipeline products indicated for DLBCL. **METHODS:** MKTXS Value Assessment Platform (MVAP) was used to evaluate Rituximab, Cyclophosphamide, Hydroxydaunomycin Oncovin, and Prednisone combination (RCHOP), and pipeline agents studied in combination with RCHOP, lenalidomide, ibrutinib, and pembrolizumab. A targeted literature review was conducted (using Pubmed and clinicaltrial.gov) to collect evidence on clinical (efficacy, safety, administration, evidence availability) and economic (need, competition, delivery) categories. Each category consists of attributes driving value, for example, efficacy included, among others, overall survival (OS) and progression free survival (PFS). Categories were weighted by importance to US Payer, therapies were scored against RCHOP, and value plotted on an X-Y axis. **RESULTS:** Clinically, RCHOP (Intravenous (IV)) received the highest score due to its performance on all efficacy attributes, and on safety (manageable adverse events (AEs). In clinical categories, lenalidomide combination outperformed RCHOP on efficacy (OS, PFS). Ibrutinib and pembrolizumab are in early development, and performed worse than lenalidomide due to lack of evidence (no OS, PFS) and poorer safety (more AEs expected). RCHOP received the highest economic score due to less competition (provider familiarity, uptake). Lenalidomide and ibrutinib offer the next highest value due to easier delivery (oral versus IV), while pembrolizumab lags due to need for an additional IV agent in addition to RCHOP. **CONCLUSIONS:** Effectively communicating superior efficacy and benign safety profile, with an oral formulation can differentiate lenalidomide against DLBCL options, but evidence generated by newer agents should be carefully monitored. Ibrutinib can also leverage its oral formulation, but, due to its, and pembrolizumab early stage in development, the manufacturer should engage in cross functional (including clinical, health economic/market access, commercial) teams to internally assess value, and fine tune future trial designs and strategize evidence generation plans that highlight product value against competitors.

PCN201

METASTATIC CASTRATION RESISTANT PROSTATE CANCER TREATMENT PATTERNS CHANGES WITH THE INTRODUCTION OF ABIRATERONE IN 2012 IN QUEBEC

Lahcene H[1], Aprikian A[1], Vanhuyse M[1], Bladou F[1], Prévost N[1], Hu J[1], Cury F[1], Kassouf W[1], Perreault S[2], Dragomir A[1]
[1]McGill University Health Centre, Montreal, QC, Canada, [2]Université de Montréal, Montreal, QC, Canada

OBJECTIVES: This study aimed to describe how real-world clinical practice was changed with the introduction of abiraterone in Quebec in 2012. **METHODS:** We conducted a retrospective cohort study in two of McGill University's academic hospitals. We selected 308 patients treated for mCRPC from January 2010 to June 2014. Data on mCRPC treatments and patients' clinical and demographic characteristics was extracted. Descriptive statistics, Kaplan-Meier method and Cox proportional-hazard regression were used to describe drugs utilization over time, to estimate time to initiate them and to identify predictive factors of receiving them. **RESULTS:** The median age at CRPC was 74.0. 52% of patients were diagnosed with mCRPC before 2012. Half of patients in the pre-2012 group had docetaxel and 1.2% had abiraterone as first-line vs 30% and 26%, respectively, in the post-2012 group. Overall, 84% of patients had docetaxel and 48% had abiraterone in the pre-2012 group versus 55% and 77%, respectively, in the post-2012 group. Patients with metastases at CRPC diagnosis: bone (HR: 2.4; 95%CI 1.4 – 4.1) and visceral (HR: 3.3; 95%CI 1.8 – 6.2), those younger than 80 at CRPC diagnosis (HR: 1.9; 95%CI 1.3 – 2.8) and those diagnosed with mCRPC pre-2012 (HR: 1.7; 95%CI 1.3 – 2.3) were more likely to have docetaxel. Patients with bone (HR: 1.9; 95%CI 1.1 – 3.2) and visceral metastases (HR: 2.4; 95%CI 1.3 – 4.7) at CRPC diagnosis and those diagnosed with mCRPC post-2012 (HR: 5.0; 95%CI 3.3 – 10.0) were more likely to have abiraterone. Median time to initiate docetaxel was delayed in post-2012 group comparatively to pre-2012 (11 (2 – 41) vs 5 (1-16) months, respectively). **CONCLUSIONS:** The introduction of abiraterone reduced docetaxel utilization as first-line and overall and delayed time to its initiation. Metastases extent, age, moment of diagnoses with mCRPC were predictive factors of receiving docetaxel and abiraterone.

PCN202

REAL WORLD DATA ON MULTIPLE MYELOMA IN BRAZIL: PATTERNS OF CARE IN THE PRIVATE HEALTHCARE SYSTEM

Lin HM[1], Luptakova K[1], Tanaka PY[2], Andrade F[2], Saad R[3], Clark OA[3], Seal B[1]
[1]Millennium Pharmaceuticals, Inc., a wholly owned subsidiary of Takeda Pharmaceutical Company Limited, Cambridge, MA, USA, [2]Takeda Farmacêutica Brasil, São Paulo, Brazil, [3]Evidencias - Kantar Health, Campinas, Brazil

OBJECTIVES: Multiple Myeloma (MM) is a rare malignancy, accounting for only 0.8% of all cancers and 10% of hematologic malignancies. The aim of this retrospective study was to generate real world data (RWD) for MM patterns-of-care in Brazilian private healthcare system. **METHODS:** We searched Evidências-Kantar Health electronic claims private market database Auditron (which represents 7% of Brazilian private healthcare system) for MM patients in treatment between Mar2013-Mar2016. We retrieved data on demographics, disease stage, chemotherapy regimens, supportive treatment, stem cell transplantation (SCT) and laboratory results. Analyses were conducted using descriptive statistics. **RESULTS:** Our search retrieved 254 MM patients, with median age of 65 years (IQR:55-75) of which 53.9% were female. Per Durie Salmon system, 5.5% had stage I disease, 14.9% stage II and 29.5% stage III. First-line therapy data was available for 245 patients. Median treatment time was 168 days (112-224). Bortezomib-containing regimens were reported by 78.8% of patients and preferred regimen was bortezomib+cyclophosphamide+dexamethasone (VCD, 51.4%). For second-line, of 92 patients (median treatment time: 126 days (84-224), 63.5% reported bortezomib-containing regimens and preferred regimen was VCD (29.4%). For later lines, distribution of patients (number of patients, preferred regimen) was: 3rd line (46, BCD); 4th (23, VCD); 5th (6, melphalan+prednisone) and 6th(1, VCD). Forty-one patients (16.1%) received SCT in at least one line. Median age for SCT+ patients were 60 years (IQR:51-63) versus 67 years (IQR:56-77) for the non-SCT group ($p<0.05$). There was a significant difference between the mean time between 1st and 2nd line therapies for SCT+ (855 days; SD±455) and SCT- patients (520 days; (SD±366; $p<0.05$). **CONCLUSIONS:** RWD from Auditron database showed that bortezomib-containing regimens, especially VCD, are the preferred regimens to treat MM in most therapy lines in Brazilian private healthcare system. As expected, SCT+ patients were younger, and had longer time between 1st and 2nd line of therapy.

PCN203

REAL-WORLD TREATMENT PATTERNS AMONG AN INCIDENT COHORT OF PATIENTS WITH HODGKIN LYMPHOMA IN THE UNITED STATES

Szabo SM[1], Juarez-Garcia A[2], Johnston KM[1], Connors JM[3]
[1]Broadstreet Health Economics & Outcomes Research, Vancouver, BC, Canada, [2]Bristol-Myers Squibb, Princeton, NJ, USA, [3]British Columbia Cancer Agency Centre for Lymphoid Cancer (BCCA CLC), Vancouver, BC, Canada

OBJECTIVES: Although most patients with Hodgkin lymphoma (HL) are successfully treated with first-line therapy, patients who fail can require multiple costly, additional treatments. Presently there is little information on how recurrent HL is managed in routine clinical practice, particularly, the progression to new lines of therapy among patients with relapsed/refractory HL (RRHL). We identified treatment patterns for an incident cohort of patients with HL in the USA. **METHODS:** We conducted a retrospective observational study of adults with HL from 2006–2015 using Truven MarketScan databases. Patients were required to be initially treated with a first-line therapy to be eligible. Therapies were classified based on records of prescriptions and chemotherapy administration. The frequency of individual therapies, and time to initiation of a subsequent therapy, were estimated according to line of therapy. **RESULTS:** The cohort included 4,304 treated incident patients: 55% male, mean age at diagnosis of 42.5 years. Twenty-three percent progressed to second-line therapy, of whom 34% proceeded to a third-line, and 56% of those treated in third line progressed to fourth-line therapy. Of all 4,304 first-line patients, 1.1% (n=48) eventually received a fourth line of therapy. The most common second-line therapies were autologous stem cell transplantation (ASCT; observed in 56% of the cohort), rituximab (18%), and ICE (ifosfamide, carboplatin, etoposide; 13%); third-line therapies were brentuximab vedotin (20%) and rituximab (11%); and fourth-line therapy was bendamustine (15%). The mean time between initiation of first- and second-line therapy was 96.3 weeks; time between lines decreased for subsequent lines of therapy. **CONCLUSIONS:** Patients with HL who fail first-line therapy are treated with a variety of strategies. In addition to ASCT and brentuximab vedotin, rituximab, bendamustine, and ICE were the most frequently used. These data characterize contemporary treatment patterns, and the variability in these confirm the individualized nature of care for RRHL patients.

PCN204

TREATMENT PATTERNS AMONG PATIENTS DIAGNOSED WITH ADVANCED MELANOMA IN A COMMERCIALLY INSURED POPULATION

Atkins M[1], Gupte-Singh K[2], Stafkey-Mailey D[3], Yue B[3], Rao S[2]
[1]Georgetown-Lombardi Comprehensive Cancer Center, Washington, DC, USA, [2]Bristol-Myers Squibb, Princeton, NJ, USA, [3]Xcenda, Palm Harbor, FL, USA

OBJECTIVES: The objective of this study is to describe treatment patterns in patients with advanced melanoma since the approval of checkpoint inhibitors (CI) and targeted therapies (TT). **METHODS:** The study used a retrospective cohort design using IMS PharMetrics claims data from 07/01/2011-03/31/2016. Adults with a diagnosis of metastases (index date) and melanoma were eligible for inclusion. Patients were followed for 6-months preindex and a minimum of 1-month postindex or until lost to follow-up. The proportion of patients and duration of therapy during first and second lines of therapy (LOT) were assessed overall, by therapy class (CI, TT, cytokines, and chemotherapy), and by individual treatments. Trends in treatments were assessed across years (2012-2016Q1). **RESULTS:** Of the 4,487 patients included, 41.8% had stage 4 disease, 60.6% were male, mean age 54.9 (±12.8) years, mean Charlson comorbidity index score 0.4 (±0.9), and 33.6% initiated first-LOT and 11.5% second-LOT. From 2012-2016Q1, CI use increased in first-LOT (28.8%-79.5%) and second-LOT (45.7%-90.3%). Among CI users, use of nivolumab monotherapy (first-LOT:4.7%-25.8%; second-LOT:7.3%-44.6%) and in combination with ipilimumab increased (first-LOT:4.1%-13.5%; second-LOT:4.5%-26.8%), whereas use of pembrolizumab monotherapy increased in first-LOT (17.0%-28.1%) and decreased in second-LOT (48.2%-17.9%) from 2015-2016Q1. From 2012-2016Q1, TT use decreased in first-LOT (26.6%-13.4%) and second-LOT (35.8%-6.5%). Among TT users, use of dabrafenib and trametinib combination increased (first-LOT:58.1%-80.0%; second-LOT:15.4%-25.0%), whereas use of vemurafenib/dabrafenib/trametinib monotherapy decreased (first-LOT:84.9%-6.7%; second-LOT:96.6%-50.0%) from 2012-2016Q1. The median duration of CI and TT use was 57 and 121 days for first-LOT, and 64 and 117 days for second-LOT, respectively. Among patients receiving CI first-LOT, 34.7% received second-LOT (58.1% CI; 29.8% TT). Similarly among patients receiving TT first-LOT, 39.8% received second-LOT (50.9% CI; 41.3% TT). **CONCLUSIONS:** Results suggest quick adoption of newly approved treatments for advanced melanoma. Additional data segregated by BRAF status are needed to determine optimal treatment sequencing.

PCN205

TREATMENT PATTERNS AND TRENDS OF PATIENTS DYING OF PROSTATE CANCER IN QUEBEC: A POPULATION-BASED STUDY

Dragomir A, Rocha J, Vanhuyse M, Kassouf W, Cury F, Hu J, Aprikian A
McGill University Health Centre, Montreal, QC, Canada

OBJECTIVES: The management of metastatic castration-resistant prostate cancer (mCRPC) has evolved considerably with the inclusion of docetaxel-based chemotherapy, bone-targeted therapies and more recently abiraterone for docetaxel-refractory patients. Our study aimed to analyze contemporary mCRPC management patterns and therapy utilization trends in Quebec, Canada. **METHODS:** The cohort included patients dying of prostate cancer (PCa) between January 2001 and December 2013 and selected from the public healthcare insurance databases, the Régie de l'Assurance Maladie du Québec (RAMQ) and Med-Echo databases. Patient selection was based on PCa-related death and/or therapy utilization according to the Canadian Urological Association guidelines. Multivariate logistic regression was used to identify factors associated with the probability of receiving chemotherapy, bone-targeted therapies and palliative radiotherapy (RT) before death from PCa. **RESULTS:** Overall 3,106 patients were identified in our cohort. The median age of death was 78 years old. Most (83%) received mCRPC-specific treatments: chemotherapy, abiraterone, palliative RT or bone-targeted therapy, while 17% of patients were managed only with maximum androgen blockade, despite diagnosis of PCa-related death. Logistic regression analyses indicate that patients dying after 2005 were more likely to have received chemotherapy (OR 1.51; 95%CI 1.22-1.85) and bone-targeted therapy (OR 1.97; 95%CI 1.64-2.37). Age was a significant predictor of utilization of chemotherapy, bone-targeted therapy and palliative RT (ORs ranged from 0.96 to 0.98, $p < 0.05$). **CONCLUSIONS:** Patient age seems to be a strong determinant in mCRPC therapy selection, with an impact in the probability of chemotherapy, bone-targeted therapy or palliative RT utilization. While chemotherapy is still used only in a minority of patients, the introduction of new therapies such as bone-targeted therapy, docetaxel and abiraterone affected treatment selection over time.

PCN206

RETROSPECTIVE REVIEW OF CANCER PATIENTS IN INDIA: ANALYSIS OF PATIENT CHARACTERISTICS AND TREATMENT METHODS

Abraham PS, Greene M
MCPHS University, Boston, MA, USA

OBJECTIVES: To review the patient characteristics and treatment methods of breast, oral and ovarian cancer patients at a tertiary care hospital in India. **METHODS:** This study was a retrospective review of electronic medical records from a tertiary care hospital in Mumbai, India. Patients ≥18 years of age hospitalized for breast (BC), oral (OC) and ovarian cancer (OVC) treatment between Jan 2014 and May 2015 were included in the study. Descriptive and inferential statistics were used to analyze and compare differences between patients. **RESULTS:** A total of 323 cancer patients met the study criteria (BC=146 patients, OC=132 patients, OVC=45 patients). The mean age for OVC patients was the highest (OVC= 52.17+13.0 years, OC=51.81+12.20 years, BC=51.07+13.34 years). Across all three cancer types, majority of them underwent a surgical procedure at the hospital (BC=120,37.2%; OC=106,32.8%; OVC=33,10.2%). The majority of the patients were subscribed to RGJAY payer scheme (RGJAY=224, 69.3%; no insurance (NI)=53, 16.4%; private insurance (PI)=26, 8%; CGHS=20, 6.2%). Abnormal growth was the most common reason for admission into the hospital among BC and OC patients, while it was pain among OVC patients (BC=106, 32.8%; OC=80, 24.8%; OVC=22, 6.8%). 81 (25.1%) patients with hypertension and 64 (19.8%) patients with diabetes were reported as major comorbidities during hospitalization. Among 120 BC patients that had surgery, majority of them (n=90) underwent a modified radical mastectomy or a breast conservation surgery (n=10). Among 106 OC patients that had surgery, majority of them (n=50) underwent a modified radical neck dissection or a combined mandibulectomy and neck dissection operation (n=30). Among 33 OVC patients that had surgery, majority of them underwent a total abdominal hysterectomy bilateral salpingo oophorectomy (n=14). **CONCLUSIONS:** Majority of the cancer patients were subscribed to RGJAY scheme. The common reason for hospital admission was abnormal growth and majority of them underwent surgery.

PCN207

HEALTHCARE RESOURCE UTILIZATION DURING MULTIPLE MYELOMA TREATMENT IN THE STOCKHOLM REGION OF SWEDEN

Nahi H[1], Ulrichsen SP[2], Zagorska A[3], Lefèvre C[3], Engstrom A[4], Falstie-Jensen AM[2], Paaske Johnsen S[2]
[1]*Karolinska Institutet, Stockholm, Sweden,* [2]*Aarhus University Hospital, Aarhus, Denmark,* [3]*Bristol-Myers Squibb, Rueil-Malmaison, France,* [4]*Bristol-Myers Squibb, Solna, Sweden*

OBJECTIVES: To estimate healthcare resource utilization (HRU) by line of therapy (LOT) for multiple myeloma (MM) patients in a high-volume Swedish university clinic. **METHODS:** The study population comprised all MM patients diagnosed January 1st 2010–December 31st2014 at the Karolinska Institutet, Stockholm, Sweden. Patients were followed from date of treatment initiation to end of study period, death, or change in LOT. HRU was based on hospital admissions and acute/planned outpatient contacts (visits and telephone calls) for MM. We calculated summary descriptive statistics (mean, standard deviation [SD], rates per month) of patient characteristics and HRU by LOT. **RESULTS:** Of 403 MM patients identified, 398 (98.8%) were treated with a 1st LOT (2nd LOT: 193 [47.9%]; 3rd LOT: 86 [21.3%]). 55% were male. Mean age at diagnosis was 69.1 (SD 11.5) years; 68.5% of patients were aged ≥65. Mean duration for 1st, 2nd and 3rdLOT was 17.7, 10.6 and 7.6 months, respectively. During follow-up (all LOTs combined), the mean number of hospital stays and days in hospital were 2.6 and 20.9 respectively. Patients on the 2nd LOT had fewer hospital stays per month (mean for 1st LOT: 0.16, 2nd LOT: 0.11, 3rd LOT: 0.14) and fewer days in hospital per month (mean for 1st LOT: 1.58, 2nd LOT: 1.10, 3rd LOT: 1.64). Mean number of outpatients visits from diagnosis was 19.9, with a slightly higher rate per month in the 2nd and 3rd LOTs compared to the 1st (1st LOT: 0.79, 2nd LOT: 0.88, 3rd LOT: 0.87). **CONCLUSIONS:** In this Swedish MM cohort, the frequency and length of hospitalization was lower during the 2nd LOT after diagnosis than 1st or 3rd. However, a different pattern was observed for outpatient visits. Future research should focus on understanding such patterns, which can be related to the nature of disease or treatment toxicity.

PCN208

REAL-WORLD HEMATOLOGIC AND LIVER FUNCTION-RELATED MONITORING PATTERNS IN FIRST-LINE THERAPY INITIATORS OF POSTMENOPAUSAL WOMEN WITH HORMONE RECEPTOR POSITIVE, HUMAN-EPIDERMAL-GROWTH-FACTOR-RECEPTOR-2 NEGATIVE (HR+/HER2-) METASTATIC BREAST CANCER (MBC)

Bauer M[1], Tang D[2]
[1]*Novartis Global Service Center, Dublin, Dublin 4, Ireland,* [2]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA*

OBJECTIVES: To explore monitoring patterns among postmenopausal women diagnosed with HR+/HER2- mBC, initiating first-line treatment. **METHODS:** Postmenopausal women with HR+/HER2- mBC initiating first-line therapy after February 3, 2015 were identified in the PharMetrics Plus database during January 1, 2006 to December 31, 2015, inclusive; index date: therapy initiation date. Patients (n≥30) were stratified by initial treatment: chemo-monotherapy (CT), endocrine-monotherapy (ET), chemo-endocrine therapy (CET), and palbociclib-endocrine therapy (PET). Study outcomes: prevalence (%), mean, standard deviation (SD) of complete blood cell (CBC) and liver function test (LFT) monitoring, one month post- vs. pre-index date. **RESULTS:** In total, 742 patients were selected; CT: n=267 (36.4%), ET: n=374 (51.0%), CET: n=30 (4.1%), PET: n=63 (8.6%). Mean age (years) (SD) at index date: 57.3 (9.3); range across sub-groups: 55.8 (8.9) for PET, 58.4 (9.3) for ET. Monitoring outcomes were greater one month post- vs. pre-index date. Overall, n=483 (65.1%), (mean: 2.3, SD: 1.4) vs. n=391 (52.7%), (mean: 1.5, SD: 1.1) had CBC monitoring, and n=481 (64.8%), (mean: 1.9, SD: 1.1) vs. n=369 (49.7%), (mean: 1.3, SD: 0.8) had LFT monitoring one month post- vs. pre-index date, respectively. For CBC: CT (92.1% vs. 65.9%; mean [SD]: 2.9 [1.5] vs. 1.5 [1.0]), ET (40.4% vs. 39.0%; mean [SD]: 1.5 [0.8] vs. 1.4 [1.1]), CET (96.7% vs. 73.3%; mean [SD]: 2.9 [1.4] vs. 1.6 [0.9]), PET (81.0% vs. 65.1%; mean [SD]: 1.7 [0.8] vs. 1.6 [1.0]). For LFT: CT (92.1% vs. 60.7%; mean [SD]: 2.3 [1.2] vs. 1.5 [1.0]), ET (39.3% vs. 37.4%; mean [SD]: 1.3 [0.6] vs. 1.2 [0.5]), CET (100% vs. 70.0%; mean [SD]: 2.2 [1.2] vs. 1.3 [0.7]), PET (81.0% vs. 63.5%; mean [SD]: 1.4 [0.5] vs. 1.3 [0.7]). **CONCLUSIONS:** There was an increase in monitoring among the study sample following first-line treatment initiation. These data may benefit payers integrating monitoring-related costs in cost-effectiveness calculations.

PCN209

CRITICAL ANALYSIS OF THE "REGIONAL HEALTH TECHNOLOGY ASSESSMENT REPORT ON THE IMPLICATIONS OF BEVACIZUMAB USE IN ADULT PATIENTS WITH METASTATIC COLORECTAL CANCER (DIME, 2015)"

Briceno V
Massachusetts College of Pharmacy & Health Sciences, Boston, MA, USA

OBJECTIVES: Analyze the results obtained in DIME-BID HTA for the treatment of metastatic colorectal cancer (mCRC). **METHODS:** a methodological analysis of the HTA presented by the DIME was performed. Focused on three parameters (research question, hypothesis, evidence and economic analysis). **RESULTS:** The efficacy of Bevacizumab for the treatment of mCCR has been tested in a Phase IV clinical trial, seven phase III clinical trials, two meta-analyzes and more than 25 scientific papers concluding that Bevacizumab is more effective Than chemotherapy in the first line treatment of mCRC. Despite the strong scientific evidence, the HTA published by DIME "Regional Technology Assessment Report on the Implications of the Use of Bevacizumab in Adult Patients with Metastatic Colorectal Cancer (Jul, 2015)" concludes that in first Line there is no difference in efficacy between Bevacizumab and chemotherapy. The results obtained were due to poor selection of evidence, a consequence of an inconsistent research question and a structure that did not establish necessary parameters to measure the question. Most troubling is the quality of evidence the authors used. The ITACA trial, despite being phase III, does not have enough external validity due to the small population, which resulted on an efficacy outcome incongruent with previous clinical trials. It is clear that the alarming negative results are a direct result of the inadequate HTA structure and the limitation in the selection of scientific evidence. **CONCLUSIONS:** If the published and accepted evidence reflects a superiority of Bevacizumab in efficacy versus the different forms of chemotherapy for the treatment of first-line mCRC, DIME should have not opted for a cost minimization analysis that implies equivalence in efficacy of Bevacizumab and chemotherapy. Therefore, the DIME decision to opt for a cost minimization analysis is considered a conceptual problem from the point of view of health economics.

PCN210

FACTORS INFLUENCING THE USE OF MASTECTOMY AMONG WOMEN WITH BREAST CANCER IN A COMMERCIALLY INSURED US POPULATION

Khanna R[1], Kalsekar I[1], Barnow A[2], Canfield T[3], Liao R[4], Yadalam S[1], Alderman A[5]
[1]*Johnson & Johnson Co., New Brunswick, NJ, USA,* [2]*Johnson & Johnson, Diamond Bar, CA, USA,* [3]*Johnson & Johnson, Irvine, CA, USA,* [4]*Janssen R&D US, Raritan, NJ, USA,* [5]*Swan Center for Plastic Surgery, EastAlpharetta, GA, USA*

OBJECTIVES: The objective of this study was to determine the factors influencing the use of mastectomy as compared to breast conserving surgery (BCS) among women with breast cancer. **METHODS:** The study involved retrospective analysis of the Truven MarketScan Commercial database. Women aged 19-64 years who underwent mastectomy or BCS between July 1, 2011 and September 30, 2014 were identified, with the first date of surgical procedure classified as index date. A breast cancer claim in the six-month pre- and post-index date and continuous enrollment in the one-year pre- and post-index period were required for study inclusion. Multivariable logistic regression analysis was used to examine the factors influencing treatment with mastectomy as compared to BCS. **RESULTS:** The final study sample included 43,597 women with breast cancer. The overall mastectomy rate during the study period was 40.14%, with little variation observed from 2011 to 2014 (range 38.30%-41.38%). Women aged 40-49 years (odds ratio [OR] 0.658; confidence interval [CI] 0.588-0.736), 50-59 years (OR 0.5333; CI 0.478-0.595), and 60-64 years (OR 0.483; CI 0.429-0.544) were significantly less likely to be treated with mastectomy as compared to those aged 19-39 years. Women who were obese (vs. non-obese) were less likely (OR 0.853; CI 0.787-0.924) to be treated with mastectomy. Women with a genetic susceptibility to breast cancer (OR 6.582; CI 5.453-7.946), claim for genetic testing (OR 1.743; CI 1.616-1.880), or with a family history of breast cancer (OR 1.436; CI 1.352-1.525) were significantly more likely to be treated with mastectomy. Factors including geographic region, time period, metropolitan statistical area classification, radiation therapy, chemotherapy, lymph node surgery, plan type, and comorbidity status also had a significant influence on treatment with mastectomy. **CONCLUSIONS:** The proportion of women with breast cancer undergoing mastectomy remained steady during the study period. Demographic, treatment-related, and comorbidity factors were found to influence treatment with mastectomy.

PCN211

ONCOLOGIST PERCEPTIONS OF CANCER CARE TREATMENT ADVANCES, VALUE ASSESSMENT, AND COMMUNICATION OF INFORMATION ON UNAPPROVED USES OF APPROVED MEDICINES

Pandya S[1], Shah-Manek B[2], DiBonaventura M[3]
[1]*PhRMA, Washington, DC, USA,* [2]*Ipsos Healthcare, San Francisco, CA, USA,* [3]*Ipsos Healthcare, New York, NY, USA*

OBJECTIVES: The aim of this study was to document how oncologists in the United States perceive treatment advances, the communication of information on

unapproved uses of approved medicines, and assessing treatment value. **METHODS:** Data were collected from a 20 minute on-line survey of United States-based oncologists recruited from an online panel. Findings were reported descriptively. **RESULTS:** Oncologists (n=202) believe the greatest progress in cancer care has been with immunotherapies and targeted therapies compared with other innovations and that this trend will continue moving forward; the majority considered immunotherapies (84%) and targeted therapies (82%) "very/extremely" promising. More than three out of four oncologists surveyed (78%) would find it useful if more information about safety and efficacy of unapproved uses was available in their clinical practice.; 85% would be interested in receiving this information from biopharmaceutical manufacturers. A similar proportion (77%) indicated that they would be more likely to refer patients to clinical trials if more information on off-label uses of medicines were available. Oncologists identified the most important attributes of a value framework as the incorporation of the best available evidence, reflection of real-world treatment decision-making, and review by qualified experts. Nearly all respondents (>95%) were familiar with the NCCN Evidence Blocks and the ASCO Value Framework and found them "very/extremely" useful in decision making (71% and 63% respectively), compared to the ICER Value Framework and MSK Drug Abacus (19% and 24% respectively). It should be acknowledged that while the ICER and MSK tools are payer-focused and not developed for use by oncologists or patients, it remains important that those frameworks incorporate attributes that oncologists value. **CONCLUSIONS:** Innovative medicines represent an opportunity for treatment progress in cancer care. Facilitating the exchange of information and addressing gaps in current value assessment tools and can help move towards a value-driven healthcare system that improves patient outcomes.

PCN212

A RETROSPECTIVE REVIEW OF PATIENT CHARACTERISTICS AND TREATMENT METHODS OF BREAST CANCER PATIENTS IN INDIA

Abraham PS, Greene M
MCPHS University, Boston, MA, USA

OBJECTIVES: To review the patient characteristics and treatment methods of breast cancer patients at a tertiary hospital in India. **METHODS:** This study was a retrospective review of electronic medical records from a tertiary care hospital in Mumbai, India. Patients ≥18 years of age hospitalized for breast cancer treatment between Jan 2014 and May 2015 were included in the study. Descriptive and inferential statistics were used to analyze and compare differences between patients. **RESULTS:** A total of 146 patients met the study criteria. Of these, 120 patients were in the age group of 18 to 64 years. The mean age for all the breast cancer patients was 51.07+13.34 years. The mean age was lowest for patients with private insurance (PI) while highest for patients with CGHS (CGHS=54.69+13.35 years, RGJAY=52.39+12.41 years, NI=46.59+16.43 years, PI=45.64+12.49 years). The majority of the patients (n=120, 82.2%) underwent a surgical procedure during their stay. The majority of the patients were subscribed to RGJAY payer scheme (RGJAY=97, 66.4%; CGHS=13, 8.9%; NI=22, 15.1%; PI=14, 9.6%). Abnormal growth was the most common reason for admission into the hospital (n=106, 72.6%). 49 (33.5%) patients with hypertension and 36 (24.6%) patients with diabetes were reported as major comorbidities during hospitalization. The majority of the patients had early stage breast cancer (108, 74.0%), while 16 (11.0%) patients had locally advanced breast cancer stage 2B and 22 (15.1%) patients had locally advanced breast cancer stage 3A to C. Of the total 120 patients that had surgery, majority of them (n=90) underwent a modified radical mastectomy (MRM) or a breast conservation surgery (n=10). **CONCLUSIONS:** Majority of the breast cancer patients were diagnosed during the early stages of the disease and were subscribed to RGJAY scheme. The common reason for hospital admission was abnormal growth and the common procedure patients underwent was the MRM.

PCN213

PAYER DECISION MAKING FOR PHARMACOGENETIC TESTS: PRELIMINARY RESULTS

Lu CY[1], Treadwell S[1], Mazor K[2], Wu AC[1]
[1]*Harvard Medical School and Harvard Pilgrim Health Care Institute, Boston, MA, USA,* [2]*University of Massachusetts Medical School, Worcester, MA, USA*

OBJECTIVES: Genetic tests are the fastest growing sector of medicine and medical science, yet there is a dearth of research on access to cancer-related pharmacogenetic tests. The study explored payers' views about management strategies for pharmacogenetic tests, and to describe criteria for coverage decisions, policy challenges and strategies used to overcome these challenges. **METHODS:** We conducted semi-structured interviews with representatives of seven US private payers and two US public payers. Interviews were recorded and transcribed verbatim. Using a directed qualitative content analysis, two members of the research team performed open coding of the transcripts in an iterative process, building a provisional code book as coding progressed. **RESULTS:** Payers may not have established coverage policies for single gene tests but even without a policy in place, these are generally accessible on a case-by-case basis. For coverage decision making for pharmacogenetic tests, payers generally followed coverage decision making processes originally established for pharmaceuticals. Some realize that the evidence requirements, which are established for pharmaceuticals, are not applicable to pharmacogenetic tests, particularly because the field is advancing rapidly. 'Outcomes based' risk sharing agreements with diagnostic companies are recognized as a possible option to collect evidence and limiting coverage. Some payers are introducing prior authorization requirements for pharmacogenetic tests to better manage utilization because an established coding system for tests is lacking. Another key challenge from payers' perspective is managing the use of and payment for gene panels. Laboratories provide different combination of genes in their panel tests, thus knowing which genes are tested is a challenge. Some payers do not pay for large gene panels. **CONCLUSIONS:** Single pharmacogenetic tests are generally readily accessible. However, as we move from single gene tests to gene panels, payers have identified challenges, and ways of overcoming those challenges as the field evolves.

PCN214

EVALUATION OF DRUG PRICE TRENDING IN THE FEDERAL 340B DRUG DISCOUNT PROGRAM

Lee C[1], McCombs J[1], Stone B[2], Chang J[2]
[1]*University of Southern California, Los Angeles, CA, USA,* [2]*PharMedQuest Pharmacy Services, Brea, CA, USA*

OBJECTIVES: The Federal 340B drug discount program provides access to significant drug price discounts for healthcare organizations serving disadvantaged patients. Currently there are no published studies documenting pricing trends in the 340B program. In this project, we analyzed drug price trends in the 340B program over a 10-year period. **METHODS:** Pharmacy purchase records were collected from a 340B-contracted pharmacy system in Los Angeles between 2006 and 2016.Data, including 340B drug price and average-whole-sale price (AWP) were analyzed chronologically to display the price change. Annual average prices were weighted by purchase volume in each year. The results were categorized by American Hospital Formulary Service (AHFS) Therapeutic Classification. All dollar values were reported in 2016 terms. **RESULTS:** 340B prices declined relative to AWP over time across all drug classes. Overall drug prices growth rate over 10-years was 16% for AWP and 19% for 340B (p=0.88). The growth rate variations were similar after 2010. Among high cost drug classes, the 10-year price growth rates were: 11% in AWP and 5% in 340B in antiretroviral drugs ($p < 0.01$), 58% in AWP and 32% in 340B in antineoplastic drugs (p=0.37), 16% in AWP and -6% in 340B in disease-modifying antirheumatic drugs (DMARD) (p=0.07) and 14% in AWP and 15% in 340B in antidiabetic drugs (p=0.97). For specialty drug classes, such as antineoplastic drugs, antiretroviral drugs and DMARDs, the 340B price growth rates were smaller than AWP growth rates after 2014. **CONCLUSIONS:** The relatively low drug price in the 340B program provides significant financial savings for eligible healthcare organizations. Eligible organizations with high specialty drug volume would benefit the most from the 340B program.

PCN215

DELAYS IN CLINICAL TRIAL DATA RELEASE ACROSS ONCOLOGY

Qunaj L[1], Jain RH[2], Atoria CL[2], Miller JE[3], Bach PB[2]
[1]*Warren Alpert Medical School of Brown University, Providence, RI, USA,* [2]*Center for Health Policy and Outcomes, Memorial Sloan Kettering Cancer Center, New York, NY, USA,* [3]*NYU School of Medicine, New York, NY, USA*

OBJECTIVES: Although much of the clinical trial data generated by pharmaceutical companies in oncology are eventually released, there are concerns regarding the speed at which this information is disseminated. Thus, we conducted a study examining the delays in publication of clinical trial results and the availability of clinically actionable data in company press releases. **METHODS:** We identified peer-reviewed publications and meeting presentations for all clinical trials mentioned in press releases issued by the top five companies in oncology between January 2011 and June 2016. Time to first publication from the availability of trial results was calculated. Availability of results was the earliest date among: initial press release, meeting presentation (minus either 120 or 90 days for regular or late-breaking abstract submission, respectively) or publication (minus 120 days). We conducted survival analyses using the log-rank test and Cox proportional hazards models. **RESULTS:** Across our sample of 76 clinical trials, the median time from the availability of trial results until the first journal publication was 363 days. The vast majority (79%) of releases reported positive results. For those which reported negative results, there was a longer delay to publication (median of 559 vs. 348 days, log-rank $p<0.001$) and the press releases were significantly less likely to include quantitative data ($p<0.01$). This result remained significant in a model controlling for company. **CONCLUSIONS:** Our study reveals that there is a tremendous amount of information emanating from human subjects research on cancer drugs that is not finding its way into the public domain in a timely fashion. These delays negatively affect both patient outcomes and scientific innovation. We propose two solutions to ensure rapid dissemination of data, including more consistent use of independent scientific preprinting and rigorous enforcement of regulations requiring that sponsors post trial results on public domains such as ClinicalTrials.gov.

PCN216

PCODR UNDER CADTH – WHAT'S CHANGED?

Macaulay R, Griffiths EA
PAREXEL, London, UK

OBJECTIVES: The pan-Canadian Oncology Drug Review (pCODR) was established in 2010 to assess oncology drugs and bring consistency to the assessment across provinces/territories. In April 2014, pCODR was transferred to the Canadian Agency for Drugs and Technologies in Health (CADTH). This research aims to see what effect this transfer has had on the number of appraisals and recommendation rates conducted by pCODR. **METHODS:** All publically available pCODR reports were extracted up to 30th November 2016 and the drug, indication, date and outcome were extracted. Statistical comparisons were made using Student's t-test. **RESULTS:** 76 appraisals have been conducted by pCODR, reflecting an average of 15.5/year (10 in 2012, 18 in 2013, 9 in 2014, 24 in 2015, and 15 in 2016). No significant change in the rate of appraisals was observed pre-CADTH transfer (14.2/year [32 from January 2012 to March 2014]) versus post-CADTH transfer (16.5/year [44 from April 2014 to November 2016]) (p=0.588). Overall, 79% of pCODR outcomes have been positive recommendations (defined as full recommendations [12%] or restricted recommendations [67%]) with the remaining 21% being

"not recommended". Annually, the highest recommendation rate was observed in 2013 (89%) and the lowest in 2012 (70%). There were no significant differences in recommendation rates since pCODR was transferred to CADTH (81% positive recommendations pre-CADTH versus 77% post-CADTH, p=0.427). **CONCLUSIONS:** The number of technologies appraised by pCODR and recommendation rates for these have fluctuated from year to year, but no meaningful trends have been observed since the transfer of pCODR to CADTH. However, this transfer began in April 2014, with a second phase aimed at aligning pCODR and CADTH review criteria and best-practice review processes that only commenced in April 2015. Thus, the full effects of this transfer may not yet be clear.

PCN217

CHANGE IN THE UTILIZATION OF BLOOD TRANSFUSION AFTER THE NATIONAL COVERAGE DETERMINATION FOR ERYTHROPOIESIS-STIMULATING AGENTS IN CANCER

Li M[1], Lu K[1], Wu J[2]
[1]University of South Carolina, Columbia, SC, USA, [2]Presbyterian College, Clinton, SC, USA

OBJECTIVES: Erythropoiesis-stimulating agents (ESAs) are commonly prescribed for cancer patients with chemotherapy-induced anemia or chronic kidney disease (CKD) patients with low levels of hemoglobin. ESAs are efficacious in increasing hemoglobin levels and reducing future requirements of blood transfusion. Due to safety concerns found in clinical trials, Centers for Medicare and Medicaid Services issued a National Coverage Determination (NCD) for ESAs in cancer to regulate ESA use. The objective of this study is to examine the utilization of blood transfusion in cancer patients before and after the NCD. **METHODS:** This study used the Surveillance, Epidemiology, and End Results (SEER)-Medicare linked database. A repeated cross-sectional design was implemented. Percentages of patients received blood transfusion in each month were compared before and after the NCD. This study used an interrupted time series (ITS) design with a control group, which is a valuable design to evaluate the effectiveness of policy at a clearly defined point in time. The ITS could examine two types of change: intercept change and slope change. **RESULTS:** During the study period, the utilization of blood transfusion was decreased before the NCD and remained stable after the NCD in the treatment group. In the control group, the utilization of blood transfusion was similar before and after the NCD. According to the ITS, the utilization (intercept) was increased by 0.10% (P=.0186) and the trend (slope) was increased by 0.01% per month but was not statistically significantly (P=.0524). **CONCLUSIONS:** The NCD only had a one-time effect on the utilization of blood transfusion. The monthly utilization of blood transfusion was increased by 0.10% (about a 10% increase). In addition to the impact on the utilization of ESAs, the NCD have resulted in an unintended consequence of increased utilization of blood transfusion.

PCN219

EFFECTS OF PHYSICIAN-HOSPITAL INTEGRATION ON TREATMENT PRODUCTIVITY: EVIDENCE FROM CHEMOTHERAPY IN LUNG CANCER

Shin E, Romley JA
University of Southern California, Los Angeles, CA, USA

OBJECTIVES: Over the past several years, hospitals in the United States have increasingly acquired physician-based oncology care. The more vertically integrated form of organization triggered by such changes can internalize the effects of decisions made by physicians and hospitals who once independently provided complementary services, potentially leading to gains in treatment productivity. This study examines the impact of physician-hospital consolidation on productivity growth, using chemotherapy claims for patients with lung cancer in the 20% Medicare Outpatient Research Identifiable Files (2009-2013). **METHODS:** While prior studies have relied on self-reported binary measures of integration available in hospital-level surveys, we instead identify oncologists who switched from being office-based to being hospital-based, using the billing structure of Medicare, and define a continuous measure of change in the share of services provided by these "switched" oncologists for each hospital. The total factor productivity of hospitals, obtained from a patient-level log health production function, is then regressed on this measure of integration, controlling for hospital fixed effects and a comprehensive set of time-varying hospital characteristics. **RESULTS:** A 10 percent increase in the share of services provided by the switched oncologists is associated with a 2.1 percent increase in productivity in treating Medicare beneficiaries with lung cancer. **CONCLUSIONS:** These study findings highlight the importance of understanding the effects of organizational changes in the provision of chemotherapy. More attention is needed, as the expansion of accountable care organizations and drug discount programs for hospitals are likely to accelerate the trend toward vertical integration.

PCN220

PATTERNS OF CARE FOR HODGKIN LYMPHOMA IN BRAZIL: REAL WORLD DATA (RWD) FROM A PRIVATE HEALTHCARE SYSTEM

Zagadailov E[1], Andrade F[2], Barreto T[2], Gautam A[1], Clark OA[3], Saad R[3], Seal B[1], Dalal M[1], Baiocchi O[4]
[1]Millennium Pharmaceuticals, Inc., a wholly owned subsidiary of Takeda Pharmaceutical Company Limited, Cambridge, MA, USA, [2]Takeda Farmacêutica Brasil, São Paulo, Brazil, [3]Evidencias - Kantar Health, Campinas, Brazil, [4]Universidade Federal de São Paulo, São Paulo, Brazil

OBJECTIVES: Hodgkin Lymphoma (HL) is a rare hematologic malignancy with an estimated 2,470 new cases projected for 2016 in Brazil. RWD on patterns of care for HL in the private healthcare sector in Brazil are scarce; thus, we aimed to evaluate patient characteristics and treatment patterns for HL patients in a private setting in Brazil. **METHODS:** This was a retrospective analysis of demographic, disease-related and treatment-related data for patients with HL. Patients were required to have a diagnosis for HL in Evidencias-Kantar Health claims database (Auditron, which covers 3+ million lives, ~7% of Brazilian private sector) between March/2013-March/2016. Data were analyzed using descriptive statistics. **RESULTS:** 147 patients with HL met study eligibility: mean age was 36 years (±17), 51.7% were females and 74.8% were from the Southeast/South Regions. At diagnosis, 40.2% were stage II and 28.6% stage III. First-line treatment for 134 patients (91.1%) was ABVD for a mean of 6 cycles. The other 13 patients received 11 different first-line regimens. There were 42 patients (28.6%) who received second-line treatment. Most patients received ICE in second-line (20 patients, 47.6%) for a mean of 4 cycles or DHAP (12 patients, 28.6%) for mean 3 cycles. Twenty-nine (19.7%) patients received third-line treatment, the most frequent being GDP (24.1%), followed by DHAP (20.7%). For further lines of treatment the numbers were: fourth-line (20 patients- 6 on brentuximab vedotin [BV]), fifth-line (9 patients - 4 on BV) and sixth-line (5 patients- 3 on BV). Time to first relapse was available for 27 patients: 33.3% relapsed in ≤12 months and 37.1% in ≤3 months. **CONCLUSIONS:** ABVD was the most common first-line treatment regimen in this cohort of HL patients from the private healthcare setting in Brazil. Treatment patterns in second-line or latter lines were heterogenous and patients did not receive BV until third or later lines.

PCN221

TREATMENT PATTERNS OF METASTATIC TRIPLE-NEGATIVE BREAST CANCER (MTNBC) IN US COMMERCIAL PLANS

Jiang S[1], Hill K[2], Varghese D[1], Waldeck R[2], Botteman M[1]
[1]Pharmerit International, Bethesda, MD, USA, [2]Celldex Therapeutics, Hampton, NJ, USA

OBJECTIVES: A generally accepted standard of care does not exist for the management of TNBC. Common recommendations include taxanes and/or anthracyclines as frontline treatment (FT) for metastatic disease and non-cross resistant agents (e.g., capecitabine) for resistant or progressed patients. We analyzed real-world treatment patterns of US commercially insured mTNBC patients. **METHODS:** Adult females with ≥1 breast cancer ICD9-CM and ≥1 distant secondary malignant neo-plasm ICD9-CM diagnoses, continuously enrolled for 6-months pre- and 1-month post-metastatic diagnosis (mDx) were identified from the IMS LifeLink Claims database (2011-2015). mTNBC status was approximated by receipt of any chemotherapy post-mDx in the absence of pre- and post-mDx use of hormonal therapy or trastuzumab. Kaplan-Meier survival curves were used to estimate time-to-treatment and proportion of patients starting each treatment regimen. **RESULTS:** 2,949 mTNBC patients (median [interquartile range] age, 53 [47-61] years) were included. Taxanes and/or anthracycline were the most commonly (45%) used FT, often in combination with other agents (30% of FT). Median [interquartile range] time from mDx to FT initiation was 20 (6-49) days. Progression to a second regimen occurred in 54% and 68% of patients after 12 and 36 months of FT initiation, respectively. Median (95% confidence interval [CI]) time from FT to a second regimen was 273 (249-305) days. Of 1,283 second regimen recipients, 52% and 64% progressed to a third regimen within 12 and 36 months of second regimen initiation, respectively; median (95% CI) time from second to third regimen initiation was 296 (263-366) days. Non-cross resistant agents (paclitaxel, capecitabine, gemcitabine, ixabepilone) were most common second regimen (64%). Median (95% CI) therapy durations were 67 (63-70) and 63 (56-65) days for FT and second regimen. **CONCLUSIONS:** Real-world treatment patterns indicate that mTNBC patients often start with a taxane- and/or anthracycline-containing combination therapy and move on to non-cross resistant therapy as a second regimen.

PCN222

BICALUTAMIDE TREATMENT PATTERNS IN ELDERLY PROSTATE CANCER PATIENTS: A HISTORICAL COHORT STUDY USING THE SURVEILLANCE, EPIDEMIOLOGY AND END RESULTS PROGRAM (SEER)-MEDICARE DATABASE

Ruterbusch JJ[1], Bylsma LC[2], Barlev A[3], Flanders S[4], Schultz NM[5], Fryzek J[2], Quek RG[3], Heath EI[1], Beebe-Dimmer J[6]
[1]Karmanos Cancer Institute, Wayne State University School of Medicine, Detroit, MI, USA, [2]EpidStat Institute, Ann Arbor, MI, USA, [3]Medivation, Inc. (Medivation was acquired by Pfizer, Inc., in September 2016), San Francisco, CA, USA, [4]Astellas Pharma Inc., Northbrook, IL, USA, [5]Astellas Pharma, Inc., Northbrook, IL, USA, [6]Karmanos Cancer Institute, Detroit, MI, USA

OBJECTIVES: Bicalutamide (BIC), an androgen receptor inhibitor, is indicated for the treatment of stage D2 metastatic prostate cancer as a combination treatment with luteinizing hormone-releasing hormone (LHRH) analog (a form of androgen deprivation therapy [ADT]). Although newer hormonal agents have been approved since 2010, BIC remains part of the National Comprehensive Cancer Network guidelines for advanced disease. Our objective was to characterize contemporary real-world use and duration of BIC treatment before and after ADT in elderly prostate cancer patients. **METHODS:** The SEER-Medicare database was used to identify men aged ≥66 years enrolled in Medicare and diagnosed with primary prostate cancer between 1/1/2007 and 12/31/2011. Patients treated with BIC after diagnosis were selected and followed until 12/31/2013 or death. Descriptive statistics were used to evaluate patient demographics, disease characteristics, and therapies. **RESULTS:** In a cohort of 7919 patients treated with BIC, 70.7% were non-Hispanic white and 16.6% had metastatic disease at time of diagnosis. Upon initial treatment with BIC, 25.4% of patients had been diagnosed with metastatic prostate cancer. Among all cohort members, 9.8% never had ADT, 1.9% underwent bilateral orchiectomy, 0.4% were ever treated with LHRH antagonists alone, 85.6% received LHRH agonists, and 3.0% received both LHRH antagonists and agonists after diagnosis. Of the total cohort, 36.0% (2852/7919) were treated with BIC only during the "potential testosterone flare prevention" period (6 months pre- to 2 months post-LHRH agonist initiation). For the remainder of the cohort (n = 5067; 64.0%), median duration of BIC use was 6.9 months (mean [standard deviation], 10.7 [11.1] months). **CONCLUSIONS:** Almost two-thirds of prostate cancer patients treated with BIC identified in the SEER-Medicare

database had a median treatment duration of < 7 months, for androgen suppression beyond flare prevention. Research on BIC use patterns and duration after the introduction of newer hormonal agents is warranted.

PCN223

AN ASSESSMENT OF ATTITUDINAL AND BEHAVIORAL TRENDS RELATED TO CONSIDERATION OF TREATMENT COST AND VALUE AMONG PROVIDERS IN ONCOLOGY CARE MODEL PARTICIPATING PRACTICES

Capuano C[1], Atsaves S[1], Bower D[1], Daniel S[2], Suponcic S[2]
[1]Navigant Life Sciences, Boston, MA, USA, [2]Navigant Life Sciences, Lawrenceville, NJ, USA

OBJECTIVES: The Oncology Care Model (OCM) is one of several alternative payment models developed by the CMS Innovation Center (CMMI). OCM practices have entered into payment arrangements that include financial and performance accountability for episodes of cancer care. This research assesses attitudinal and behavioral trends related to consideration of treatment cost and value among providers in OCM practices. It also considers emerging evidence needs in the context of value-based oncology and how these may be served by manufacturers. **METHODS:** There are 190 practices participating in the OCM. Primary research was conducted with providers including medical oncologists and nurse practitioners from a subset of these practices. Respondents completed a survey assessing attitudinal and behavioral trends related to consideration of treatment cost and value within their practices. This included: awareness of cost and health economic evidence; referencing of emerging oncology value frameworks; discussion of these elements with peers and patients; and consideration of these elements in development of oncology pathways and/or prescribing. **RESULTS:** Providers in OCM practices indicated growing awareness, discussion and consideration of treatment cost and value. Although drugs were not currently considered to be a top focus area for cost savings, providers nonetheless indicated greater appetite for health economic evidence to support decision-making. Moreover, they expect that these elements will become more important, with introduction of two-sided risk for OCM and/or eventual reform to Medicare Part B payment policies. **CONCLUSIONS:** There is a gradual but important shift in mindset among oncologists in which treatment cost and value is becoming a better understood quantity and this trend is more pronounced in OCM sites. These providers seek health economic data and analysis to support their clinical decision-making. This may include medical resource utilization and patient-reported outcomes (e.g., functionality) in well-defined patient populations.

PCN224

TREATMENT PATTERN OF CETUXIMAB FOR COLORECTAL CANCER IN REAL WORLD SETTING BY USING CHINESE ADMINISTRATIVE DATABASES

Qiu W[1], Lv J[1], Qi W[1], Liu N[1], Wu B[2]
[1]Department of Oncology, Affiliated Hospital of Qingdao University, Qingdao, Shandong, Qingdao, China, [2]Medical Decision and Economic Group, Department of Pharmacy, Renji Hospital, School of Medicine, Shanghai Jiaotong University, Shanghai, China

OBJECTIVES: The differences in treatment patterns for metastatic colorectal cancer (mCRC) patients have not been extensively studied in Chinese practice setting.This study evaluated the treatment patterns of cetuximab in the real-world setting in China. **METHODS:** This study used administrative data from the Qingdao City and Zhejiang Province from 2015 to 2016. All patients with metastatic colorectal cancer (mCRC) treated with cetuximab were included.The outcome of cetuximab was monitored during this period, and the combining regimens and agents were analyzed for 2 years following the initiation of chemotherapy **RESULTS:** There are 105 cases that received cetuximab treatment. The median time of adding cetuximab is 359 days (quartile range: 85.0 – 571.0 days). When health insurance or patients assistant program was provided, frequency of receiving cetuximab treatment at the initiating chemotherapy would be increased. The combination regimens were FFOLFIRI(49.10%), Other(17.10%),Capecitabine(17.6%), FOLFOX(10.50%), Capecitabine+Oxaliplatin(6.30%), mFOLFOX6(1.80%),FOLFOXIRI(0.60%). There are 26 cases that received two combing regimens , including 8 cases with the regimens switched from FOLFIRI to Capecitabine, 3 cases from FOLFIRI to FOLFOX.There are 6 cases that received three combing regimens **CONCLUSIONS:** Our findings suggest that patients with mCRC could gain health benefits from the Chinese health insurance or patients assistant program covering cetuximab. The combing regimens were varied in Chinese practice, which should be evaluated for there their difference in efficacy and safety.

PCN225

IMPACT OF PAYER ON HEALTHCARE RESOURCE UTILIZATION AND COSTS AMONG BREAST CANCER PATIENTS IN INDIA

Abraham PS[1], Greene M[1], Eguale T[1], Rodriguez-Monguio R[2], Seoane-Vazquez E[3]
[1]MCPHS University, Boston, MA, USA, [2]University of Massachusetts Amherst, Amherst, MA, USA, [3]Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA

OBJECTIVES: To evaluate the impact of the type of payer on health care utilization and the costs of patients treated for breast cancer at a tertiary hospital in India. **METHODS:** This study was a retrospective review of electronic medical records from a tertiary care hospital in Mumbai, India. Patients ≥18 years of age hospitalized for breast cancer treatment between Jan 2014 and May 2015 were identified and included in the study. Descriptive and inferential statistics were used to analyze and compare differences between patients. Regression models were also used to determine predictors of total costs for all patients. **RESULTS:** A total of 146 patients met the study criteria. The mean length of stay (LOS) for all patients was 5.3+2.5 days. The mean LOS was highest for RGJAY scheme patients and lowest for patients with no insurance (NI). (RGJAY=6.4+1.8 days, private insurance (PI) =4.3+3.5, CGHS=3.5+2.28, NI=2.6+1.8; p<0.001). Patients with NI went into surgery the earliest (1.2+0.6 days) while CGHS patients were discharged from the hospital the earliest (2.6+1.3 days). Patients with PI received the highest number of per patient clinician visits compared to other patients (PI=16.3 visits/patient, NI=11.8, CGHS=2.7, RGJAY scheme=2.2; p<0.001). Patients with NI (unit doses=3435) and PI (unit doses=1863) received the highest unit doses of drug while RGJAY scheme patients (unit doses=649) received the least. Mean hospital costs were highest for patients with PI and lowest for RGJAY scheme patients (PI=$2381.03+1739.31, NI=$1558.70+1342.56, CGHS=$723.19+731.57, RGJAY=$637.41+118.20,). Clinician visits (r=0.576, p<0.01) and having PI (r=0.334, p<0.01) were found to be significant predictors of costs in the regression model. **CONCLUSIONS:** Significant differences were found in resource utilization and costs among breast cancer patients. Patients covered by private insurance and no insurance incurred higher costs but received more resources, which could lead to better care, compared to patients with other insurances.

PCN226

IMPACT OF PAYER ON HEALTHCARE RESOURCE UTILIZATION AND COSTS AMONG ORAL CANCER PATIENTS IN INDIA

Abraham PS[1], Greene M[1], Eguale T[1], Rodriguez-Monguio R[2], Seoane-Vazquez E[3]
[1]MCPHS University, Boston, MA, USA, [2]University of Massachusetts Amherst, Amherst, MA, USA, [3]Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA

OBJECTIVES: To evaluate the impact of the type of payer on health care utilization and the costs of patients treated for oral cancer at a tertiary hospital in India. **METHODS:** This study was a retrospective review of electronic medical records from a tertiary care hospital in Mumbai, India. Patients ≥18 years of age hospitalized for oral cancer treatment between Jan 2014 and May 2015 were included in the study. Descriptive and inferential statistics were used to analyze and compare differences between patients. Regression models were also used to determine predictors of total costs for all patients. **RESULTS:** A total of 132 patients met the study criteria. The mean length of stay (LOS) for all patients was 9.1+5.13 days. The mean LOS was highest for private insurance (PI) patients and lowest for patients with no insurance (NI). (PI =11+2.82, RGJAY=9.3+5.04 days, CGHS=9+4.94, NI=5.5+4.46; p=0.006). Patients with PI went into surgery (2+0 days) and also got discharged the earliest (10+2.8 days). Patients with NI received the highest number of per patient clinician visits compared to other patients (PI=36.5 visits/patient, NI=24.6, CGHS=8, RGJAY scheme=1.2; p<0.001). Patients with NI (unit doses=3674) and PI (unit doses=508) received the highest unit doses of drug while RGJAY scheme patients (unit doses=1415) received the least. Mean hospital costs were highest for patients with PI and lowest for RGJAY scheme patients (PI=$5132.61+6158.41, NI=$1998.52+2057.81, CGHS=$1178.21+309.23, RGJAY=$795.77+$314.92). Clinician visits (r=0.485, p<0.01), having NI (r=0.128, p<0.01), undergoing surgery (r=0.379, p<0.01) and gender (r=-0.152, p<0.001) were found to be significant predictors of costs in the regression model. **CONCLUSIONS:** Significant differences were found in resource utilization and costs among oral cancer patients. Patients covered by private insurance and no insurance incurred higher costs but received more resources, which could lead to better care, compared to patients with other insurances.

PCN227

IMPACT OF PAYER ON HEALTHCARE RESOURCE UTILIZATION AND COSTS AMONG OVARIAN CANCER PATIENTS IN INDIA

Abraham PS[1], Greene M[1], Eguale T[1], Rodriguez-Monguio R[2], Seoane-Vazquez E[3]
[1]MCPHS University, Boston, MA, USA, [2]University of Massachusetts Amherst, Amherst, MA, USA, [3]Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA

OBJECTIVES: To evaluate the impact of the type of payer on health care utilization and the costs of patients treated for ovarian cancer at a tertiary hospital in India. **METHODS:** This study was a retrospective review of electronic medical records from a tertiary care hospital in Mumbai, India. Patients ≥18 years of age hospitalized for ovarian cancer treatment between Jan 2014 and May 2015 were included in the study. Descriptive and inferential statistics were used to analyze and compare differences between patients. Regression models were also used to determine predictors of total costs for all patients. **RESULTS:** A total of 45 patients met the study criteria. The mean length of stay (LOS) for all patients was 9.4+4.55 days. The mean LOS was highest for RGJAY patients and lowest for private insurance (PI) patients. (RGJAY=10.5+3.85, no insurance (NI)=9.5+6.02, CGHS=8.5+0.70 days, PI=7.2+4.18; p=0.289). Patients with CGHS went into surgery (2+0 days) the earliest while private insurance patients got discharged the earliest (6.5+2.64 days). Patients with NI received the highest number of per patient clinician visits compared to other patients (NI-35.9 visits/patient, CGHS-19.5, RGJAY-1.1, PI-30.3; p<0.001). Patients with NI (unit doses=3926) and PI (unit doses=1980) received the highest unit doses of drug while RGJAY scheme patients (unit doses=208) received the least. Mean hospital costs were highest for patients with NI and lowest for RGJAY scheme patients (NI=$3843.77+$2735.89, PI=$2735.89+2454.62, CGHS=$1849.73+1023.56, RGJAY=$653.01+$257.18). Clinician visits (r=0.826, p=0.004), having NI (r=0.532, p=0.025), undergoing surgery (r=0.224, p=0.044) were found to be significant predictors of costs in the regression model. **CONCLUSIONS:** Significant differences were found in resource utilization and costs among ovarian cancer patients. Patients covered by private insurance and no insurance incurred higher costs but received more resources, which could lead to better care, compared to patients with other insurances.

PCN228

REAL WORLD DATA ANALYSIS OF TREATMENT PATTERNS AND COSTS ASSOCIATED WITH NON-SMALL CELL LUNG CANCER (NSCLC) IN ITALY

Degli Esposti L[1], Saragoni S[1], Brown J[2], Kiiskinen U[3], Blini V[4], Muschera S[5]
[1]CliCon S.r.l., Ravenna, Italy, [2]Eli Lilly and Company Limited, Windlesham, UK, [3]Eli Lilly Finland, Helsinki, Finland, [4]CliCon S.r.l., RAVENNA, Italy, [5]Eli Lilly Italia S.p.A, Firenze, Italy

OBJECTIVES: To describe treatment patterns/costs for patients with stage IV NSCLC in Italy. **METHODS:** Retrospective database analyses were conducted for 3

Local Health Units (LHUs) from 3 separate regions: Veneto, Tuscany and Lombardy. Resource use/costs were estimated from administrative databases provided by the LHUs from Tuscany and Lombardy, and chemotherapy regimens from hospital electronic medical records (EMR) provided by the LHU from Veneto. **RESULTS:** A total of 306 patients were enrolled: 248 (81.0%) non-squamous (non-sq) NSCLC, 58 (19.0%) squamous (sq) NSCLC. For the non-sqNSCLC and sqNSCLC patients, respectively, the average age was 66.9, 68.8 years, 64.1%, 81.0% were male, the most common co-morbidities were cardiovascular disease: 34.3%, 48.3% and metabolic disorders: 12.9%, 20.7%. Among non-sqNSCLC patients, 193/248 (77.8%) received chemotherapy. In the LHU from Veneto, the most common first-line therapy was pemetrexed+platinum (42/93 (45.2%) patients). 46/93 (49.5%) received second line treatment. Erlotinib was most commonly used (23/46 patients). Among sqNSCLC patients, 46/58 (79.3%) received chemotherapy. In Veneto, the most common first-line therapy was a gemcitabine+platinum (18/23 (78.3%) patients). 9/23 (39.1%) received second line treatment. Docetaxel monotherapy was most commonly used (7/9 patients). 106/124 (Tuscany and Lombardy) non-sqNSCLC patients (85.5%) had a NSCLC inpatient hospitalisation. Mean number of inpatient days was 34.0 days per patient. Total health care cost related to the first line of chemotherapy was €7,435 of which €3,812 was for NSCLC hospitalisations. 21/28 (Tuscany and Lombardy) sqNSCLC patients (75.0%) had a NSCLC inpatient hospitalization. Mean numbers of inpatient days was 29.2 days per patient. Total health care cost related to the first line of chemotherapy was €5,257 of which €3,716 was for NSCLC hospitalisations. **CONCLUSIONS:** LHU databases provide an important means for assessing patient treatment patterns and resource use/costs and are encouraged to make their data available

PCN229

EFFICACY AND SAFETY OF DIFFERENT PHARMACEUTICAL ETOPOSIDE PRESENTATIONS USED IN ENDOMETRIAL CANCER TREATMENT

Galdino-Pitta MR[1], Teixeira DR[1], Nunes TR[2], Viana DC[3], Araujo BC[2], Oliveira PS[2], Zanghelini F[4], Pitta MG[2], Rego MJ[4], Andrade CA[2], Oliveira MD[5], Pereira MC[2], Pitta MG[2], Pitta IR[3]

[1]*Federal University of Pernambuco, Recife, Brazil,* [2]*Universidade Federal de Pernambuco, Recife, Brazil,* [3]*Avenida Professor Moraes Rego, Recife, Brazil,* [4]*UFPE, Recife, Brazil,* [5]*University Federal de Pernambuco, Recife, Brazil*

OBJECTIVES: Etoposide is a chemotherapy drug used to treat small cell lung cancer, ovarian cancer, testicular cancer, leukaemia and lymphoma. The indication to the use of etoposide in the treatment of patients with endometrial cancer is related in the National Therapeutic Form of Brazil 2010. Although not included in the National List of Essential Medicines (RENAME 2014), it should be considered to be included on RENAME 2016. This study aimed to evaluate the therapeutic indication of etoposide 50mg and 100mg in capsule form and 20mg/mL in injectable solution form in the treatment of endometrial carcinoma. **METHODS:** The research was carried out in the specialized literature on February 23, 2015, on Best Practice (BMJ), Dynamed and UpToDate databases, being used the DeCS and MeSH indexed terms: “Endometrial Cancer”, “Cancer of the endometrium” and “Etoposide". **RESULTS:** According to the evidence on UpToDate database, agents commonly used in recurrent endometrial cancer treatment include doxorubicin, placitaxel and bevacizumab. On Micromedex database it was found the use of etoposide in the treatment of endometrial cancer in a phase II study, however, the use of oral 50 mg/m2/day etoposide produced no objective response in patients with advanced endometrial cancer. No evidence was found on BMJ and Dynamed databases. **CONCLUSIONS:** The suggested use of etoposide for endometrial cancer treatment comes from a phase II study with no objective response in patients with advanced endometrial cancer. Until now, other reports do not mention the use of etoposide or recommend it to the treatment of endometrial cancer. In conclusion, the indication of 50mg and 100mg capsule form and 20 mg/ml injectable etoposide is not recommended for the endometrial carcinoma treatment.

SOMATOSTATIN AND ANALOGS IN THE TREATMENT OF PANCREATIC TUMOR

Teixeira DR[1], Galdino-Pitta MR[1], Nunes TR[2], Araujo BC[2], Viana DC[3], Zanghelini F[4], Andrade CA[2], Pitta MG[2], Pitta Id[1]

[1]*Federal University of Pernambuco, Recife, Brazil,* [2]*Universidade Federal de Pernambuco, Recife, Brazil,* [3]*Avenida Professor Moraes Rego, Recife, Brazil,* [4]*UFPE, Recife, Brazil*

OBJECTIVES: In Brazil, the injectable octreotide is present in the National List of Essential Medicines (RENAME 2014). It is indicated to the treatment of severe diarrhea and flushing caused by certain types of cancer. It is also used to treat acromegaly in certain patients. However, its use has also been identified in the treatment of pancreatic cancer. This study aimed to evaluate the therapeutic indication of octreotide in various pharmaceutical forms, in order to present response to this new inclusion to RENAME 2016. **METHODS:** The research was carried out in the specialized literature on February 15, 2015, on the Best Practice (BMJ), Dynamed and UpToDate databases, being used the DeCS and MeSH indexed terms: “Pancreatic Neoplasms” and “Octreotide". Details on the evidence were identified on the use of 0.1mg, 10mg, 20mg and 30mg/mL injectable octreotide for the treatment of the cited neoplasia. **RESULTS:** No evidence was located on BMJ and UpToDate databases. It was located on Dynamed database that the use of 100µg subcutaneous octreotide three times a day during 7 days is recommended for patients undergoing pancreas surgery. On Micromedex database it was found the use of octreotide and alpha interferon are effective in the treatment of advanced metastatic disease in patients unresponsive to the single use of octreotide. The recommended dosage of octreotide associated with interferon alpha is 200µg, 3 times a day. **CONCLUSIONS:** There is evidence on the use of octreotide to treat patients with pancreas cancer. Therefore, it is recommended to include its 0.1mg, 10mg, 20mg and 30 mg/mL injected form in RENAME 2016, for the indication evaluated.

PCN231

REAL-WORLD TREATMENT PATTERNS OF SYSTEMATIC COMBINATION THERAPY IN PATIENTS WITH METASTATIC MELANOMA

Qiu Y[1], Li Z[2], Tang J[2], Atanasov P[2], Mahmood S[1], Grzegorzewski K[1], Chen L[1], Chen J[1]

[1]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA,* [2]*Asclepius Analytics LLC, New York, NY, USA*

OBJECTIVES: First-line systemic combination therapies for metastatic melanoma (MM) include targeted therapy combination such as dabrafenib/trametinib (dab/tram) or vemurafenib/cobimetinib (vem/cobi) for patients with BRAF-mutation, and immunotherapy combination ipilimumab/nivolumab (ipi/nivo) for patients irrespective of BRAF status. Our objective is to describe the real-world baseline characteristics and treatment patterns of ipi/nivo and dab/tram. **METHODS:** Flatiron Oncology electronic health record (EHR) data from Jan 2013 to July 2016 was used. Included patients were ≥18 years and treated with either ipi/nivo or dab/tram after MM diagnosis. Baseline characteristics and treatment patterns were analyzed descriptively. **RESULTS:** 40 ipi/nivo patients (11 BRAF positive) and 98 dab/tram patients were included. 93% of the included patients were white and 64% male. The median age was 65 years for dab/tram and 60 years for ipi/nivo patients. Before receiving combination therapies, 10% ipi/nivo and 29% dab/tram patients had high LDH level. 25% ipi/nivo and 41% dab/tram patients had brain metastasis. 78% ipi/nivo patients and 59% dab/tram patients received combination as first-line. 21/40 ipi/nivo patients did not complete the 4-dose ipi induction therapy, and 23/40 discontinued ipi+nivo during follow-up (median 185 days). The 3 and 6 months discontinuation rates for ipi/nivo were 23% and 40%. 53/98 patients discontinued dab/tram during follow-up (median 235 days). The 3 and 6 months discontinuation rates for dab/tram were 14% and 31%. **CONCLUSIONS:** MM patients receiving combination therapies in real-world were typically aging white male with high disease burden. Dab/tram patients were 3 times more likely to have high LDH before therapy than ipi/nivo patients. The 3 and 6 months discontinuation rates were high (23% and 40% for ipi/nivo, 14% and 31% for dab/tram), mostly due to progression and toxicity.

PCN232

LOW USE OF BIOLOGICS IN FIRST-LINE THERAPY AMONG PATIENTS WITH METASTATIC COLORECTAL CANCER (MCRC)

Klink AJ, Nabhan C, Ernst FR, Feinberg BA

Cardinal Health, Dublin, OH, USA

OBJECTIVES: Treatment outcomes have improved greatly over the last decade for patients with metastatic colorectal cancer (mCRC) due to the advances in systemic chemotherapies, targeted agents, and supportive care. We aimed to describe contemporary real-world first line (1L) treatment among patients with mCRC. **METHODS:** Patients with mCRC diagnosed from 2012–2014 (ICD-9 codes 153.x, 154.0x, or 154.1x and 197.x–198.x) were identified from a US healthcare claims database consisting of 129 million unique covered patient lives. Patients were classified into treatment groups based on the 1L treatment received. The end of 1L was defined as addition of new drug(s) to the original treatment outside of the first 30 days of treatment; if an additional agent was added to a fluoropyrimidine (FP) backbone within 60 days, then the regimen was classified as a combination instead of incrementing the line of therapy. Time from diagnosis to initiation of 1L was calculated for each treatment group. **RESULTS:** There were 4,527 mCRC patients identified (mean age at diagnosis, 61.2 years; 54% male) who initiated 1L therapy. On average (mean, SD), patients were followed for 12.8 months (8.47 months) after diagnosis. The most common 1L regimen (39%) consisted of FP + chemotherapy, followed by biologic + FP + chemotherapy (36%), FP monotherapy (21%), and biologic + FP (5%). Across treatment groups, half of patients initiated 1L within 39 days of diagnosis (range of medians across treatment groups: 15 days to 43 days; all pairwise comparisons, $p<0.05$). **CONCLUSIONS:** These real world data show substantial variability in treatments received in 1L and time to 1L initiation among patients with mCRC. Despite published guidelines, just over 1/3 of patients received a chemotherapy doublet plus biologic. Further research is needed to understand the surprisingly low penetration of biologics into 1L.

PCN233

EARLY STAGE BREAST CANCER TREATMENT PATTERNS BY JOINT RECEPTOR SUBTYPE AND INSURANCE STATUS

Singer D[1], Alcusky M[2], Mitchell F[3], Delgado D[1]

[1]*Thomas Jefferson University, Philadelphia, PA, USA,* [2]*University of Massachusetts Medical School, Worcester, MA, USA,* [3]*Sidney Kimmel Cancer Center at Jefferson, Philadelphia, PA, USA*

OBJECTIVES: Since 2010, HER2 status has been reported to the Surveillance Epidemiology and End Results (SEER) registry for breast cancer (BC) cases. Previous research reported variations in adherence to guideline recommended treatment of early stage breast cancer (ESBC) that were associated with different receptor subtypes and race/ethnicity. This study sought to characterize associations between early stage breast cancer treatment patterns and joint receptor subtype, race/ethnicity, and insurance status. **METHODS:** Females diagnosed with Stage I-II BC from 2010-2013 were identified in the SEER database based on availability of joint receptor subtype data. This population included patients diagnosed at ages 18-64 and excluded patients missing key information about demographics, tumor

characteristics or treatment. Patients were classified as having received or not received guideline-concordant locoregional treatment (GCT) based on receipt of surgery and radiation per NCCN guideline recommendations. Multivariate logistic regression models identified factors associated with receiving GCT. **RESULTS:** The final sample included 74,047 patients from 18 SEER registries. Patients were 67% non-Hispanic white, 11% African American, 10% Asian/Pacific Islanders, and 12% Hispanic white. Two percent were uninsured, 12% were Medicaid beneficiaries, and 85% were insured, non-Medicaid. The prevalence of receptor subtypes at diagnosis was 11% HER2+/HR+, 4% HER2+/HR-, 72% HER2-/HR+, and 12% HER2-/HR-. Overall, 87% of patients received GCT. Insured, non-Medicaid patients were 76% more likely to receive GCT (OR 1.76, 95%CI:1.56-1.98) and Medicaid patients were 25% more likely to receive GCT (OR 1.25, 95%CI:1.10-1.42) compared to uninsured patients. Race/ethnicity of African American was associated with decreased likelihood of receiving GCT (OR 0.77, 95%CI:0.72-0.82). HER2-/HR+ status was associated with increased likelihood of receiving GCT (OR 1.46, 95%CI:1.37-1.55). **CONCLUSIONS:** Insurance status, receptor subtype, and race/ethnicity were significantly associated with receipt of GCT for ESBC. More research is needed to examine how these relationships may be influenced by additional variables not included in the SEER database.

PCN234

HIGHER PATIENT COST SHARING IS ASSOCIATED WITH PRESCRIPTION ABANDONMENT AND DELAY IN FILLS OF NOVEL ORAL ONCOLYTIC PRESCRIPTIONS

Doshi JA[1], Li P[1], Huo H[1], Pettit AR[1], Armstrong K[2]
[1]University of Pennsylvania, Philadelphia, PA, USA, [2]Massachusetts General Hospital, Boston, MA, USA

OBJECTIVES: Increased availability of novel oral oncolytics has had important implications for the delivery, financing, and outcomes of cancer care. Oral oncolytics are typically covered under the prescription benefit and are increasingly being subject to high cost sharing, raising the question of whether high out-of-pocket costs may interfere with cancer treatment initiation. Our study is the first to examine this issue for a range of novel oral oncolytics and to use data from recent years wherein aggressive cost-sharing strategies have become more prevalent. **METHODS:** Utilizing 2014-2015 Integrated DataVerse data, we examined patients with a new adjudicated prescription for one of 42 oral oncolytics. We examined associations between out-of-pocket costs for the index oncolytic prescription and abandonment (i.e., failure to purchase index adjudicated prescription, with no alternative oral or infusible oncolytic prescription obtained within 90 days) and delayed initiation (i.e., failure to purchase index adjudicated prescription but same or alternative oncolytic obtained within 90 days). We used logistic regressions controlling for sociodemographic, clinical, and treatment characteristics to estimate adjusted outcome rates. Extensive sensitivity and subgroup analyses were conducted. **RESULTS:** The sample included 38,111 Medicare and commercial insurance enrollees. Risk-adjusted abandonment rates were higher among greater out-of-pocket cost categories: 9% for the ≤$10 group vs. 13% for the $50.01-$100 group, 29% for the $100.01-$500 group, 38% for the $500.01-$2000 group, and 45% for the >$2000 group, $P<0.001$ for all comparisons. Delayed initiation was also more frequent among patients in higher cost-sharing categories (3% in ≤$10 group vs. 19% in >$2000 group, $P<0.001$). Sensitivity and subgroup analyses by type of insurance, pharmacy, and cancer identified similar associations. **CONCLUSIONS:** Higher cost sharing was associated with higher rates of prescription abandonment and delayed initiation of oral oncolytic prescriptions. Our findings suggest cost sharing as a substantial barrier to prompt initiation of lifesaving treatments.

PCN235

CANCER CONCERNS AND ONCOLOGY CARE MANAGEMENT IN THE US

Brook RA[1], Smeeding JE[2], Carlisle JA[3]
[1]The JeSTARx Group & NPRT, Newfoundland, NJ, USA, [2]The TPG-NPRT & JeSTARx, Glastonbury, CT, USA, [3]The Pharmacy Group, Glastonbury, CT, USA

OBJECTIVES: Cancer is costly, managed by a variety of treatments that include traditional and robotic surgery, radiation, chemotherapy, and immunotherapy. Pharmaceutical treatments are shifting from **METHODS:** Managed care (MC) MDs+PDs completed an online interactive survey. Topics included: advisor+plan information; Ranking (highest=1-to-13=lowest) of cancer-types; Copays; benefit-design; management of cancer; and top concerns today and in 5 years from budgetary and medical points of view. **RESULTS:** The survey was completed by 52 MDs+PDs (11.3%): 55.8% were MDs and 57.7% worked for health plans/IDNs/PPOs/IPAs; 9.6% for PBMs; 3.8% for Government; the remainder consultants. Plans were National=41.9%; Regional=34.9%; or Local=23.3%. Advisors/pPlans could cover multiple types of members: commercial (54.2%=FFS; 70.8%=HMO/PPO), Medicaid (Traditional=22.9%;HMO/PPO=62.5%);Medicare (66.7%; Traditional=22.9%; PDP-only=45.8%) and Employer/Self-funded lives=66.7%. Oncology was tied for the top-ranked Specialty-Pharmacy condition covered 84.4% (vs 64.3% last year) and 34.1% of advisors reported they participated in Oncology accountable care/disease management organizations. Breast cancer received the most #1 rankings, however based on average rankings (out of 13) the most concerning were: Lung Cancer=2.54; Breast Cancer=2.72; Colon and Rectal Cancers=3.64; Prostate Cancer=6.0; Myeloma=6.44; Leukemia=6.97; Melanoma=7.08; Pancreatic Cancer=7.72; Non-Hodgkins Lymphoma=7.82; Kidney Cancer=8.85; Endometrial Cancer=9.76; Bladder Cancer=9.97; and Thyroid Cancer=11.38. When asked about their management of cancer therapies and treatments, 48.7% of the plans/advisors sometimes leave oncology specialists alone; 65.0% of plans/advisors always follow NCCN guidelines; 56.4% sometimes follow other guidelines or pathways; and 38.5% sometimes follow internal protocols. Cancer/oncology was consistently reported the top concern from medical care (50% today, 42.5% in 5 years) and budgetary (35.7% today, 57.5% in 5 years) points of view. **CONCLUSIONS:** The environment for cancer treatment is undergoing a series of changes. The shift from traditional chemotherapies toward targeted immunotherapies and the potential cost implications requires payor medical and pharmacy directors to focus on, adapt and evaluate these newer agents and pathways rapidly as they become available.

PCN236

A DESCRIPTIVE ANALYSIS OF THE HEALTH CARE UTILIZATION AND COSTS OF PATIENTS DIAGNOSED WITH LYMPHOMA IN THE US MEDICARE POPULATION

Ogbomo A[1], Lin Y[1], Wang Y[1], Xie L[1], Yuce H[2], Baser O[3]
[1]STATinMED Research, Ann Arbor, MI, USA, [2]New York City College of Technology-CUNY and STATinMED Research, New York, NY, USA, [3]Columbia University and STATinMED Research, New York, NY, USA

OBJECTIVES: Examine the health care utilization and costs incurred by patients diagnosed with lymphoma in the US Medicare population. **METHODS:** Patients diagnosed with lymphoma (International Classification of Diseases, 9th Revision, Clinical Modification diagnosis codes 200.4x, 200.7x, 202.0x, and 202.8x) were identified using 100% national Medicare data from 01JAN2009-31DEC2013. The first diagnosis date was designated as the index date, and patients were required to have continuous medical and pharmacy benefits 12 months pre- and post-index date. Study outcomes included demographic and clinical characteristics as well as health care costs and utilization for patients diagnosed with lymphoma. **RESULTS:** A total of 299,349 lymphoma patients were included in the study. The mean age was 77 years. A majority of the patients were female (53.49%) and white (91.24%). Most patients resided in the South (36.62%), Midwest (25.27%), or Northeast (20.40%) US region. The mean Charlson Comorbidity Index score was 4.86 (standard deviation = 3.40). The most commonly diagnosed comorbid conditions included hypertension (78.13%), and diabetes mellitus (34.52%). Health care utilization was assessed, including the proportion of patients with inpatient (26.71%), emergency room (ER; 26.95%), physician office (94.02%), outpatient hospital (81.22%), skilled nursing facility (SNF; 7.11%), hospice (1.66%), home health agency (HHA; 14.60%), and durable medical equipment (DME; 41.11%) visits. Patients with lymphoma incurred higher mean health care costs, including inpatient ($6,729), ER ($279), physician office visit ($4,835), outpatient hospital ($9,371), SNF ($1,519), hospice ($352), HHA ($851), DME ($559), Part D pharmacy ($2,683), and total costs ($27,177). **CONCLUSIONS:** During a 12-month period, Medicare patients diagnosed with lymphoma incurred substantial health care utilization and costs.

PCN237

BUDGET IMPACT ANALYSIS OF THE USE OF TRASTUZUMAB SC IN THE TREATMENT OF HER2 POSITIVE IN PUBLIC HEALTH INSTITUTIONS OF ECUADOR

Calvache J[1], Briceno V[2]
[1]SOLCA Quito, Quito, Ecuador, [2]Massachusetts College of Pharmacy & Health Sciences, Boston, MA, USA

OBJECTIVES: The standard treatment OF HER2+ breast cancer in Ecuador is Trastuzumab IV+Chemotherapy, however, the pharmaceutical formula Trastuzumab Subcutaneous (SC) has been shown to have the same efficacy, treatment regimen and a higher patient preference, which is why an economic analysis is fundamental for decision making. **METHODS:** We opted for a Budget Impact to reflect the savings that the incorporation of the pharmaceutical formula SC would generate to Ecuador. The analysis proposes a difference of 6% between the price of Trastuzumab IV ($1821.94) and Trastuzumab SC ($1712.62), in addition, it includes administration costs (USD, 2015) for patients between 40 and 59 years old with an average weight of 66.7 kg (95% CI 66kg: 68kg) for a population of 515 people (Globocan 2012) and a time horizon of three and five years. Due to the fact that in Ecuador there is no available data on waste management and vial sharing, the following article was used as guide ¨Drug waste minimization and cost-containment in Medical Oncology: Two-year results of a feasibility study¨ (Fasola G et al., 2014). **RESULTS:** Considering an average of 7% of vial waste in the first year and a 3.5% of vial waste from the second year on, Trastuzumab IV represents an investment of $15,710,806 in the first year and of $15,199,073 from the Second year while Trastuzumab SC represents an investment of $14,842,096 per year. The incorporation of Trastuzumab SC would generate savings of $868,716 the first year and of $356,978 from the second year on. Savings of $1,582,665 would be generated in 3 years and of $2,296,620 in 5 years. **CONCLUSIONS:** The reimbursement of Trastuzumab SC would generate substantial savings to Ecuador ($2,296,620 in five years) as well as a more efficient drug management and a better health system approval from patients with HER2+ breast cancer who are currently receiving intravenous treatment.

PCN238

A DESCRIPTIVE ANALYSIS OF THE HEALTH CARE UTILIZATION AND COSTS OF PATIENTS DIAGNOSED WITH MYELODYSPLASTIC SYNDROME IN THE US MEDICARE POPULATION

Lin Y[1], Ogbomo A[1], Wang Y[1], Xie L[1], Yuce H[2], Baser O[3]
[1]STATinMED Research, Ann Arbor, MI, USA, [2]New York City College of Technology-CUNY and STATinMED Research, New York, NY, USA, [3]Columbia University and STATinMED Research, New York, NY, USA

OBJECTIVES: To examine the health care utilization and costs incurred by patients diagnosed with myelodysplastic syndrome (MDS) in the US Medicare population. **METHODS:** Patients diagnosed with MDS (International Classification of Diseases, 9th Revision, Clinical Modification diagnosis codes 238.72-238.75) were

identified from the 100% national Medicare data population from 01JAN2009-31DEC2013. The first diagnosis date was designated as the index date. Patients were required to have continuous medical and pharmacy benefits 12 months pre- and post-index date. Study outcomes included demographic and clinical characteristics as well as health care costs and utilization for patients diagnosed with MDS. **RESULTS:** A total of 166,545 MDS patients were identified. The mean age was 80 years. The majority of patients were female (53.42%), white (88.06%), and resided in the South (38.99%) or Midwest (24.18%) US region. The mean Charlson Comorbidity Index scores were 4.99 (standard deviation = 3.49). The most commonly diagnosed comorbid conditions included hypertension (78.36%), and diabetes mellitus (33.07%). Health care utilization was assessed, including the proportion of patients with inpatient (26.89%), emergency room (ER; 28.00%), physician office (94.00%), outpatient hospital (80.81%), skilled nursing facility (SNF; 8.07%), hospice (2.04%), home health agency (HHA; 16.27%), and durable medical equipment (DME; 39.91%) claims. Patients with MDS incurred higher mean health care costs, including inpatient ($6,482), ER ($285), physician office ($4,805), outpatient hospital ($9,237), SNF ($1,720), hospice ($429), HHA ($1,004), DME ($511), Part D pharmacy ($2,496), and total costs ($26,968). **CONCLUSIONS:** During a 12-month period, Medicare patients diagnosed with MDS incurred substantial health care utilization and costs.

PCN240

OPPORTUNITIES FOR HIGH-COST DRUGS IN INDIA

Ramabadran A[1], Samuel JJ[2], Edathodu A[2], Mukku SR[2]
[1]University of Cambridge, Cambridge, UK, [2]Access Infinity Ltd, London, UK

OBJECTIVES: Healthcare in India is a rapidly expanding sector. Increased urbanisation, better standards of living, a growing middle class, improvements in health standards cumulatively have led to increased longevity and a shift in burden of disease dominated by infectious diseases to non-communicable diseases (NCDs). NCDs like cancer are now one of the leading cause of morbidity and mortality in India. Oncology therapeutics are generally highly priced and recognised as defining the 'high-cost drugs' space in the Indian market. Emerging markets such as India represent untapped revenue potential for the major pharmaceutical companies. We sought to assess market access opportunity for such drugs in India including current disease treatment landscape and reimbursement channels. **METHODS:** Research involved targeted review of literature published on the topic, followed by primary research with senior oncologists involved in formulary decision-making and nationally influential on the field of practice. **RESULTS:** Various public and private health insurance schemes were identified, particularly those that reimburse high cost drugs. Extrapolating from the cover provided under various schemes and affordability across income groups, a threshold of ₹2 lakh (~$3000) per treatment course was set beyond which any drug was considered high cost. Overall, ~6% of the population receive very comprehensive health cover that reimburse high cost drugs through schemes provided by central government, state government, railway, armed forces. **CONCLUSIONS:** At first glance, opportunities for high cost drugs in India can be considered low considering limited reimbursement options and lack of affordability for majority of the population. However, 6% of the population engaged in the public sector have good health cover which include reimbursement for high cost drugs. Together, this is a substantial market and the opportunity should be considered as 'high'.

PCN241

THE IMPACT OF DIFFERENT TYPES OF PAYER ON HEALTHCARE RESOURCE UTILIZATION AND COSTS AMONG CANCER PATIENTS IN INDIA

Abraham PS, Greene M
MCPHS University, Boston, MA, USA

OBJECTIVES: To review the patient characteristics and treatment methods of breast, oral and ovarian cancer patients at a tertiary care hospital in India. **METHODS:** This study was a retrospective review of electronic medical records from a tertiary care hospital in Mumbai, India. Patients ≥18 years of age hospitalized for breast (BC), oral (OC) and ovarian cancer (OVC) treatment between Jan 2014 and May 2015 were included in the study. Descriptive and inferential statistics were used to analyze and compare differences between patients. Regression models were also used to determine predictors of total costs for all patients. **RESULTS:** A total of 323 cancer patients met the study criteria (BC=146 patients, OC=132 patients, OVC=45 patients). The mean length of stay was highest for OVC patients (OVC=9.4+4.55 days, OC=9.1+5.13 days, BC=5.3+2.5 days). Patients with BC went into surgery early and were discharged the early (Pre-surgery: BC=3.6+1.8 days, OVC=4.2+2.32 days, OC=4.6+1.9 days; Post-surgery: BC=3.2+1.2 days, OVC=7.2+2.57 days, OC=6.3+3.3 days) from the hospital. Among BC patients, patients with private insurance (PI) received the highest number of per patient clinician visits (PI=16.3 visits/patient, no insurance (NI)=11.8, CGHS=2.7, RGJAY scheme=2.2; $p<0.001$). Among OC and OVC patients, patients with NI received the highest number of per patient clinician visits (OC: PI=36.5 visits/patient, NI=24.6, CGHS=8, RGJAY scheme=1.2; $p<0.001$; OVC: NI-35.9 visits/patient, CGHS-19.5, RGJAY-1.1, PI-30.3; $p<0.001$). Among BC and OC patients, mean hospital costs were highest for patients with PI (BC: PI=$2381.03+1739.31, NI=$1558.70+1342.56, CGHS=$723.19+731.57, RGJAY=$637.41+118.20; OC: PI=$5132.61+6158.41, NI=$1998.52+2057.81, CGHS=$1178.21+309.23, RGJAY=$795.77+$314.92). While NI patients incurred the highest mean hospital costs among OVC patients (OVC: NI=$3843.77+$2735.89, PI=$2735.89+2454.62, CGHS=$1849.73+1023.56, RGJAY=$653.01+$257.18). Clinician visits was found to be the significant predictor of costs in all regression models across cancer type. **CONCLUSIONS:** Patients with PI and NI incurred higher costs but received more resources, which could lead to better care, compared to patients covered under other insurance schemes.

PCN242

REAL-WORLD TREATMENT PATTERNS AND COSTS AMONG ADVANCED HEPATOCELLULAR CARCINOMA (AHCC) PATIENTS TREATED WITH SYSTEMIC CANCER THERAPIES

Bonafede MM[1], Cai Q[1], Singh P[2], Parikh N[3], Cappell KA[4], Jariwala-Parikh K[4], Korytowsky B[2]
[1]Truven Health Analytics, an IBM Company, Cambridge, MA, USA, [2]Bristol-Myers Squibb, Princeton, NJ, USA, [3]University of MIchigan Health System, Ann Arbor, MI, USA, [4]Truven Health Analytics, an IBM Company, Ann Arbor, MI, USA

OBJECTIVES: To describe the patient characteristics, pharmacologic treatment patterns and costs among commercially insured patients diagnosed with aHCC. **METHODS:** Newly diagnosed aHCC adults were identified using the Truven MarketScan Research Databasesbetween 1/1/2008-9/30/2015 (ICD-9-CM 155.0.x, 155.2x; on ≥1 inpatient or ≥2 outpatient claims). Continuous enrollment was required 6 months prior- and 1 month post- first diagnosis (index date). A claim for systemic therapy after the index date was required. Patients with prior diagnosis of other primary/secondary cancers were excluded. Outcomes included a descriptive assessment of patient characteristics, patterns of systemic therapy use and monthly/total healthcare costs. **RESULTS:** 4,902 patients met study criteria, mean (±SD) age 60.9 (±11.0) years, 32.6% female, and mean follow-up of 467 days (±466). 25.1% had a pre-index diagnosis of cirrhosis, 16.3% had HCV only, 3.0% had HBV only, 0.7% had both HCV and HBV. 43.6% of patients received sorafenib (SOR) as a first exposure. SOR users were more likely to have cirrhosis (39.5% versus 13.2%), HBV (6.3% versus 1.5%), and HCV (27.6% versus 8.3%) than non-SOR patients (all $p>0.01$). Among SOR users (n=2,217), 42.5% used target therapies, 5.1% used chemotherapies, and only 1 patient used immunotherapy within 60 days after first SOR use. Overall, mean total per patient per month (PPPM) healthcare costs were $16,148 (±$14,502). PPPM costs for SOR users (vs non-SOR) were significantly lower ($14,033 (±$12,488) vs $17,894 (±$15,766), $p<0.01$). Among sub-sets of patients with 6-months (n=3,309) or 12-months (n=2,103) of continuous enrollment, mean total costs were $101,119 (±$95,807) and $164,897 (±$143,357), respectively. **CONCLUSIONS:** The majority of aHCC patients received SOR (in first-line); however a variety of agents are used post-SOR despite no approved standard of care in second line. Given the limited number of approved treatment options overall and substantial PPPM costs, there is a clear need for more effective aHCC treatments.

PCN243

ASSOCIATION BETWEEN CANCER INFORMATION SEEKING VIA INTERNET AND CANCER FATALISTIC BELIEFS AMONG AMERICANS USING HEALTH INFORMATION NATIONAL TRENDS SURVEY

Acharya M, Bhandari NR, Payakachat N
University of Arkansas for Medical Sciences College of Pharmacy, Little Rock, AR, USA

OBJECTIVES: To determine association between internet cancer information seeking behavior and cancer fatalistic beliefs across people with and without cancer history. We hypothesized that the behavior would mitigate cancer fatalistic thoughts on cancer prevention and treatment. **METHODS:** A pooled cross-sectional study was conducted among US adults (≥ 18 years) using Health Information National Trends Survey 2012 and 2014 data. Participants were categorized into two groups: with and without cancer history. The behavior of interest was whether they sought cancer information for themselves via internet (the eSeekers) in past 12 months (yes/no). Fatalistic beliefs were operationalized by participants' agreement or disagreement with three statements along the lines of everything causes cancer, cancer prevention is not possible, and too many recommendations are available for preventing cancer. Each fatalistic belief was analyzed separately across both groups. Weighted descriptive bivariate analyses were used to explore associations between socio-demographic factors and each fatalistic belief. Adjusted multivariable logistic regression was then employed to examine association between internet cancer information seeking behavior and each fatalistic belief. **RESULTS:** Of the total 5,454 participants, 1,022 (18.7%) reported using internet for seeking cancer information. Greater proportions of the eSeekers were aged 35-64 years, college graduates, urban dwellers, and with either personal or family cancer history. The eSeekers also reported higher agreement on behaviors (such as diet, smoking, exercise) cause cancer ($p<0.001$). The eSeekers without cancer history were 38% less likely to believe that they were overwhelmed with many recommendations for preventing cancer (Adj.OR: 0.62, 95% CI: 0.44-0.86). However, internet cancer information seeking behavior was insignificantly associated with the other fatalistic beliefs across both groups. **CONCLUSIONS:** Information seeking is a desired behavior for cancer prevention. However, we did not observe significant associations between the behavior and two out of the three cancer fatalistic beliefs across participants with and without cancer history.

PCN244

FDAMA114 LANDSCAPE ASSESSMENT: ARE US PAYER AND PROVIDER ACCESS DECISION MAKERS RECEPTIVE TO HEALTHCARE ECONOMIC INFORMATION CONSIDERING THE RECENT CHANGES TO FDAMA114

Bower D[1], Zhang Y[1], Daniel S[2], Capuano C[1], Suponcic S[2], Zan R[2]
[1]Navigant Life Sciences, Boston, MA, USA, [2]Navigant Life Sciences, Lawrenceville, NJ, USA

OBJECTIVES: Section 114 of the FDA Modernization Act of 1997 (FDAMA114) provides companies with guidelines to share healthcare economic information (HCEI) with formulary decision makers. However, ambiguity in the phrasing of FDAMA114 has caused companies to exercise caution when distributing HCEI. The enactment of the 21stCentury Cures Act in December 2016 aimed to remove this ambiguity in an effort to increase HCEI utilization and standardization, and encourage collaboration in addressing rising healthcare costs. This research

identifies four areas of ambiguity within FDAMA114, seeks to understand if the Cures Act provided sufficient clarity, and captures the Payer and Provider Access Decision Maker (ADM) perspective on the credibility and believability of HCEI. **METHODS:** Secondary research was conducted to identify four phrases in FDAMA114 considered ambiguous to Payer and Provider ADMs. Each identified phrase was analyzed in relation to guidance provided in the Cures Act. Primary research was conducted with Payer and Provider ADMs to understand the extent to which the Cures Act addressed ambiguity in FDAMA114 and impacts the perceived credibility and believability of HCEI. **RESULTS:** The Cures Act stoked new interest in FDAMA114 by pharmaceutical companies. Specifically, the four primary areas of uncertainty in FDAMA114 identified were acknowledged through changes brought by the Cures Act. However, Payer and Provider ADMs do not recognize a meaningful advancement in reducing the ambiguity around HCEI communications. Moreover, stakeholders acknowledged that the lack of coordination and consistency between pharmaceutical companies further enhances the low perception of credibility and believability around HCEI. **CONCLUSIONS:** HCEI continues to present an opportunity to utilize a data-driven approach to confronting rising healthcare costs. Even with recent revisions to FDAMA114 through the Cures Act, ambiguity and uncertainty still remain with Payer and Provider ADMs. Furthermore, the pharmaceutical industry must work towards standardization for the communication of HCEI to improve its overall credibility and believability.

PCN245

ASSESSING THE MOTIVATION FACTORS AND REASONS FOR NON-ATTENDANCE AT CERVICAL CANCER SCREENING AMONG ROMANY MINORITY POPULATION

Pakai A[1], Bogdáné Basa E[1], Csákvári T[1], Boncz I[2], Váradyné Horváth Á[2], Horváthné Kívés Z[2], Oláh A[2], Máté O[2], Endrei D[2], Vajda R[2]
[1]University of Pécs, Zalaegerszeg, Hungary, [2]University of Pécs, Pécs, Hungary

OBJECTIVES: The aim of our study was to assess the main reasons for romany women to stay away from cervical cancer screening, factors that affect screening attendance and knowledge about cervical cancer and its screening process. **METHODS:** We carried out a quantitative, cross-sectional study with non-probability convenience sampling in 2016. Our sample consists of romany women living in the agglomeration of Nagyatád, Hungary (N=126). We excluded women with cervical cancer, women receiving treatment for gynecological cancer or women who underwent hysterectomy. In the questionnaire we measured health status, reasons for non-attendance and knowledge with a test consisted of 20 questions. During statistical analysis we calculated descriptive statistics, χ^2-test and t-test ($p<0.05$). **RESULTS:** Mean age of responders is 37.45±12.05 years. 26.2% of women have not attended any kind of gynecological screening in their life. Mean age of women when they attended for screening for the first time was 24.05±8.96 years (n=91). 76.2% of women who have selected physicians attend screening in every three years. We did not find any significant connection between time of the last attendance or frequency of attendance and socio-demographic data ($p>0.05$). Main score of the knowledge test is 31.4±3.93 points. Knowledge about HPV and cervical cancer is low in 8,7%, average is in 87.3% of the case and only 4% of the sample has sufficient knowledge. According to knowledge level there is no connection between attendants and non-attendants (p=0.141). **CONCLUSIONS:** It is necessary for romany women to be screened for cervical cancer regularly. Expand knowledge is key to increase the frequency of screening attendance.

PCN246

DEVELOPING A PHARMACOECONOMICS PROGRAM IN AN ACADEMIC MEDICAL CENTER

Prasad S[1], Cohen H[1], Adelson K[2], Abdelghany O[1]
[1]Smilow Cancer Hospital at Yale New Haven Health, New Haven, CT, USA, [2]Smilow Cancer Hospital and Yale School of Medicine, New Haven, CT, USA

OBJECTIVES: While the cost of cancer care continues to rise, the traditional approach to formulary management is no longer sustainable. Several FDA approved anti-cancer drugs in development provide marginal impact on patient survival, little or no improvement in quality of life, and raise questions about the true value of the drug. Value is a key consideration in discussions about reducing oncology drug costs. Unlike in other countries, the U.S. lacks a national program that provides comprehensive review of costly oncology medications. By existing standards, most cancer treatments are unlikely to be cost-effective. A national discussion is needed around the economic value placed on a year of life, what a value-based price is and how it is determined. The objective is to develop an evidence-based program in pharmacoeconomics at an academic medical center to look beyond the traditional approach to oncology formulary management. **METHODS:** The oncology pharmacy and therapeutics (P&T) subcommittee was identified as an initial strategic avenue for developing pharmacoeconomic analyses for new drug requests and conversion from one drug to another. The methodology are expected to be transparent and replicable, and key stakeholders from disease teams to billing/reimbursement are engaged in data collection, selection of analytical framework, and applicability of results. Ongoing efforts include educating hospital leadership about the value of pharmacoeconomics. **RESULTS:** Current efforts to identify the value of high cost oncology drugs on formulary include cost-effectiveness and budget impact analyses. Additional areas for development are oncology care model, treatment pathways and medication policy determination. **CONCLUSIONS:** The inclusion of pharmacoeconomics is essential for efficient formulary management. Successful program development requires physician and pharmacy champions in determining guiding principles of the program. Moving toward a pricing system that matches the value of a drug will be challenging. We share these experiences to encourage a national conversation about the rising costs of cancer care.

PCN247

PARTICIPATION IN CERVICAL CANCER SCREENING AND EXAMINATION OF ITS AFFECTING FACTORS AMONG WOMEN LIVING IN BARANYA COUNTY, HUNGARY

Rasztik R[1], Boncz I[1], Pakai A[2], Gyuró M[1], Csákvári T[2], Danku N[1], Horváthné Kívés Z[1], Endrei D[1], Vajda R[1]
[1]University of Pécs, Pécs, Hungary, [2]University of Pécs, Zalaegerszeg, Hungary

OBJECTIVES: The aim of our study was to explore the habits and attitudes to cervical cancer screening among women aged between 18 and 70 years. **METHODS:** A quantitative, cross-sectional study was conducted using self-administered questionnaire (socio-demographic data, motivation to take part in screening, participation rate and habits) among women who were selected by non-random sample selection method in Baranya county, Hungary in 2016 (n=166). Data were processed by SPSS 22.0 program, using descriptive statistical analysis, χ^2-test and multivariate logistic regression ($p<0.05$). **RESULTS:** 51.2% of women attended screening within a year, 17.7% of them continued this practice every two years. Almost 20 % of the women participated in screening less than three years. Women living in reasonably good financial position (χ^2=18.563; p=0.005) went to screening more often than their less well-off counterparts. The first examination usually occurred at the age of 20.8 (SD=4.81). Early recognition was a motivating factor for screening (94.6%) and for examination of disease in order to prevent a serious illness (92.8%). Motivations for non-attendance are the following: 16.3% of the women did not participate in screening due to fear of examination. Women with lower education kept away screening to a greater extent due to the above reason. (χ^2=13.650; p=0.008). 42.2% of them knew that health visitors may perform screening, since they heard of the Cervical Cancer Screening Program significantly to a great extent (χ^2=78.949; $p<0.001$). 34.9% of the women asked for help from the health visitors on gynecological problems because they had some knowledge on screening given by the health visitor. Those persons who asked for help were usually young women (ß=0.044; OR=1.045; 95% CI[1.007;1.084]). **CONCLUSIONS:** The role of health visitors is an extremely important job in health promotion because they can reduce the fear that keeps women away from screening.

PCN248

AVERAGE TIME TO PATIENT ACCESS FROM DRUG APPROVAL: AN ANALYSIS OF ONTARIO & QUEBEC

Bremner S[1], Lapierre M[2], Fraelic A[1], Stewart D[1]
[1]QuintilesIMS, Kanata, ON, Canada, [2]QuintilesIMS, Kirkland, QC, Canada

OBJECTIVES: This study compares two provinces to provide insight into the time to provincial reimbursement from Health Canada approval for novel oncology drugs. **METHODS:** Health Canada's "Notice of Compliance (NOC)" database was used to identify "new active substances" in oncology approved from January 1, 2012 until December 31, 2016. The pan-Canadian Oncology Drug Review (pCODR) and Institut National d'excellence en sante et en services sociaux (INESSS) databases were used to determine the date that Ontario and Quebec publically listed each drug. Prescription claims from a private pay direct drug plan database that includes all major insurance providers in Ontario and Quebec were provided by QuintilesIMS to determine the date of first private claim. **RESULTS:** 43 oncology drugs met inclusion criteria. As of January 2017, Ontario had listed 23/43 (53%) and Quebec had listed 21/43 (49%) of the drugs. Of the listed drugs, the median time (range) to provincial listing from NOC was 382 (134-817) days in Ontario and 367 (188-1008) days in Quebec. The median time (range) to first private claim from NOC was 84 (13-411) days and 127 (45-665) days in Ontario and Quebec, respectively. Nine drugs received no private claims in Quebec or Ontario during the study period, and four drugs had a greater than expected time to first private claim. **CONCLUSIONS:** These findings suggest private insurance plans continue to reimburse novel oncology treatments in a shorter timeframe than public programs. There was a trend that time to first private claim in Quebec was longer than that in Ontario, which needs to be investigated further as time to first private claim could be impacted by various confounding factors. A limitation of this study is that access to drugs via clinical trial, compassionate usage and pharma-sponsored programs would not be captured in this analysis.

PCN249

CHALLENGES OF PRICING STRATEGY FOR DRUGS BEING LAUNCHED IN MULTIPLE ONCOLOGY INDICATIONS

Edathodu A[1], Gonzalez AO[2], Leung SK[1], Mukku SR[2]
[1]Access Infinity, London, UK, [2]Access Infinity Ltd, London, UK

OBJECTIVES: Most oncology drugs have development plans that includes multiple indications and often the value they bring in some indications can be higher than others.This study aimed to understand what the best pricing strategy would be when a drug's value is different across indications and how payer willingness to pay may be impacted when the time between the regulatory approval of the indications takes 1 year or more. **METHODS:** In-depth secondary research was conducted on 18 oncology drugs that were launched in 2 indications or more This was followed by 1-1 interviews with senior clinicians, policy makers and national and regional payers in EU5. **RESULTS:** Observation of price changes indicated differences in response by market. The key difference was observed in net prices. Factors such as the unmet need in different populations, the magnitude of efficacy (primarily OS and PFS), the size of the population, the time difference between launches were determined to be key decision drivers influencing the price and access of oncology drugs. Although payer concerns were more related to

clinical benefit and budget impact, they were also vary of deliberate delaying tactics by pharma in manipulating launch sequence to influence price. The analysis revealed that in order to ensure the price of one indication is not impacted by that of a follow-on indication, a minimum of 18 months between indications is expected. **CONCLUSIONS:** Even though delaying a drug's initial launch in one indication to obtain a higher price for another may appear to be an attractive strategy, research shows that drugs that employed this strategy have often resulted in a lower price than what they might have achieved by pursuing 'natural' launch sequence. Companies developing drugs in oncology should aim to come to market upon initial approval to maximise revenue and avoid conflicts with regulatory authorities, clinicians and patient groups.

PCN250

ARE HTAS FOR ONCOLOGY AGENTS TAKING LONGER TO COMPLETE? TRENDS IN TIME TO AN HTA DEICSION IN 6 MAJOR MARKETS

Jaksa A[1], Pontynen A[1], Bastian A[2]
[1]Context Matters, New York, NY, USA, [2]INCYTE CORPORATION, Wilmington, DE, USA

OBJECTIVES: To determine how the time required for health technology assessment (HTA) after regulatory approval has changed. **METHODS:** Oncology drugs approved 2005-2015 by the EMA, 2013-2015 by Health Canada, and 2009-2015 by TGA were matched on indication with HTAs from G-BA, HAS, NICE, SMC, pCODR, and PBAC. The analysis included 569 HTAs. Resubmissions were excluded. The date of the first reimbursement decision was subtracted from the date of the regulatory approval to determine the time taken to complete HTA and to issue reimbursement decision. Trends over time were analyzed using regression analysis. **RESULTS:** On average it takes 321 days from regulatory approval to issue a reimbursement decision for oncology drugs. Since 2005, the time from regulatory approval to the first reimbursement decision for has lengthened (increased) by approximately 10 days per year (p=0.04). Trends over time varied by HTA agency. PBAC's time to reimbursement has trended upwards (i.e., longer time to issue a decision), while G-BA's time to decision has been steadily decreasing. HAS and SMC's time to reimbursement decisions have increased slightly, with a recent dip in 2016. **CONCLUSIONS:** Delays in patient access to life-saving oncology therapies appear to be getting longer over the past decade. This increase may be due to changes in HTA processes, the time it takes manufacturers to prepare and submit their dossiers, or the time to finalize intense negotiations between companies and payers. For example, negotiating patient access schemes for higher cost cancer therapies may require more time. The cost-effectiveness agencies (i.e., NICE, SMC, pCODR, PBAC) have demonstrated lengthier trends, while G-BA, an agency that does not consider cost during the evaluation, has not.

PCN251

DO LONGER HTA REVIEW TIMES FOR ONCOLOGY PRODUCTS REFLECT WORSE OUTCOMES? A REVIEW OF 482 HTAS ACROSS 5 MARKETS

Jaksa A[1], Pontynen A[1], Bastian A[2]
[1]Context Matters, New York, NY, USA, [2]INCYTE CORPORATION, Wilmington, DE, USA

OBJECTIVES: To determine how reimbursement decision type affects the time required for health technology assessment (HTA) agencies to issue a decision in oncology. **METHODS:** Oncology drugs approved between 2005-2015 by the EMA, 2013-2015 by Health Canada, and 2009-2015 by TGA were matched on indication with HTAs from HAS, NICE, SMC, pCODR, and PBAC (n=482). Resubmissions were excluded. The date of the first reimbursement decision was subtracted from the date of the regulatory approval to determine the time to reimbursement decision. Reimbursement decisions were categorized as "recommend," "recommend with restrictions," or "do not recommend." An analysis of variance test was used. **RESULTS:** On average it took 304, 382, and 353 days to issue "recommend", "recommend with restrictions," and "do not recommend" decisions, respectively. Although demonstrating a trend, there was no difference in the time to a decision by the type of decision (p=0.16). All agencies (except SMC) required more time for "recommend with restrictions" decisions than "recommend" decisions. It took longer, on average, for pCODR, HAS, and NICE to issue a "do not recommend" decision than a "recommend" or "recommend with restrictions" decision. **CONCLUSIONS:** The most positive decision ("recommend") takes the shortest time for all agencies, except for SMC; "recommend with restrictions" and "do not recommend" decisions require longer time, reflecting challenges in negotiations with manufacturers or the time needed to determine restrictions. For example, negotiating with manufacturers on patient access schemes or allowing the manufacturer to comment, appeal, or counter a preliminary decision could require additional time to reach a conclusion. The time it takes agencies to issue decisions post regulatory approval can lead to delaying patient's access to oncology treatments.

PCN252

VALUE FRAMEWORKS IN ONCOLOGY: UNDERSTANDING AND IMPLICATIONS TO PHARMA

Slomiany M, Madhavan P, Richardson SK
GfK, New York, NY, USA

OBJECTIVES: GfK reviewed the capabilities and limitations of five of the most notable value frameworks to emerge in recent years, to compare and contrast the relative value that each conveys as well as their application among the intended stakeholders. **METHODS:** GfK contrasted the methodology of the ASCO Value Framework (version 2.0), NCCN Evidence Blocks, MSKCC DrugAbacus, ICER Value Assessment Framework and ESMO Magnitude of Clinical Benefit Scale with respect to the input, scoring approach and output. In addition, GfK gleaned stakeholder insight on these frameworks and their potential application from dialogues with physicians and payers as well as secondary research and meta-analysis of existing data. **RESULTS:** GfK noted several framework-specific themes related to trial analysis, breadth of evidence, evidence weighting, scoring and value to stakeholders. Our dialogues with physicians and meta-analysis of existing data revealed level of awareness and use of value frameworks in practice. For example, while the ASCO value framework appears nascent in clinical practice, physicians believe they will be more purposeful in the future as they become more established and the outputs more widely accepted. **CONCLUSIONS:** The value of drugs is emerging as a particularly acute concern in oncology, where the cost of cancer care has evoked concerns of "financial toxicity". Along with patients and payers, physicians and policymakers have waded into the discussion, as well as the pharmaceutical industry that seek to understand the impact of these value frameworks as they model the value and financial threshold of innovative, high-cost drugs. Each of these five major value frameworks is geared to a different set of stakeholders. By understanding not only the meaning of the output(s) generated by each framework, but also the value of each framework to each stakeholder, pharma has an opportunity to selectively utilize these fledging frameworks to shape clinical and commercial development in oncology.

PCN253

EVOLVING TREATMENT PATTERNS IN METASTATIC MELANOMA IN CANADA IN 2016

Khamis ZJ, Merali T
Drug Intelligence Inc., Toronto, ON, Canada

OBJECTIVES: Treatment of metastatic melanoma has evolved rapidly with changes to the approval and access status of new therapies. In 2016, several agents became available on compassionate use programs and later through public reimbursement, including Immuno-Oncology (I/O) agents. With open access to all available treatments, our objective is to compare the upfront treatment at centers in Canada prior to and after the availability of these new treatments. **METHODS:** This study used ONCO-CAPPS, a proprietary database of patient chart abstractions collected through regular survey of physician panels. The data includes demographic details, disease markers, and details of patients' cancer treatment by line of treatment. Data from the time periods 2013 to 2016 were used to identify patients with metastatic melanoma and analyze changes in upfront cancer treatment. **RESULTS:** 157 first line-treated (1L) metastatic melanoma patients were reviewed for 2013, and 338 1L patients for 2016. The most important factor in determining the 1L treatment, throughout the time period of data capture, was BRAF mutation status. In 2013, prior to the widespread availability of new agents, 88% of patients known to have BRAF mutation (BRAFm) were treated with a BRAF targeting agent in 1L. In 2016, 78% of 1L BRAFm patients were treated with a BRAF targeted agent, and 11% were treated with I/O agents. For patients without known BRAF mutation (BRAF WT), 87% were treated with chemotherapy in 1L in 2013; in 2016 only 8% of 1L BRAF WT patients were treated with chemotherapy and 88% were treated with I/O agents. **CONCLUSIONS:** With open access to all treatments for metastatic melanoma, there remains a physician preference for upfront targeted treatment in BRAFm patients. In the first line setting, Immuno-Oncology agents have had the effect of replacing chemotherapy for patients without known BRAF mutation.

PCN254

DO ADVANCES IN BREAST CANCER TREATMENT RENDER SCREENING MAMMOGRAPHY NOT COST-EFFECTIVE FOR AVERAGE-RISK WOMEN?

Shen Y[1], Dong W[1], Xu Y[2], Shih YT[2]
[1]UT MD Anderson Cancer Center, Houston, TX, USA, [2]The University of Texas MD Anderson Cancer Center, Houston, TX, USA

OBJECTIVES: Researchers have postulated that screening mammography could become less effective in reducing cancer mortalities as breast cancer (BC) treatment improves over time. We evaluated the association between treatment advances and the cost-effectiveness of screening mammography for women at average-risk for BC. **METHODS:** Our microsimulation model includes "no screening" plus 6 other strategies at three initiation (40/45/50) and two cessation ages (75/80). We captured treatment advances by modeling a hypothetical treatment with the same hazard reduction and costs as trastuzumab but would benefit 50% (or 100%) of BC patients, instead of only HER2+ patients. We obtained clinical parameters from the literature or statistical modeling and cost parameters from Medicare fee schedule and SEER-Medicare. Deterministic CEA was based on simulating a birth cohort of 500,000 women and probabilistic CEA from 100 repetitions of the simulation, each with a cohort of 100,000 women. **RESULTS:** The most cost-effective screening strategy in the base case scenario was a hybrid strategy that started screening at 45 and switched to biennial between 55 and 75, yielding ICER $69,235/QALY. The ICER of the same strategy increased to $70,612/QALY and $71,162/QALY in the scenario in which the new treatment benefited 50% and 100% of patients, respectively. At $50,000/QALY willingness-to-pay, the probability that this hybrid strategy yielded the highest net benefit was 30% at base case, and reduced to 28% and 23% in the 50% and 100% new treatment scenario, respectively. At $100,000/QALY, the probability that the above hybrid strategy had the highest net benefit stayed around 37% for all three scenarios. **CONCLUSIONS:** Treatment advances reduce the cost-effectiveness of screening mammography, especially in countries with lower CE threshold. For countries with a higher CE threshold, a new treatment would have to be substantially better than trastuzumab and benefit a large proportion of patients to render screening mammography not cost-effective.

PCN255

THE REPORTING OF ADVERSE EVENTS AND DEATHS USED FOR ECONOMIC MODEL INPUTS IS INCONSISTENT THROUGHOUT ONCOLOGY TRIALS

Nelson L, Moeller A, Chadda S
SIRIUS Market Access, London, UK

OBJECTIVES: Cost-effectiveness analyses require accurate and uniform data relating to adverse events (AEs) and deaths. The consistency of reporting of these data in peer-reviewed oncology trial publications was explored. **METHODS:** The consistency of reporting of non-mortality AEs and deaths was evaluated in published articles relating to 21 trials in the last 10 years in previously untreated diffuse large B-cell lymphoma (DLBCL) and 12 in relapsed/ refractory small cell lung cancer (SCLC). **RESULTS:** The criteria used to report AEs, and the rate and the severity of AEs that were included, differed across the publications. In the 21 publications for DLBCL, four different criteria were used to report AEs, and 17 papers (81%) clearly stated which criteria were used. The severity of AEs reported ranged from 'all AEs' to 'grade 3–4', and the frequency of AEs ranged from 'all', to 'common AEs'. As a result, AEs were reported in 18 different ways in the 21 studies. For SCLC, most publications (92%) specified the criteria used to report AEs. AEs were reported in seven different ways, ranging from 'all' to 'grade $\geq$3 occurring in $\geq$5% of participants'. The number of deaths was not always reported. In DLBCL, 71% of publications reported the total number of deaths, and 62% reported the number of treatment-related deaths. For SCLC, 67% reported total deaths, and 58% specified toxicity- or treatment-related deaths. **CONCLUSIONS:** Within and across oncology indications, there is variation in the criteria used to report AEs, and the detail to which AEs are reported, making comparisons between treatments difficult. There is also a lack of clear reporting of deaths and treatment-related deaths. Greater consistency in the reporting of these important clinical endpoints would assist decision-making by health technology assessment agencies.

PCN256

BARRIERS TO CONDUCTING CLINICAL TRIALS AND ONCOLOGY RESEARCH IN COMMUNITY ONCOLOGY IN THE US

Nabhan C, Feinberg BA, Fillman J, Ernst FR
Cardinal Health, Dublin, OH, USA

OBJECTIVES: Less than 3-4% of cancer patients enroll in clinical trials. While 80% of oncology patients are treated in a community setting, trial patients are mostly enrolled in academic institutions. Understanding barriers to conducting clinical research in the community is essential to increase trial enrollment. **METHODS:** We surveyed 53 community-based oncologists of various geography and practice types to understand barriers to conducting clinical trials. Data were collected at a live meeting with audience response technology. **RESULTS:** Almost 35% of oncologists participated in phase III trials and an additional 31% participated in phase II studies. While 75% of oncologists participated in cooperative groups and/ or pharma-sponsored studies, 58% indicated that more than 50% of pharma-studies have enrolled no patients. Almost 65% of oncologists were interested in observational trials and 62% stated that they have biomarkers-related studies open. Majority of oncologists (72%) claimed good understanding of required compliance, but 41% needed external advisors to help explain continuous regulatory changes. Barriers to clinical research: difficulty recruiting: 81%, budget/contract negotiations: 77%, IRB processes: 70%, time and resource constraints, 50%, and technology needs: 50%. A majority of the advisors (65%) indicated that clinical trials-related functional requirements and operational concerns moderately influenced their decision to set up a clinical research department. Protocol design was cited by 41% as the main cause for poor enrollment. Notably, 77% of oncologists did not have experience in healthcare economics and outcomes research, but 37% expressed an interest in learning more. Despite limitations, 82% stated that their practice provides added value to patients when clinical research is conducted. **CONCLUSIONS:** Community oncologists are eager to participate in clinical research, which is perceived as high-value to patients. The strength of the barriers is so significant that few trials can fully accrue patients, and few community practices participate broadly. Strategies to overcome barriers are urgently needed.

PCN257

IDENTIFYING THE HIGHEST BUSINESS OPPORTUNITY FOR FUTURE DEVELOPMENT AMONG KEY PATIENT SUBGROUPS IN NON-SMALL CELL LUNG CANCER (NSCLC)

Black J, Shah S, Narayanan S
Market Access Solutions LLC, Raritan, NJ, USA

OBJECTIVES: Lung cancer is an increasingly segmented disease as more targeted and biological therapies are launched every year, particularly for non-small cell lung cancer (NSCLC). Given segmentation is being used by key opinion leaders and Payers in developing guidelines and policies, it is pertinent to assess the current landscape, HTA evidence requirements, and clinical trial design of current/future competitors in order to identify the subgroup(s) with the highest business opportunity for an interested manufacturer. **METHODS:** MKTXS reviewed published studies of FDA and EMA approved NSCLC drugs using PubMed and clinicaltrials.gov. The latter was also leveraged to extract trial design information for not-yet-approved treatments, such as comparator, outcomes, inclusion criteria, etc. Published HTA reports from NICE, SMC, HAS/CT, and IQWiG were assessed for each recently approved therapy to understand key drivers of decision-making. Current price and access for NSCLC therapies was collated via online country-specific databases. **RESULTS:** Four subgroups within metastatic NSCLC were identified: ALK+, EGFR-, adenocarcinoma, and squamous cell carcinoma. Within the crowded EGFR- and ALK+ subgroups, multiple therapies have demonstrated meaningful improvements in PFS and are not associated with considerable safety concerns. The adenocarcinoma and squamous cell carcinoma segments have few non-chemotherapy options recommended by NCCN, as a result of a dearth of indicated, highly effective and/or tolerable treatments. From an HTA standpoint, no demonstrated benefit in overall survival (OS) was needed to earn a positive assessment; progression-free survival (PFS) was sufficient. Well-defined and narrow target patient populations, such as the previously treated ALK+ subgroup associated with critzotinib, allowed for a price two to three times greater than other NSCLC therapies. **CONCLUSIONS:** Adenocarcinoma and squamous cell carcinoma represent the most promising future business opportunities within NSCLC. Optimal access in ALK+ or EGFR- will prove difficult without a substantial efficacy benefit or economic incentive (i.e., significant price discount).

PCN258

EXPLORING STAKEHOLDERS' PERSPECTIVES WITH MULTI-CRITERIA DECISION ANALYSIS (MCDA): APPLYING A PARACONSISTENT FRAMEWORK TO HEALTH TECNHOLOGY ASSESSMENT (HTA)

Campolina AG[1], Soarez PC[2]
[1]*Cancer Institute of the State of Sao Paulo, Sao Paulo, Brazil,* [2]*Sao Paulo University, São Paulo, Brazil*

OBJECTIVES: To assess multi-stakeholder expressed preferences around health care prioritization in the Brazilian National Committee for Technology Incorporation (CONITEC). **METHODS:** In addition to systematic consideration of scientific evidence, healthcare decision making requires reconciliation of all competing interests. For this purpose, paraconsistent multi-criteria decision analysis (MCDA) approach enables exploration of stakeholders' perspectives, regarding imperfect information and contradictory valuation, as well as explicit organization of broad range of criteria on which real-world decisions are made. A pilot MCDA approach was used do access multi-stakeholder concerns about resource allocation based on health technology assessment (HTA) report provided by CONITEC. An appraisal group, at hospital level, was convened and "Erlotinibe for Lung Cancer" was selected as a case study. A by-criterion HTA report was developed to synthesize evidence. The paraconsistent MCDA approach (a framework that can be used as the basis for inconsistent but non-trivial theories) was tested in 3 steps: selection, scoring and weighting of criteria. Interpretation was explored through discussion. **RESULTS:** Four criteria for assessing "Erlotinibe for Lung Cancer" were identified from the HTA report: clinical effectiveness, cost-effectiveness, budget impact and clinical relevance. Scoring was elicited according to standard approach in annotated logics, considering the concepts of magnitude and confidence on the available evidence. Weights for the criterion representing their relative importance, apprehended from the HTA report, were derived from a survey with the 8 members of the appraisal group. Scenario analyses were done varying criteria, scores and weights. The effect of different criteria and weights resulted in distinct recommendation, similar to the ones described in the HTA report. **CONCLUSIONS:** Feedback from participants revealed that the tool could help to promote a more structured and transparent approach to HTA. Further testing and validation are needed to advance the paraconsistent MCDA approach in healthcare decision making.

PCN259

PAYER ACCEPTABILITY OF METASTASIS-FREE SURVIVAL AS PRIMARY END-POINT IN NON-METASTATIC CASTRATION-RESISTANT PROSTATE CANCER

Degener F[1], Naidoo S[2], Holmstrom S[3], van Engen A[1]
[1]*Quintiles Advisory Services, Hoofddorp, The Netherlands,* [2]*Astellas Pharma Europe, Ltd, Chertsey, UK,* [3]*Astellas Medical Affairs Global, Leiden, The Netherlands*

OBJECTIVES: Life expectancy of patients with non-metastatic prostate cancer may exceed 10 years, making overall survival impractical as a primary efficacy endpoint. Therefore, pivotal trials in non-metastatic castration-resistant prostate cancer (M0 CRPC) have proposed metastasis-free survival (MFS) as an intermediate primary efficacy endpoint. While new oncology drugs may be conditionally approved by regulators based on attaining intermediate efficacy endpoints, their acceptance by payers seems to vary widely across regions and agencies. This research aimed to assess the acceptance of MFS by payers to demonstrate clinical benefit to patients. **METHODS:** A targeted search for products with MFS as an endpoint was performed. Health technology assessments (HTAs) of these products and analogs in early-stage oncology indications published from January 2011–March 2016 were obtained from HTA agencies around the globe (NICE, SMC, G-BA, IQWiG, HAS, PBAC, and TLV). **RESULTS:** Six products with MFS as primary endpoint were identified: five in M0 CRPC and one in stage III melanoma; no products had been approved by regulators. Searches for products in analog indications resulted in 40 HTAs of seven products in 10 different indications. Notably, progression-free survival (PFS) was the primary endpoint in most (9/10) indications and its definitions closely resembled MFS in M0 CRPC. No included assessments demonstrated statistically significant survival benefits and all submissions relied on intermediate primary endpoints to demonstrate clinical benefits (36 PFS; four objective response rate). A correlation between PFS gain of $\geq$5 months and positive recommendations was observed for most agencies, except in Germany (IQWiG and G-BA) and France (HAS), where the acceptance of intermediate endpoints remains challenging. **CONCLUSIONS:** Payers' acceptance of intermediate endpoints has increased over time and is mainly driven by the effect size of the demonstrated benefit. However, benefit ratings in France remain low and strict endpoint validation guidelines seem to hinder acceptance in Germany.

PCN260

COMPARISON OF FACTORS INFLUENCING RECENT REIMBURSEMENT DECISIONS OF ADVANCED NON-SMALL-CELL LUNG CANCER THERAPIES ACROSS LEADING HTA AGENCIES

Kumar P[1], Jyothsna B S[1], Outteridge G[2]
[1]Kinapse, Gurgaon, India, [2]Kinapse, London, UK

OBJECTIVES: To compare the factors leading to favorable and unfavorable recommendations for advanced non-small cell lung cancer therapies across six HTA bodies. **METHODS:** We evaluated HTA reports published by NICE, SMC, IQWiG, HAS, PBAC and pCODR on non-small cell lung cancer therapies to identify final decisions and the clinical and economic factors influencing these decisions. The decisions were classified as either positive or negative and to analyze the factors affecting decisions, recommendation summaries of HTA reports were assessed. **RESULTS:** A total of 25 HTA reports published between January 2016 and January 2017 were identified among which the decisions were positive for 68% submissions. Highest percentage of positive decisions were provided by SMC (100%) and pCODR (100%). But in pCODR, all being conditional on cost-effectiveness improvement to an acceptable level. Major factors driving positive decisions were overall survival (OS) and added clinical benefit for IQWiG, pCODR and HAS; and cost-effectiveness versus relevant comparator(s) for NICE and SMC. Highest negative decisions were provided by PBAC (100%) followed by HAS (66.7%) and IQWiG (37.5%). The leading factors for negative decisions included high ICER values mainly due to economic modelling issues for NICE and PBAC; and no added clinical benefit for IQWiG and HAS. The chief issues of economic modelling by HTA bodies involved inappropriate extrapolation of immature OS data, improper cross-over adjustment, non-inclusion of adverse event-related disutility and costs, underestimation of utility and costs due to post-progression, overestimation of comparator drug costs, and underestimation of resource use costs. **CONCLUSIONS:** The current evaluations signified that supporting data on OS benefit versus relevant comparators should be considered for reimbursement submissions by pharmaceutical manufacturers. In addition, robust economic models which incorporate appropriate cost and utility values and utilize sensitivity analysis for adjusting uncertainties could be useful to attain market access approvals.

PCN261

APPLICATION OF ONCOLOGY VALUE FRAMEWORKS TO THE 2ND LINE TREATMENTS IN RENAL CELL CARCINOMA (2L-RCC)

Forsythe A[1], Schneider J[2], Shor A[1], Patel P[3], Briggs A[4]
[1]Purple Squirrel Economics, New York, NY, USA, [2]Avalon Health Economics, Morristown, NJ, USA, [3]Global Pricing Innovations, London, UK, [4]Memorial Sloan-Kettering Cancer Center, New York, NY, USA

OBJECTIVES: With multiple recent approvals. substantial progress has been made in the treatment of RCC patients who failed the initial therapy. Recently emerged US oncology value frameworks use heterogeneous methodologies, consider different evidence and target audience. Here we summarize the different approaches and outcomes of National Comprehensive Cancer Network Evidence Blocks (NCCN), American Society of Clinical Oncology Conceptual Framework (ASCO) and Memorial Sloan Kettering Cancer Center DrugAbacus (MSKCC), using examples in 2L-RCC. **METHODS:** PSE curated oncology database identified six FDA-approved treatments with multiple publications of randomized controlled trials (RCTs) in 2L-RCC: axitinib (AXI), cabozantinib (CAB), everolimus (EVE) lenvatinib+everolimus (LEN+EVE), nivolumab (NIV), sorafenib (SOR). Relevant endpoints from PSE database and 30-day costs derived from GPI pulse (averages sales prices/ wholesaler acquisition costs) were used to calculate ASCO Net Health Benefit (NHB) and MSKCC value price; and compare with NCCN approach. **RESULTS:** There were significant differences in the assessment of value by frameworks. NCCN assigned higher efficacy and safety score to NIV (4/5), while ASCO NHB was the highest for LEN+EVE (66/130). All regimens had the same NCCN affordability score (2/5) despite >3X monthly costs variations. MSKCC does not include combination therapy nor CAB. For the remainder, the MSKCC price fell below the market price only when $150,000/life year was used for pricing. Using a 20% discount for toxicity and a multiplier of 1.5 for other attributes yielded MSKCC price above the market price for all products accept AXI. **CONCLUSIONS:** Although there are common themes among frameworks, heterogeneous methodologies and various data considerations lead to significant variability in value judgement and inconsistent recommendations. Further refinement of each framework is ongoing; however, it is clear that in the dynamic environment where growing evidence may change rapidly, a careful review of such evidence and transparent methodology are important to support clinical decision making.

PCN262

INTERNATIONAL COMPARISON OF HEALTH TECHNOLOGY ASSESSMENT DECISIONS IN PERSONALIZED ONCOLOGY THERAPIES

Ho CY, Gless P, Lawless G
University of Southern California, Los Angeles, CA, USA

OBJECTIVES: To identify the Health Technology Assessment (HTA) decision preferences of targeted therapies across the globe by comparing the decision rates and rationale of government-based HTA between Western and Eastern agencies. **METHODS:** A literature review was conducted to identify decision rates and rationale for targeted cancer therapies from five HTA agencies: NICE in UK, CADTH (pCODR) in Canada, PBAC in Australia, HIRA in South Korea and CDE in Taiwan. This study focused on cancer therapies with biomarkers in the top three cancer types — non-small cell lung cancer (NSCLC), breast, and colorectal cancer (CRC) — based on the GLOBOCAN 2012 report. 17 targeted therapies were selected. Bevacizumab and Alectinib for NSCLC and Ramucirumab for CRC were excluded due to absence of HTA reports in more than three HTA agencies. Consequently, four therapies in breast cancer and five in NSCLC and CRC were reviewed. **RESULTS:** Seventy HTA reports were identified and reviewed. 15 of 70 HTA reports were not available since the assessments were still in progress or have not been published. The positive decision rate for targeted therapies was 67% (n=37) including the conditional positive decision rate of 29% (n=16). Taiwan had the highest positive decision rate, 100% (n=7/7), while NICE was 50% (n=6/12). CRC therapies had the lowest positive decision rate, 52% (n=11/21), while NSCLC had a positive decision rate of 90% (n=18/20). The reasons of negative decisions included the uncertainty of the clinical outcome (n=6), no comparative effectiveness to standard or current therapies (n=5) and insufficient cost-effectiveness (n=10). **CONCLUSIONS:** Based on the selected countries and cancer areas, Asian countries (Korea and Taiwan) were more favorable to targeted therapies than Western countries. CRC and breast cancer had lower positive decision rates compared to general cancer therapy which was 65% and 79% in NICE and CADTH respectively.

PCN263

EVALUATING VALUE BASED FRAMEWORKS IN THE US MARKETPLACE: CHALLENGES IN REAL WORLD APPLICATION

Goble JA[1], Djatche L[2], Chun G[3], Varga S[2]
[1]Baylor Scott & White Health, Temple, TX, USA, [2]Thomas Jefferson University, Philadelphia, PA, USA, [3]Rutgers University, Piscataway, NJ, USA

OBJECTIVES: To compare and contrast value based framework (VBF) applicability in stakeholder decision making and to describe the challenges and limitations associated with real world application of each VBF. **METHODS:** All available VBFs for oncology therapies were used in a test case for refractory or relapsing multiple myeloma (RRMM). Regimens included carfilzomib, elotuzumab, and ixazomib because they share a common comparator in clinical trials, lenalidomide plus dexamethasone. The output of each VBF was computed according to the most recent guidance from each respective organization and differences in output for treatment decision making were reported. Additionally, we reviewed the challenges and limitations associated with running the test case in RRMM for each VBF. **RESULTS:** The ASCO, ICER, and NCCN VBFs suggest carfilzomib may be the most valued treatment option from payer, provider, and patient perspectives. A number of challenges and limitations of VBFs were identified including evidence limited to clinical practice guidelines and clinical trial data. The ASCO VBF had complexities of drug evidence evaluation, difficult interpretation of “good” or “bad” net health benefit, and limitations of drug comparisons within clinical trials. Due to the limited number of drugs in the tool and low interrater reliability of the eight domain inputs, no output from DrugAbacus was available for the test case. The published ICER report lacks continuous updates, and isn’t adjustable to specific populations and clinical applications. Furthermore, it doesn’t incorporate indirect benefits/costs of treatment and doesn’t make clear suggestions for stakeholder use. NCCN scoring is subjectively rated by consulting disease specialist clinicians. The included affordability block doesn’t clarify other factors (e.g., discounts, price adjustments) and doesn’t establish thresholds. **CONCLUSIONS:** Although the test case provided a consensus on treatment decision, there is much nuance and limitations with VBFs available for RRMM. Clearer objectivity and better adaptability to specific treatment decisions is warranted.

PCN264

APPLYING THE ASCO VALUE FRAMEWORK NET HEALTH BENEFIT SCORE (NHB) TO METASTATIC PANCREATIC CANCER (mPA) SOC THERAPIES ESTABLISHING CRITERIA FOR ASSESSING NEW NOVEL TREATMENTS

Proach J[1], Cromer K[1], Dabbous O[2], Muhsin M[2]
[1]Triage HealthCom, LLC, Princeton, NJ, USA, [2]Halozyme Therapeutics, San Diego, CA, USA

OBJECTIVES: Pancreatic cancer is difficult to treat effectively and the optimal first-line treatment has not yet been defined. The objective of this research is to provide benchmark reference for the evaluation of newer therapies. The ASCO Value Framework NHB and the NCCN recommended chemotherapy treatment combinations were utilized to assess the clinical benefit of three treatment regimens. **METHODS:** Phase III RCTs based on the NCCN recommended first line therapies for advanced mPC, were selected for analysis: “MPACT”, GEM + nab-Paclitaxel (GN-P); “ACCORD”, FOLFIRINOX and “NCIC-CTG” GEM + Erlotinib (GEM-E). The ASCO framework was applied to calculate the clinical/toxicity and NHB scores of each regimen. We also calculated the monthly drug cost for each of these standard regimes based on the 2016 Medicare Part B Drug Payment Allowance. **RESULTS:** The NCCN guidelines list all regimes in Category 1 preferred chemotherapy combinations. All regimens delivered an NHB over GEM: FOLFIRINOX 23.1 pts; GN-P 21.4 pts; GEM-ER 18.3pts. The clinical benefit score for each regimen, FOLFIRINOX 41pts, GN-P 28pts and GEM-E 23 pts. The toxicity scores based on adverse events were higher in FOLFIRINOX, GN-P and GEM-E and lower in the GEM group. Bonus points were achieved in FOLFIRINOX, GN-P based on overall survival benefit. The cost of drug treatment per month was significantly higher in each group while GEM was the lowest cost treatment: GEM $278; FOLFIRINOX $2,975; GN-P $11,350; GEM-E $8,320. **CONCLUSIONS:** The ASCO NHB is an attempt to represent therapy value in a single score but can be prejudiced by trial design and treatment cost. The regimens assessed support the NCCN category 1 recommendations for first line mPA treatment. FOLFIRINOX provided the highest NHB and was the least expensive. This assessment provides a reference for stakeholder evaluation and assessment of new therapies and for patient and provider therapy choice decisions.

PCN265

IS NICE BEING NICE IN THEIR RE-EVALUATION OF ONCOLOGY DRUGS IN THE CANCER DRUGS FUND IN ENGLAND?

Foxon G[1], Wolfram V[1], Bailey S[1], Butler E[1], Craddy P[2]
[1]Remap Consulting, Cheshire, UK, [2]Remap Consulting, Zug, Switzerland

OBJECTIVES: Since July 2016, NICE took over responsibility for the Cancer Drugs Fund (CDF) in England, which contained 25 drugs for 35 indications. NICE is currently evaluating all existing treatments in the CDF to determine their cost-effectiveness and if they should be recommended for use by NHS England; retained in the CDF to gather additional evidence or not recommended. This study investigates NICE's evaluation of existing CDF treatments and its potential impact on funding and patient access. **METHODS:** Publicly available data sources were analyzed to determine the outcome of the 35 on-going NICE evaluations for oncology indications previously funded through the CDF. Information was collected on the stage of the evaluation process for each product and the outcome of the NICE assessment (recommended; recommended for use in CDF; not recommended). **RESULTS:** Of the 35 indications, manufacturers agreed to receive transition CDF funding for 34 indications whilst NICE undertakes an evaluation of their treatments. To date, 19 indications have been assessed of which treatments for 12 indications were recommended for NHS use, with seven indications not being recommended. Of the positive recommendations, nine were only recommended on condition of a patient access scheme and four with a restricted patient population. Only one indication was recommended for use within the CDF to generate additional evidence within a two-year deadline. The remaining 15 indications will be reviewed before December 2017. **CONCLUSIONS:** NICE is using cost effectiveness as an assessment criteria for treatments entering the CDF, resulting in limited patient access through removal of some treatments previously funded by the CDF. The removal of treatments for seven indications implies that collation of additional evidence is unlikely to make these treatments cost-effective. Access to the CDF will only occur if there is a realistic chance that additional evidence will reduce the uncertainty of their cost effectiveness.

PCN266

MANUFACTURER REGULATORY SUBMISSION STRATEGIES FOR ONCOLOGY THERAPIES IN THE UNITED STATES AND EUROPEAN UNION, 2012-2016

Madhavan P[1], Jun K[2], Infante K[1], Richardson SK[1]
[1]GfK, New York, NY, USA, [2]GfK Market Access, New York, NY, USA

OBJECTIVES: To investigate regulatory submission strategies employed by manufacturers of anticancer therapies in the US and EU, we sought to identify any discrepancies between the regulatory dossiers submitted to the FDA and EMA for the period of 2012–2016. **METHODS:** A review of all relevant FDA-approved oncology products granted marketing approval between 01/01/2012 and 07/15/2016 was conducted, followed by a cross-check to identify any associated CHMP opinions. In order to capture all potential submission delays across post-2012 FDA and EMA new drug applications, data for supplemental NDAs or BLAs submitted during the same period were also collected and cross-checked against the EMA database. Any FDA/EMA application pair associated with a submission delay of 6 or more months was selected for deep-dive assessment. FDA Summary Review, EPARs, and CHMP opinion summaries were consulted to extract data on sponsor application evidence packages and submission timelines. All data were then cross-examined to identify any variations between corresponding applications across the two regulatory agencies. **RESULTS:** Of unique NDA and BLA approvals granted by the FDA for the period in question, 41 corresponding conditional or positive CHMP recommendations were identified. 32 additional submissions to the EMA were identified as being associated with FDA approvals for follow-on indications. Three new drug and six follow-on indication FDA/EMA pairs were associated with submission delays of greater than 6 months. Of these nine cases, five were found to have substantial differences in the evidence packages submitted to the respective agencies **CONCLUSIONS:** The majority of regulatory submissions for anticancer indications were found to be submitted within similar time frames to both the FDA and EMA. However, the identification of multiple instances of more comprehensive data package submissions to the EMA may allude to potential regulatory strategies utilized by manufacturers to obtain optimal product positioning at launch.

PCN267

COMMUNITY ONCOLOGY PERCEPTION AND PERSPECTIVES ON PATIENT REPORTED OUTCOMES (PROS) AND REAL-WORLD EVIDENCE (RWE) RESEARCH IN THE CONTEMPORARY ERA

Nabhan C, Braverman J, Fillman J, Ernst FR, Feinberg BA
Cardinal Health, Dublin, OH, USA

OBJECTIVES: PROs and RWE research are vital components in patient-centered care. The recently passed Cures-21 bill named both as important parts of new drug approval processes. Views on RWE and RWE research among community oncologists, where patients are seen most, are not well studied. The purpose of this study was to understand clinician perspectives regarding participation in and use of such research. **METHODS:** This descriptive study identified PROs and RWE-related attitudes among 51 community-based US oncologists. Data were collected at a live meeting with audience response technology. **RESULTS:** While only 13% of oncologists were aware of any oncology drug containing PRO claims in its package insert, and only 25% ever considered PROs in prescribing decisions, 80% agreed that the value of PROs increases if cost savings were shown. Only 11% of oncologists have ever participated in PRO-research and 74% stated that identifying patients for such studies is somewhat/very difficult. If patients were identified, 64% of oncologists believed that contacting these patients would not be a barrier. Over 80% of oncologists believed that ≥25% of their patients would participate in PRO research if compensated. Similarly, 70% of oncologists would participate if compensated. Top barriers to participating in PRO research: staffing (64%), education of patients/staff (57%), and technology (53%). Almost all oncologists believed that RWE drives efficiency and improves quality of care, and 46% believed that RWE is very impactful on their clinical-decision making. Most oncologists believed that "decreasing total healthcare expenditures" and "patients' quality of life" are where RWE research impacts oncology care. Barriers to participating in RWE research: logistics (60%), personnel (58%), and finances (52%). Most (72%) favor participating in RWE and PRO research if the process is made seamless for participating practices. **CONCLUSIONS:** Addressing barriers to PROs and RWE research in community oncology is essential moving forward; logistics and finances are major hurdles.

PCN268

COMMUNITY ONCOLOGISTS' PERCEPTION AND UNDERSTANDING OF BIOSIMILARS' ROLE IN ONCOLOGY

Nabhan C[1], Fillman J[1], Ernst FR[2], Feinberg BA[1]
[1]Cardinal Health, Dublin, OH, USA, [2]Cardinal Health, Marietta, GA, USA

OBJECTIVES: Biosimilars are highly similar drugs to innovator biologics and are uniquely regulated by the FDA, different from their reference biologic, small molecules, or generics. In light of these regulatory differences, data are needed to understand prescribers' perceptions and barriers to use. The purpose of this study was to gather and elucidate these perceptions from practicing clinicians. **METHODS:** This descriptive study identified biosimilars-related attitudes among 61 community-based US oncologists of various geography and practice types. Data were collected at a live meeting with audience response technology. **RESULTS:** One quarter of respondents stated lack of familiarity with biosimilars. 46% indicated that additional evidence is needed before prescribing them. 23% admitted no knowledge of regulatory processes while 19% stated that regulatory approval is similar to other anti-neoplastics. 78% believed that efficacy of biosimilars will be comparable to the reference product. 90% did not associate lower costs of biosimilars with lesser efficacy. 51% endorsed reference drug mirror labeling. 45% considered familiarity with the manufacturer as essential. Concerns about potential litigation was raised by less than 20%. 33% would treat biosimilars like generics with automatic substitution while 33% expect internal review. 3% were unwilling to prescribe biosimilars unless mandated by a payer. 57% identified cost reduction by prescribing biosimilars as important. 76% believed an 11-30% discount on reference drug necessary to prescribe biosimilars. Likelihood of prescribing a biosimilar to the following reference drugs was: trastuzumab in breast cancer - adjuvant (39%), metastatic (69%); bevacizumab in metastatic colon cancer (75%); rituximab - chronic lymphocytic leukemia (75%), non-Hodgkin lymphoma (60%) versus their reference biologics. **CONCLUSIONS:** While community oncologists appear receptive to biosimilars and are willing to incorporate them into their daily practice, significant educational gaps exist regarding efficacy and toxicity data, cost, reimbursement, and regulatory processes.

PCN269

INITIAL UPTAKE AND UTILIZATION PATTERNS OF FILGRASTIM-SNDZ, THE FIRST US BIOSIMILAR

Smoyer KE[1], Fitzpatrick T[2], Radtchenko J[3], Feinberg B[3]
[1]Envision Pharma Group, Philadelphia, PA, USA, [2]Envision Pharma Group, Horsham, UK, [3]Cardinal Health, Dublin, OH, USA

OBJECTIVES: The first US biosimilar, filgrastim-sndz (FIL-SNDZ), available since September 2015, is a granulocyte-colony stimulating factor (G-CSF) approved for 5 of 6 filgrastim (FIL) indications. The American Society of Clinical Oncology (ASCO) clinical practice guidelines include FIL-SNDZ among recommended G-CSFs for prevention of treatment-related febrile neutropenia in patients with solid tumors or lymphoma receiving chemotherapy. In January 2017, FIL-SNDZ replaced FIL on the CVS Health formulary. We assessed FIL-SNDZ utilization versus other G-CSFs by quarter (Q) during the first year of FIL-SNDZ availability in the United States. **METHODS:** Patients with claims for FIL-SNDZ, tbo-filgrastim (TBO-FIL), FIL, or pegfilgrastim (PEG); a cancer diagnosis; evidence of antineoplastic therapy; and medical and pharmacy benefits were identified for each Q, October 2015 through September 2016, for fully adjudicated claims. Demographics, plan type, and treatment setting were reported **RESULTS:** In Q4 2015, 5133 patients received a G-CSF: 31 (1%) FIL-SNDZ; 221 (4%) TBO-FIL; 1315 (26%) FIL; and 3739 (73%) PEG. In Q3 2016, among 2371 patients receiving a G-CSF, 107 (5%) received FIL-SNDZ, 46 (2%) TBO-FIL, 508 (21%) FIL, and 1797 (76%) PEG. Patients could have received >1 G-CSF. The top 5 diagnoses for FIL-SNDZ were agranulocytosis, encounter for antineoplastic therapy/other aftercare, breast cancer, leukemia, or multiple myeloma. 41% of FIL-SNDZ patients had a commercial payer, exceeding other G-CSFs: 39% (TBO-FIL), 33% (FIL), and 38% (PEG). Similar to other G-CSFs, outpatient use was most common for FIL-SNDZ (44% of claims), while 23% of FIL-SNDZ claims were covered by pharmacy benefit, the highest among G-CSFs. **CONCLUSIONS:** FIL-SNDZ use increased between Q4 2015 and Q3 2016 at the expense of FIL and TBO-FIL and despite an increase in PEG, based on switching between G-CSFs. FIL-SNDZ adoption commercially and by pharmacy benefit managers was higher compared with other G-CSFs. Further evaluation should assess FIL-SNDZ impact on G-CSF market size.

PCN270
UPTAKE OF THE FIRST US BIOSIMILAR: FILGRASTIM-SNDZ UTILIZATION OBSERVED IN A MEDICAL TRANSCRIPTION DATABASE OF PATIENT OFFICE VISITS
Smoyer KE[1], Ó Hartaigh B[2]
[1]Envision Pharma Group, Philadelphia, PA, USA, [2]Envision Pharma Group, Southport, CT, USA
OBJECTIVES: Since September 2015, filgrastim-sndz (FIL-SNDZ), a biosimilar of filgrastim (FIL), has been available in the United States (US) at approximately a 15% discounted price compared with FIL. FIL-SNDZ is approved for 5 out of 6 FIL indications, and is listed among the recommended granulocyte colony-stimulating factors (G-CSFs) in the American Society of Clinical Oncology (ASCO) clinical practice guidelines for prevention of treatment-related febrile neutropenia in patients with solid tumor or lymphoma receiving chemotherapy. Our objective was to identify physician documentation and utilization of FIL-SNDZ during patient office visits, and compare FIL-SNDZ use with other G-CSFs. **METHODS:** Physician records were extracted from January 1, 2016 through December 31, 2016 from RealHealthData, a US nationwide medical transcription database providing data within 72 hours of each patient visit to a participating provider. Records were searched for mention of FIL-SNDZ, tbo-filgrastim (TBO-FIL), FIL, and pegfilgrastim (PEG), then counts were tabulated to identify the most common location (US state) and medical specialty of the providers. Counts will be refreshed in May 2017. **RESULTS:** Counts of each mentioned G-CSF, unique patients, and most frequent provider type and state were: FIL-SNDZ: 72 (33 patients), general practitioner, Kansas; TBO-FIL: 1136 (420 patients), multispecialty, Texas; FIL: 4149 (2347 patients), general practitioner, Texas; PEG: 6496 (3391 patients), general practitioner, Pennsylvania. Most G-CSF mentions originated from general practitioners in Texas, Pennsylvania, and Virginia. **CONCLUSIONS:** Among 11,853 records reporting a G-CSF, only 72 mentions (0.6%) of FIL-SNDZ occurred in the 15 months since entry into the US marketplace. Although provider type was similar, the current data underline the geographic disparity in utilization of FIL-SNDZ from that of other G-CSFs. The May 2017 update will confirm whether FIL-SNDZ utilization has increased, as is anticipated with growing awareness and understanding of biosimilars among US clinicians and payers.

PCN271
USE OF DIETARY SUPPLEMENTS AND CANCER FATALISTIC BELIEFS AMONG AMERICANS
Lakkad M, Bhandari NR, Payakachat N
University of Arkansas for Medical Sciences College of Pharmacy, Little Rock, AR, USA
OBJECTIVES: To explore associations between fatalistic beliefs about cancer and self-reported use of dietary supplements (DS). **METHODS:** A cross-sectional study among American adults was conducted using Health Information National Trends Survey-Food and Drug Administration 2015 data. Primary outcome was DS usage (yes/no) in the past 12 months. Five fatalistic belief (agreement or disagreement) statements including DS prevent cancer, DS treat cancer, behavior/lifestyle causes cancer, everything causes cancer, and cancer prevention not possible were used to explore associations with DS usage. Weighted bivariate descriptive analysis to compare sociodemographics between users/non-users of DS, and adjusted multivariate logistic regression analysis were conducted to examine the associations. **RESULTS:** 2,938 (78.6%) reported using DS (either multivitamins or single vitamin or herbal supplements). Higher proportions of DS users were older age groups, females, married, higher education, former smokers, and higher income. Compared to DS users, a majority of non-DS users disagreed that DS could help prevent or treat cancers. Compared to non-DS users, a majority of DS users agreed that behavior/lifestyle causes cancer as well as everything causes cancer. However, they disagreed that "there's not much you can do to lower your chances of getting cancer." Participants who agreed that "all or some cancers could be avoided through DS" were 100% more likely to use DS (Adj.OR:2.00, 95%CI:1.39-2.89), compared to those who disagreed. Participants who perceived that "all or some cancers could be treated through DS" were 90% more likely to use DS (Adj. OR: 1.90, 95%CI: 1.37-2.63), compared to those who thought otherwise. There were no significant associations between other fatalistic beliefs and use of DS. **CONCLUSIONS:** The use of DS is predominantly affected by the perceived belief that cancer can be avoided or treated through DS. These positive findings highlight the need for research in exploring the roles of DS in cancer prevention and treatment.

PCN272
COMMUNITY ONCOLOGISTS' PERCEPTION AND ADAPTABILITY TO EMERGING CAR-T THERAPIES
Nabhan C, Feinberg BA, Ernst FR, Fillman J
Cardinal Health, Dublin, OH, USA
OBJECTIVES: Chimeric Antigen Receptors of T cells (CAR-T) are emerging cellular-based therapies with remarkable responses in several hematologic malignancies and solid tumors. Regulatory approval of this technology is expected in less than 12 months. Little is known about barriers to market penetration, oncologists' acceptance, and forecasted use within current patterns of care. The purpose of this study was to understand clinician perspectives regarding these barriers. **METHODS:** This descriptive study identified CAR-T-related attitudes among 87 community-based US oncologists of various geography and practice types. Data were collected at two live meetings with audience response technology. **RESULTS:** Regarding personal experience: 20% referred at least one patient in the preceding 12 months for a clinical trial. Impressions of CAR-T were highly variable: 33% believed it a game changer, 23% another anti-cancer option, 21% similar to other immuno-oncology (i.e. anti PD-1 and PDL-1) and 33% lacked familiarity. Likelihood of prescribing CAR-T: 63% said limited to hematologic malignancies, 50% believed <10% patients eligible, while 20% didn't foresee any potential patient. The top 5 cited barriers to use: logistics (72%), cost (35%), toxicity (35%), clinical trial eligibility criteria (22%), and lack of efficacy (17%). Regarding site of care 43% plan to refer all eligible patients to academic institutions, 26% plan on referring some, and 30% anticipated treating their patients locally at their own centers. **CONCLUSIONS:** Many community oncologists believe that CAR-T therapy is a game changer. Many perceive logistics, toxicity, and cost as major barriers. The fact that nearly one third expect to personally administer CAR-T exposes a significant education gap regarding the complexity of therapy. Comprehensive education initiatives for community oncologists and scalability of this technology are needed to optimize referral channels which will be essential to wider market adaptability once CAR-Ts are approved for adult malignancy.

PCN273
PATIENT-LEVEL PREDICTORS OF RECEIPT OF WRITTEN CANCER SURVIVORSHIP PLAN: AN ANALYSIS OF THE NATIONAL HEALTH INTERVIEW SURVEY
Hinyard L, Wirth LS
Saint Louis University Center for Health Outcomes Research (SLUCOR), Saint Louis, MO, USA
OBJECTIVES: Provision of written survivorship care plans for cancer survivors is lower than desired. The purpose of this study was to investigate patient-level predictors of receipt of written documentation of advice for follow up care or documentation of all cancer treatments. **METHODS:** Adults aged 18+ years with a history of cancer were identified from the 2010 National Health Interview Survey. Patients currently receiving cancer treatment and those who were diagnosed with cancer prior to age 18 were excluded (final sample 2,329). Logistic regression was used to assess the association of individual level predictors with two primary outcome variables: receiving advice from a health care professional about routine cancer check-ups after completing cancer treatment in a written format (WA) (n=1327) and receiving a written documentation of all cancer treatments (WTx) (n=1783). All analyses were weighted to account for the sampling scheme. **RESULTS:** After adjusting for all other variables, older age and being male were associated with lower odds of receiving a WTx (OR = 0.98, 95% CI 0.98-0.99 and OR = 0.67, 95% CI 0.52-0.86, respectively). Hispanics and non-Hispanic Blacks were 2.24 (95% 1.40-3.59) and 2.40 (95 CI 1.60-3.60) times more likely to receive a WTx compared to non-Hispanic Whites, and survivors who participated in counseling or a support group were 1.78 (95% CI: 1.23-2.58) times more likely to receive WTx compared to those who did not. Compared to non-Hispanic Whites, non-Hispanic Blacks were 2.17 (95% CI 1.29-3.66) times more likely to receive WA. Survivors who participated in counseling or a support group were 1.82 (95% CI 1.21-2.75) times more likely to receive WA. **CONCLUSIONS:** Age, sex, race, and participation in counseling or support groups are all associated with receipt of written advice and/or written statements of treatment received. Future work should investigate provider-level factors and the patient-provider relationship.

PCN274
PRECISE PROGNOSIS, KEY TO END-OF-LIFE PLANNING AND REACHING MEDICARE QUALITY MEASURES; HOW THE VERISTRAT TEST CAN HELP
Arnaud A
Biodesix, Boulder, CO, USA
OBJECTIVES: The 2015 Medicare Access and CHIP Re-authorization Act (MACRA) will base physician payments on quality-of-care. This system will rely on specific outcomes and patient metrics to assign a composite performance score; however, there are inherent challenges to measuring and improving upon that score. Here, we reviewed the current standing of oncology end-of-life care, and how VeriStrat® testing and other tools can help physicians improve quality care at end-of-life. **METHODS:** This study was conducted through a systematic literature review of clinical trials, survey-based studies, medical practice guidelines and reports on the following oncology topics: Establishing prognosis (including advanced diagnostic laboratory tests), referral to hospice or best-supportive care, and patient quality-of-life. **RESULTS:** The review of Merit-based Incentive Payment System (MIPS) and Oncology Care Model (OCM) Quality measures identified specific quality metrics related to end-of life care for oncology patients -overtreatment at end-of life, late or no hospice referral, and hospital admissions- and underscored the importance of establishing and communicating prognosis. When informed of poor prognosis, patients and physicians were less likely to select aggressive treatments, more likely to engage in early palliative care and focus on comfort, all of which are correlated with decreased hospital admissions and improved quality-of-life. While knowing a patient's prognosis is crucial, studies consistently demonstrate the difficulties of establishing prognosis through clinical factors (tumor stage, performance status). The collective literature shows advanced diagnostic laboratory tests such as the blood-based VeriStrat test (prognostic for survival outcomes in NSCLC patients across treatments) help establish prognosis and guides treatment decisions and referrals to hospice for patients with poor prognosis. **CONCLUSIONS:** Knowledge and communication of prognosis is central to planning end-of life care and optimizing patient quality-of-life. By combining prognostic testing and clinical factors, physicians and practices can optimize end-of-life care and measurement and improvement of composite performance score.

PCN275
ADHERENCE TO 'CHOOSING WISELY' RECOMMENDATIONS FOR RADIATION THERAPY IN A COMMERCIALLY INUSRED LOW-RISK ENDOMETRIAL CANCER POPULATION
Roth JA[1], McDougall J[2], Halasz L[3], Fedorenko CR[1], Sun Q[1], Goulart B[1], Patel S[3]
[1]Fred Hutchinson Cancer Research Center, Seattle, WA, USA, [2]University of New Mexico, Albuquerque, NM, USA, [3]University of Washington, Seattle, WA, USA
OBJECTIVES: The American Society for Radiation Oncology (ASTRO) 'Choosing Wisely' (CW) recommendations note radiation interventions lacking evidence of

benefit in cancer care. This study characterizes adherence to the 2014 CW recommendation to 'not recommend radiation following hysterectomy in low-risk endometrial cancer' (Stage I, Grade 1-2) using a novel linkage between the Western Washington Cancer Surveillance System (CSS) and claims from two large commercial insurance plans. No studies have previously evaluated adherence to this CW recommendation in a commercial insurance setting. **METHODS:** CSS records for patients with first primary diagnosis of Stage I (Grade 1-2) endometrial cancer (2008-2015) were linked with Premera Blue Cross and Regence Blue Shield claims. Included cases had coverage for ≥12-months before/after diagnosis and hysterectomy 1 month before to 4 months after diagnosis. We used generalized estimating equations (GEE) clustered by institution to evaluate associations between demographic (age, race) and tumor characteristics (grade, dx year) and receipt of radiation therapy within 1 year of diagnosis. **RESULTS:** Among 2,227 identified endometrial cancer patients, 514 were Stage I & Grade 1/2, and 112 met all inclusion criteria. Mean age was 59.8, 91.9% were white, and 67.0% were Grade 1. Overall, 12.5% were non-adherent. Non-adherence was 10.7% in Grade 1, 16.2% in Grade 2, and was highest (15.8%) after the ASTRO CW recommendation (2014-2015). Most non-adherent cases (78.6%) received brachytherapy. In multivariate analyses, only age in years (continuous) was associated with non-adherence (Odds Ratio=1.05, p=0.01). **CONCLUSIONS:** More than 12% of low-risk endometrial cancer cases in our sample were non-adherent to ASTRO CW recommendations. Surprisingly, non-adherence was highest in the time after the ASTRO CW recommendation (2014-2015). This is an important finding because non-adherence may result in side effects and/or substantial cost without commensurate clinical benefit. Future studies should evaluate non-adherence in other regions and patient populations and evaluate strategies to curb overuse.

PCN276

SOMATOSTATIN ANALOG (SSA) DOSE ESCALATIONS AMONG PATIENTS WITH METASTATIC GASTROENTEROPANCREATIC NEUROENDOCRINE TUMORS (GEP-NET) TREATED AT A TERTIARY REFERRAL CENTER

Jalbert JJ[1], Casciano R[1], Meng J[2], Dutton T[3], Brais LK[3], Pulgar SJ[4], Berthon A[5], Gabriel S[5], Dinet J[5], Kulke MH[3]

[1]*LASER Analytica, New York, NY, USA,* [2]*LASER Analytica, Lorrach, Germany,* [3]*Dana-Farber Cancer Institute, Boston, MA, USA,* [4]*Ipsen Biopharmaceuticals Inc, Basking Ridge, NJ, USA,* [5]*Ipsen Pharma SAS, Boulogne-Billancourt, France*

OBJECTIVES: To describe the frequency and nature of SSA dose escalations among patients with advanced GEP-NET treated at a tertiary referral center. **METHODS:** We conducted a cohort study of patients with GEP-NET recruited between June 2003 and May 2015 from Dana-Farber Cancer Institute's (DFCI) and Brigham and Women's gastrointestinal clinics, by linking an institutional research database to DFCI's outpatient pharmacy dispensation data. Eligible patients had well-differentiated, metastatic GEP-NET and were seen ≥2 at DFCI. Dispensation frequency was categorized into weeks (dispensations +/-3 days considered part of the same week) and monthly SSA dosing regimens were derived. Dose escalations were defined as ≥2 increases in monthly SSA dosing regimens compared to last 2 SSA monthly regimens. Exposure gaps were dispensations separated by >6 weeks, with dosing regimens before and after the gap considered separately. **RESULTS:** Among 682 patients (mean age [SD]: 58.5 [11.9], 50.1% male, 96.5% white, 44.9% midgut NET, 28.7% pancreatic NET, 26.4% other NET, 38.9% with carcinoid symptoms at baseline, and 62.6% with <1 year since metastatic GEP-NET diagnosis), 341 patients had >1 octreotide (long-acting release) LAR dispensation at DFCI's pharmacy. No lanreotide dispensations were observed as lanreotide was not on formulary during the study period. Over 3.5 patient-years of octreotide LAR exposure, we observed 472 dose escalations among 213/341 (62.5%) patients (range: 1-9). Octreotide LAR dose escalations comprised increases in dose, increases in dispensation frequency, or both in 42.8%, 53.0%, and 4.2% of cases, respectively. The frequency of the most common dose escalations for derived monthly octreotide LAR regimens was 20.8% for 20 to 30 mg, 13.6% for 30 to 40 mg, and 13.1% for 40 to 53 mg (i.e. 40 mg/3 weeks). **CONCLUSIONS:** Octreotide LAR dose escalations in the treatment of metastatic GEP-NET were common and may reflect an increased need for symptom control over the disease course.

PCN277

BEYOND HYPOMETHYLATING AGENTS (HMAS): TREATMENT OF PATIENTS WITH HIGHER-RISK MYELODYSPLASTIC SYNDROMES (HR-MDS) AFTER FIRST-LINE THERAPY (1LT) USING A UNITED STATES (US) ELECTRONIC MEDICAL RECORD (EMR)

Bell J[1], Galaznik A[1], Farrelly E[2], Blazer M[2], Seal B[1], Ogbonnaya A[3], Eaddy M[2], Fram R[1], Faller D[1]

[1]*Millennium Pharmaceuticals, Inc., a wholly owned subsidiary of Takeda Pharmaceutical Company Limited, Cambridge, MA, USA,* [2]*Xcenda LLC, Palm Harbor, FL, USA,* [3]*Xcenda, LLC, Scientific Consulting, Palm Harbor, FL, USA*

OBJECTIVES: MDS encompasses multiple, rare hematological stem cell disorders resulting in cytopenias and disease-related complications/deaths. Overall of the two HMAs approved, only azacitidine has been shown to impact survival; no approved therapies exist post 1LT progression. We examined treatment patterns after ending 1LT in HR-MDS patients in routine care. **METHODS:** Adult HR-MDS patients initiating 1LT (1/1/2008 - 7/31/2015) were identified from a large US EMR database. As complete cytogenetics were unavailable, HR-MDS was based on: International Classification of Diseases (ICD) coding of HR-MDS (with ³1 HR-MDS code [ICD-9 code: 238.73; ICD-10 codes: D46.20, D46.21, D46.22]) or HR-MDS algorithm based on Revised International Prognostic Scoring System. 1LT was defined as MDS-specific treatment (MDS-Tx) initiated after the first HR-MDS claim; the addition/substitution of an MDS-Tx >28 days post 1LT triggered second-line therapy (2LT). MDS-directed supportive care (MDS-SC) included erythrocyte or platelet transfusions, erythropoietic-, and granulocyte-stimulating agents. Patients were followed until death, progression to acute myeloid leukemia (AML), loss to follow-up, or end of study. **RESULTS:** 218 HR-MDS patients initiating 1LT were identified with HMAs (azacitidine [63.3%]; decitabine [24.8%]) predominating. Post 1LT, 30 patients (13.8%) received MDS-Tx +/- MDS-SC; 56 patients (25.7%) received MDS-SC alone. Most common MDS-Txs in 2LT were HMAs (decitabine [30.0%] and azacitidine [23.3%]), followed by lenalidomide ± an HMA (23.3%) and antimetabolite chemotherapy (23.3%). Post 1LT, 33.5%, 9.6%, and 9.6% received transfusions, erythropoietic-, and granulocyte-stimulating agents, respectively. Death (33.5%) and progression to AML (22.5%) were the main outcomes post-1LT in patients not initiating MDS-Tx in 2LT. **CONCLUSIONS:** A majority of HR-MDS patients in routine care do not receive 2LT with an MDS-Tx. Of those who receive MDS-Tx, HMAs remain the predominate choice. MDS-SC post 1LT progression is still utilized in most patients. Outcomes in patients not initiating 2LT are poor, highlighting the need for additional treatment options.

PCN278

SIGNIFICANT VARIATION IN FIRST-LINE TREATMENT DURATION AMONG PATIENTS WITH METASTATIC COLORECTAL CANCER (MCRC) TREATED IN THE COMMUNITY SETTING

Klink AJ, Nabhan C, Ernst FR, Feinberg BA

Cardinal Health, Dublin, OH, USA

OBJECTIVES: Overall survival (OS) has significantly improved over the last decade for patients with metastatic colorectal cancer (mCRC) due to advances in systemic chemotherapy, targeted agents, and supportive care. Duration and sequencing of therapies have correlated with OS. We aimed to describe duration of first line (1L) treatment among patients with mCRC in the community setting. **METHODS:** Patients with mCRC diagnosed from 2012–2014 (ICD-9 codes 153.x, 154.0x, or 154.1x and 197.x–198.x) were identified from a US healthcare claims database consisting of 129 million unique covered patient lives. Patients were classified into treatment groups based on 1L treatment received. Treatment duration (TD) was defined as time from initiation to 30 days prior to initiation of 2L or end of follow-up and calculated by Kaplan-Meier estimator (median and 95% CI). Log-rank test assessed equality of survivor functions (i.e., time to 1L discontinuation). **RESULTS:** There were 4,527 mCRC patients identified (mean age at diagnosis, 61.2 years; 54% male) who initiated 1L therapy. On average (mean, SD), patients were followed for 12.8 months (8.47 months) after diagnosis. Median 1L TD was 211 days (95% CI: 204 days, 221 days) across all treatments. The longest 1L median TD was 250 days (95% CI: 239 days, 262 days) among those treated with a biologic + fluoropyrimidine (FP) + chemotherapy, followed by 217 days (95% CI: 202 days, 237 days) among those treated with FP + chemotherapy, followed by 178 days (95% CI: 148 days, 280 days) among those treated with biologic + FP, and 141 days (95% CI: 133 days, 151 days) among those treated with FP monotherapy (p<0.0001). **CONCLUSIONS:** These real world data show significant variability in the duration of 1L treatments among patients with mCRC. The choice of 1L therapy may have an impact on the time to treatment discontinuation.

PCN279

RETROSPECTIVE REVIEW OF ORAL CANCER PATIENTS IN INDIA: ANALYSIS OF PATIENT CHARACTERISTICS AND TREATMENT METHODS

Abraham PS, Greene M

MCPHS University, Boston, MA, USA

OBJECTIVES: To review the patient characteristics and treatment methods of oral cancer patients at a tertiary hospital in India. **METHODS:** This study was a retrospective review of electronic medical records from a tertiary care hospital in Mumbai, India. Patients ≥18 years of age hospitalized for oral cancer treatment between Jan 2014 and May 2015 were included in the study. Descriptive and inferential statistics were used to analyze and compare differences between patients. **RESULTS:** A total of 132 patients met the study criteria. Of these, 108 patients were in the age group of 18 to 64 years. The mean age for all the oral cancer patients was 51.81+12.20 years. The mean age was lowest for patients with no insurance (NI) while highest for patients with CGHS (CGHS=66.60+7.16 years, PI=61+9.89 years, RGJAY=51.39+12.43 years, NI=49.40+9.53 years). The majority of the patients (n=106, 80.3%) underwent a surgical procedure during their stay. The majority of the patients were subscribed to RGJAY payer scheme (RGJAY=105, 79.5%; NI=20, 15.2%; CGHS=5, 3.8%; PI=2, 1.5%). Abnormal growth was the most common reason for admission into the hospital (n=80, 60.6%). 21 (15.9%) patients with hypertension and 18 (13.6%) patients with diabetes were reported as major comorbidities during hospitalization. The majority of the patients had stage 3 or 4 oral cancer (99, 75.0%), while 30 (22.7%) patients had stage 1 or 2 oral cancer and 3 (2.3%) patients had stage 0 oral cancer. Of the total 106 patients that had surgery, majority of them (n=50) underwent a modified radical neck dissection (MRND) or a combined mandibulectomy and neck dissection operation (n=30). **CONCLUSIONS:** Majority of the oral cancer patients were diagnosed during the advanced stages of the disease and were subscribed to RGJAY scheme. The common reason for hospital admission was abnormal growth and the common procedure patients underwent was MRND.

PCN280

REAL-WORLD TREATMENT PATTERNS AMONG PATIENTS WITH SQUAMOUS CELL CARCINOMA OF THE HEAD AND NECK (SCCHN) IN CANADA

Byrne K[1], Hallworth P[1], Tahami Monafred AA[2], Moshyk A[2], Shaw JW[2]

[1]*Adelphi Real World, Bollington, UK,* [2]*Bristol-Myers Squibb, Princeton, NJ, USA*

OBJECTIVES: Real-world treatment patterns in patients with SCCHN are largely unknown. In light of emerging therapies, our objective was to elucidate real-world

patterns of drug treatment for SCCHN in Canada. **METHODS:** Real-world data were collected through a cross-sectional survey administered to oncologists across Canada between May and July 2016. Physicians provided data regarding disease history, characteristics, and treatment patterns for 6–8 consecutive patients receiving drug treatment for SCCHN. **RESULTS:** Sixteen physicians provided data on 109 patients receiving first- or second-line drug treatment for SCCHN. The mean (SD) age was 61.8 (8.7) years; 24% were current smokers with a mean (SD) exposure of 26.2 (12.7) pack-years, and 66% were former smokers. The most common primary tumor site was oropharynx (48%); 66% of patients had stage IV cancer; 75% of patients had received radiotherapy, and 32% had undergone surgery. Most patients (83%) received a platinum-based regimen as first-line treatment, with 44% receiving cisplatin monotherapy. Use of cetuximab-based regimens as first-line treatment was limited (17%). Among 53 patients receiving second-line treatment, platinum-based regimen use was markedly lower (13%) than in first-line. The most common second-line regimens included cetuximab (44%), docetaxel (13%), paclitaxel (13%), and methotrexate (8%) monotherapies. A median (interquartile range [IQR]) of 49 (19-149) days between the end of first-line and the beginning of second-line treatment was reported. Among patients receiving second-line treatment, 87% had received a first-line platinum-based regimen. Nearly half (46%) of previously platinum-treated patients received cetuximab monotherapy as second-line treatment, whereas 13% received docetaxel monotherapy, 9% methotrexate monotherapy, and 9% another platinum-based regimen. Patients treated with a first-line platinum-based regimen who progressed to second-line had a median (IQR) of 55 (20-146) days between treatment lines. **CONCLUSIONS:** Real-world data on the treatment of SCCHN in Canada showed high use of platinum-based regimens as first-line. Second-line treatment patterns varied, although cetuximab use was prevalent.

PCN281

PREDICTING TREATMENT STRATEGIES FOR ACUTE MYELOID LEUKEMIA ACROSS THE UNITED STATES, WESTERN EUROPE, AND JAPAN

Higginbottom K[1], DiBonaventura M[2], Ilacqua J[1]
[1]Ipsos Healthcare, Mahwah, NJ, USA, [2]Ipsos Healthcare, New York, NY, USA

OBJECTIVES: National Comprehensive Cancer Network (NCCN) guidelines recommend different treatment strategies for the treatment of acute myeloid leukemia (AML) based on patient age. Patients younger than 60 years are recommended to receive a standard (or high) dose of a cytarabine-based regimen whereas patients older than 60 years are recommended to receive a standard dose of cytarabine or lower intensity therapy (i.e., low dose cytarabine or hypomethylating agents [HMAs]). This study examined how these treatment strategies were implemented in the real world and across various regions. **METHODS:** A retrospective chart review of patients with AML was conducted by physicians in the US, 5EU (France, Germany, Italy, Spain, UK), and Japan between Q4 2015 and Q3 2016. Physicians randomly selected patient charts and abstracted data on patient demographics, disease history, and treatment patterns. Only adult AML patients with complete dosing information who were using cytarabine or HMA agents were included (N=1,037; US: N=106, 5EU: N=490, Japan: N=441). **RESULTS:** The mean age of the sample was 59.7 years (SD=14.9); 59.8% were male. 32.6% of patients were using high dose cytarabine (>220 mg/m2), 20.5% were using standard dose cytarabine (>89 to ≤220 mg/m2), 10.0% were using low-dose cytarabine (≤89 mg/m2), and 36.8% were using HMAs. The strongest predictors of high dose cytarabine relative to low dose cytarabine were lower ECOG scores (e.g., 0 vs. 3; (odds ratio [OR] = 8.36), age<60 (OR=6.48), and being treated in an academic center (OR=1.96) (all $p<.05$). Similarly, the strongest predictors of high dose cytarabine relative to HMAs were being treated in an academic center (OR=6.22), age<60 (OR=3.62), fewer comorbidities (OR=0.72), and lower ECOG scores. **CONCLUSIONS:** Consistent with NCCN guidelines, age was a strong predictor of high dose cytarabine use relative to other, less intensive therapy options. However, ECOG scores, comorbidities, and setting also played an important role.

PCN282

IMPUTATION OF PERFORMANCE STATUS FROM A CLAIMS-BASED MODEL TO EVALUATE FIRST-LINE THERAPY GUIDELINE COMPLIANCE IN METASTATIC NON-SMALL CELL LUNG CANCER

Casebeer AW[1], Drzayich Antol D[1], Hopson S[1], Li Y[2], DeClue RW[1], Khoury R[3], Parikh A[3], Michael T[3], Sehman M[4], Stemkowski S[1], Bunce M[3]
[1]Humana, Inc., Louisville, VA, USA, [2]Comprehensive Health Insights, Inc., Louisville, KY, USA, [3]Genentech, South San Francisco, CA, USA, [4]Humana Inc., Fountain Hills, AZ, USA

OBJECTIVES: Guideline recommendations for first-line non-small cell lung cancer (NSCLC) therapy are partially based upon physician-reported performance status (PS). Lack of PS in claims data limits evaluation of guideline recommended initiation (GRI) of therapy. This study adapted a previously validated claims-based algorithm for PS to assess GRI. **METHODS:** Patients with metastatic NSCLC and Medicare coverage were identified from Humana medical claims and 2013-2014 treatment preauthorizations for infusion therapy. Index was the first infusion date. PS was imputed from a classification model using procedure, diagnosis and durable medical equipment codes one year pre-index. The model predicted poor (PS=3-4) vs good/moderate PS (PS=0-2). Moderate PS (PS=2) was estimated using the top quintile of good/moderate PS. Six-month post-index mortality and hospice status validated PS cut-points. GRI was >1 cycle of National Comprehensive Cancer Network recommended first-line therapy based on age and PS or targeted therapies regardless of age and PS. Significance was from Chi-square and t-tests. **RESULTS:** For 1,353 eligible patients with metastatic NSCLC, mean (SD) age was 71.4 (6.6), 45.9% were female. After applying the PS algorithm, 75.8% had good, 18.8% had moderate and 5.4% had poor PS. Mean Deyo-Charlson Comorbidity score was 7.98 (3.3) with no difference by PS. Six-month mortality was 25.7% for good, 33.7% for moderate and 48.4% for poor PS (p=0.015). Hospice was initiated by 8.0% of patients with good PS, 10.5% with moderate PS and 25.8% with poor PS (p=0.0163). GRI was observed in 88.1% of patients with good PS, 11.6% with moderate PS, and 5.1% with poor PS ($p<0.0001$). **CONCLUSIONS:** Determining PS from claims data allows assessment of GRI of first-line therapy for metastatic NSCLC. Increased rates of mortality and hospice with worsening PS suggests that cut-points used to distinguish poor, moderate and good levels of PS may offer discrimination of PS categories and determination of GRI from claims data.

PCN283

PREDICTING WATCHFUL WAITING AMONG PATIENTS WITH MULTIPLE MYELOMA IN THE UNITED STATES AND WESTERN EUROPE

Higginbottom K[1], DiBonaventura M[2], Ilacqua J[1]
[1]Ipsos Healthcare, Mahwah, NJ, USA, [2]Ipsos Healthcare, New York, NY, USA

OBJECTIVES: Although there are a number of treatments available for patients with multiple myeloma (MM), a "watchful waiting" approach can often be used among patients who are asymptomatic. This study sought to understand the frequency of "watchful waiting" across regions and identify the strongest predictors of this strategy. **METHODS:** A retrospective chart review of patients with MM was conducted by physicians in the United States (N=6,085) and 5EU (France, Germany, Italy, Spain, UK; N=4,379) between Q4 2015 and Q3 2016. Physicians randomly selected patient charts and abstracted data on patient demographics and disease and treatment history. Only patients with complete watchful waiting information were included. Regression models predicted watchful waiting and time spent waiting from available patient and physician variables. **RESULTS:** A total of 8,798 patients were included (mean age =68.7 years [SD=9.4], 58.2% male). "Watchful waiting" was significantly more common in the 5EU (11.4%) than in the US (5.4%) ($p<.05$). The strongest predictors of engaging in a "watchful waiting" period was being in Spain ((odds ratio [OR] = 9.63), being in Germany (OR = 9.40), being treated by an internist (OR = 4.43), being male (OR = 1.19), having a low risk stratification (OR = 1.21), being older (OR = 1.02), and being a non-smoker (OR = 1.51) (all $p<.05$). Similar factors were associated with length of watchful waiting (mean = 20.5 months, median = 12.0 months). However, although being treated by a hematologist or hematologist/oncologist were not associated with an increased likelihood of "watchful waiting" they were both associated with a longer period if it did occur (bs = 1.32 and 0.55, respectively; $ps<.05$). **CONCLUSIONS:** "Watchful waiting" was relatively uncommon in the study sample, though more common in Western Europe than in the US. Specific countries, notably Germany and Spain, were the strongest predictors though other physician and patient level factors contributed.

PCN284

EVALUTION OF TREATMENT PATTERNS AMONG PATIENTS WITH DIFFUSE LARGE B-CELL LYMPHOMA (DLBCL)

Galaznik A[1], Bell J[1], Seal B[1], Ogbonnaya A[2], Hennenfent K[3], Hamilton L[3], Eaddy M[3]
[1]Millennium Pharmaceuticals, Inc., a wholly owned subsidiary of Takeda Pharmaceutical Company Limited, Cambridge, MA, USA, [2]Xcenda, LLC, Scientific Consulting, Palm Harbor, FL, USA, [3]Xcenda LLC, Palm Harbor, FL, USA

OBJECTIVES: Treatment guidelines for DLBCL recommend a combination of chemotherapy agents with rituximab in first-line therapy (1LT). For patients with refractory/relapsed disease, high-dose chemotherapy with stem cell transplant, combination chemotherapy, or single-agent rituximab are considered. This study assessed real-world DLBCL treatment patterns as compared to guideline recommendations. **METHODS:** Patients newly diagnosed with DLBCL were identified between 01/01/08 and 08/31/15 within the Humedica electronic medical record (EMR). The first DLBCL diagnosis date served as the index date. Patients were required to have 12 months of continuous activity in the EMR before the index date, and were followed from index until end of continuous activity, death, or end of study period. DLBCL treatment patterns were assessed during follow-up. **RESULTS:** Of 2,657 patients meeting the inclusion criteria, 1,436 (54%) had evidence of initiating 1LT; median (IQR) time to therapy was 0.5 (0.2–0.9) months. Combination chemotherapy was most common in 1LT (92.1% vs 7.9% single-agent), with rituximab-based therapies dominating ([R-CHOP], 58.3%). Rituximab monotherapy comprised ~80% (6.1%) of single-agent use in 1LT. Median duration of 1LT was 4.2 (2.2–4.5) months; 164 patients received second-line therapy (2LT); 29.3% received a single-agent, and 70.7% received combination chemotherapy. 25% of 2LT received stem cell transplant. In 2LT, rituximab (10.4%) remained the top single-agent, while bendamustine+rituximab (11.6%) was the most common combination therapy. Median duration of 2LT was 2.3 (0.8–4.8) months. 24 patients received third-line therapy (3LT); 62.5% received a single-agent, while 37.5% received combination chemotherapy. In 3LT, lenalidomide (29.2%) was the most common single-agent; bendamustine+rituximab (20.8%) remained the most common combination therapy. Median duration of 3LT was 3.4 (0.9–5.2) months. **CONCLUSIONS:** Consistent with guidelines, most first-line DLBCL patients received rituximab-based combinations. A small subset received 1LT monotherapy, which increased during subsequent lines of therapy, with rituximab as the most common 1LT and 2LTmonotherapy.

PCN285

TREATMENT AND OUTCOMES IN RECURRENT/METASTATIC SQUAMOUS CELL CARCINOMA OF THE HEAD AND NECK: A CHART REVIEW STUDY IN FRANCE

Cotte F[1], Shaw JW[1], Juarez Garcia A[1], Harshaw Q[2], Macahilig C[3], Shillington AC[2]
[1]Bristol-Myers Squibb, Princeton, NJ, USA, [2]EPI-Q Inc., Oak Brook, IL, USA, [3]Medical Data Analytics, Parsippany, NJ, USA

OBJECTIVES: Real-world treatment and outcomes in patients with recurrent or metastatic (R/M) squamous cell carcinoma of the head and neck (SCCHN) after

platinum therapy are largely unknown. In light of emerging therapies, a retrospective chart review was conducted in France to characterize the experiences of patients with R/M SCCHN who have been previously treated with a platinum-based regimen. **METHODS:** Real-world data were collected through a chart review. Included were patients randomly selected from all adults aged ≥18 years diagnosed with SCCHN at treating sites between January 1, 2013 and June 30, 2014 to meet an a priori sample-size calculation. Patients were followed through August 20, 2016 or until death. Clinical trial participants were excluded. Demographics and treatment data were analyzed descriptively. Overall survival (OS) was quantified using Kaplan-Meier analysis censoring for date of chart abstraction in surviving patients. **RESULTS:** Twenty-three oncologists contributed data for a random selection of 204 patients; 86% were men and 97% were current or former tobacco users. The mean (SD) age was 63 (10.5) years at initial R/M SCCHN diagnosis. Most patients (89%) were treated first-line with a platinum-based regimen, and 117 (65%) of these patients progressed to second-line treatment. Second-line treatment among these 117 patients consisted largely of monotherapy with a taxane (33%), cetuximab (21%), or methotrexate (12%) irrespective of disease stage (ie, IVC vs non-IVC), and 98 (84%) patients were identified as being second-line platinum-refractory (ie, did not receive second-line platinum). Among those receiving second-line treatment, median OS from first-line initiation was 14.6 (95% CI: 13.0, 16.3) months. **CONCLUSIONS:** More than half of the patients in this chart review received second-line treatment following first-line platinum-based therapy, but median survival remained well under 1.5 years. This study highlights the need for more effective treatments for a patient population with a significant level of unmet need.

PCN286

RETROSPECTIVE ANALYSIS OF PATIENTS WITH OVARIAN CANCER RECEIVING TREATMENT AT A TERTIARY CARE HOSPITAL IN INDIA

Abraham PS, Greene M
MCPHS University, Boston, MA, USA

OBJECTIVES: To review the patient characteristics and treatment methods of ovarian cancer patients at a tertiary hospital in India. **METHODS:** This study was a retrospective review of electronic medical records from a tertiary care hospital in Mumbai, India. Patients ≥18 years of age hospitalized for ovarian cancer treatment between Jan 2014 and May 2015 were included in the study. Descriptive and inferential statistics were used to analyze and compare differences between patients. **RESULTS:** A total of 45 patients met the study criteria. Of these, 38 patients were in the age group of 18 to 64 years. The mean age for all the ovarian cancer patients was 52.17+13.0 years. The mean age was lowest for patients with CGHS while highest for patients with RGJAY (RGJAY=56.50+11.57 years, PI=55.8+9.50 years, NI=43.36+12.33 years, CGHS=35.0+18.38 years,). The majority of the patients (n=33, 73.3%) underwent a surgical procedure during their stay at the hospital. The majority of the patients were subscribed to RGJAY payer scheme (RGJAY=22, 48.9%; NI=11, 24.4%; PI=10, 22.2%; CGHS=2, 4.4%). Pain was the most common reason for admission into the hospital (n=22, 48.9%). 11 (24.4%) patients with hypertension and 10 (22.2%) patients with diabetes were reported as major comorbidities during hospitalization. The majority of the patients had stage 2 or 3 ovarian cancer (16, 48.5%), while 11 (33.3%) patients had stage 1 ovarian cancer and 6 (18.2%) patients had stage 4 ovarian cancer. Of the total 33 patients that had surgery, majority of them underwent a total abdominal hysterectomy bilateral salpingo oophorectomy (TAHBSO) (n=14). **CONCLUSIONS:** Majority of the ovarian cancer patients were diagnosed during the advanced stages of the disease and were subscribed to RGJAY scheme. The common reason for hospital admission was pain and the common procedure patients underwent was the TAHBSO.

MUSCULAR-SKELETAL DISORDERS – Clinical Outcomes Studies

PMS1

PREVALENCE OF BISPHOSPHONATE-ASSOCIATED OSTEONECROSIS OF THE JAW USING TRUVEN HEALTH ANALYTICS MARKETSCAN® 2008-2014

Alqhtani H, Hartzema A
University of Florida, Gainesville, FL, USA

OBJECTIVES: To determine the prevalence of Osteonecrosis of the jaw (ONJ) cases among adult users of Bisphosphonates (BPs) and identify the potential risk factors that contribute to ONJ among BPs users. **METHODS:** In a retrospective cohort study, we used Truven Health Analytics MarketScan® databases from 2008 to 2014 to identify cohort members. The cohort included patients aged ≥18 years who received at least one prescription of bisphosphonates (oral or IV) for underlying bone or malignant disorders. We included BPs that were approved in the US for human use. The outcome variable is having ONJ, (ICD 733.45), and the independent variables included BPs types (Alendronate, Risedronate, Ibandronate, Zoledronic acid, Pamidronate and Etidronate), route of administration of BPs (oral Vs. IV), demographic characteristics (age and gender), and comorbidities (diabetes, hypertension, hypercholesterolemia). Multivariate logistic regression analysis was used to examine the association between risk factors and ONJ outcomes. **RESULTS:** We identified a study population of 837867 men and women who aged ≥18 years and had at least one prescription of BPs. We found only 66 patients with ONJ, so the prevalence of ONJ among the BPs users is less than 0.01%. We found that there was no statistically significant association between the outcome (ONJ) and BPs' characteristics (BPs type OR=0.751 95% CI 0.419-1.359). Furthermore, there was no statistically significant association between the outcome (ONJ) and patients' characteristics (age OR=1.01 95% CI 0.914-1.104 and gender OR=0.1228 95% CI 0.440-3.43). Moreover, there was no statistically significant association between the outcome (ONJ) and comorbidities (diabetes OR=1.23 95% CI 0.69-5.37, hypertension OR=0.797 95% CI 0.47-1.36 and hypercholestremia OR=0.69 95% CI 0.418-1.141). **CONCLUSIONS:** The prevalence of ONJ among the BPs users is less than 0.01% and there is no statistically significance association between ONJ and BPs type, route of administration, age, gender, diabetes mellitus, hypertension and hypercholestremia.

PMS2

BISPHOSPHONATES AND OSTEONECROSIS: ANALYSIS OF THE KOREA ADVERSE EVENT REPORTING SYSTEM

Kim NH, Je S, Song SM, Shin AN, Suh D
Chung-Ang University, Seoul, South Korea

OBJECTIVES: To examine if bisphosphonate (BP) use is associated with drug related osteonecrosis (osteonecrosis) using adverse drug reaction (ADR) data reported in the Korea Adverse Event Reporting System (KAERS) from 2013 to 2015. **METHODS:** The KAERS database contained a total of 754,231 ADR reports from 38,974 patients, resulting in an average of 1.99reportsperpatient; the ADR reports include patient demographics, concomitant drugs, patients' outcomes, reaction severity, reporting centers, and the results of causality assessments. The reporting odds ratio (ROR) was calculated to estimate the association between osteonecrosis and implicated medications. Chi-square tests were also conducted to compare the sociodemographic characteristics of osteonecrosis patients who reported BP use to those using other drugs. **RESULTS:** 230 ADR reports involving osteonecrosis cases were identified from the total 754,231 ADR reports. Among the 230 osteonecrosis reports, 201 reports (87.4%) were attributed to BP use, while 27 reports (11.7%) were attributed to other drug use; 2 reports lacked drug information. The ROR for osteonecrosis and BP use was 82.57 (95%CI, 55.06-123.82), with a majority of cases (n=105) associated to alendronate use among the six different classes of BP. Among the 228 reports of osteonecrosis, females (n=167, 87.6%) were more likely to report BP-related osteonecrosis than males (n=24, 12.6%) ($p<0.001$). Concomitant medications that were used with BP were rare and included Amlodipine, Calcitriol, Risedronate and Tiotropium bromide (each. n=3, 7.5%). **CONCLUSIONS:** The risk of BP use for drug related osteonecrosis in ADR reports in South Korea were examined. The results imply that BP use needs to be carefully monitored for patients with susceptibility for osteonecrosis.

PMS3

A NETWORK META-ANALYSIS OF THE EFFICACY OF TREATMENTS IN BIOLOGIC NAÏVE PATIENTS WITH MODERATE TO SEVERE RHEUMATOID ARTHRITIS AFTER INADEQUATE RESPONSE TO CONVENTIONAL DISEASE MODIFYING ANTIRHEUMATIC DRUGS

Tongbram V[1], Mutebi A[2], Hawkins N[3], Ndirangu K[1], McGovern A[1], Gharaibeh M[2], Kaur P[2], Collier D[2], Stolshek B[2]
[1]*ICON, New York, NY, USA,* [2]*Amgen Inc, Thousand Oaks, CA, USA,* [3]*University of Glasgow, Glasgow, UK*

OBJECTIVES: To compare the efficacy of treatments in moderate-to-severe rheumatoid arthritis (RA) in biologic-naïve patients with inadequate response to conventional disease modifying antirheumatic drugs (cDMARDs). **METHODS:** MEDLINE, Embase, and Cochrane Central Register were searched for RCTs published in 01/1990 to 08/2016. Treatments included were tumor necrosis factor inhibitors (TNFis; etanercept, adalimumab, infliximab, certolizumab pegol, golimumab), rituximab, abatacept, Interleukin 6 inhibitors (tocilizumab, sarilumab), and Janus kinase inhibitors (tofacitinib and baricitinib), each combined with cDMARDs. Outcomes were difference in mean change in modified Total Sharp Scores (mTSS) between each regimen and cDMARDs, and probabilities of ≥20% improvement in the American College of Rheumatology response criteria (ACR20), at 6-months and 12-months. A Bayesian network meta-analysis using random-effects models estimated the comparative efficacy for these regimens. **RESULTS:** Up to 72 studies were included in this analysis. At 6-months, the difference in mean change in mTSS (95%CrI) versus cDMARDs ranged from -1.01(-3.70;1.69) for adalimumab to -3.74(-8.07;0.62) for infliximab in TNFis; and from -0.36(-2.80;2.04) for tofacitinib to -1.08 (-3.21;1.01) for tocilizumab in non-TNFis. At 6-months only the etanercept regimen had statistically significant difference in mean mTSS change -2.08(-3.67;-0.52) vs. cDMARDs. At 6-months, ACR20 (95%CrI) in TNFis ranged from 58.8% (47.8%;69.8%) for infliximab to 74.3%(66.2%;81.1%) for certolizumab pegol; and from 52.8%(33.5%;71.7%) for baricitinib to 63.3%(45.1%;80.0%) for sarilumab in non-TNFis. At 12-months, differences in mean change in mTSS ranged from –2.15(-5.41;1.10) for adalimumab to -7.03(-10.34;-3.83) for infliximab in TNFis; and from -1.08(-5.56;3.35) for rituximab to -2.52(-6.36;1.43) for sarilumab in non-TNFis. At 12-months, ACR20 ranged from 62.7%(48.0%;75.9%) for infliximab to 82.5% (56.9%;95.3%) for certolizumab pegol in TNFis; and from 63.6%(41.0%;85.5%) for sarilumab to 73.0%(56.1%;88.3%) for tocilizumab in non-TNFis. **CONCLUSIONS:** Targeted immune modulator in general showed reduced radiographic progression as measured by mTSS compared with cDMARDs. TNFis appear to be the most effective class as measured by the ACR20.

PMS4

COMPARATIVE EFFICACY OF TARGETED IMMUNE MODULATORS AS MONOTHERAPY AND IN COMBINATION WITH CONVENTIONAL DMARDS IN RHEUMATOID ARTHRITIS

Synnott PG, Liu S, Agboola FO, Ollendorf D
Institute for Clinical and Economic Review, Boston, MA, USA

OBJECTIVES: To evaluate the comparative effectiveness of targeted immune modulators (TIMs) in patients with moderately-to-severely active rheumatoid arthritis (RA) who have had an inadequate response to prior conventional disease modifying antirheumatic drugs (cDMARDs) and are TIM-naïve. **METHODS:** Two investigators conducted a systematic literature review of RCTs that evaluated the efficacy of 11 TIMs relative to cDMARDs and to each other: rituximab, abatacept, tocilizumab, sarilumab, tofacitinib, baricitinib, adalimumab, certolizumab pegol, etanercept, golimumab, and infliximab. Outcomes of interest included measures of disease activity, ACR response, and radiographic progression. Bayesian network

meta-analysis (NMA) was also performed to combine direct and indirect evidence on ACR response, which was analyzed using a random-effects, multinomial likelihood model. **RESULTS:** Our literature search identified 68 RCTs, nine of which examined head-to-head comparisons. All TIMs produced statistically- and clinically-significant improvements in disease activity and ACR response relative to cDMARDs alone. In head-to-head studies, tocilizumab and sarilumab monotherapy were superior to adalimumab in rates of clinical remission and ACR response; combination therapy with baricitinib + cDMARD was also superior to adalimumab + cDMARD in ACR20/50/70, but rates of clinical remission were similar between the two regimens. Abatacept, tofacitinib, certolizumab pegol, and adalimumab (all in combination with cDMARDs) showed comparable rates of remission, ACR response, and radiographic progression. Thirty-nine RCTs were included in the NMA; results showed small incremental differences in ACR response between TIMs (for example, rates of ACR50-70 ranged from 16% with rituximab + cDMARD to 22% with tocilizumab monotherapy), and a lack of statistically significant differences in most comparisons. **CONCLUSIONS:** Among patients with an inadequate response to cDMARDs, all TIMs provide substantial benefits relative to cDMARDs alone. Distinguishing the benefits between TIMs is more difficult, although tocilizumab and sarilumab monotherapy were superior to adalimumab in head-to-head studies.

PMS5

REMISSION AND RADIOGRAPHIC PROGRESSION IN RHEUMATOID ARTHRITIS: REVIEW OF REGISTRY DATA AND LONG-TERM COHORT STUDIES

Peterson S[1], Ganguly R[2], Van Laer J[3], Atanasov P[4], Li N[1]
[1]*Janssen Research & Development, LLC, Spring House, PA, USA,* [2]*GlaxoSmithKline, Collegeville, PA, USA,* [3]*Janssen Pharmaceutica NV, Beerse, Belgium,* [4]*Amaris, London, UK*

OBJECTIVES: The objective of this review is to synthesise available evidence from long-term cohort studies and registries on remission and radiographic progression of rheumatoid arthritis (RA) and its predictors. **METHODS:** Registry studies published between 2006 and 2015 were systematically identified through the MEDLINE, EMBASE and Cochrane databases. Literature were assessed for eligibility by two independent reviewers based on pre-specified criteria. **RESULTS:** Forty-eight studies reporting remission and 25 reporting radiographic progression were included. Disease duration across cohorts varied between 2 and 15 years. Disease remission rates were reported using 28-joint Disease Activity Score (DAS28), European League Against Rheumatism (EULAR), Clinical Disease Activity Index (CDAI), and Simple Disease Activity Index (SDAI). Remission rates across studies were low, with up to 98% of patients unable to achieve and sustain remission over 12 months (non-remission rates: DAS28, 48%–91%; EULAR 81%–98%; CDAI, 60%–95%; SDAI, 74%–89%). Sharp/van der Heijde, Larsen, and Ratingen scores were the most common measures of radiographic progression. In 20 studies in treatment-naive patients with early RA, sustained and substantial radiographic progression was observed, with variability in annual rates driven by risk factors (eg, anti-cyclic citrullinated peptide, rheumatoid factor positivity, baseline damage). In 5 studies enrolling patients with established RA (duration at baseline, 5–11 years), patients had received both non-biologics and biologics and annual change in radiographic damage was comparable to early RA studies (before biologics were available). A single study assessed radiographic progression before and after biologic treatment and showed a statistically significant 67% reduction in the annual rate after treatment initiation. **CONCLUSIONS:** This review showed that, while improvements in long-term clinical outcomes could be expected with a treat-to-target approach in combination with biologic therapy, a significant unmet need remains for higher rates of remission over time and inhibition of radiographic progression in RA.

PMS6

SUITABILITY OF A NETWORK META-ANALYSIS OF TARGETED SYNTHETIC OR BIOLOGIC THERAPY FOR PATIENTS WITH ACTIVE RHEUMATOID ARTHRITIS DESPITE BIOLOGIC DMARDS

Peterson S[1], Alfonso-Cristancho R[2], Pacou M[3], Belhadi D[3], Van Sanden S[4], Webb T[1], Ganguly R[5], Kurrasch R[5], Rao R[6], Hsu B[1], Popik S[1], Jansen JP[7]
[1]*Janssen Research & Development, LLC, Spring House, PA, USA,* [2]*GSK R&D, Collegeville, PA, USA,* [3]*Amaris, Paris, France,* [4]*Janssen Health Economics & Market Access EMEA Statistics & Modelling, Beerse, Belgium,* [5]*GlaxoSmithKline, Collegeville, PA, USA,* [6]*GSK Medicines Research Centre, Hertfordshire, UK,* [7]*Precision Health Economics, Oakland, CA, USA*

OBJECTIVES: To assess the suitability of a network meta-analysis (NMA) of targeted synthetic and biologic DMARDs in patients with active RA despite biologic DMARD (bDMARD) treatment. **METHODS:** A systematic literature review was performed to identify relevant randomized controlled trials (RCTs). Efficacy outcomes of interest were ACR20 response and change in DAS28(CRP) at 24±4 weeks. Suitability of a valid NMA was assessed according to the following criteria: 1) presence of 1 connected network where each trial has ≥1 intervention in common with another trial; 2) the distribution of study characteristics, patient characteristics, and contextual factors that are effect-modifiers are balanced across trials; and 3) the ability to overcome bias due to differences in effect-modifiers with statistical analysis. Identification of potential effect-modifiers was based on reported subgroup results in the literature and analysis of patient level data from a sirukumab phase 3 RCT (SIRROUND-T). **RESULTS:** Eight RCTs (2005–2016) were identified. Meaningful between-trial variation was observed, including differences in inclusion criteria, prior bDMARD use, and rescue therapy. Six trials included patients who failed anti-TNFs only, whereas 2 included patients who failed any bDMARD. Percentages of patients failing ≥2 prior bDMARDs ranged from 21%–61%. Where permitted, rescue therapy was administered after 12–18 weeks. Pre-study cDMARD stabilization periods varied (4–8 weeks). Unexplained variability in the placebo response (10%–34% ACR20 response) further highlighted the differences in patient characteristics between trials. A meta-regression analysis attempting to control for between-trial differences in effect-modifiers or high placebo response was not feasible due to the small number of trials. **CONCLUSIONS:** Available trials in the post-bDMARD population are characterized by meaningful variation in likely effect-modifiers. In the absence of patient-level data to adjust for patient-related between-trial differences, a NMA based on reported study-level data is likely to be biased.

PMS7

INITIATION OF BIOLOGIC DISEASE-MODIFYING ANTIRHEUMATIC DRUG THERAPY AND ASSOCIATED CHANGES IN DISEASE ACTIVITY MEASURES IN ROUTINE CLINICAL PRACTICE

Su Z, Brecht T, Gliklich R, Menon V
OM1, Cambridge, MA, USA

OBJECTIVES: To evaluate changes in disease activity measures associated with biologic disease-modifying antirheumatic drug (DMARD) therapy in patients with rheumatoid arthritis (RA). **METHODS:** The OM1 RA Data include electronic medical record (EMR) data (from a specialized rheumatology EMR) on ~75,000 patients diagnosed with RA, from across the US. This analysis included patients who a) were treated with non-biologic DMARD (nDMARD) between January 2013 and June 2016, b) had not received prior treatment with biologic DMARD, c) either added or switched to another nDMARD or initiated biologic DMARD (bDMARD) during the observation period (date of change in therapy is the index date) and d) had at least 2 disease activity measures. Disease activity measures included RAPID-3, HAQ-II, CDAI, and DAS28 and established American College of Rheumatology cutpoints were used to define remission. To reduce the impact of subsequent treatment changes, data were censored at 12 months. Survival analyses were conducted to evaluate the time to remission as well as time to sustained remission defined as 2 consecutive scores denoting remission. **RESULTS:** There were ~14,000 disease activity measures during the 12 month study period and none of the patients were in remission at index date. Of the 4,005 patients, 2,038 added or switched to another nDMARD and 2,0141 added or switched to a bDMARD. A larger proportion of patients in the bDMARD group achieved remission and sustained remission compared to the nDMARD group (23% versus 19%; 14% versus 11%, $p<0.05$). Time to remission was significantly shorter in the bDMARD group compared to the nDMARD group (mean±SD=5.6±4.4 months versus 6.0±4.4 months, $p<0.001$). **CONCLUSIONS:** Disease activity improved with changes in DMARD therapy; however, the addition of bDMARDs were associated with significantly shorter time to remission and sustained remission.

PMS8

IMPACT OF SPIRONOLACTONE ON ACR RESPONSE VARIABLES IN NAIVE RHEUMATOID ARTHRITIS PATIENTS

Prajapati SK[1], Tahir M[2], Aziz S[3], Mohiuddin SG[4], Wal P[5], Sara UVS[6], Ahmed MU[7]
[1]*AIMST University, Bedong, Kedah Darul Aman, Malaysia, Malaysia,* [2]*University of Veterinary and Animal Sciences, Lahore Pakistan, Lahore, Pakistan,* [3]*Aimst University, Sungai Petani, Malaysia,* [4]*AIMST University, Sungai Petani, Malaysia,* [5]*Pranveer Singh Institute of Technology, Kanpur, India, India, India,* [6]*Dr. Mc Saxena College of Pharmacy, Luckno, Lucknow, India,* [7]*University of Veterinary Animal Sciences (UVAS), Lahore, Lahore, Pakistan*

OBJECTIVES: To determine the ACR response of spironolactone when added to continuing regimen of Disease-Modifying anitrheumatic durgs (DMARDs) therapy in 28 naive rheumatoid arthritis (RA) patients, who failed to respond adequately on monotherapy or combination of conventional disease modifying agents. **METHODS:** A distinct study on 28 patients of 24 weeks was designed to gain additional data concern the use of spironolactone (2mg/Kg/OD) in RA patients with active disease despite core standard therapy with DMARDs. American College of Rheumatology (ACR) responses at zero week, 12 week and 24 weeks were calculated statistically. The differences before and after spironolactone treatment were examined by 2-tailed paired student t-test. Results were considered significant at 95% level ($p\leq0.05$) and presented as mean ± SEM. **RESULTS:** All ACR (20, 50, 70, 90) core set variables were significantly improved after 6 months with spironolactone treatment when compared with baseline in 26 patient. Two patients dropped out the study. 23 patients (88.4%) achieved target response (ACR 20% response), measured as composite index which is based on standard criteria set by American College of Rheumatology and is evaluated as 20% improvement in at least 20% reduction of Tender Joint Count (TJC), Swollen Joint Count (SJC) and in addition to a 20% improvement in at least three of the five activity measures; patient & physician assessment of general health on VAS scale, pain intensity assessment, ESR and HAQ functional questionnaire. Sixteen (61.5%), eleven (42.3%), nine (34.6%) and four (15.3%) patients also achieved ACR 50%, 70%, 90% response respectively after 24 weeks treatment. **CONCLUSIONS:** The study suggests that when spironolactone added with DMARDs, impacts both clinically and biologically to the patients with RA. The addition of spironolactone to the treatment of patients who respond incompletely to DMARDs alone or in combination may be distinctly valuable in the management of RA.

PMS9

REAL-WORLD HEALTH OUTCOMES ASSOCIATED WITH INFLIXIMAB FOR MODERATE-TO-SEVERE ANKYLOSING SPONDYLITIS IN A MEDIUM-SIZED CITY OF CHINA

Li J[1], Wen Z[1], Cai A[1], Tian F[1], Zhang L[1], Luo X[1], Deng L[1], He J[1], Chen Y[2], Chen W[3]
[1]*Zhuzhou Hospital of Xiangya Medical School, the Central South University, Zhuzhou, China,* [2]*Changsha Normin Health Technology Ltd, Changsha, China,* [3]*Normin Health Consulting Ltd, Mississauga, ON, Canada*

OBJECTIVES: to assess the real-world impact of infliximab on the disease activity and quality of life in Chinese patients with moderate-to-severe ankylosing spondylitis (AS) in a medium-sized city of China. **METHODS:** A cohort of Chinese patients with moderate-to-severe AS (Bath Ankylosing Spondylitis Disease Activity

Index (BASDAI) score greater than 4) were prospectively followed up at a tertiary care hospital in Zhuzhou, a medium-sized city in the central south of China, for their disease severity and quality of life associated with infliximab-contained therapy (ICT) or conventional disease-modified anti-rheumatic drugs (cDMARD). The disease severity of AS was measured by BASDAI and the quality of life was measured by both EQ-5D & SF-12 score in the study cohort. Conventional linear regression analyses with full adjustment of patient baseline characteristics compared ICT versus cDMARD for the changes of BASDAI, EQ-5D utility values, and SF-12 physical and mental scores over 22-week follow-up. **RESULTS:** A total of 31 patients completed 22-week follow-up (20 patients receiving ICT and 11 patients receiving cDMARD). The ICT group was associated with significantly younger age (34.0 years vs. 43.9 years, p=0.016) but a higher proportion of urban resident health insurance plan (54.5 vs. 0.0, p=0.002) at baseline than the cDMARD group. Relative to cDMARD, ICT was associated with significantly reduced BASDAI score (coefficient -2.910, p=0.001), improved EQ-5D utility value (coefficient 0.383, p<0.001), and increased SF-12 physical score (coefficient 15.597, p<0.001) in the multiple linear regression analyses with full adjustment of patient baseline characteristics. **CONCLUSIONS:** Patient social economic status could strongly impact the utilization of infliximab for moderate-to-severe AS in Chinese patients. The infliximab treatment led to significantly reduced disease severity and improved quality of life associated with moderate-to-severe AS in a medium-sized city of China.

PMS10

EFFECTIVENESS OF A PATIENT CENTERED CARE MODEL IN PATIENTS WITH RHEUMATOID ARTHRITIS RECEIVING ONLY CONVENTIONAL DMARDS IN COLOMBIA

Santos-Moreno P[1], Alvis-Zakzuk NJ[2], Carrasquilla Sotomayor M[3], Alvis Guzman N[3]
[1]Biomab, center for rheumatoid arthritis, bogota, Colombia, [2]ALZAK Foundation, CARTAGENA, Colombia, [3]ALZAK Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia

OBJECTIVES: The aim of study was to describe the change in Disease Activity Score 28 (DAS28) in patients with rheumatoid arthritis (RA) receiving only conventional treatment under a patient centered care model (PCC) in a specialized rheumatology center. **METHODS:** We carried out a retrospective review of clinical records of patients with RA and treated with conventional treatment in a rheumatology center in Colombia. Patients were followed-up during 24 months using a treat-to-target strategy (T2T); a PCC model means that a patient should be seen by rheumatologist, physical and occupational therapist, physiatrist, nutritionist and psychologist, at least three times a year according to disease severity. Clinical follow-up was according to DAS28: every 3-5 weeks (DAS28 > 5.1), every 7-9 weeks (DAS28 ≥ 3.1 and ≤ 5.1), and every 11-13 weeks (DAS28 <3.1). Patients were classified into four groups due to DAS28: Remission (REM), low disease activity (LDA), moderate disease activity (MDA) and severe disease activity (SDA). Statistical analysis was done. **RESULTS:** A total of 968 patients were included, 80.2% were women; average age was 63 years (SD 10.7). Regarding conventional treatment, 52.4% received methotrexate, 26.0% leflunomide and 21.6% other DMARDs. At 24 months follow-up, an improvement was observed. At baseline 41% of patients were in remission, 17% in LDA and 42% in MDS/SDA. At the month 24 of follow-up, 66% were in remission, 18% in LDS and 16% in MDS/SDA. Regarding to DAS28, the mean at the beginning of the time analysis was 3.1 (SD 1.0) and after 24-months it was 2.4 (SD 0.7), showing a statistically significant improvement (p <0.000). **CONCLUSIONS:** We observed a global improvement of DAS28 in patients receiving only conventional therapy, followed under T2T strategy and a PCC model. Those results should be used by decision makers in order to do cost-savings for health systems.

PMS11

CONFLICTING COMPARATIVE EFFECTIVENESS EVIDENCE OF HYALURONIC ACID USING REAL WORLD DATA EVIDENCE. AN UPDATE USING A HIGH DIMENSIONAL PROPENSITY SCORE MATCHING APPROACH

Shewale AR[1], Barnes L[1], Fischbach LA[1], Ounpraseuth ST[1], Painter JT[1], Martin BC[2]
[1]University of Arkansas for Medical Sciences, Little Rock, AR, USA, [2]University of Arkansas for Medical Sciences College of Pharmacy, Little Rock, AR, USA

OBJECTIVES: Recent evidence from large observational studies suggest that intra-articular HA injections are associated with a delay in total knee replacement among patients with knee osteoarthritis (OA). However, this recent industry sponsored evidence is limited considering residual confounding and potential selective loss to follow up. The objective of this study was to evaluate the effectiveness of intra-articular HA injections for knee OA management. **METHODS:** A nested cohort of persons with knee OA visiting a specialist and a recent history of pain medication use was created using the Lifelink Plus claims (2010-2015) to compare the risk of composite (any) knee surgical interventions, total (TKR) / unicompartmental knee replacement (UKR) and TKR only among HA users and two comparison groups: corticosteroid (CS) users and HA/CS non-users. A high dimensional propensity score (hdPS) was used to match HA users with HA/CS non-users and with CS users on background covariates. The risk of surgical interventions among HA users relative to the comparison groups was assessed using Cox proportional hazard models. A wide range of sensitivity analyses were also conducted including falsification tests. **RESULTS:** Among 13,849 patients, 797 were HA users, 5,327 were CS users, and 7,725 were HA/CS non-users. After hdPS matching, the risk of composite surgical interventions did not differ between HA users and HA/CS non-users (HR=0.88, 95% CI 0.67-1.16) and CS users (HR= 0.89, 95% CI 0.65-1.12). A sensitivity analysis that restricted the sample to patients who had any type of knee surgery (an approach used in recent studies), showed a significant lower risk of surgery for those using HA relative to HA/CS non-users (HR=0.87, 95% CI 0.79-0.95) **CONCLUSIONS:** There were no significant differences in the risk of surgical interventions among HA users compared to HA/CS non-users and CS users after accounting for residual confounding using a high dimensional propensity score.

RISK FACTORS AND ECONOMIC BURDEN OF COMPLICATIONS AFTER AN OSTEOPOROTIC HIP FRACTURE IN CHINA

Liu R[1], Wang K[2], Chen Y[2], Liu J[3], Wu J[1]
[1]Tianjin University, Tianjin, China, [2]Lilly Suzhou Pharmaceutical Company, Ltd., Shanghai, China, [3]Tianjin Health Insurance Research Association, Tianjin, China

OBJECTIVES: To investigate the complication incidence and its risk factors following an osteoporotic hip fracture, and quantify and compare the healthcare resource utilization and direct medical costs among patients with and without complications. **METHODS:** Data was obtained from Tianjin Urban Employee Basic Medical Insurance database (2009-2014). Patients aged ≥50 years, had ≥ 1 diagnoses of hip fracture during 2010 and 2012, and had continuous enrollment during 12-month before (baseline) and 24-month after (follow-up) the first identified hip fracture were included. Medical complications were identified within 4-month after the fracture, while surgical complications were identified within the 24-month follow-up. All-cause healthcare resource utilization and direct medical costs were measured and compared between patients with and without complications. Logistic regression was applied to identify risk factors associated with any complication. **RESULTS:** 1,675 patients were identified (mean age=70.5 years, 58.4% female). 66.9% (N=1120) of them had at least one complications during the identified period. Cerebral infarction was the most common medical complication (17.7%), followed by constipation (13.9%) and pneumonia (13.3%), while the most common surgical complications were osteoarthritis (20.9%) and subsequent hip fracture (11.4%). Compared with those without complications, patients with complications had higher all-cause total costs ($8371 vs. $5946, p<0.001) during the 24-month period, with longer length of hospitalization (39.0 vs. 25.6, p<0.001) and more outpatient visits (96.3% vs. 87.2%, p<0.001). Patients aged older (Odds Ratio [95% CI]: 1.02 [1.01-1.03]), had comorbidities including chronic heart disease (1.38 [1.04-1.84]), peripheral vascular disease (1.53 [1.05-2.22]), or hemiplegia (5.38 [2.75-10.50]), and had higher baseline all-cause direct medical cost (1.04 [1.00-1.09]) were more likely to have complications. **CONCLUSIONS:** Complication following an osteoporotic hip fracture is associated with increased economic burden in China. The most common complications were cerebral infarction, constipation, pneumonia, and osteoarthritis. Effective strategies should be made to prevent osteoporotic fractures and their complications.

PMS13

MICROVASCULAR COMPLICATIONS AND RISK OF HIP FRACTURE IN PATIENTS WITH TYPE II DIABETES

Chang P[1], Wang I[2], Valderrabano R[3], Tsai Y[4], Lee JS[3]
[1]University of California, Davis, Davis, CA, USA, [2]National Yang Ming University, Taipei, Taiwan, [3]Stanford University, Stanford, CA, USA, [4]Institute of Health and Welfare Policy, National Yang-Ming University, Taipei, Taiwan

OBJECTIVES: People with type II diabetes (T2DM) have increased risk of microvascular complications and fracture. How microvascular complications are related to hip fracture has not been established. We investigated hip fracture risk by numbers of different microvascular complications in T2DM using the Taiwan National Health Insurance Research Database. **METHODS:** Among people with newly diagnosed T2DM, 2000-2005, 247,177 participants (48% female) who developed at least one complication 1-yr after T2DM diagnosis ("exposed") were 1:1 matched at index date to 245,456 participants who never developed complications. Index date referred to the first complication diagnosis date among the exposed. Matching factors included age, sex and T2DM duration. Participants were followed to the first occurrence of inpatient hip fracture diagnosis, disenrollment or 12/31/2013. We calculated hip fracture incidence. Cox proportional-hazards regression modelling estimated hazard ratios and 95% confidence interval (CI) for hip fracture. Sex-specific models included age, T2DM duration and cardiovascular disease. **RESULTS:** Median age for T2DM diagnosis was 57. Among the exposed, first complication occurred at age 62. Over 4.2-year of follow-up, hip fracture occurred in 2258 women and 1034 men without complications (incidence: 42/10,000 person-years, women; 18/10,000 person-years, men) and 3727 women and 2011 men with any complication (incidence: 67/10,000 person-years, women; 35/10,000 person-years, men). In participants with 1, 2 or 3 complications, hip fracture incidence was 47, 126, and 266 per 10,000 person-years in women and 22, 72, to 130 per 10,000 person-years in men. Compared to participants without complications, adjusted hazard ratios for hip fracture in those with 1, 2 or 3 complications was 1.51 (CI: 1.44-1.60), 2.05 (CI: 1.83-2.29) and 3.38 (CI: 2.12-5.40) in women; 1.77 (CI: 1.64-1.90), 2.71 (CI: 2.33-3.16) and 4.03 (CI: 2.10-7.73) in men, respectively. **CONCLUSIONS:** Microvascular complications increase hip fracture risk in T2DM, particularly people with multiple complications. Bone health management should be considered for people with complicated T2DM.

PMS14

365 DAY SURVIVAL ANALYSIS OF PREDICTORS IN PATIENTS WITH SECOND HIP FRACTURE

Juhász K[1], Boncz I[2], Molics B[2], Sebestyén A[2]
[1]Baranya County Government Office, Pécs, Hungary, [2]University of Pécs, Pécs, Hungary

OBJECTIVES: Patients with second hip fractures are at increased risk of death. The aim of the study was to analyse the predictors of 365 day survival in patients with second hip fractures. **METHODS:** Patients aged 60 years and over treated with primary femoral neck fractures in the year 2000 and suffered from contralateral hip fractures between 01 January 2000 and 31 December 2008 were selected from the database of the Hungarian National Health Insurance Fund. The following prognostic factors were evaluated: age, gender, comorbidities, location of second hip fracture, type of surgical intervention, local complication after second hip fracture, and day of hospital admission were studied. The 365 day mortality was calculated

for each group. Predictors for 365 day survival were evaluated by Kaplan-Meier survival analysis and log-rank test. Statistical analyses were performed using the SPSS version 19.0. **RESULTS:** 312 patients met the criteria. The mean survival time was 113.22 days. The 365 day mortality rate was 38.4%. There was significantly longer survival (p=0.004) found in patients with femoral neck fracture (mean survival time: 135 days) relative to patients with pertrochanteric (mean survival time: 73.28 days) and other fractures (mean survival time: 93.60 days). There was no significant difference found in 365 day survival of patients with gender (p=0.610), type of surgical intervention (p=0.269), local complication after second hip fracture (p=0.847), comorbidities (p=0.537), and day of hospital admission (p=0,698). **CONCLUSIONS:** The 365 day mortality rate was high. Patients with femoral neck fracture had better survival then those with peritrochanteric fracture location. The worse survival in patients with peritrochanteric fracture could be explained by better blood supply, and higher risk for hemorrhage of this region.

PMS15

30 DAY SURVIVAL ANALYSIS OF PREDICTORS IN PATIENTS WITH SECOND HIP FRACTURE

Juhász K[1], Boncz I[2], Molics B[2], Sebestyén A[2]
[1]Baranya County Government Office, Pécs, Hungary, [2]University of Pécs, Pécs, Hungary

OBJECTIVES: Patients with second hip fractures are at increased risk of death. The aim of the study was to analyse the predictors of 30 day survival in patients with second hip fractures. **METHODS:** Patients aged 60 years and over treated with primary femoral neck fractures in the year 2000 and suffered from contralateral hip fractures between 01 January 2000 and 31 December 2008 were selected from the database of the Hungarian National Health Insurance Fund. The following prognostic factors were evaluated: age, gender, comorbidities, location of second hip fracture, type of surgical intervention, complication after second hip fracture, and day of hospital admission were studied. The 30 day mortality was calculated for each group. Predictors for 30 day survival were evaluated by Kaplan-Meier survival analysis and log-rank test. Statistical analyses were performed using the SPSS version 19.0. **RESULTS:** 312 patients met the criteria. The mean survival time was 13.12 days. The 30 day mortality rate was 8.3%. The 30 day survival time was longer in men vs. female (13.57 vs. 12.95 days), in patients with pertrochanteric fracture vs. femoral neck fracture (13.53 vs. 12.22 days), in patients with arthroplasty vs. osteosynthesis (15 vs. 13.41 days), and in patients were admitted to hospital on weekday vs. weekend (13.32 vs. 12.57 days). However there was no significant difference found in 30 day survival of patients with different gender (p=0.818), location of second hip fracture (p=0,805), type of surgical intervention (p=0.616), complication after second hip fracture (p=0.254), and day of hospital admission (p=0,795). **CONCLUSIONS:** The 30 day mortality rate was high, but the investigated prognostic factors didn't show significant correlation with patients' survival. Further analyses of risk factors are needed to clarifying their role in the survival of patients with second hip fracture.

MUSCULAR-SKELETAL DISORDERS – Cost Studies

PMS16

POTENTIAL IMPACT OF THE BIOSIMILARS INTRODUCTION OF 3 ANTI-TNFS IN THE EUROPEAN MARKET

Psachoulia E, Martin-Rinconada MC, Levysohn A
Biogen International GmbH, Zug, Switzerland

OBJECTIVES: Anti-TNFs represent a substantial cost in the European healthcare systems. Patents of infliximab and etanercept have expired in Europe, with patent of adalimumab expected to expire in Europe in 2018. Biosimilars of former two are available in Europe. This study's objective was to assess the potential savings of introducing infliximab, etanercept and adalimumab biosimilars in Europe. **METHODS:** Savings for each anti-TNF were estimated from the year of biosimilar entry in Europe (2015 for infliximab, 2016 for etanercept and 2018 for adalimumab) up to 2020. Annual sales ($) of originator products in the year prior to biosimilar entry were used assuming these to remain constant in subsequent years (adalimumab from 2015). Infliximab biosimilars average market share (MS) was 20% in 2015 and 45% in 2016 and it was assumed a 10% increase in 2017 and a 5% in subsequent years. Etanercept biosimilars MS was assumed 20% in 2016, 40% in 2017 (2nd biosimilar in the market), 50% in 2018, 55% in 2019 and 60% in 2020. Adalimumab biosimilars MS was assumed 30% in 2018, 50% in 2019 and 60% in 2020. Infliximab biosimilar average discount was 40% in 2015 and 50% in 2016 assuming further 2.5% in subsequent years. Etanercept biosimilar average discount was 35% in 2016 assuming further 10% discount in 2017 and further 2.5% in subsequent years. For adalimumab biosimilar, 35% discount was assumed in 2018 with further 2.5% in subsequent years. Originator prices were assumed to decrease by 10% in first 2 years of biosimilar introduction and by 20% in subsequent years. **RESULTS:** Biosimilar introduction of the 3 anti-TNFs in Europe is likely to result in savings of $11.44b between 2015-2020; i) infliximab: $5.31b, ii) etanercept: $2.95b & iii) adalimumab: $3.18b. **CONCLUSIONS:** Biosimilars of these 3 anti-TNFs will provide significant savings to the healthcare systems across Europe contributing to their sustainability.

PMS17

BUDGET IMPACT ANALYSIS OF ETORICOXIB IN THE TREATMENT OF OSTEOARTHRITIS IN CHINA

Fan CS[1], Wu J[2]
[1]Beijing Medical and Health Economic Research Association, Beijing, China, [2]306 hospital of PLA, Beijing, China

OBJECTIVES: To estimate the potential budget impact of Etoricoxib in the Treatment of Osteoarthritis from the public health insurance payer's perspective in China from 2017-2021. **METHODS:** A budget impact model was developed in the context of national reimbursement drug list with a five-year time frame in accordance with the ISPOR BIA guideline. The target patient population of Osteoarthritis patients was estimated with official national population statistics and published epidemiological data. The patient population was then divided into resident and employed groups because of different reimbursement level. The national hospital sales data of last year were used to forecast the annual growth and patient share sizes. Daily dosage of drug was determined by drug instructions' average dose. Two scenarios were modeled: etoricoxib covered or not covered by the public health insurance. **RESULTS:** China's target osteoarthritis patients was estimated to be 10.02 million. Chinese and many international guidelines had established etoricoxib as alternative to the drugs including ibuprofen, naproxen, loxoprofen, dicofenac, sulindac, acemetacin,etodolac,nabumetone,meloxincam, nimesulide,celecoxib,paracetamol tranadol, hydrochloride tramadol. The annual expenditure of etoricoxib (1,784.12 CNY/patient) was lower than celecoxib (1,984.38 CNY/patient) based on average bidding prices. Thus, including etoricoxib in the national reimbursement list could potentially increase 7.37 million, 15.88 million, 24.00 million, 32.68 million, 41.85 million CNY medical expenditure from 2017-2021. Sensitivity analyses showed the result were robust. **CONCLUSIONS:** Inclusion of etoricoxib in China's national reimbursement list will increased the annual medical insurance expenditure. The reason is that the prices of ibuprofen, loxoprofen, diclofenac and meloxincam are lower than etoricoxib, market share was higher. But compared with ibuprofen, loxoprofen, diclofenac and meloxincam, etoricoxib has the advantages of safety , and saving the use of other medical resources. Because it will increase medical insurance expenditure, appropriately reducing the price can significantly reduce medical insurance expenditure.

PMS18

PHARMACOECONOMIC INSIGHTS TO GUIDE BIOSIMILAR ADOPTION AND EVIDENCE OF COST SAVINGS FOR FOUR FDA-APPROVED BIOSIMILARS

Nayak D[1], Gu A[2], Nayak R[2]
[1]ST JOHNS UNIVERSITY, QUEENS, NY, USA, [2]St. John's University, Jamaica, NY, USA

OBJECTIVES: US health plans have been slow to adopt newer biosimilar (BS) drugs partly due to uncertainties surrounding their safety, efficacy and economic superiority. This study aims to collect evidence of economic value of four new biosimilars that have been FDA-approved for sale so far to provide information that might aid formulary adoption and uptake by health plan decision makers (HPDMs). **METHODS:** A systematic review of pharmacoeconomic studies of four USFDA-approved biosimilars to date (filgrastim, infliximab, etanercept, adalimumab) from PubMed, Embase, and SciDirect databases. Eligible studies included cost-based comparative evaluations of a biosimilar product vs. another biologic, an originator product, or a qualified reference product. Empirical and review studies documenting traditional HEOR results, findings of comparative effectiveness, budget impact analyses (BIA) and resource use projections were drawn from multiple literature databases for final review **RESULTS:** We identified 44 studies (15 peer reviewed articles and 29 meeting abstracts) that met the eligibility criteria. Nearly all the studies were either simulated models with cost projections or retrospective cost analyses (>90%) with only three real-world utilization studies; only four were US-based studies. BIAs constituted a majority (>75%) and more than half involved multi-national comparisons in EU. QALYs, incremental costs, and projected savings to cover additional lives were the most common outcome measures. Price discounts modeled varied from 20% to as high as 75%, and savings generated were substantial to significant in most cases. **CONCLUSIONS:** US studies demonstrating the value of BS are extremely rare, but the international experience with these products shows strong cost advantages. Market uptake rates and acquisition cost discounts drive savings in most cases and savings are sensitive to jurisdictional variations, interchangeability parameters and clinical factors .Scarcity of real-world performance data in the USA, and the difficulty of using European commercial experience for US adoption and forecasting make immediate BS acceptance challenging.

PMS19

AN EVALUATION OF THE IMPACT OF STATIN DRUG-DRUG INTERACTIONS LEADING TO RHABDOMYOLYSIS REQUIRING HOSPITALIZATION

OH M, Malone DC
University of Arizona, Tucson, AZ, USA

OBJECTIVES: This study examined the annual incidence, mortality, and cost of rhabdomyolysis due to the potential drug-drug interactions between statins and other agents in the United States. **METHODS:** This study was a decision model developed based on data from the National Health and Nutrition Examination Survey (NHANES) and the Healthcare Cost and Utilization Project (HCUP) to estimate use of statins, cost, and mortality associated with rhabdomyolysis. The incidence rate of statin-induced rhabdomyolysis was identified using multiple published studies. Estimates of the proportion of statin-related rhabdomyolysis attributable to drug interactions was from a systematic review of 35 trials. Our study evaluated adults forty years of age or more using a statin. The incident rate of hospitalized rhabdomyolysis was estimated for patients on statin monotherapy or combination therapy including a statin. The proportion of drug-drug interaction was incorporated to the total number of annual statin-related rhabdomyolysis patients. One-way sensitivity analyses were conducted to evaluate the robustness of the findings. **RESULTS:** In the primary analysis the incidence of rhabdomyolysis per 10,000 person-years was 0.44 (95%CI:0.20-0.84) for monotherapy and 5.98 (95%CI:1.46-13.68) for combination therapy. An estimated 3,487 patients a year experience severe rhabdomyolysis requiring hospitalized due to drug-drug interactions with statins. The estimated total annual cost was $21.9 million. At this incidence rate approximately 30 individuals die each year due to the interaction. In the second analysis, a different incidence rate for each statin therapy was utilized. It was estimated that 1,938 patients annually experience

rhabdomyolysis requiring hospitalization due to statin drug-drug interactions and estimated total annual costs of $17.2 million with an estimated 23 patients expiring. A deterministic one-way sensitivity analysis indicated that incidence rate of hospitalized rhabdomyolysis as the most influential model parameter. **CONCLUSIONS:** Statin drug-drug interactions may result in rhabdomyolysis that has significant costs and mortality.

PMS20

EVALUATING THE ECONOMIC BURDEN AND HEALTH CARE UTILIZATION OF RHEUMATOID ARTHRITIS PATIENTS IN THE US DEPARTMENT OF DEFENSE POPULATION

Vaidya N[1], Tan H[1], Xie L[1], Wang Y[1], Baser O[2]
[1]STATinMED Research, Ann Arbor, MI, USA, [2]Columbia University and STATinMED Research, New York, NY, USA

OBJECTIVES: To examine the economic burden and health care utilization of rheumatoid arthritis (RA) patients in the US Department of Defense (DoD) population. **METHODS:** Patients diagnosed with RA (International Classification of Diseases, 9th Revision, Clinical Modification diagnosis code: 714) were identified using DoD data from 01OCT2010-31OCT2015. The first diagnosis date was designated as the index date. A comparison cohort was created for patients without RA, but of the same age, gender, race, index year, and with similar baseline Charlson Comorbidity Index scores. The index date was chosen randomly for the comparison cohort to minimize selection bias. Patients in both cohorts were required to have continuous medical and pharmacy benefits for 1 year pre- and 1 year post-index date. Study outcomes, including health care costs and utilization, were compared between the disease and comparison cohorts using 1:1 propensity score matching (PSM), and adjusted for baseline demographic and clinical characteristics. **RESULTS:** Eligible RA and non-RA patients (N=32,512) were included for study. After 1:1 PSM matching, 14,223 patients were identified in each cohort; the baseline characteristics were well balanced. Patients with RA had a greater mean number of inpatient (0.27 vs 0.12; $p<0.001$), emergency room (ER) (0.81 vs 0.45; $p<0.001$), ambulatory (26.69 vs 14.11; $p<0.001$) and pharmacy (21.55 vs 11.7; $p<0.001$) visits. Higher all-cause health care costs were also observed for RA patients, including mean inpatient ($3,278 vs $1,398; $p<0.001$), ER ($535 vs $291; $p<0.001$), ambulatory ($7,685 vs $3,978; $p<0.001$), pharmacy ($3,495 vs $1,142; $p=0.4138$), and total costs ($14,992 vs $6,808; all $p<0.001$). **CONCLUSIONS:** During a 12-month period, DoD beneficiaries who were diagnosed with RA had higher health care utilization and incurred higher costs than matched control patients.

PMS21

ECONOMIC IMPACT OF BIOLOGIC DMARD TREATMENT FOR APCA+ AND RF+ PATIENTS: A COMPARISON OF ABATACEPT AND TNFI BIOLOGIC DMARDS

Shafrin J[1], Tebeka M[1], Price K[2], Patel C[2], Michaud K[3]
[1]Precision Health Economics, Los Angeles, CA, USA, [2]Bristol-Myers Squibb, Plainsboro, NJ, USA, [3]University of Nebraska Medical Center, Omaha, NE, USA

OBJECTIVES: Anti-citrullinated protein antibodies (ACPA) and Rheumatoid Factor (RF) are markers used to diagnose rheumatoid arthritis (RA). Patients that are both RF+ and ACPA+ (hereafter Double+) have more severe disease and improved clinical response to abatacept treatment compared with other patients1. This study estimates changes in RA-related medical cost after initiation of treatment with abatacept or tumor necrosis factor inhibitor (TNFi) biologic disease-modifying anti-rheumatic drugs (bDMARDs) among RA patients who have Double+ RA. **METHODS:** In our three-step simulation model, we first measured RA-related costs for Double+ patients using IMS PharMetrics Plus health insurance claims data linked to electronic medical record data (2010-2015). Second, we measured the changes in functional status comparing patients who initiated treatment with abatacept versus TNFi in terms of Clinical Disease Activity Index (CDAI). Finally, we monetized functional status improvement among these patients using the literature2. **RESULTS:** Annual RA-associated total expenditure was $5,335 for Double+ patients compared to $3,581 for other patients (Δ=$1,754, $p<0.01$). Double+ patients who initiated treatment with abatacept had an 8.5 point decrease in CDAI score compared to a 7.2 point decrease among those who initiated a TNFi, a difference of 1.3 ($p<0.001$)1. These reductions in CDAI are estimated to reduce mean annual RA-related cost by $893 (-14.7%) for abatacept users and by $756 for patients initiating TNFi therapy (-12.4%). Switching all Double+ RA patients that use bDMARDs from TNFi therapy to abatacept would reduce mean annual RA-related medical expenditures by $14.7 million. **CONCLUSIONS:** Abatacept initiation among Double+ RA patients lead to large improvements in functional status and lower RA-related medical costs compared to TNFi initiation. Harrold et al. Ann Rheum Dis 2016; **75**; 123-4 Michaud K, et al. Arth & Rheum 2003;**48**:2750-62

PMS22

HEALTHCARE UTILIZATION AND COSTS FOR RA PATIENTS ON BIOLOGICS COMPARED TO THOSE ON CONVENTIONAL SYNTHETIC DMARDS: RESULTS FROM A NATIONWIDE POPULATION-BASED COHORT STUDY IN TAIWAN

Tang C[1], Chen D[2], Yu F[3], Tuan L[4]
[1]Taipei Medical University, Taipei, Taiwan, [2]Division of Allergy, Immunology and Rheumatology, Taichung Veterans General Hospital, Taichung, Taiwan, [3]Pfizer Ltd., New Taipei City, Taiwan, [4]Formosa Biomedical Technology Corp., Taipei, Taiwan

OBJECTIVES: This study aimed at assessing the changes in healthcare utilization and costs between patients treated with conventional synthetic and biological disease modifying antirhumatic drugs (csDMARD and bDMARD) for rheumatoid arthritis (RA) in Taiwan. **METHODS:** Two cohorts of severe RA patients were identified from National Health Insurance claims database. The csDMARD cohort was patients who had medication claim for cyclosporine ≥ 50 mg/day with concomitant use of ≥ 2 csDMARDs for ≥ 28 days within 56 days after cyclosporine use during 1997-2003 (N=1,569) . After csDMARD cohort was determined, the bDMARD cohort was selected if patients had ≥ 1 claim for bDMARD during 2003-2011 (N=1,530). The index date was the date with the first qualifying claim. Patients were followed up for maximum of 10 years, or death, switched to bDMARDs (for csDMARD only), or end of 2013, whichever came first. Per-patient-per-year (PPPY) annual healthcare utilization and costs were calculated by bootstrapping with 1,000 nonparametric replications drawn from the source cohorts. Annual incremental utilization and costs for csDMARD and bDMARD cohorts were compared. **RESULTS:** Incremental number of hospitalization days decreased by 75% (from 2.3 days for csDMARD to 0.58 day for bDMARD). The incremental total costs and RA medication costs were increased by 3.66 times (US$9,081 vs. US$2,481) and 4.78 times (US$8,992 vs. US$1,883), respectively, for bDMARD compared to csDMARD. However, the sum of incremental healthcare utilization costs and incremental non-RA medication costs was decreased by 64% (from US$1,302 for csDMARD to US$467 for bDMARD). **CONCLUSIONS:** The introduction of biologics in the treatment of RA has significantly reduced the hospitalization days for RA patients. Incremental costs of healthcare utilization and non-RA medication also decreased for bDMARD compared to csDMARD.

PMS23

TRENDS IN HEALTHCARE EXPENDITURES, UTILIZATION, AND HEALTH STATUS AMONG US PATIENTS WITH RHEUMATOID ARTHRITIS FROM 1998-2014: A REPORT FROM THE MEDICAL EXPENDITURE PANEL SURVEY

Gressler LE, Li C
University of Arkansas for Medical Sciences, Little Rock, AR, USA

OBJECTIVES: The research was conducted to estimate the annual expenditures, healthcare utilization, and change in health status for patients who sought health care services for rheumatoid arthritis (RA) based on the nationally representative sample from the Medical Expenditure Panel Survey (MEPS). **METHODS:** Adult respondents were sampled from the years 1998, 2002, 2006, 2010, and 2014. Patients with RA were identified and compared to those without RA. Annual total expenditures and utilization were recorded for the inpatient setting, office-based setting, pharmacy, and emergency department. Data were compared to the self-reported health status from short-form 12 for patients each year. Sociodemographic factors were adjusted for, and a generalized linear model was developed to identify factors associated with RA expenditure. The quantity of biologics used and expenditures associated since their initial release in 1998 were estimated. **RESULTS:** The adjusted average total expenditure of the RA population over the five sampled years in 2014 US dollars was $9363.40 compared to $7179.30 in the non-RA sample ($p<0.0001$). Pharmacy accounted for an average expenditure of $4181.1 in RA patients and $2291.2.14 in non-RA patients ($p<0.0001$). The average total utilization of the RA population over the five sample years was 54.21 in RA patients and 39.86 in non-RA patients ($p<0.0001$). The mean physical health summary score for was significantly lower for RA patients (31.52) compared to non-RA patients (39.26) ($p<0.0001$). The number of biologics dispensed for RA treatment increased from 0 per patient in 1998 to 0.35 per patient in 2014. **CONCLUSIONS:** Despite having lower physical and mental health scores, RA-related expenditure represents a considerable economic burden on the US health care system. Pharmacy is the primary area of expenditure.

PMS24

CLINICAL RESPONSE AT WEEK 52 AND COSTS IN PATIENTS WITH RHEUMATOID ARTHRITIS USING BIOLOGICAL THERAPY IN A SPECIALIZED CENTER IN COLOMBIA

Santos-Moreno P[1], Villarreal L[1], Aza A[1], Jaimes H[1], Jaimes J[1], Castro C[2], Buitrago-Garcia D[2]
[1]Biomab, center for rheumatoid arthritis, bogota, Colombia, [2]SIIES investigation and research, Colombia, bogota, Colombia

OBJECTIVES: Rheumatoid Arthritis (RA) is a chronic autoimmune disease with a prevalence of 1% in general population. Due to the course of disease patients have progressive disability that causes productivity losses and early retirement leading to great expenses for society. Biological treatment for RA has been proved as an effective treatment but it is associated with high costs. We describe the costs of biological therapy in patients with RA in a specialized center. **METHODS:** We conducted a real-world, retrospective, cross-sectional study, we included patients with biological therapy; they were followed-up during 52 weeks and treated according to Disease Activity Score 28 (DAS28). Descriptive epidemiology was done; means were analyzed using t-Student performing a normality test for DAS28 and overall therapy costs were assessed. **RESULTS:** 684 patients were included; mean DAS28 at begining of therapy was 3.1 ± 1.1; the majority of patients received Adalimumab 16% followed by Etanercept 25 mg 12%, Tocilizumab, Infliximab and Rituximab 11%, Abatacept IV 10%, Etanercept 50 mg 10%, Certolizumab and Golimumab 7%, Tofacitinib 3% and Abatacept SC 2%. The most expensive biologic treatment was Golimumab (USD 12.770/year) followed by Certolizumab (USD 10.357), Etanercept 25 mg and 50 mg (USD 10.347), Tofacitinib (USD 9.811) Adalimumab (USD 9.799), Abatacept SC (USD 9.656) Tocilizumab (USD 8.795). Abatacept IV (USD 8.330 Infliximab (USD 6.564) and Rituximab (USD 4.427). When the progression of the disease was compared at week 52, most of patients went from a DAS28 of 3.1± 1.1 to a mean DAS28 of 2.4 ± 0.8 using biological therapy. **CONCLUSIONS:** The use of biologic therapies in the treatment of RA is effective but continues to be associated with high costs of biological therapy is to carefully evaluate patients that will receive this medications, nonetheless further research based on cost-effectiveness analysis is needed to verify these results.

PMS25

ADVERSE EVENT DATA AS PROXY TO DETERMINE TOTAL MEDICAL COSTS FOR TNF-ALPHA INHIBITORS

Hoffman KB[1], Dimbil M[1], Bartholow T[2], Lukazewski A[2], Davis J[1]
[1]Advera Health Analytics, Inc., Santa Rosa, CA, USA, [2]WEA Trust, Madison, WI, USA

OBJECTIVES: Adverse drug events (ADEs) lead to 700,000 ER visits and are the fourth leading cause of death in the U.S. ADE costs are paramount to understanding total medical cost and differential economic impacts between therapies. This study examined downstream medical costs associated with infections from the use of TNF-alpha inhibitors. The goal was to establish whether ADE cost analytics can be compared with claims databases to model safer and more cost-effective drug decisions. **METHODS:** We analyzed ADE and claims data for six TNF-Alpha inhibitors from August 2013 through July 2015. We examined: 1) ADE and outcome-specific medical costs obtained from AHRQ; 2) ADE and outcome data from FAERS; 3) drug usage information from Evaluate Pharma; and 4) claims data from WEA Trust. ICD-9 diagnoses were mapped to each ADE. Focus was limited to EudraVigilance Important Medical Events and "primary suspect" ADE reports. CPT Service Codes were used to establish three cost measurements: ER visits, hospitalizations, and ambulance transportation. Only medical services incurred after a filed pharmacy claim were examined. **RESULTS:** Certolizumab and golimumab were associated with a higher incidence of ADEs compared to other TNF-alpha's (adalimumab, etanercept, and infliximab) in both ADE and claims data. Downstream medical cost per dispense were: $522, $256, and $190 for certolizumab, adalimumab and etanercept, respectively, for ER visits. Hospitalizations costs were $156, $79, and $57 and ambulance transportation were $30, $19, and $19 for certolizumab, adalimumab, and etanercept, respectively. **CONCLUSIONS:** Given that both ADE and claims data suggested that two TNF-alpha inhibitors were more likely to cause infections and higher medical costs, WEA Trust will be working with providers to modulate TNF-alpha inhibitor prescriptions to lower cost and improve safety. Future work will examine other drug classes regarding the use of ADE analytics as a proxy for drug benefit design.

PMS26

COST-EFFECTIVENESS ANALYSIS OF SECUKINUMAB IN PSORIATIC ARTHRITIS: A CANADIAN PERSPECTIVE

Goeree R[1], Gladman D[2], Chiva-Razavi S[3], Gunda P[4], Graham CN[5], Miles L[5], Nikoglou E[6], Jugl SM[7]
[1]Professor Emeritus, McMaster University and Goeree Consulting Ltd, Hamilton, ON, Canada, [2]Toronto Western Hospital, University Health Network, University of Toronto, Toronto, ON, Canada, [3]Novartis Pharmaceutical Canada Inc, Dorval, QC, Canada, [4]Product Life Cycle Services - NBS, Novartis Healthcare Pvt. Ltd., Hyderabad, India, [5]RTI Health Solutions, Research Triangle Park, NC, USA, [6]Product Lifecycle Services - NBS, Novartis Global Service Center Dublin, Dublin, Ireland, [7]Novartis Pharma AG, Basel, Switzerland

OBJECTIVES: To evaluate the cost-effectiveness of secukinumab, a fully human monoclonal antibody that selectively neutralizes interleukin (IL)-17A, versus currently licensed biologic therapies in patients with active psoriatic arthritis (PsA) from a Canadian healthcare system perspective. **METHODS:** A decision analytic semi-Markov model evaluated the cost-effectiveness of secukinumab 150mg and 300mg compared to certolizumab pegol, etanercept, adalimumab, infliximab, infliximab biosimilar, golimumab, and ustekinumab in biologic-naïve and biologic-experienced patients, respectively, over a lifetime horizon. The response to treatments was evaluated after 12 weeks by PsA Response Criteria (PsARC) response rates. Non-responders or patients discontinuing initial-line of biologic therapy were allowed to switch to subsequent-line biologics. Model input parameters (Psoriasis Area Severity Index [PASI], Health Assessment Questionnaire [HAQ], withdrawal rates, costs, and resource use) were collected from clinical trials, published literature, and other Canadian sources. Benefits were expressed as quality-adjusted life years (QALYs). Costs were reported in Canadian dollars (CAD). An annual discount rate of 5% was applied to costs and benefits. **RESULTS:** In the biologic-naïve population, patients treated with secukinumab achieved the highest number of QALYs (8.54) at the lowest cost (CAD 925,387) over a lifetime horizon compared to all comparators, except for infliximab and its biosimilar, which achieved minimally more QALYs (8.58) than secukinumab. However, infliximab and its biosimilar incurred more costs than secukinumab (infliximab: CAD 1,015,437; infliximab biosimilar: CAD 941,004), resulting in worse cost-effectiveness profiles. Secukinumab dominated all therapies except infliximab, but was cost-effective versus infliximab in this population. In the biologic-experienced population, secukinumab dominated all treatments as it generated more QALYs (8.89) at lower costs (CAD 954,692). Deterministic sensitivity analyses indicated the results were most sensitive to variation in PsARC response rates, change in HAQ, and utility values. **CONCLUSIONS:** Secukinumab is either dominant or cost-effective versus all licensed biologics for the treatment of active PsA in biologic-naïve and biologic-experienced populations in Canada.

PMS27

COST-EFFECTIVENESS OF PHARMACOLOGICAL RHEUMATOID ARTHRITIS TREATMENTS IN THE UNITED STATES: A SYSTEMATIC REVIEW OF THE LITERATURE

Axon DR, Patel M
University of Arizona, Tucson, AZ, USA

OBJECTIVES: To conduct a literature review to identify cost-effective analysis (CEA) studies for the pharmacological treatment of rheumatoid arthritis (RA) in the United States (US). **METHODS:** A total of four databases were searched to identify articles relevant to CEA of pharmacological interventions for rheumatoid arthritis: (1) Embase; (2) Medline; (3) Tufts CEA registry; and (4) The UK National Institute for Health Research (NIHR) Health Technology Assessment (HTA) Database; from inception to November 5, 2016. Key search terms included "rheumatoid arthritis" and "cost" or "cost-effectiveness". English, peer-reviewed studies from the US perspective that reported original CEA's were included. **RESULTS:** The search identified a total of 2,882 articles. After the removal of duplicates and title screening, 110 articles remained for full-text review. A total of 11 articles were included in the review. These articles were assessed for quality according to the CHEERS checklist and had scores ranging from 11/24 (46%) to 18/24 (75%). The pharmacological agents most commonly reported in the articles were: methotrexate (n=7), etanercept (n=7), and adalimumab (n=5). The model types of the articles were decision models (n=5), Markov models (n=2), Monte-Carlo simulations (n=2), and individual patient simulations (n=2). The time horizons ranged from 6 months to lifetime, and generally performed discounting at a rate of 3%. The perspectives of the studies were either payer (n=7), societal (n=3), or both (n=1). Incremental cost-effectiveness ratio values reported in the studies ranged from a low of $4,849/quality-adjusted life-year (QALY) to a high of $12.5 million/QALY. **CONCLUSIONS:** Overall, there were a total of 11 articles that presented CEA of various pharmacological treatment options for RA in the US. However, since some drugs were analyzed less frequently than others, and they were not all compared against each other, it was not possible to state which was the most cost-effective option overall.

PMS28

AN INTRA-ARTICULAR, EXTENDED-RELEASE FORMULATION OF TRIAMCINOLONE ACETONIDE AS A COST-EFFECTIVE THERAPY FOR TREATING OSTEOARTHRITIS OF THE KNEE

Kelley SD[1], Johnson JR[1], Thornton D[1], Skaar JR[2], Varsos GV[2], Peyerl FW[2]
[1]Flexion Therapeutics, Burlington, MA, USA, [2]Boston Strategic Partners, Inc., Boston, MA, USA

OBJECTIVES: The present study investigated the cost-effectiveness of a novel, intra-articular, extended-release formulation of triamcinolone acetonide (TA-ER) in comparison to other methods for treating knee osteoarthritis (OA) pain. **METHODS:** Clinical outcome data from 324 patients enrolled in three Phase 2 and Phase 3 randomized trials (NCT01487161, NCT02116972, NCT02357459) evaluating an investigational intra-articular corticosteroid formulation (FX006 40 mg) for treatment of knee OA pain were used. In these studies, Western Ontario and McMaster Universities Osteoarthritis Index (WOMAC-A [Pain], -B [Stiffness], -C [Physical Function]) data were assessed at baseline and at 4-week intervals through 12 (one study) or 24 weeks (2 studies) post-treatment. Health Utilities Index Mark 3 (HUI3) scores were calculated from WOMAC values. Cost-effectiveness was assessed using cost per quality-adjusted life years ($/QALY) and the incremental cost-effectiveness ratio (ICER) versus other knee OA treatments, including conventional care with non-steroidal anti-inflammatory drugs (NSAIDs), acetaminophen, physical therapy, and assistive devices (CC); prescription NSAIDs (diclofenac); and hyaluronic acid treatment regimens with 1-5 intra-articular injections (HAs); based upon 2016 WAC pricing. **RESULTS:** TA-ER demonstrated sustained significant improvements from baseline in all WOMAC components through 24 weeks, with concordant improvements in HUI3; peak HUI3 gain from baseline was 0.229 at week 4. Overall, TA-ER treatment produced an average QALY gain from baseline of 0.189 per 6 months, higher than published for CC (0.030), diclofenac (0.078) and HAs (average 0.110). At a hypothetical drug cost of $500, TA-ER yields a $/QALY estimate of $3,201, in comparison to other treatments: diclofenac ($2,708), CC ($10,717), and HAs (average $13,267). TA-ER at this treatment cost provided ICERs of $1,783 versus CC, $3,549 versus diclofenac, and was the dominant strategy versus HA injection regimens. **CONCLUSIONS:** Intra-articular TA-ER injection provides sustained positive clinical outcomes, and if priced similarly to HA therapies, will be a cost-effective therapy for treating knee OA pain.

PMS29

ASSESSING THE COMPARATIVE EFFECTIVENESS OF TOCILIZUMAB IN GIANT CELL ARTERITIS WITHIN A DE NOVO HEALTH ECONOMIC MODEL, BASED ON THE GIACTA TRIAL AND DATA FROM MARKET SCAN DATABASE

Orfanos P[1], Felizzi F[1], Harland D[1], Gale SL[2]
[1]F. Hoffmann La Roche, Basel, Switzerland, [2]Genentech, South San Francisco, CA, USA

OBJECTIVES: To assess the comparative effectiveness of tocilizumab with prednisone vs. prednisone alone, in Giant Cell Arteritis (GCA). **METHODS:** A de-novo cost-effectiveness model was built to reflect the natural history of GCA, with the following health states: remission (on and off steroids), relapse/flare and death. A lifetime horizon was applied. Patient's quality of life was estimated using the EQ-5D results from the GiACTA trial. The model accounts for adverse events (AEs) related to prednisone cumulative dose and GCA related AEs with a flare. Time to first flare Kaplan Meier curves were extrapolated using parametric models, rates of subsequent flares were assessed using Poisson regression. Cumulative prednisone dose for each treatment arm was extrapolated in the long run using a logistic regression and linked with probabilities of prednisone related AEs such as diabetes, fractures and serious infections based on the real world data from US MarketScan. **RESULTS:** In the tocilizumab arm, the median time in steroid free remission was two years longer than patients on prednisone alone. Patients who received tocilizumab had an improved quality of life to those on prednisone alone; this was driven by the reduction in their risk of flare by over 50%. This resulted in a statistically significant ($P<0.0001$) decrement over baseline utility, equal to 0.13. Furthermore, patients on tocilizumab reduced their cumulative prednisone significantly, as a result, patients on prednisone alone risk for developing glucocorticoids related AEs are 117% higher than tocilizumab patients. **CONCLUSIONS:** Tocilizumab significantly improved the quality of life of patients with GCA compared to the current standard of care through more patients achieving better disease control and by reducing the risk of long term AEs.

PMS30

A COST PER RESPONDER MODEL FOR ORAL TOFACITINIB AND BIOLOGIC TNF INHIBITORS IN RHEUMATOID ARTHRITIS DURING THE INITIAL 24 WEEKS OF THERAPY

Simmons D, Shan J, Shukla S, Lee H, Toscani M
Rutgers, The State University of NJ, Piscataway, NJ, USA

OBJECTIVES: Current therapy for moderate to severe rheumatoid arthritis (RA) often utilizes a subcutaneous or infused tumor necrosis factor (TNF) inhibitor with methotrexate. Tofacitinib is an oral Janus kinase (JAK) inhibitor that is indicated for the treatment of RA. Tofacitinib is priced similarly to injectable biologics and the purpose of this study is to evaluate the cost-effectiveness of tofacitinib, in combination with methotrexate, for the initial 24 weeks of treatment compared to currently available TNF inhibitors. **METHODS:** A cost per responder model was created for the initial 24 weeks of treatment with combination therapy of methotrexate and tofacitinib, infliximab, adalimumab, etanercept, golimumab for infusion, or certolizumab pegol. A number needed to treat (NNT) was calculated from the ACR20 response rate at 24 weeks of treatment in the phase three trials for each drug. Dosing was based on approved prescribing information and includes any recommended loading doses during the initial 24 weeks. Weight based dosing was estimated from CDC reported average adult weights and the gender distribution from the phase three clinical trials of the drugs. Wholesale acquisition costs (WAC) from the FDA Redbook were used for pricing each drug. **RESULTS:** The NNT ranged from 1.41 to 2.00. Infliximab had the lowest cost per responder ($33,398.10 NNT: 2.00), followed by etanercept ($34,628.96 NNT: 1.41), tofacitinib ($40,419.73 NNT: 1.94), golimumab for infusion ($41,158.51 NNT: 1.70), adalimumab ($48,274.24 NNT: 1.81), and certolizumab pegol ($50,066.26 NNT: 1.70). **CONCLUSIONS:** While tofacitinib demonstrates a similar NNT and cost per responder to many biologics, it is less cost effective than infliximab and etanercept. Limitations of the model are that it does not include administration costs or the costs of treating adverse events. Future research is needed to determine the cost-effectiveness of therapy beyond the initial 24 weeks since loading doses are no longer needed.

PMS31

COST SAVINGS ASSOCIATED WITH THE DECREASE OF USE OF BIOLOGICAL THERAPY IN PATIENTS WITH RHEUMATOID ARTHRITIS USING CONVENTIONAL DMARDS DURING A 5 YEAR PERIOD

Santos-Moreno P[1], Villarreal L[1], Aza A[1], Jaimes H[1], Jaimes J[1], Castro C[2], Buitrago-Garcia D[2]
[1]*Biomab, center for rheumatoid arthritis, bogota, Colombia,* [2]*SIIES investigation and research, Colombia, bogota, Colombia*

OBJECTIVES: Pharmacological therapy in patients with rheumatoid arthritis (RA) include conventional therapy (DMARDs) and biological therapy (BT), but BT is still associated with high costs and has impacted the budget in Colombian Health System. We aim to describe the effectiveness of conventional DMARDs therapy in patients with RA by reducing the Disease Activity Score 28 (DAS28) in patients with moderate-severe disease activity during 5 years in a specialized center in RA and subsequently cost savings obtained. **METHODS:** We conducted a real-world, descriptive cohort study. We included patients who had moderate/severe disease activity in a specialized RA center in Bogotá, Colombia during 2012-2016. These patients were potential candidates for biological therapy and were followed-up under T2T standards. Clinical follow-up was done according to DAS28: every 3-5 weeks (DAS28 $>$ 5.1), every 7-9 weeks (DAS28 $\geq$ 3.1 and $\leq$ 5.1), and every 11-13 weeks (DAS28 $<$ 3.1). Therapy had to be adjusted with DAS28 $>$ 3.2 unless patient's conditions don't permit it. Descriptive epidemiology was done; the means were analyzed using Chi2 test performing a normality test for DAS28 distribution. **RESULTS:** 776 patients meet inclusion criteria; 83% were female, mean age was 64 $\pm$ 10. At baseline 616 (79%) had moderate disease activity and 160 (21%) severe disease activity, mean DAS was 4.7 $\pm$1.0. After a 5 year of follow-up, 80% of patients achieved remission/low disease activity. The cost of biological therapy in Colombia finishing 2016 on average was 9201 US dollars/year/patient, and for 613 patients amount in projected costs-savings of preventing use of biologics was approximately 5.640.213 US dollars/year. **CONCLUSIONS:** The results of this cohort showed the effectiveness of conventional DMARDs therapy for the achievement of remission/low disease activity in patients with RA in a model with T2T strategy and a multidisciplinary approach, leading to significant cost savings for health system.

PMS32

COST-EFFECTIVENESS OF THERAPIES FOR EARLY RHEUMATOID ARTHRITIS IN THE CONTEXT OF THE EVIDENCE-BASED CLINICAL PRACTICE GUIDELINE FOR COLOMBIA

Díaz Rojas JA[1], Moreno A[1], Urrego J[1], Huerfano C[2], Davila F[2], Quintana G[1]
[1]*Universidad Nacional de Colombia, Bogotá,DC, Colombia,* [2]*Universidad Nacional de Colombia, Bogota, Colombia*

OBJECTIVES: To evaluate the cost-effectiveness of two or more non-biological DMARDs versus biological+MTX in the context of the evidence-based clinical practice guideline for Colombia. **METHODS:** The analysis of cost effectiveness was conducted in development of the clinical practice guideline for early detection, diagnosis, and treatment of the Rheumatoid Arthritis in Colombia. A decision tree was constructed to determine the cost-effectiveness. The patients over the age of 16, with early rheumatoid arthritis or very early, with two or more poor prognostic factors and high activity of the disease during one year. The model compared two or more non-biological DMARDs versus a biological+methotrexate. Efficacy information was taken from the controlled clinical trial (Goekoop-Ruiterman et al., 2005), and the costs of procedures and medications from national tariff system. The perspective of the General System of Social Security in Health (third payer) was used. The remission of the disease was the outcome. **RESULTS:** The average cost of a case of remission in a year with DMARDs was 448,68 USD, and with biological+MTX was 10,591 USD. One additional case of remission in a year with biological+MTX versus 2 DMARDs has an incremental cost of 338,063.3 USD. In the sensitivity probability analysis with a threshold of 3 GDP per capita (14,998 USD), the 70,27% of the estimates for biological+MTX was above the threshold, and 29.73% was a dominated strategy, since, it was less effective and more expensive than the alternative with DMARDs. **CONCLUSIONS:** The combination of a biological+MTX is not cost effective in the Colombian context, for the first line treatment of early rheumatoid arthritis in adult patients with high activity and two more poor prognostic factors.

PMS33

COST-EFFECTIVENESS OF SINGLE-DOSE ZOLEDRONIC ACID FOR NURSING HOME RESIDENTS WITH OSTEOPOROSIS

Ito K
Hebrew SeniorLife, Dedham, MA, USA

OBJECTIVES: Hip fracture sustained in nursing homes is an important source of mortality, morbidity, and healthcare expenditure. The study aimed at evaluating the cost-effectiveness of routine administration of single-dose zoledronic acid in nursing home residents with osteoporosis. **METHODS:** A Markov cohort simulation model was developed. The target population was a hypothetical cohort of nursing home residents aged 85 years with osteoporosis. The analysis was conducted from a health care system perspective over a lifetime horizon. Two strategies were compared: a single intravenous dose of zoledronic acid 5mg (ZOL); and usual care (calcium and vitamin D supplementation only). Data sources were published literature. The relative risk of hip fracture was estimated based on a surrogate outcome of bone mineral density in the ZEST (Zoledronic acid in frail Elders to STrengthen bone) trial. The main outcome was incremental cost-effectiveness ratio (ICER) as measured by cost per quality-adjusted life year (QALY) gained. **RESULTS:** Compared with usual care, the ZOL strategy had an ICER of $220,300 per QALY gained and was not cost-effective at a conventional willingness-to-pay threshold of $100,000 per QALY gained. The results were robust to a reasonable range of assumptions about incidence, mortality, quality-of-life effects, and the cost of hip fracture and the administration cost of ZOL. The ZOL strategy had a potential to become cost-effective if 6-month mortality in nursing home residents was below 15% or if fracture risk reduction by ZOL was above 25%. Probabilistic sensitivity analysis revealed that the ZOL strategy would be cost-effective in 11%, 24%, and 42% of simulations at willingness-to-pay thresholds of $50,000, $100,000 or $200,000 per QALY gained, respectively. **CONCLUSIONS:** Routine administration of single-dose zoledronic acid in nursing home residents with osteoporosis is not a cost-effective use of resources from a health care system perspective. It would be justifiable in nursing home residents with a favorable life expectancy.

PMS34

EXPLORATORY COST-EFFECTIVENESS EVALUATION OF DIFFERENT TREATMENT STRATEGIES FOR MENISCUS ROOT TEARS

Faucett SC[1], Liu S[2], Krych AJ[3], Kurzweil PR[4], LaPrade RF[5], Pietzsch JB[2]
[1]*George Washington Hospital, Washington, DC, USA,* [2]*Wing Tech Inc., Irvine, CA, USA,* [3]*Mayo Clinic, Rochester, MN, USA,* [4]*Memorial Orthopaedic Surgical Group, Long Beach, CA, USA,* [5]*Steadman Philippon Research Institute, Vail, CO, USA*

OBJECTIVES: Medial meniscus root tears are common among patients over 50 years of age, and are the biomechanical equivalent of a total meniscectomy, which typically leads to the rapid advancement of knee osteoarthritis. Studies have documented the clinical consequences of conservative therapy, meniscectomy and meniscus root repair, but limited information is available related to their long-term costs. Our objective was to explore the cost-effectiveness of these differing treatment strategies in the United States. **METHODS:** A Markov model was constructed to project strategy-specific progression to symptomatic osteoarthritis (OA), total knee arthroplasty (TKA) and revision TKA in a cohort of 50-year old patients presenting with no significant OA at time of treatment. Failure rates of repair and meniscectomy procedures were accounted for. Utilities, costs, and event rates were based on literature and public databases. Analyses considered a 10-year timeframe, and explored the effects of parameter uncertainty and of different analysis horizons. **RESULTS:** Over 10 years, 45.8% of the meniscectomy and non-treated patients were projected to have undergone TKA, compared to 29.3% of repair patients. Discounted 10-year costs were $15,864 for repair, compared to $17,943 and $20.972 for no treatment and meniscectomy. Projected quality-adjusted life years (QALY) were 7.03, 6.75, and 6.72, respectively, yielding repair to be associated with most favorable outcomes at concurrent cost savings of $2,079 compared to next best strategy. Repair was either cost-effective or dominant across a broad range of OA progression and repair failure rates. Analysis horizons of 2 years or longer found repair to be cost-effective, and dominant for horizons of 6 years or more. **CONCLUSIONS:** Our model-based projections suggest that repair of meniscal root tears is associated with improved mid- and long-term outcomes and cost savings relative to both meniscectomy and conservative therapy, making repair the most cost-effective strategy for meniscal root tears.

PMS35

THE COST-EFFECTIVENESS OF XIAN LING GU BAO FOR THE TREATMENT OF POSTMENOPAUSAL OSTEOPOROSIS IN CHINA: A DECISION-TREE MODEL

Zhang L[1], Liu J[2], Liu B[3], Xuan J[2]
[1]*Shanghai Centennial Scientific Ltd., Shanghai, China,* [2]*Sun Yat-Sen University, Guangzhou, China,* [3]*Department of Health Economics, School of Public Health, Fudan University, Shanghai, China*

OBJECTIVES: The multi-component Fufang (non-leguminous traditional Chinese herbal formulas with multi-interactive compounds) Xian Ling Gu Bao (XLGB) in capsular form was officially approved by China FDA for the management of menopausal osteoporosis and related conditions based on its safety and efficacy evidence. This study was conducted to evaluate the cost-effectiveness of XLGB versus placebo in the management of postmenopausal osteoporosis from Chinese

payer's perspective. **METHODS:** A decision-tree model based on the BMD change efficacy information from a randomized clinical trial (RCT) was developed to estimate the outcomes of XLGB treatment over 10 years. After one-year treatment of XLGB or placebo, changes in bone mineral density (BMD) in femoral neck were utilized to predict the10-year risk of hip fracture and thus the risk of hip-fracture related mortality. The 10-year hip fracture risk was assessed via FRAX ® WHO Fracture Risk Assessment Tool. The mortality followed by hip fracture was estimated from a large population-based cohort study among Taiwanese. The effects of hip fracture on utilities were estimated based on a systemic review. Cost data, including treatment cost of hip fracture and adverse events were obtained from literature and KOL survey. A one-way sensitivity analysis was conducted. **RESULTS:** The total cost for XLGB and placebo was ¥6,911.77 and ¥5,789.69, respectively. The QALY of XLGB group was 5.302 while that of placebo group was 3.286. The ICER value of 70,396.91 RMB/QALY, which is below the WHO recommended threshold (less than 3 times of GDP) in all Chinese provinces, indicating that XLGB is a cost-effective alternative for treating postmenopausal osteoporosis . The one-way sensitivity analysis of key parameters suggested the robustness of the model. **CONCLUSIONS:** Compared with placebo, XLGB is a cost-effective alternative for the treatment of postmenopausal osteoporosis in China.

PMS36

MODELING THE COST-EFFECTIVENESS OF RITUXIMAB USE COMPARED TO TUMOR NECROSIS FACTOR INHIBITORS (ANTI-TNF) AGENTS AS A SECOND-LINE THERAPY IN PATIENTS WITH RHEUMATOID ARTHRITIS (RA) IN QUEBEC, CANADA USING RHUMADATA REGISTRY DATA

Lopatina E[1], Marshall DA[2], Coupal L[3], Choquette D[4]
[1]University of Calgary, Calgary, AB, Canada, [2]and Director, Health Technology Assessment, Alberta Bone and Joint Health Institute, Calgary, AB, Canada, [3]Institut de rhumatologie de Montréal, Montréal, QC, Canada, [4]Institut de Rhumatologie de Montréal, Montreal, QC, Canada

OBJECTIVES: No guidelines are available for selecting a particular biologic agent for Rheumatoid Arthritis (RA) treatment. We conducted a cost-utility analysis to compare rituximab and three tumor necrosis factor inhibitors (anti-TNF) (adalimumab, etanercept, and infliximab) used as second-line therapy in terms of direct RA-related costs borne by the public health care system and Quality Adjusted Life Years (QALYs) gained. **METHODS:** Four two-state (e.g., "on second-line treatment" and "after failing second-line treatment") Markov models reproduced the 6-years long course of patients treated either with adalimumab, etanercept, infliximab or rituximab. Baseline patient characteristics, transition probabilities, cost and treatment effectiveness were estimated for each group of patients based on the data from a clinical registry RHUMADATA®. We included RA patients who started the second-line treatment between January 1st, 2007 and January 1st, 2013. Only patients who had complete data on baseline and follow-up Health Assessment Questionnaire (HAQ) scores were included in this preliminary analysis. Transition probabilities for rituximab and the combined anti-TNFs were obtained from Kaplan-Meier survival estimates of the 6-year drug retention rates. Unit costs (2016 CAD) from Quebec, Canada were applied to value RA-related healthcare resources used (e.g., biologic agent and rheumatologist visits costs) measured on an item-by-item basis. Treatment effectiveness was measured in QALYs calculated from HAQ scores over follow-up time. **RESULTS:** Out of 130 RA patients identified, 96 patients were included in this preliminary analysis. Over 6 year follow-up, rituximab as a second-line treatment was associated with cost of $18,312 and effectiveness of 2 QALYs and was dominant over treatment with adalimumab, etanercept, and infliximab, which were associated with cost of $22,022, $21,976 and $26,502, and effectiveness of 1.98 QALYs, 1.97 QALYs and 1.76 QALYs, respectively. **CONCLUSIONS:** Based on results of the preliminary analysis, the second-line rituximab therapy was more effective and less costly when compared to adalimumab, etanercept, and infliximab.

PMS37

COST MINIMIZATION ANALYSIS IN THE SWITCH OF INFLIXIMAB FOR ITS BIOSIMILAR IN THE BRAZILIAN PRIVATE HEALTHCARE SYSTEM

Alexandre RF, Squiassi HB, Santana CF
Pfizer, São Paulo, Brazil

OBJECTIVES: To develop a cost minimization analysis in the switch of infliximab to it biosimilar, in the treatment of rheumatoid arthritis (RA) from the perspective of Brazilian private health system (BPHS). **METHODS:** A cost minimization analysis model was developed to measure the impact of treatment switch from Infliximab to its biosimilars. The analysis considered the perspective of the BPHS, and has included only direct costs of medicines (as regulated by the local Ministry of Health), in a cohort of 2 million lives (based on average of top 10 largest Brazilian Private Health Plans). The incidence rates for RA in the Brazilian population (0.46%; N= 9,200), followed by an estimate percentage of patients treated with Infliximab (34.15%; N=3,142), for the switch scenario were considered an increasingly switching rate from 30% with additional 5% early, up to 50% at the end of 5 years. The population was adjusted using a growth rate of 0.09% after first year. **RESULTS:** During first year, the "without switch" scenario costs were BRL 151,769 million, followed by BRL 151,905 million, BRL 152,042 million, BRL 152,178 million and BRL 152,315 million in the following years. For the "switch to biosimilar" scenario costs were BRL 136,088 million in the first year, followed by BRL 133,596 million, BRL 131,099 million, BRL 128,594 million and BRL 126,091 million in the following years. The difference between the scenarios generated an economy of BRL 15,6 million followed by BRL 18,3 million, BRL 20,9 million BRL 23,5 million and BRL 26,2 million in the following years resulting in a total economy of BRL 104,7 million. **CONCLUSIONS:** The switch to biosimilar could provide payers an option for expenditures reduction, being a viable alternative for physicians to provide the chosen treatment at a lower cost, increasing the access to the drug, and overall treatment availability.

PMS39

IMPACT OF RHEUMATOID ARTHRITIS ON EMPLOYMENT AND PRODUCTIVITY LOSS AMONG NON-INSTITUTIONALIZED INDIVIDUALS IN THE U.S.

Gaitonde P, Zheng Z, Shaya F
University of Maryland, Baltimore, MD, USA

OBJECTIVES: Rheumatoid arthritis (RA) is a chronic inflammatory condition characterized by chronic pain and joint deformity, which affects function, productivity and overall quality of life. There is limited literature on nationally representative estimates of current RA-related burden. Our objective was to examine the impact of RA on employment and productivity loss among adults in the US. **METHODS:** In this pooled cross-sectional study, we used the Medical Expenditure Panel Survey (MEPS) data for the years 2010-2014. We identified RA patients using the clinical classification code – 202 and ≥45 years of age. We measured employment disability, days missed at work for employed and days in bed (2010-2012) for unemployed RA patients. Additionally, we measured productivity loss as limitation in work, housework or any activity. We used multiple logistic and negative binomial regression models to control for covariates such as age, gender, race, education, occupation, comorbidities, and overall health status. The wage estimates are for 2014 and value of home productivity for 2012. **RESULTS:** In descriptive analysis, more RA patients were older, females, not working due to illness, had limitation in work, housework and any activity. In adjusted analysis, compared to non-RA, the RA patients were 74% more likely to have employment disability (95% CI 1.34-2.27) leading to per capita wage loss of $6,990 (95% CI $4,418-$9,994); had 1.52 missed work days (p=0.02) corresponding to $160 per capita productivity loss. At home, RA patients spent 1.92 days in bed ($p<0.01$) with per capita productivity loss of $81. Additionally, RA patients were 24% and 44% more likely to have limitations in housework and any activity respectively. **CONCLUSIONS:** RA is highly associated with productivity loss both at home and in the workplace. These results will help inform interventions aimed at reducing the overall economic burden associated with RA in different at-risk groups.

HEALTH CARE RESOURCE USE OF MEDICARE BENEFICIARIES WITH PRIMARY OSTEOARTHRITIS (OA) OF THE KNEE – A CLAIMS DATA ANALYSIS

Su W[1], Chen F[1], Iacobucci W[1], Bedenbaugh A[2], Bair N[2], Oruc A[2]
[1]IHS Markit, Washington, DC, USA, [2]Samumed, San Diego, CA, USA

OBJECTIVES: To estimate how health care resource use patterns have shifted over time for Medicare beneficiaries with primary knee osteoarthritis (OA) across 5 care delivery settings. **METHODS:** De-identified patient level claims data from 2009 and 2014 were provided by CMS. Datasets for primary care, home-health, inpatient, outpatient, and skilled nursing facilities (SNF) were assessed. 534,004 primary knee OA patients were identified using ICD-9 codes 715.16, 715.36, 715.96, and excluding confounding comorbidities such as rheumatoid arthritis. Submitted costs for each site of care per dataset year were analyzed to report resource utilization trends. A benchmark population without OA will also be generated using demographics-based propensity score matching and the burden of OA will be calculated. **RESULTS:** On average, each OA patient had 1.2 inpatient stays, 7.7 outpatient visits, 9.9 primary care visits, 0.89 home care episodes and 0.16 SNF stays in 2009. In 2014, the number of primary care visits increased to 11.3 and SNF stays tripled to 0.48, while outpatient visits decreased slightly to 7.28 and home care utilization dropped to near-zero. In both years, 95% of OA hospitalizations were for joint replacements with an average length of stay of 3 days. The cost of delivering care increased for most of the settings. In 2009, average cost (inflated to 2014 value) for each episode of care in inpatient, outpatient, and SNF setting was $52,949, $1,079, and $8,236, respectively. In 2014, this changed to $55,379, $1,403, and $8,517, respectively. For primary-care visits, while cost per visit decreased ($165 to $147), overall costs for visits increased. **CONCLUSIONS:** Primary knee osteoarthritis is a significant source of economic burden in Medicare patients. Overall, most costs have increased between 2009 and 2014, despite adjustment for inflation. Further research into overall burden and cost drivers will assist in understanding treatment trends in the OA Medicare population.

PMS41

HEALTH CARE RESOURCE USES AND COSTS IN COLOMBIAN EARLY RHEUMATOID ARTHRITIS PATIENTS

Díaz Rojas JA[1], Quintana G[1], Aristizabal F[1], Brown P[2]
[1]Universidad Nacional de Colombia, Bogotá,DC, Colombia, [2]University of California, Merced, Merced, CA, USA

OBJECTIVES: To establish the use of health resources (drugs, clinical laboratory, diagnostic imaging, medical appointments and abcenteeism) and costs related to the care of early rheumatoid arthritis (ERA) in a Colombian real world, **METHODS:** A cohort of 345 patients with ERA from two health care institutions in Bogota, Colombia, followed by two years (2013-2015). On the first appointment, patients were classified according to the disease activity (DAS), and were checked every three months. In this period, the use of resources and costs for each patient was identified. **RESULTS:** The total cost for 345 patients was $2,323,373 USD. According to DAS in the first appointment patients were classified as: remission 13.3%, low 7.8%, moderate 42.9%, and high 35.9%. The 21.2% of the patients received biological treatment, representing a cost of care equivalent to 86.4% of the total cost. In the biological group, distribution of costs by initial DAS was remission 3.1%, mild 1.6%, moderate 30.8%, and high 64.5%; additionally, drugs accounted for 95.6% of the cost of care, followed by work abcenteeism with 3.3%. The 78.8% of patients received treatment with DMARDs, its cost of care was 13.6% of the total. The distribution of costs by initial DAS was remission 8.2%, low 8.2%, moderate 40.5%, and high 43.1%. In this group, the drugs represent 42.5% of the cost, and the abcenteeism 37.2%. The average cost of care per patient with biologicals was $27,505 USD and $1,160 USD DMARDs. The average of work abcenteeism by patient days were 64.2 and 31.3 respectively. **CONCLUSIONS:** The most expensive stage was high, followed by the

moderate for the two groups of the study. The group that received biologicals on average is 23.7 times more expensive than the DMARDs group.

MUSCULAR-SKELETAL DISORDERS – Patient-Reported Outcomes & Patient Preference Studies

PMS42

SWITCHING AND MEDICATION PERSISTENCE OF PATIENTS TAKING DISEASE MODIFYING ANTI RHEUMATIC DRUGS (DMARDS): A COMPARATIVE EFFECTIVENESS STUDY

Dibie C, Banahan III B
Center for Pharmaceutical Marketing and Management, University of Mississippi, University, MS, USA

OBJECTIVES: Rheumatoid arthritis (RA) is a chronic autoimmune disorder that affects small joints of the hands and feet. It usually results in swollen and painful joints. In severe cases, there may be lethargy and weakness which progresses within months. Despite the progress in the area of Rheumatoid Arthritis in terms of prognosis, drug response and treatment modalities can be erratic. Patients are typically switched to agents with similar action and efficacy. This study is aimed at determining the number and proportion of rheumatoid arthritis patients with a new start of a DMARD, switching to another DMARD within a 6 and12 month period. **METHODS:** This study is a retrospective analysis of a cohort of Rheumatoid Arthritis patients This study will utilize the Mississippi Medicaid administrative claims database. Patients must be ≥ 18 years identified through a diagnosis of Rheumatoid arthritis with ICD 9 code (714.xx) and ICD 10 code (M06.9). The index date will be the date of a new start for a DMARD within the time period and continuous eligibility in Medicaid for 6 months would be the pre index period The primary outcome of interest would be to determine the number patients that change from their current DMARD to another within the time frames – 6months and 12 months following initial therapy. Patients must also be DMARD naïve prior to study. **RESULTS:** 980 patients on 10 different DMARDS were identified using the inclusion criteria, all patients were consistent with their medication for the initial 6 months. However, 63 patients switched to another DMARD or quit their current DMARD therapy within a 12 month period. **CONCLUSIONS:** This study shows that majority of patients currently on DMARDS show tolerability to their current medication, although a significant number of patients do not tolerate therapy after using these medications for some time.

PMS43

ADHERENCE EVALUATIONS FOR TUMOR NECROSIS FACTOR ALPHA INHIBITORS FOR RHEUMATOID ARTHRITIS I

Watanabe JH[1], Saseen JJ[2], Dilokthornsakul P[3], Campbell JD[4]
[1]*University of California San Diego, La Jolla, CA, USA,* [2]*University of Colorado Anschutz Medical Campus, Aurora, CO, USA,* [3]*Naresuan University, Phitsanulok, Thailand,* [4]*University of Colorado Anschutz Medical Campus, Denver, CO, USA*

OBJECTIVES: To characterize one-year follow-up rates of treatment response parameters in new users of tumor necrosis factor (TNF)-alpha inhibitors for rheumatoid arthritis in nationally representative medicare and commercial claims databases. **METHODS:** A retrospective cohort analysis of RA patients in the 2011 Truven MarketScan database was conducted. Subjects were required to have RA based on ICD-9 code, at least one claim for one of the TNF-alpha inhibitors and 12 months continuous enrollment before and after the first TNF-alpha inhibitor claim. Adherence was defined as medication possession ratio of at least 80%. Glucorticoid equivalent dose of at least 10 mg designated flare management. Analyses conducted using SAS 9.4 (Cary, NC) and Python 9.4.3 (Python Software Foundation). **RESULTS:** In the Medicare cohort (n=8,123), 33.0% of new users experienced a 60 day gap or more or switched TNF-alpha inhibitors. Regarding adherence, 37.2% were non-adherent. In terms of glucorticoid usage, 7.2% of the cohort failed based on increased glucorticoid dose and 4.0% failed based on glucocorticoid initiation. In terms of DMARDs, 67.2% of the cohort used a DMARD concurrently with TNF-alpha inhibitor use. Outpatient costs during the study period were an average of $413 and TNF-alpha inhibitor costs were an average of $20,516. In the commercial cohort (n=41,244), 41.0% of new users experienced a 60 day gap or more or switched TNF-alpha inhibitors. Regarding adherence, 47.2% were non-adherent. In terms of glucorticoid usage, 7.7% of the cohort failed based on increased use of glucorticoid and 4.3% failed based on glucocorticoid initiation. In terms of DMARDs, 73.4% of the cohort used a DMARD concurrently with TNF-alpha inhibitor use. Outpatient costs during the study period were an average of $518 and TNF-alpha inhibitor costs were an average of $19,558. **CONCLUSIONS:** Substantial discontinuation and nonadherence present challenges to RA management. Developing means of improving appropriate use are needed.

PMS44

IMPACT OF ABBVIE'S PATIENT SUPPORT PROGRAM (PSP) ON PERSISTENCE WITH ADALIMUMAB THERAPY AMONG PATIENTS WITH RHEUMATOID ARTHRITIS IN URUGUAY

Hernandez J[1], Maciel G[2], Chaves L[3], Becerra V[4], Chen N[3], Skup M[3], Garg V[3]
[1]*Hospital Cooperativa Médica Florida, Florida, Uruguay,* [2]*Universidad de la República, Montevideo, Uruguay,* [3]*AbbVie Inc., North Chicago, IL, USA,* [4]*AbbVie, Montevideo, Uruguay*

OBJECTIVES: AbbVie provides a PSP to support adalimumab (ADA)-treated patients with laboratory tests, nurse support, injection training, pen disposal, and medication reminders. We investigated associations between PSP and rate of ADA persistence among ADA-treated patients with rheumatoid arthritis (RA) in Uruguay. **METHODS:** A retrospective study was conducted (03/2010–11/2014) among adults with RA who initiated ADA and opted-in to the PSP (PSP-users) versus patients who initiated ADA and did not opt-in to PSP (non-users). All patients were evaluated using AbbVie's PSP database and available dispensing data at 12 and 24 months following initiation. For PSP-users, the index date was the date of enrollment. ADA initiation was used to assign index dates to non-users. The difference in persistence (time from index date to ADA discontinuation date) between PSP-users and non-users was evaluated. Discontinuation was defined as no ADA dispensing for 3 consecutive months. No formal statistical tests were required because the full population of ADA-treated patients in Uruguay was analyzed, eliminating the need for hypothesis testing. **RESULTS:** A total of 210 (98 PSP-users, 112 non-users) and 136 (44 PSP-users, 92 non-users) patients were available for the 12- and 24-month analyses, respectively. By 12 months, PSP-users persisted on ADA for an average of 11 months versus 9.98 months for non-users. Persistence on ADA continued to be higher at 24-months with PSP-users using ADA for an average of 20.0 months versus 16.2 months for non-users, resulting in 23% more time spent on therapy for PSP-users. **CONCLUSIONS:** Enrollment in AbbVie's PSP resulted in a higher persistence for ADA among Uruguayan patients with RA, demonstrating that it is an important tool for helping patients adhere to their medication. Additional studies are needed to evaluate PSP impact on disease control, patients' and physicians' preferences, and associated healthcare resource utilization.

PMS45

TRANSLATION AND VALIDATION OF THE CQR-19 FOR ROMANIAN PATIENTS WITH RHEUMATIC DISEASES

Subtirelu M, Turcu-Stiolica A, Vreju A, Neamtu J
University of Medicine and Pharmacy, Craiova, Romania

OBJECTIVES: The aim of the study was to translate and validate a Romanian version of the original English edition of the 19th Compliance Questionnaire for Rheumatology (CQR-19) and use it for Romanian patients with rheumatic diseases. **METHODS:** The questionnaire was translated into Romanian by two translators, native speakers of Romanian, familiar with the medical aspects and each translated item was pilot-tested to 10 patients with rheumatic diseases in several community pharmacies in Craiova, Romania. After identifying and resolving the problems in translation, CQR-19 was applied to a sample of 100 patients with rheumatic diseases, with 50 patients completing them again after 3 weeks. Reliability, validity and responsiveness were evaluated. Test-retest reliability was tested by Cronbach's alpha and Intraclass Correlation Coefficients (ICC). The 4-point Likert scale was used to calculate the adherence for each patient. We used SPSS v.19.0 in order to examine the characteristics of the sample and of the questionnaire. Correlations were conducted to evaluate the possible associations between various sociodemographic factors and medication adherence. **RESULTS:** The mean age of the sample was 52.4 years (SD=17.88 years), 46% were male, 88% living in urban, 8% had finished high school, 62% had graduated a faculty, 45% were employed. The mean score for the medication adherence was 61.99 (95%CI, 58.41-65.57). The Romanian version was easily understood by the patients and had good levels of reliability (Scale's reliability analysis revealed a Cronbach's alpha of 0.76) and consistency (ICC=0.88). It was found that age was related to adherence score ($rs=0.48$, $p<0.05$), indicating that older people were more likely to adhere to antirheumatic medication. Gender, living place, level of education and job didn't influence adherence's level. **CONCLUSIONS:** The Romanian version of the CQR-19 is a reliable and valid measure to evaluate the adherence for patients with rheumatoid arthritis.

PMS46

HEALTH-RELATED QUALITY OF LIFE FOLLOWING A TRAUMATIC BRAIN INJURY: A RETROSPECTIVE OUTCOMES ANALYSIS FROM SAUDI ARABIA

Alghnam S[1], Alkelya M[1], Albabtain I[2]
[1]*KAIMRC, Riyadh, Saudi Arabia,* [2]*King Abdulaziz Medical City, Riyadh, Saudi Arabia*

OBJECTIVES: In Saudi Arabia, trauma is associated with 18% of all fatalities, representing the leading cause of death. Among the wide spectrum of injuries, traumatic brain injuries (TBI), pose a pervasive threat as they significantly impact health outcomes. If not fatal, TBIs are associated with long-term disabilities and little is known on the burden of trauma-related disability in the country, and specifically due to TBI. Thus, the study aims to examine long-term health outcomes of TBI survivors treated at a level-I trauma center. **METHODS:** We used a dataset from King Abdulaziz Medical City in Riyadh. To be included in the study, patients had to be hospitalized due to a TBI between years 2005-2014. Of the 1,620 patients (age=16-60 years) who met the inclusion criteria, a 50% random sample was selected. Patients were contacted via the phone and information about Activity of Daily Living (ADL) and Instrumental Activity of Daily Living (IADL) was ascertained. Univariate analyses were performed to examine patients' characteristics and to estimate the prevalence of disability. **RESULTS:** Of the 760 patients contacted, 3 patients were deceased. Of the remaining, 260 (34%) patients were reached and agreed to participate in the study. The overall sample was relatively young (mean age= 24.8; SD=9.8) and predominantly males (92.7%). The average time since the injury is 6.8 years (range=3-12, SD=2.6). Of the TBI patients, 25.4% reported at least some limitations in ADL while 19.8% reported IADL limitations. Half of TBI patients in the study received at least one session of rehabilitation services. **CONCLUSIONS:** The fact that one of every four TBI patients becomes disabled poses a significant burden on population health and healthcare institutions. Further studies are warranted to elucidate the reasons for these findings. More importantly, this highlights the need for further investment in injury prevention programs in order to reduce associated disabilities.

PMS47

WORK PRODUCTIVITY AND GENERAL HEALTH STATUS IMPROVEMENTS WITH SIRUKUMAB, AN ANTI-IL-6 CYTOKINE MONOCLONAL ANTIBODY, IN PATIENTS WITH ACTIVE RHEUMATOID ARTHRITIS DESPITE ANTI-TNF THERAPY: RESULTS FROM THE PHASE 3 SIRROUND-T STUDY

Tanaka Y[1], Aletaha D[2], Peterson S[3], Ganguly R[4], Kurrasch R[4], Popik S[3], Agarwal P[3], Li N[3]
[1]*University of Occupational & Environmental Health, Kitakyushu, Japan,* [2]*Division of Rheumatology, Medical University of Vienna, Vienna, Austria,* [3]*Janssen Research & Development, LLC, Spring House, PA, USA,* [4]*GlaxoSmithKline, Collegeville, PA, USA*

OBJECTIVES: This study evaluated effects of sirukumab, a selective anti-IL-6 cytokine monoclonal antibody, on work productivity/interference and health status in patients with active rheumatoid arthritis (RA) despite treatment with anti-tumor necrosis factor (TNF) therapy. **METHODS:** In this randomized, double-blind, phase 3 trial, 878 eligible patients with active RA who were intolerant/refractory to anti-TNFs were randomized 1:1:1 to sirukumab subcutaneous (SC) 50mg every 4 weeks (q4w; n=292), sirukumab SC 100mg every 2 weeks (q2w; n=292), or placebo SC q2w (n=294). At Week 18, placebo patients were re-randomized to 1 of the sirukumab doses if insufficient (<20%) improvement; at Week 24, all patients remaining on placebo crossed over to sirukumab. The Work Limitations Questionnaire (WLQ) evaluated health-related job limitations and productivity loss in 4 domains (mental-interpersonal, output, physical demands, time management); the 3-level EuroQol-5 Dimension (EQ-5D) questionnaire measured 5 dimensions of health status (mobility, self-care, usual activities, pain/discomfort, anxiety/depression). **RESULTS:** At Week 24, mean total WLQ scores improved significantly from baseline for sirukumab 50mg q4w and 100mg q2w versus placebo (mean change, –2.2 and –2.3 vs 0.2, respectively; both $p<0.001$), as did all 4 mean WLQ domain scores (all $p\leq0.01$). Improvements from baseline in mean total WLQ and all 4 domain scores were maintained through Week 52 for both sirukumab doses. Mean EQ-5D index and health state visual analog scale (VAS) scores improved significantly from baseline at Week 24 for sirukumab 50mg q4w and 100mg q2w versus placebo (mean index change, 0.2 and 0.2 vs 0.0, respectively; mean VAS change, 13.9 and 15.4 vs 4.8, respectively; all $p<0.001$); improvements from baseline were maintained through Week 52 with both sirukumab doses. **CONCLUSIONS:** Sirukumab treatment led to significant improvements in work-related productivity and general health status in patients with active RA despite anti-TNF therapy, consistent with demonstrated effects of sirukumab on RA disease improvement.

PMS48

REAL-WORLD, MULTI-SITE, OBSERVATIONAL STUDY OF INFUSION TIME AND TREATMENT SATISFACTION IN RHEUMATOID ARTHRITIS (RA) PATIENTS TREATED WITH INTRAVENOUS GOLIMUMAB (GLM-IV) OR INFLIXIMAB (IFX)

Ellis L[1], Le C[2], McDermott, Jr JD[3], Daniel S[4]
[1]*Janssen Scientific Affairs, LLC, Horsham, PA, USA,* [2]*Covance Market Access Services Inc., San Diego, CA, USA,* [3]*Covance Market Access Services Inc., Gaithersburg, MD, USA,* [4]*Covance Market Access Services Inc., Conshohocken, PA, USA*

OBJECTIVES: This study assessed infusion times associated with GLM-IV and IFX in RA patients and factors associated with patient satisfaction for these treatments. **METHODS:** An observational study in RA patients at 6 US sites assessed GLM-IV or IFX infusion time variables including: **clinic visit duration** - time from patient's arrival to verbal discharge; **total infusion time** - time from infusion start to completion; and **total infusion process time** - the sum of medication preparation, patient preparation, and medication infusion times. Patient satisfaction was assessed by Treatment Satisfaction Questionnaire for Medication (TSQM-IV) and study-specific questionnaires. Descriptive statistics and comparative tests (analysis of variance for continuous and Fisher's exact test for categorical measures) were summarized. **RESULTS:** RA patients (n=150; 72 GLM-IV; 78 IFX) from 6 US sites were studied. Mean age of GLM-IV cohort was 61 years; 85% were female. The IFX cohort was older (66 years; P=0.0105), had fewer females (76%; not statistically significant—NS) and higher proportion of retirees (64% IFX vs. 40% GLM-IV). Mean weight was 83.8 kg for GLM-IV and 85.4 kg for IFX (NS). Infusions of GLM-IV and IFX averaged 3.7 and 4.9 vials, respectively. Mean clinic visit times were 65.1 (GLM-IV) and 153.1 minutes (IFX; $P<0.0001$). Mean medication infusion times were 32.8 (GLM-IV) and 119.5 minutes (IFX; $P<0.0001$). Mean infusion process times were 45.8 (GLM-IV) and 134.1 minutes (IFX; $P<0.0001$). Higher overall satisfaction ratings were reported by GLM-IV than IFX patients for the following: infusion time ($P<0.0001$), visit time ($P<0.0003$), and length of time the IV line was inserted ($P<0.0001$). **CONCLUSIONS:** Shorter overall clinic, infusion process, and medication infusion times were observed for GLM-IV compared to IFX. These differences were driven primarily by shorter medication infusion time. Shorter infusion time, shorter visit time, and shorter IV insertion time were associated with higher patient satisfaction ratings.

PMS49

RHEUMATOID ARTHRITIS AND PATIENT BURDEN OF DISEASE

Priest J[1], Strand V[2], Litman HJ[3], Saunders KC[3], Persuitte G[3], Brand A[4], Kremer JM[4], Greenberg JW[5]
[1]*GlaxoSmithKline, Durham, NC, USA,* [2]*Standford University, Stanford, CA, USA,* [3]*Corrona, LLC, Southborough, MA, USA,* [4]*Corrona, LLC, Seattle, WA, USA,* [5]*Albany Medical College, Albany, NY, USA,* [6]*New York University, New York, NY, USA*

OBJECTIVES: To describe patient reported outcomes (PROs) among those who have initiated targeted biologic treatment in a US observational cohort of patients with Rheumatoid Arthritis (RA). **METHODS:** Eligible patients were from the Corrona RA registry who had initiated a biologic agent between 2001-2016 and had a 6 month follow-up visit post initiation. Outcomes included the Clinical Disease Activity Index (CDAI), pain and fatigue (visual analog score; 0-100); morning stiffness (yes/no and hours); patient reported depression and anxiety; and others. Participants were grouped by initiation of a biologic: 1st line initiators, (patients initiating their 1st biologic), 2nd line initiators, and 3rd+ line initiators and by Tumor Necrosis Factor inhibitors (TNFi) and non-TNFi therapies. Means (SD) of outcomes are presented as changes between initiation and the 6 month follow-up visit by line of therapy. **RESULTS:** 11,299 patients initiated a biologic agent, 79% were female with mean (SD) age of 56.9 (12.9) years. Mean (SD) CDAI improvements from baseline to follow-up were -8.9 (14.2) 1st line, -6.6 (13.5) 2nd line, -6.4 (14.1) 3rd+ line. Mean CDAI improvements in TNFi initiators were -9.1 1st line, -5.9 2nd line, -5.5 3rd+ line vs -6.9, -7.8 and -6.9 in non-TNFi initiators, respectively. Follow-up average (SD) pain scores by line of therapy were 33.5 (27.5), 39.6 (27.7), 46.9 (27.7) (changes of -10.9, -7.5 and -7.5); fatigue scores: 39.0 (29.8), 43.7 (29.7) and 51.6 (28.6) (changes of -6.8, -4.6 and -5.0). 71%, 78% and 85% still experienced morning stiffness (average 1.5-2.0 hours/day at follow-up). Patient reported anxiety and depression were similar at baseline and follow-up. **CONCLUSIONS:** Despite many therapies to treat RA, patients still experience significant burden of disease. For the majority of outcomes, biologic naïve patients reported the largest improvements; lesser improvements occurred in 2nd and 3rd line initiators. Initiators of non-TNFi had more homogenous changes across lines of therapy.

PMS50

PATIENT REPORTED OUTCOMES AND CHANGES IN DMARD THERAPY FOR RHEUMATOID ARTHRITIS IN ROUTINE CLINICAL PRACTICE

Su Z[1], Brecht T[1], Menon V[1], Gliklich R[1], Solomon DH[2]
[1]*OM1, Cambridge, MA, USA,* [2]*Brigham and Women's Hospital, Boston, MA, USA*

OBJECTIVES: To examine the role of patient reported outcomes (PRO) as assessed by the RAPID3 in guiding therapy in rheumatoid arthritis (RA) in routine clinical practice. **METHODS:** The OM1 RA Data include electronic medical record (EMR) data (from a specialized rheumatology EMR) on ~75,000 patients diagnosed with RA, from rheumatology practices across the US. This analysis includes 64,663 patients on DMARDs seen between January 2013 and June 2016. RAPID3 scores within 30 days before changes to DMARD drugs were compared with those at other subsequent time points in a linear mixed model. The RAPID3 is scored 0-10 with higher scores associated with higher disease activity. To adjust for differences in follow up, data were censored at 24 months after the first DMARD recorded in the database. **RESULTS:** During the study period, there were 32,635 changes in DMARD therapy among 24,053 patients. 51% of physicians collected RAPID3s on at least 25% or more of their patients. Patients with ≥2 RAPID3 measurements (n=4,856) were more likely to have a DMARD change than patients with ≤1 measurement (n=59,807; 50% vs. 36%, $p<0.001$ by Chi square test). RAPID3 scores reported in the 30 days prior to a change in DMARD therapy (mean±SD=4.4±2.3) were worse than scores reported at time periods not associated with change in therapy (3.6±2.4) ($p<0.001$). In a mixed model, with time in months as a fixed effect and patients as a random effect, patients with changes in DMARD therapy had worse RAPID 3 scores than those who did not have change in DMARD ($p<0.001$). **CONCLUSIONS:** Rheumatologists that routinely monitor PROs (e.g., RAPID3) in clinical practice appear to use that information to guide DMARD therapy in patients with RA. Patients reported worse RAPID3 before they changed therapies.

PMS51

ASSOCIATION OF OBESITY WITH PATIENT-REPORTED OUTCOMES IN PATIENTS WITH AXIAL SPONDYLOARTHRITIS: A CROSS-SECTIONAL STUDY IN AN URBAN ASIAN POPULATION

Kwan YH[1], Lee YX[2], Png WY[2], LIM KK[1], Tan CS[2], Lui NL[3], Chew EH[2], Ostbye T[1], Thumboo J[3], Fong W[3]
[1]*Duke-NUS Medical School, Singapore, Singapore,* [2]*National University of Singapore, Singapore, Singapore,* [3]*Singapore General Hospital, Singapore, Singapore*

OBJECTIVES: To determine if obesity is associated with poorer patient-reported outcome (PRO) in patients with Spondyloarthritis (SpA). **METHODS:** We conducted a cross-sectional study using data of the PREcision medicine in SPondyloarthritis for better Outcomes aNd Disease remission (PRESPOND) registry from a tertiary referral centre in Singapore between 2011-2015. All patients fulfilled the Assessment of Spondyloarthritis (ASAS) 2009 criteria. Demographics, clinical and PRO variables were collected. Patients were divided into three categories: normal (BMI<23 kg/m2), overweight (23 kg/m2≤BMI<27.5 kg/m2) and obese (BMI≥27.5 kg/m2), using Asian BMI classification. The dependent variables are Pain Score, Bath Ankylosing Spondylitis Patient Global Score (BAS-G), Bath Ankylosing Spondylitis Disease Activity Score (BASDAI), Bath Ankylosing Spondylitis Functional Index (BASFI), Health Assessment Questionnaire (HAQ), Medical Outcomes Study Short Form 36 version 2 (SF-36) and Ankylosing Spondylitis Quality of Life questionnaire (ASQoL). Multivariate regression analyses were performed with these dependent variables and obesity categories, adjusting for confounders. **RESULTS:** Amongst 202 patients with SpA, 32% are overweight while 21% are obese. We found that patients in obese category had significantly poorer pain score (β: 12.81, 95%CI: 3.53,22.09) and BAS-G score (β: 10.43, 95%CI: 2.23,18.62) when compared to normal BMI patients. However, obesity was not associated with BASDAI (β: 0.53, 95%CI: -0.15,1.21), BASFI (β:0.36, 95%CI: -0.34,1.06), HAQ (β: -0.05, 95%CI: -0.17,0.07), ASQoL (β: -0.06, 95%CI: -1.60,1.48), Physical Component Summary (β: -1.03, 95%CI: -5.37,3.30) and Mental Component Summary (β: -2.40, 95%CI: -6.90,2.10) of SF-36. **CONCLUSIONS:** Obesity was associated with pain score and BAS-G score but not with BASDAI, BASFI, HAQ, SF-36 and ASQoL. Further study is needed to examine the causal relationship between obesity and poorer PRO.

PMS52

PRO INSTRUMENTS USED IN STUDIES OF ANKYLOSING SPONDYLITIS SINCE 1960

Martin A
Crystallise Ltd., East Tilbury, UK

OBJECTIVES: To create an evidence map of the different patient-reported outcome instruments used in studies of patients with ankylosing spondylitis, the geographical settings in which these studies were conducted and the interventions assessed. **METHODS:** We searched the heoro.com database (www.heoro.com) for PRO studies on ankylosing spondylitis published between 1960 and December 7 2016, and analysed the abstracts identified by the search to determine the different PRO instruments cited across the range of geographical locations and interventions. We presented the findings as an evidence map. **RESULTS:** We found a total of 128 abstracts that reported the use of 64 different PRO instruments. Of these, 22 instruments were specific for ankylosing spondylitis or other inflammatory arthritis, 27 were general instruments used to evaluate quality of life or utilities, 12 assessed non-disease-specific symptoms, in particular fatigue, or other conditions or diseases that were common comorbidities of people with ankylosing spondylitis, and three evaluated the impact of the disease on work productivity. The most frequently used tool was the BASDAI, cited in 66 abstracts, followed by the BASFI (54 abstracts), SF-36 (52 abstracts), AS Quality of life questionnaire (34), Health Assessment Questionnaire (20) and the EQ-5D (14). The Netherlands was the most frequent location for the studies, with 16 abstracts, followed by the United States (14 abstracts), then Germany, Turkey and the United Kingdom (12 abstracts each), then Canada (11 abstracts). Interventions assessed were generally targeted therapies such as TNF inhibitors and physical therapies. **CONCLUSIONS:** A wide range of PRO tools have been used in studies of ankylosing spondylitis from a wide range of locations, but only nine tools and six countries were cited in more than 10 abstracts.

PMS53

TREATMENT PATTERNS FOR PATIENTS WITH RHEUMATOID ARTHRITIS ENROLLED IN ACA EXCHANGE PLANS IN 2015

Teigland C, Niu X
Avalere Health - An Inovalon Company, Bowie, MD, USA

OBJECTIVES: Disease-modifying anti-rheumatic drugs (DMARDs) are the standard of care for rheumatoid arthritis (RA). This study aims to identify factors associated with receipt of DMARDs among patients diagnosed with rheumatoid arthritis (RA) and enrolled in an ACA insurance exchange plan in 2015. **METHODS:** Member-level data were extracted from a large nationally representative and statistically de-identified administrative claims database. The sample included 23,278 members. Patients were included in the study if they were (1) 18 years old or older; (2) diagnosed with RA anytime during 2015; (3) continuously enrolled for at least 11 months. **RESULTS:** The sample was approximately 70% females with average age of 52. Twelve percent of RA patients enrolled in 2015 received DMARDs. The 65-69 and 75-79 age groups had proportionately more recipients of DMARDs (14.0% and 14.3%, respectively). Slightly higher proportion of enrollees in households with $15,000 or less median income received DMARDs (14.2%), followed by households with income of $100,000 or more (13.4%). There were more recipients of RA treatment drugs in West South Central (27.3%) and at the 'platinum' level (17.9%) Differences among age groups were not significant. The linear model revealed that difference between income of $15,000 (14.2%) or less and $30,000 - $39,999 (9.6%) was significant ($p < .01$). The model showed that receipt of DMARDs differs significantly based on metal level: between 'bronze' (10.4%) and 'platinum' and between 'silver' (10.4%) and 'platinum' ($p < .001$). **CONCLUSIONS:** The probability of receiving DMARDs is associated with metal level and income level among the ACA enrollees. The finding that persons in households with lower incomes significantly receive DMARDs is revelatory and warrants further investigation.

PMS54

A SYSTEMATIC REVIEW OF THE ASSOCIATION BETWEEN OBESITY AND OUTCOME OF RHEUMATIC DISEASES

Kwan YH[1], Lee YX[2], LIM KK[1], Tan CS[2], Lui NL[3], Chew EH[2], Ostbye T[1], Thumboo J[3], Fong W[3]
[1]*Duke-NUS Medical School, Singapore, Singapore,* [2]*National University of Singapore, Singapore, Singapore,* [3]*Singapore General Hospital, Singapore, Singapore*

OBJECTIVES: To provide a systematic review of current literature on the association of obesity and outcome of rheumatic diseases. **METHODS:** We conducted a literature search using related keywords on three databases: PubMed®, Embase® and PsycInfo®. We categorized the articles found into three categories, namely positive, neutral or negative association of obesity and outcomes of rheumatic diseases. The subject population, country, type of studies, number of patients, measurement of obesity and outcomes assessed were presented. Outcomes assessed were split into two categories, patient reported outcomes and clinical outcomes. **RESULTS:** A total of 3454 articles were screened and 48 articles were found to be relevant to the objective. About half of the studies showed that obesity has a negative association with outcomes of rheumatic disease. No conducted studies on psoriatic arthritis, ankylosing spondylitis, axial spondyloarthritis and polyarthritis showed that obesity has a positive association on outcomes. The disease population of most of the studies found by this systematic review are subjects diagnosed with rheumatoid arthritis (RA). Most of the studies were completed in western populations such as America and Europe **CONCLUSIONS:** A systematic review on the association of obesity and outcome of rheumatic diseases was conducted. Most of the completed studies are based on Western populations. Therefore, to achieve a more precise assessment of the association of obesity on the disease outcome in Asian populations, further studies devoted to examining Asian subjects suffering from various types of rheumatic diseases, in particular those other than RA are warranted.

PMS55

TREATMENT FAILURE, TREATMENT SWITCHING AND HEALTH-RELATED QUALITY OF LIFE IN PATIENTS WITH ANKYLOSING SPONDYLITIS: RESULTS FROM A REAL WORLD SURVEY IN THE US

Deodhar A[1], Strand V[2], Conaghan PG[3], Alten R[4], Sullivan E[5], Blackburn S[5], Tian H[6], Gandhi K[6], Williams S[7], Park Y[6], Jugl SM[8]
[1]*Oregon Health & Science University, Portland, OR, USA,* [2]*Standford University, Stanford, CA, USA,* [3]*University of Leeds, Leeds, UK,* [4]*Schlosspark-Klinik , University Medicine Berlin, Berlin, Germany,* [5]*Adelphi Real World, Bollington, UK,* [6]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA,* [7]*Novartis Pharmaceuticals, East Hanover, NJ, USA,* [8]*Novartis Pharma AG, Basel, Switzerland*

OBJECTIVES: To describe the use and switching of biologics among ankylosing spondylitis (AS) patients, and the correlates of treatment failure. **METHODS:** US Rheumatologists and their AS patients completed surveys capturing reasons for switching biologics, including primary lack of efficacy (1°LE, initial non-response) and secondary lack of efficacy (2°LE, loss of response over time). Patients reported HRQoL (SF-36, EQ-5D), work productivity and activity impairment (WPAI). Current biologic was determined as 'failed' if, after ≥3 months, rheumatologist perceived disease severity had worsened, remained severe, was 'unstable' or 'deteriorating', or they were dissatisfied with disease control, and/or did not consider treatment a 'success'. **RESULTS:** 92 Rheumatologists and 534 patients participated in the study. Of 525 patients with full treatment data, 19.8% had never received a biologic, 65.1% had received 1, 11.4% 2 and 3.6% ≥3 biologics. Of 76 patients with known reasons for switching from 1st biologic, 22.4% switched due to 1°LE and 38.2% due to 2°LE. Despite 1°LE, patients (n=16) continued the 1st biologic for on average 12.6 months. Overall 17.4% patients were determined to be failing biologic treatment; 16.5% (43/261) on 1st biologic, 19.6% (9/46) on 2nd and 26.7% (4/15) on 3rd or later biologic. Failing patients reported significantly worse EQ-5D utility (0.68 vs 0.85) and SF-36 physical component summary (PCS; 37.2 vs 46.2), mental component summary (MCS; 42.4 vs 50.2) and social function domain (SF; 59.0 vs 80.8) scores (all $p < 0.0003$). Patients failing biologics had greater work productivity impairment (higher WPAI scores) than non-failing patients (36.6% vs 17.1%, p=0.0003). **CONCLUSIONS:** Only a minority of biologic patients had ever switched biologic therapies. The main reasons for switching were loss or lack of efficacy. Despite treatment failure some patients did not switch biologics. Failing biologic treatment was associated with worse health utilities and HRQOL scores and lower work productivity.

PMS56

TREATMENT FAILURE, TREATMENT SWITCHING AND HEALTH-RELATED QUALITY OF LIFE IN PATIENTS WITH PSORIATIC ARTHRITIS (PSA): RESULTS FROM A REAL WORLD SAMPLE IN THE US

Strand V[1], Deodhar A[2], Alten R[3], Conaghan PG[4], Sullivan E[5], Blackburn S[5], Tian H[6], Gandhi K[7], Williams S[8], Palmer JB[6], Jugl SM[9]
[1]*Standford University, Palo Alto, CA, USA,* [2]*Oregon Health & Science University, Portland, OR, USA,* [3]*Schlosspark-Klinik , University Medicine Berlin, Berlin, Germany,* [4]*University of Leeds, Leeds, UK,* [5]*Adelphi Real World, Bollington, UK,* [6]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA,* [7]*Novartis Pharmaceuticals Corporation, New Jersey, NJ, USA,* [8]*Novartis Pharmaceuticals, East Hanover, NJ, USA,* [9]*Novartis Pharma AG, Basel, Switzerland*

OBJECTIVES: To describe use and switching of advanced therapy (AT; subcutaneous biologics, and small molecules (apremilast)), and the correlates of failure among PsA patients. **METHODS:** US specialists (Rheumatologists and Dermatologists) and their PsA patients completed surveys capturing reasons for switching AT, including primary lack of efficacy (1°LE, initial non-response), secondary lack of efficacy (2°LE, loss of response over time). Patients reported HRQoL (SF-36, EQ-5D), work productivity and activity impairment (WPAI) and disability (HAQ-DI). Current AT was determined as 'failed' if, after ≥3 months, specialists perceived disease severity had worsened, remained severe, was 'unstable' or 'deteriorating', or they were dissatisfied with disease control and/or did not consider treatment a 'success'. **RESULTS:** 140 specialists and 628 patients participated in the study. Of 601 patients with full treatment data, 29.6% had never received AT, 52.7% 1, 11.3% 2, and 6.3% >3 ATs. Of 93 patients with known reasons for switching from 1st AT, 36.6% switched owing to 2°LE and 26.9% due to 1°LE. Despite 1°LE, patients (n=21) continued on 1st AT for on average 12.4 months. Overall 13.6% were determined to be failing AT; 12.0% (28/233) on 1st AT, 7.5% (4/53) on 2nd and 22.2% (6/27) on third or later AT. Failing patients reported significantly worse EQ-5D utility (0.73 vs 0.87; p=0.0002), SF-36 physical component summary (39.8 vs 48.2; $p < 0.0001$), and social function domain (69.4 vs 82.8; p=0.0008) scores than those not failing; mental component summary score was not significantly different (47.6 vs 50.8; p=0.0991). They also reported higher WPAI (24.6% vs 13.4%, p=0.0018) and HAQ-DI (0.60 vs 0.29, p=0.0009). **CONCLUSIONS:** Few patients had ever switched AT, when switches occurred the main driver was loss or lack of efficacy. Some patients persisted with their current AT despite treatment failure; AT failure was associated with poorer health utilities and HRQoL scores and lower work productivity.

PMS57

BURDEN OF DISEASE ASSOCIATED WITH MOOD OR DEPRESSION IN PATIENTS WITH RHEUMATOID ARTHRITIS

Peterson S[1], Ganguly R[2], Van Laer J[3], Purushotham S[4], Li N[1]
[1]*Janssen Research & Development, LLC, Spring House, PA, USA,* [2]*GlaxoSmithKline, Collegeville, PA, USA,* [3]*Janssen Pharmaceutica NV, Beerse, Belgium,* [4]*Amaris, London, UK*

OBJECTIVES: The objective of this review is to synthesise available evidence on the burden of depression in rheumatoid arthritis (RA). **METHODS:** Burden of illness, cost, and health-related quality-of-life studies (2006–2015) were

systematically identified through MEDLINE, EMBASE and Cochrane databases. Literature was screened for eligibility by two independent reviewers based on pre-specified criteria. Studies evaluating relationships between RA outcomes and depression were analysed and findings summarised using descriptive statistics. **RESULTS:** Eighteen studies met eligibility criteria. The reported prevalence of depression in RA patients was in line with previous data (8.9%–47.3%). Overall annual healthcare costs and hospitalisation rates were significantly higher (nearly double) in patients with RA and comorbid depression versus those with RA alone. Depression was a risk factor for sick leave episodes, suggesting an impact on work productivity loss. Depression was significantly associated with increased disease severity at follow-up visits (as measured by 28-joint Disease Activity Scores, tender joint counts, and patient global assessment scores). Depression was also associated with slower clinical improvement (change in Clinical Disease Activity Index) and reduced odds of achieving clinical remission. Higher depressive domain scores on the MOODS-Spectrum were associated with significant worsening of Short Form-36 scores. Elevated Centre for Epidemiologic Studies Depression Scale (CES-D) scores (range, 0–60; higher scores indicate more depressive symptoms) were identified as independent predictors of elevated Pittsburgh Sleep Quality Index scores (indicating poorer sleep quality). A multivariate analysis showed a 2% increased risk of mortality with each 1-point increase on the CES-D. **CONCLUSIONS:** This comprehensive review and synthesis of available evidence showed that depression influences diverse RA outcome measures, including disease activity, response to treatment, quality of life, and sleep measures, suggesting that mental health is an important area to manage in RA. Further evidence is needed to determine whether treating depression improves RA outcomes.

PMS58

THE EFFECT OF GOLIMUMAB, AN ANTI-TNFA MONOCLONAL ANTIBODY, ON GENERAL HEALTH STATUS, DAILY ACTIVITY AND WORK PRODUCTIVITY IN SUBJECTS WITH ACTIVE ANKYLOSING SPONDYLITIS: 28-WEEK RESULTS OF THE PHASE III GO ALIVE TRIAL

Reveille JD[1], Deodhar A[2], Li N[3], Han C[4], Chan E[5], Hsia EC[6], Kim L[3], Lo KH[3], Harrison DD[3], Peterson S[3]
[1]University of Texas Health Sciences Center, Houston, TX, USA, [2]Oregon Health & Science University, Portland, OR, USA, [3]Janssen Research & Development, LLC, Spring House, PA, USA, [4]Janssen Global Services, LLC, Malvern, PA, USA, [5]Janssen Global Services, LLC, Raritan, NJ, USA, [6]University of Pennsylvania, Philadelphia, PA, USA

OBJECTIVES: To evaluate health-related quality of life (HRQoL) including general health status, daily activity, and work productivity outcomes of intravenous (IV) golimumab in subjects with active ankylosing spondylitis (AS). **METHODS:** In this randomized, double-blind, Phase 3 trial, adults with AS received golimumab 2 mg/kg (n=105) or placebo (n=103). At Week 16, placebo recipients crossed-over to golimumab. Current health state was measured by EuroQol-5D index including 5 domains: mobility, self care, usual activities, pain/discomfort, and anxiety/depression; impact of AS on daily productivity was measured by visual analogue scale (VAS); and impact of AS on work productivity was measured by Work Limitations Questionnaire (WLQ) productivity loss score in subjects who work or volunteer, which was converted from the 25-item version. Changes from baseline were summarized at Weeks 8, 16, and 28. Unadjusted p-values of least square mean differences (LSMD) between treatment groups were based on analysis of covariance (ANCOVA) controlling for prior anti-TNF therapy. **RESULTS:** Mean EuroQol-5D index improvements were greater with golimumab vs. placebo at Week 8 (0.16 vs. 0.04 [LSMD: 0.11, $p<0.001$]) and Week 16 (0.17 vs. 0.05 [LSMD: 0.11, $p<0.001$]). Greater mean reductions in impact of AS on daily productivity were observed with golimumab vs. placebo at Week 8 (−2.21 vs. −1.07 [LSMD: −1.18, $p<0.001$]) and Week 16 (−2.93 vs. −1.08 [LSMD: −1.89, $p<0.001$]). Likewise, greater mean reductions in WLQ productivity loss score were observed with golimumab (n=56) vs. placebo (n=64) at Week 8 (−2.86 vs. −1.72 [LSMD: −1.44, p=0.04]) and Week 16 (−3.46 vs. −1.87 [LSMD: −1.97, p=0.009]). At Week 28, placebo recipients who crossed over to golimumab had similar mean improvements from baseline in EuroQoL-5D index, productivity VAS, and WLQ productivity loss score as those randomized to golimumab. **CONCLUSIONS:** In active AS, IV golimumab improved HRQoL outcomes.

FACTORS ASSOCIATED WITH INITIATION OF BIOLOGICS IN PATIENTS WITH AXIAL SPONDYLOARTHRITIS IN AN URBAN ASIAN CITY: A PRESPOND STUDY

Kwan YH[1], Png WY[2], Lee YX[2], LIM KK[1], Chew EH[2], Lui NL[3], Tan CS[2], Thumboo J[3], Ostbye T[1], Fong W[3]
[1]Duke-NUS Medical School, Singapore, Singapore, [2]National University of Singapore, Singapore, Singapore, [3]Singapore General Hospital, Singapore, Singapore

OBJECTIVES: Axial Spondyloarthritis (AxSpA) is a type of inflammatory rheumatic disease that is chronic in nature and can cause severe disability. As biologics play a crucial role in managing AxSpA, it is important for clinicians to understand why biologics are initiated or refused. Hence, we aim to examine if patient's sociodemographic, clinical characteristics, and patient reported outcomes were associated with biologics initiation in patients with AxSpA in Singapore. **METHODS:** Data from a dedicated registry, the PREcision medicine in SPondyloarthritis for better Outcomes aNd Disease remission (PRESPOND) from a tertiary referral centre in Singapore from January 2011 to July 2016 were used. Initiation of first biologics was the main outcome of interest. Logistic regression analyses were used to explore the association of duration of disease, age, employment status, BASDAI, SF-36 (PCS and MCS), ESR, comorbidities of peptic ulcer disease (PUD) and skin symptoms, as well as responsiveness to NSAIDs on biologics initiation. **RESULTS:** Of 189 eligible patients (age 37.7 ± 13.3 years, 76.2% males), 30 (15.9 %) were started on biologics during follow-up. In the univariable analyses, higher ESR (OR=1.02; 95%CI 1.00-1.03; p=0.03) as well as presence of PUD (OR=3.78; 95%CI 1.14-12.5; p=0.03) were associated with higher odds of biologics initiation. Older age (OR=0.96; 95%CI 0.93-1.00; p=0.03) and good response to NSAIDs (OR=0.32; 95%CI: 0.14-0.72; $p<0.01$) were associated with lower odds. In the multivariable model, age (OR=0.93; 95%CI 0.89-0.98; $p<0.01$), MCS of SF-36 (OR=0.18; 95%CI 0.03-0.89; p=0.04), ESR (OR=1.02; 95%CI 1.00-1.04; p=0.02), presence of PUD (OR=10.4; 95%CI 2.21-48.8; $p<0.01$) and good response to NSAIDs (OR=0.23; 95%CI 0.08-0.61; $p<0.01$) were found to be associated with biologics initiation. **CONCLUSIONS:** Age, ESR, MCS of SF-36, comorbidities of PUD and responsiveness to NSAIDs were associated with biologics initiation. Thus, clinicians might consider using these factors to guide biologics treatment in patients.

PMS61

A SYSTEMATIC REVIEW OF THE FACTORS ASSOCIATED WITH THE INITIATION OF BIOLOGICS IN PATIENTS WITH RHEUMATOLOGICAL CONDITIONS

Png WY[1], Kwan YH[2], LIM KK[2], Chew EH[1], Lui NL[3], Tan CS[1], Ostbye T[2], Thumboo J[3], Fong W[3]
[1]National University of Singapore, Singapore, Singapore, [2]Duke-NUS Medical School, Singapore, Singapore, [3]Singapore General Hospital, Singapore, Singapore

OBJECTIVES: Rheumatological diseases place a significant burden on patients and society due to their association with multiple comorbidities and functional disability. As biologics play a crucial role in managing some of these diseases, it is important for clinicians to understand why biologics are initiated or refused so as to make better clinical decisions in the course of improving patients' disease outcomes. Although there were many studies investigating factors associated with initiation of biologics for patients with rheumatological conditions, there have been no systematic review that provide a comprehensive summary in this area. The objective of this paper is to provide a summary of factors associated with biologics initiation for patients with rheumatological conditions. **METHODS:** We performed a literature search in PubMed®, Embase® and PsycInfo®. We identified and screened studies according to the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA). Factors were presented according to patient, disease-related, therapy-related, healthcare team-related and system in-place factors. **RESULTS:** A total 1755 articles were being reviewed and 25 articles were found to be relevant to our objective. Forty eight factors reviewed were categorized into five main categories namely patient factors (n=13), disease-related factors (n=12), therapy-related factors (n=10), healthcare team related factors (n=4) and system in-place related factors (n=9). An illustration for biologics initiation was also presented to allow clinicians to better understand the complex nature of decision making. **CONCLUSIONS:** Forty eight factors of five different categories were found to be associated with biologics initiation for patients with rheumatological conditions. Clinicians need to be mindful of the complex nature of these factors to optimize therapeutic outcomes of patients with rheumatological conditions.

PMS62

ASSOCIATION BETWEEN ALLOPURINOL DOSE-TITRATION AND SERUM URIC ACID LEVELS IN GOUT PATIENTS: US ELECTRONIC HEALTH RECORD DATA

Fu A, Taylor DC, Reasner DS
Ironwood Pharmaceuticals, Inc., Cambridge, MA, USA

OBJECTIVES: To understand allopurinol dose-titration relative to sUA levels. Allopurinol is a first-line urate lowering therapy for patients with gout. The American College of Rheumatology guidelines recommend allopurinol dose-titration to maintain serum uric acid (sUA) levels <6 mg/dl. **METHODS:** This retrospective study used the de-identified Humedica electronic medical record database. The study included all sUA and allopurinol records among gout patients (ICD-9-CM: 274.xx) ≥18 years old with first gout diagnosis in 2007 – 2015. An episode was defined as an allopurinol initial dose (ID) prior to (closest) and titrated dose (TD) after (within 30 days) an sUA test. Dose-titration was categorized as an episode with a dose-change (up-titration: ID < TD; down-titration: ID > TD), or no-dose-change (ID = TD). For multiple different doses recorded on the same prescription date, the sum of doses was taken as daily dosage. Episodes were considered uncontrolled when sUA ≥6 mg/dl. Descriptive episode-level analyses were performed. **RESULTS:** Within 64,609 episodes, 57% of episodes were uncontrolled (sUA: 6 to <8 mg/dl: 38%; 8 to <10 mg/dl: 15%; ≥10mg/dl: 4%). Seventy-one percent of uncontrolled episodes were no-dose-change, 21% were up-titrated, and 7% were down-titrated. Within no-dose-change episodes, 51% were uncontrolled and lower doses corresponded to higher percentages of uncontrolled episodes (<100mg/day: 88%; 100mg/day: 70%; >100, <300 mg/day: 49%; 300mg/day: 38%; >300mg/day: 36%). Seventy-eight percent of dose-change episodes were uncontrolled, of which 100 to 300 mg/day (39%) was the most frequent dose titration. Overall, the most frequent TD was 300 mg/day (52%) followed by 100mg/day (36%), >100 – <300mg/day (8%), >300mg/day (3%), and <100mg/day (<1%). **CONCLUSIONS:** Allopurinol dose is not generally titrated regardless of sUA control. This pattern suggests a need for active management of patients with gout with uncontrolled sUA including consideration of new treatment options in addition to allopurinol.

PMS63

RHEUMATOLOGIST- AND PATIENT-SPECIFIC FACTORS ASSOCIATED WITH CURRENT ADVANCED THERAPY USE IN RHEUMATOID ARTHRITIS

Araujo AB[1], Larmore C[1], Tanaka Y[1], Blackburn S[2], Sullivan E[2], Chang L[1], Boytsov N[1], Muram D[1], Bradley JD[1]
[1]Eli Lilly and Company, Indianapolis, IN, USA, [2]Adelphi Real World, Bollington, UK

OBJECTIVES: Identify factors associated with current advanced therapy (AT) use among patients with rheumatoid arthritis (RA). **METHODS:** Data were obtained

from the US 2016 Adelphi RA Disease Specific Programme. Rheumatologists (HCP, N=85) provided details about their RA patients (N=1,003) and patients voluntarily completed a self-reported questionnaire (N=639). The analysis sample consisted of patients with complete data on variables of interest (N=327). AT for RA was defined as current use of a tumor necrosis factor inhibitor (TNFi), non-TNFi, or Janus kinase inhibitor (JAKi). Multivariable logistic regression was used to examine predictors of current AT vs. conventional disease-modifying antirheumatic drug (cDMARD) use. The following variables were included based on clinical relevance and univariable analyses: age, sex, RA duration at initiation of current therapy, accepting of injectables (IV or SC) therapy (HCP-reported); treatment goal set, concern with side effects, cost factor in treatment decision (patient-reported); disease severity prior to treatment initiation, patient engagement/willingness to change therapy (HCP- and patient-reported). Odds ratios (OR) and 95% confidence intervals (95%CI) were assessed. **RESULTS:** Mean±SD age was 54±15y, 74% were female, with duration of RA 88±96 months, 70% were current users of AT [TNFi (69%), non-TNFi (21%), JAKi (10%)], and most (63%) were 1st-line AT. Current AT use was more common among patients whose HCP classified them as accepting of injectable therapies (OR=2.29, 95%CI: 1.21–4.31) and when patients expressed willingness to change therapy to meet treatment goals (OR=2.33, 95%CI: 1.33–4.07). In contrast, HCP perception of patients' engagement/willingness to change therapy was unrelated to current AT use (OR=1.15, 95%CI: 0.64–2.06). **CONCLUSIONS:** Key predictors of AT use are patient willingness to switch and perceived acceptance of injectable therapies. This suggests that the patient voice is important in uptake of AT and may help to counter any inertia in appropriate treatment escalation.

PMS64

ANALYSIS OF FORMULARY COVERAGE AND COST OF BIOLOGIC DISEASE-MODIFYING ANTI-RHEUMATIC DRUGS IN MEDICARE PART D

Alghamdi A[1], Seoane-Vazquez E[2], Rodriguez-Monguio R[3]
[1]King Saud University, Riyadh, Saudi Arabia, [2]Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA, [3]University of Massachusetts Amherst, Amherst, MA, USA

OBJECTIVES: This study examined the drug formulary coverage, usage restrictions (i.e. prior authorization, step therapy and quantity limits), and cost-sharing rates of biologic disease modifying anti-rheumatic drugs (DMARDs) in Medicare Part D in the period 2006 to 2015. **METHODS:** Study data were derived from the Centers for Medicare and Medicaid Services (CMS) Medicare Prescription Drug Plan Formulary and Pharmacy Network Files data. National Drug Codes (NDCs) information was derived from the U.S. Food and Drug Administration (FDA) NDC Directory. Descriptive statistics were performed. **RESULTS:** The FDA approved 10 biologic DMARDs in the period 2006 to 2015. In 2006, the mean percentage of Medicare Part D formularies covering all biologic DMARDs was 74.5%. The Medicare Part D prescription drug coverage reached its highest level (85.9%) in 2007 and it went down to 73.8% in December 2015. The percentage of formularies requiring prior authorization across biologic DMARDs ranged from 68.4% in 2006 to 93.1% in 2014. The use of step therapy varied by drug. No formularies required step therapy for adalimumab and rituximab; whereas, over 10% of formularies required step therapy for certolizumab, golimumab, tocilizumab, abatacept, tofacitinib, and etanercept in 2015. The percentage of formularies requiring quantity limits ranged from 0.0% (rituximab) to 47.4% (tofacitinib) in 2015. Placement in tier 5 increased from 7.9% in 2006 to 61.5% in 2015. Placement in tiers 2-4 decreased during the study period. Coinsurance was the most commonly used type of cost-sharing mechanisms; it was required by 62.3% of the plans in 2006 and 68.4% in 2015. **CONCLUSIONS:** All Medicare Part D formularies covered at least one biologic DMARD during the period 2006-2015. The large majority of formularies placed prior authorization, step therapy and quantity limits on the utilization of biologic DMARDs. In addition, biologic DMARDs were increasingly placed in higher specialty tiers that required high cost-sharing rates.

PMS65

ANALYSIS OF THE IMPACT OF AFFORDABLE CARE ACT AND THE 2011 FDA SAFETY COMMUNICATION ON THE UTILIZATION OF BIOLOGIC DISEASE-MODIFYING ANTI-RHEUMATIC DRUGS IN THE MEDICAID OUTPATIENT PHARMACY PROGRAM

Alghamdi A[1], Seoane-Vazquez E[2], Rodriguez-Monguio R[3]
[1]King Saud University, Riyadh, Saudi Arabia, [2]Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA, [3]University of Massachusetts Amherst, Amherst, MA, USA

OBJECTIVES: To describe trends in utilization and expenditures of biologic Disease Modifying Anti-rheumatic drugs (DMARDs) in the Medicaid outpatient pharmacy program from 2007 to 2014 and to assess the impact of the 2010 Affordable Care Act (ACA) and 2011 FDA safety communications about anti-tumor necrosis factor (TNF) drugs on the utilization of biologic DMARDs. **METHODS:** Medicaid drug utilization data were collected from Centers for Medicare & Medicaid Services. Biologic DMARDs and national drug codes were collected from the Food and Drug Administration (FDA) databases. An interrupted time series analysis was conducted to assess the association of the ACA and FDA safety communications and the utilization of biologic DMARDs. **RESULTS:** The Medicaid outpatient pharmacy utilization for biologic DMARDs increased from 11,187 claims in first quarter of 2007 to 64,684 in the fourth quarter of 2014. The highest utilization occurred in the second quarter of 2010 (104,996 claims). The Medicaid expenditures of biologic DMARDs increased from $21.9 million in the first quarter of 2007 to $202.4 million in the fourth quarter of 2014. ACA led to an increase of 17.4% in the number of anti-TNF claims per quarter in the Medicaid outpatient pharmacy program. After controlling for the effect of ACA, the 2011 FDA safety communication was significantly associated with a decrease in anti-TNF utilization ($p<0.001$). In addition, the FDA anti-TNF safety communication was significantly associated with an increase in the utilization of non-anti-TNF ($p<0.001$). **CONCLUSIONS:** The utilization of biologic DMARDS in the Medicaid outpatient pharmacy program significantly changed over time. The utilization of biologic DMARDS was higher post- enactment of the ACA compared to the period pre-ACA. Likewise, the utilization of Anti-TNF biologics significantly increased after the implementation of the ACA and decrease following the 2011 FDA safety communication.

PMS66

TRENDS IN PRESCRIPTION DRUGS UTILIZATION AMONG INDIVIDUALS WITH ARTHRITIS IN THE UNITED STATES, 2005 TO 2014

Raval A[1], Vyas A[2]
[1]Healthcore, Inc., Wilmington, DE, USA, [2]University of Rhode Island, Kingston, RI, USA

OBJECTIVES: Given the rise in the population of arthritis and advances in the therapeutic options to manage arthritis, there are needs to evaluate the real-world pharmacotherapeutic management of arthritis. Therefore, we evaluated retrospective cross-sectional trends in prescription drugs utilization among adults with arthritis using a nationally representative data, the Medical Expenditures Panel Survey. **METHODS:** Study population comprised of bi-annual cross-sectional cohorts of individuals aged ≥ 18 years during calendar year of 2005 through 2014. Prescription drugs were classified based on therapeutic class and subclass as per Multum Lexicon database. Chi-square statistics were used to examine differences in the proportion of particular prescription drugs utilization between those with and without arthritis. **RESULTS:** An annual-weighted individual with doctor-diagnosed arthritis rose from 44.3 million in 2005/06 to 63.5 million in 2013/14. For arthritis-related medications, we found a gradual increase in single opioid agent use (4.7% vs. 13.3%), a minor increase in glucocorticoids (8.6% vs. 10.0%), as well as topical steroids (4.6% vs. 5.2%) and no changes in overall non-opioid analgesic use (46.3% vs. 45.0%) in 2013/14 as compared to 2005/06. With respect to co-medications, we found a stable use proportion of individuals utilizing cardiovascular agents (56.4%), central nervous system agents (57.0%), antibiotics (34.7%), and proton-pump Inhibitors (19.7%) from 2005/06 to 2013/14, whereas, an increase in proportion of individuals utilizing anticonvulsant (12.8% vs. 18.4%), statins (29.1 vs.35.0%), and antidepressant (22.8% vs. 24.9%) from 2005/06 to 2013/14 among those with arthritis. Individuals with arthritis were more likely to receive cardiovascular, central nervous system agents, gastrointestinal agents, respiratory agents as compared to those without arthritis throughout 2005/06 to 2013/14. **CONCLUSIONS:** Our study highlights an uptake of opioid analgesic with a relatively stable proportion of other arthritis-related medication. In addition, high use of cardiovascular, psychotherapeutic agents, antibiotics, gastrointestinal and respiratory agents suggest a significant medication burden among individuals with arthritis.

PMS67

INCREASED PREVALENCE IN OPIOID PRESCRIPTION AS A FIRST LINE THERAPY IN OSTEOARTHROSIS

Armstrong HF[1], Mountford WK[2]
[1]QuintilesIMS, New York, NY, USA, [2]QuintilesIMS, Durham, NC, USA

OBJECTIVES: Concerns regarding the misuse of opioid analgesics are widespread in public health literature, resulting in increased regulations and guidelines suggesting the use of alternative therapy (weight-loss and exercise) as first-line treatment. The objective of this study is to use real-world data to compare the longitudinal prevalence of opioid prescription in patients with newly diagnosed generalized osteoarthrosis (OA) (ICD-9-CM 715.0). **METHODS:** The Q-EMR database was used to gather records between 1/1/05 to 4/30/16, with the index event (first diagnosis of osteoarthrosis) occurring between 1/1/05 and 4/30/15 to allow for a one-year follow-up. Two outcomes were assessed: 1) opioid prescription within one week after index event and 2) opioid prescription within one year after index event. To detect trends over time, linear regression was used with percentage of patients on opioids as the dependent variable and calendar year as the independent variable. **RESULTS:** There was a total of 100,578 patients newly diagnosed with OA during the study period; 28,947 were prescribed opioids within one year and 14,072 were prescribed opioids within one week of diagnosis. The percentage of patients prescribed opioids within one year of diagnosis ranged from 18% in 2005 to 36% in 2015, significantly increasing by 2% (95%CI: 1.7 to 2.4%; $p<0.0001$) per year. Similarly, the percentage of patients prescribed opioids within week of diagnosis ranged from 8% in 2005 to 17% in 2015, significantly increasing by 1% (95% CI: 0.8% to 1.3%; $p<0.0001$) per year. **CONCLUSIONS:** This study used real-world data to assess the longitudinal trend of opioid prescription in newly diagnosed osteoarthrosis patients. Results suggest an increase in prescription of opioids both within the first week and year of diagnosis. Despite public health concerns regarding misuse, opioids still appear to be a common and increasingly prescribed treatment for osteoarthrosis.

PMS68

NEBULOUS GUIDELINES: CAN PHARMACOECONOMICS SUPPORT THE EVIDENCE?

Mohan P, Singhal A, Sharma AK
Armed Forces Medical College, Pune, India

OBJECTIVES: To examine the role of pharmacoeconomics in ascertaining the choice of appropriate therapeutics. **METHODS:** This is a retrospective analysis, conducted using the clinical records from a tertiary referral hospital in western Maharashtra, India. Data on patients of ankylosing spondylitis and rheumatoid

arthritis was collected. Biological response modifiers (BRMs) are indicated for NSAID failure and DMARD failure cases, respectively. We compared the input costs and relative benefit of various BRMs. **RESULTS:** Out of 35 patients of ankylosing spondylitis who had NSAID failure, 15 were given etanercept (24 injections/patient) and 20 were given infliximab (8 injections/patient). Mean reduction in Bath Ankylosing Spondylitis Disease Activity Index (BASDAI) score in etanercept and infliximab group was 1.79 and 2.41 respectively (difference not statistically significant). The total input cost per patient of etanercept and infliximab was INR 1,56,984 and INR 2,55,360 respectively. The average cost incurred for per unit reduction in mean BASDAI score was INR 87,700 (1,56,984/1.79) for etanercept and 105958 for infliximab. Though the gross input cost of infliximab was 1.62 (2,55,360/1,56,984) times higher, its cost per unit benefit offered was only 1.2 (1,05,958/87,700) times higher than etanercept. Similarly, in 28 cases of DMARD failure RA cases, 15 were given infliximab and 13 were given etanercept. The average cost incurred for per unit reduction in mean disease activity score (DAS-28) was INR 1,22,643 for etanercept and INR 1,78,573 for infliximab.Cost of infliximab per unit benefit offered was 1.4 times higher than etanercept. **CONCLUSIONS:** In view of its lower cost for comparable clinical effect, etanercept appears to be a more appropriate BRM.The case study demonstrates that pharmacoeconomic analysis of competing therapies can single out the appropriate treatment choice. However, for drawing generalizable conclusions, prospective studies with indirect costs and longer time horizon are required.

PMS69

ASSESSING ASSOCIATIONS BETWEEN INSURANCE TYPE AND DRUG THERAPY IN PATIENTS WITH RHEUMATOID ARTHRITIS

Mishra P, Thomas III J
Purdue University, West Lafayette, IN, USA

OBJECTIVES: Rheumatoid arthritis (R.A.) is a chronic disease with a large impact on quality of life. Introduction of biologic disease-modifying antirheumatic drugs (TNF-alpha blockers) for treatment of R.A. has yielded significantly improved outcomes, however cost is high. We examined association between insurance coverage and likelihood of biologic therapy in patients with Rheumatoid arthritis. **METHODS:** Patients with R.A. were identified from 2014 Medical Expenditure Panel Survey data using ICD-9M codes (714.xx) as inclusion criteria and combining records from the Medical Conditions and Prescribed Medications file. Patients were classified as biologic users, or non-biologic users. Patients were classified as having poor, fair, or good health based on self-reports. Insurance type was categorized as "Private," "Public," or "Uninsured." SF-12 physical component (PCS) and mental component scores (MCS) were compared across groups using generalized linear models. The SURVEYREG procedure in SAS was used to assess relationship between insurance and medication type with weights adjusting for the MEPS complex survey design. Charleson comorbidity index, health, age and gender were included as covariates. **RESULTS:** A total of 387 individuals met inclusion criteria. Females made up 27.6% of the sample. Mean age was 59.3 ±14.6 years. Only 5% of the sample used biologics. Patients with private insurance were more likely than uninsured patients to be on biologic therapy, odds ratio=3.94, 95% confidence interval= 1.2 to 13.4. Mean SF-12 physical component scores did not differ among patients using biologics and those not using biologics. However privately insured patients had higher mean PCS (33.7± 16.24) than publicly insured patients (27.0 ± 14.44), $P < 0.001$. MCS scores did not differ across groups, P=0.63. **CONCLUSIONS:** Privately insured patients were almost 4 times more likely to be on biologics as compared to uninsured patients ($p < 0.05$).

PMS70

FACTORS ASSOCIATED WITH THE INITIATION OF BIOLOGIC DISEASE MODIFYING ANTI RHEUMATIC DRUGS IN A PRIVATELY INSURED POPULATION WITH RHEUMATOID ARTHRITIS BETWEEN 2004 AND 2013

Atzinger CB, Guo JJ, Kelton CM
University of Cincinnati, Cincinnati, OH, USA

OBJECTIVES: Biologic Disease Modifying Anti-Rheumatic Drugs (bDMARDS) have revolutionized the treatment of rheumatoid arthritis. Biologic DMARDs are highly effective but demand extremely high costs. Understanding appropriate timing and risk factors for the use of bDMARDs is a concern for patients, physicians, and payers. The objectives were to identify, describe, and measure the risk factors associated with initiation of a bDMARD in newly diagnosed adult patients with RA between 2004 and 2013. **METHODS:** Patients were selected from a large national private insurance-claims database if they had at least 2 claims for ICD-9 code 714.xx at least 45 days apart and received DMARD therapy between 2004 and 2013. Predictors of initiation of a biologic included first line treatment regimen, ultrasound use, insurance plan generosity, disease severity, age, sex, comorbidities, and year of diagnosis. Cox Proportional Hazard models were used to evaluation the predictors associated with the initiation of a bDMARD. **RESULTS:** A cohort of 20,731 patients with RA was selected, 64% were female, and the median age of onset was 54 years. Earlier initiation of a bDMARD was associated with dual therapy use vs. mono therapy (HR 1.27, 95% CI 1.17-1.38), ultrasound use 3-6 months before diagnosis (HR 5.46, CI 2.60-11.48), high plan generosity (HR 7.23, CI 6.60-7.91), disease severity (HR 1.12, CI 1.10-1.14), and year of diagnosis 2013 vs. 2004 (HR 2.09, CI 1.41-3.12). Protective factors included age at onset (HR 0.984 CI 0.981-0.987), comorbidities (HR 0.93, CI 0.91-0.95), and female sex (HR 0.92, CI 0.87-0.98). **CONCLUSIONS:** Patients that initiated dual therapy, were younger, had more severe disease, had increased ultrasound use, had better drug benefit coverage, and were more recently diagnosed are more likely to initiate bDMARDs earlier in their disease history. Understanding these factors can help ensure bDMARDs are being used appropriately to achieve optimal therapies, and avoiding unnecessary costs and risks.

PMS71

ASSOCIATION BETWEEN DISEASE ACTIVITY LEVEL IMPROVEMENT AND REDUCTION IN HEALTHCARE RESOURCE UTILIZATION IN PATIENTS WITH RHEUMATOID ARTHRITIS RECEIVING TARGETED THERAPY

Lopez A[1], Priest J[2], Duh MS[1], McDonnell E[1], Bobbili PJ[1], Haider BA[1], Sundaresan D[3], Yood RA[3], Reed JI[3]
[1]*Analysis Group, Inc., Boston, MA, USA,* [2]*GlaxoSmithKline, Durham, NC, USA,* [3]*Reliant Medical Group, Worcester, MA, USA*

OBJECTIVES: To evaluate the impact of change in patient-reported disease activity assessment measured using the Routine Assessment of Patient Index Data 3 (RAPID3) on healthcare resource utilization (HRU) in patients with rheumatoid arthritis (RA) receiving targeted therapy. **METHODS:** Electronic medical records (EMR) from Reliant Medical Group (Worcester, MA, USA) were used to identify adult RA patients with first observed prescription for a targeted therapy ("index") between 1/1/2008 and 6/30/2015. Change in RAPID3 score was calculated as the difference in RAPID3 score (range 0-30) at baseline and 6 (±1) months post-index and was categorized as good, moderate or poor response. All-cause and RA-related medical visits, including inpatient, emergency room, and outpatient visits, as well as prescription drug use was assessed using EMR data in the 6-12 month period following index. A generalized linear model with a log link function and negative binomial distribution was used to assess the association between RAPID3 response category and HRU outcomes, adjusting for RAPID3 score and HRU at baseline. **RESULTS:** The mean age of the study population (N=90) was 59.6 years and 73.3% were female. The mean RAPID3 score was 13.2 at baseline and 10.1 at 6 months post-index; 41 patients (45.6%) had good (N=24) or moderate (N=17) disease response. Compared to patients with poor response, patients with good/moderate response had fewer mean all-cause medical visits (6.1 vs. 11.0, p=0.003), RA-related medical visits (2.5 vs. 5.3, p=0.022), and non-targeted therapy prescriptions (7.3 vs. 12.2, p=0.006). Multivariate regression models showed patients with good/moderate response had significantly reduced all-cause (incidence rate ratio [IRR]=0.68, p=0.029) and RA-related (IRR=0.59, p=0.008) visits, driven mainly by reduction in outpatient visits, compared to poor responders. **CONCLUSIONS:** Patients with good or moderate disease response to targeted therapy, as assessed by RAPID3, have reduced HRU, highlighting the association of patient-reported disease response and economic endpoints.

PMS72

TRENDS IN DIRECT AND OUT-OF-POCKET HEALTHCARE EXPENDITURES AMONG INDIVIDUALS WITH ARTHRITIS IN THE UNITED STATES, 2005 TO 2014

Raval A[1], Vyas A[2]
[1]*Healthcore, Inc., Wilmington, DE, USA,* [2]*University of Rhode Island, Kingston, RI, USA*

OBJECTIVES: No up-to-date information since a decade about direct and out-of-pocket (OOP) healthcare expenditures among US adults with arthritis exists. Hence, we evaluated retrospective cross-sectional trends in incremental direct and OOP healthcare expenditures among adults with arthritis using a nationally representative data, the Medical Expenditures Panel Survey. **METHODS:** Study population comprised of bi-annual cross-sectional cohorts of individuals aged ≥ 18 years during calendar year of 2005 through 2014. Total direct and OOP healthcare expenditures per person per year were estimated. Two-part models were used to estimate the incremental total and types of annual direct and OOP healthcare expenditures (adjusted to 2014 US dollars) of arthritis after adjusting for predisposing, enabling, need, personal health practice and external environment factors as per the Anderson Healthcare Behavior Model. **RESULTS:** Annual weighted population of individuals with arthritis rose from 44.3 million in 2005/06 to 63.5 million in 2013/14. The unadjusted annual average direct and OOP expenditure were $10,963 (Standard Error, SE: $292, aggregated: $485.7 billion) and $1,949 (SE: $57, aggregated: $86.3 billion) in 2005/06 while these were $10,036 (SE: $237, total: 637.3 billion) and $1,177 (SE: $37, aggregated: 74.8 billion) in 2013/14, respectively, among individuals with arthritis. The incremental direct expenditures among adults with arthritis were $1,061 (SE: $198) in 2005/06 which reduced to $652 (SE: $172) in 2013/14. As compared to the direct and OOP expenditures in 2005/06, there was a significant decline in these estimates in 2013/2014. **CONCLUSIONS:** Although there was a decline in the intensity of incremental direct and OOP expenditures among individuals with arthritis in the recent years, arthritis still pose significant economic burden to the US.

PMS73

THE CANADIAN MARKET FOR BIOLOGIC RESPONSE MODIFIERS, 2015

Lungu E, Potashnik T, Biggs J, Bosnic N, El Fateh E, Warwick G, Landry K
Patented Medicine Prices Review Board, Ottawa, ON, Canada

OBJECTIVES: The market for biologic drugs used in the treatment of chronic inflammatory conditions has rapidly evolved over the last two decades. This study provides insight into the uptake in utilization, market shares, pricing, annual treatment costs and the broader drug portfolio of manufacturers operating in this space. **METHODS:** This project was initiated in response to a request from the NPDUIS Advisory Committee in support of the pan-Canadian Pharmaceutical Alliance (pCPA). The drugs considered are Enbrel, Remicade, Kineret, Humira, Rituxan, Orencia, Simponi, Cimzia and Actemra. International comparisons focus on the seven countries the PMPRB considers in reviewing the prices of patented drugs (PMPRB7): France, Germany, Italy, Sweden, Switzerland, the UK and the US, as well as select countries in the Organisation for Economic Co-operation and Development (OECD). The report focuses on 2015 calendar year and provides a retrospective look at trends since 2010. **RESULTS:** The study shows that the sales and use of these biologic drugs are higher in Canada than in most comparable international markets. Despite the availability of lower-cost treatments, the majority of Canadian patients continue to use the drugs with the highest

treatment costs: Remicade, Humira, and Enbrel. Aligning Canadian drug prices with international levels, especially for Remicade, and using less expensive alternative therapies, such as biosimilars, would result in lower drug costs for Canadians. **CONCLUSIONS:** This report is designed to inform policy discussions on the price and reimbursement of this drug class at public and private payer level, including the pricing and uptake of emerging biosimilars.

PMS74

ANALYSIS OF THE FEMORAL FRACTURE REOPERATION RATE IN SÃO PAULO STATE

Oliveira FM[1], Junqueira Junior SM[1], Oliveira D[1], Luque A[2], Cabra HA[3]
[1]Johnson & Johnson Medical Brazil, São Paulo, Brazil, [2]Johnson&Johnson Medical Brazil, Sao Paulo, Brazil, [3]Johnson & Johnson Medical, Miami, FL, USA

OBJECTIVES: To estimate the burden of reoperation rate (clinical and economic) of hip fractures in São Paulo (Brazil). These fractures are associated with different implications to the patient, such as, high mortality rate in the first year (up to 24%), loss of function (after one year less than 40% of patients are able to walk again) and reoperation (6.3 %). **METHODS:** A longitudinal analysis was performed (2008-2015), using hospitalization records - without patient identification, the Hospitalization Service (SIH) of DATASUS, which is a real world evidence database. **RESULTS:** 29,188 primary and 1,903 reoperation procedures were performed in the period, resulting in an average reoperation rate of 6.5%. In 91.5% of the cases a second procedure operation was needed. 49% of the reoperation procedures were performed in the first year after primary surgery, 26% in the second year and 24% the third year. The procedures in people over 50 years correspond to 69.9% of primary procedures. Up to 50 years, women represent 40.1% of cases. Over 50 years the relationship man vs. woman is inverted and 77.8% of surgical cases for fracture treatment were performed on women. The average length of stay of patients was 6.7 days. The mortality rate was 3.72 for the surgical treatment of subtrochanteric fracture, 3.68 for transtrochanteric fracture and 1.15 for surgical treatment of delay on consolidation in the trochanteric region. The economic impact of reoperations was R $ 3.8 million (Reais) in the period studied **CONCLUSIONS:** The complications related to hip fracture often require reoperation. The reoperation rate found in SUS is similar to the reoperation rate published in the literature, 6.5% vs. 6.3%. Our research shows that hip fractures represent a huge burden in the State of São Paulo in terms of reoperation and it brings a huge cost to the health care system

PMS75

TREATMENT PATTERNS AND HEALTHCARE RESOURCE USE OF RHEUMATOID ARTHRITIS PATIENTS TREATED WITH BIOLOGIC DISEASE-MODIFYING ANTI-RHEUMATIC DRUGS IN SOUTH KOREA: RESULTS FROM THE HIRA HEALTH INSURANCE CLAIMS DATABASE

Park J[1], Lee M[2], Nam JH[1], Lee Yj[3], Won J[3], Shi Q[4], Wood R[5], Holbrook T[5], Treuer T[6], Lee E[1]
[1]Sungkyunkwan University, Suwon-si, Gyeonggi-do, South Korea, [2]VIAplus, Siheueng-si, South Korea, [3]Lilly Korea, Seoul, South Korea, [4]Lilly China, Shanghai, China, [5]Adelphi Real World, Bollington, UK, [6]Lilly Hungary, Budapest, Hungary

OBJECTIVES: To characterize real-world patients, treatment patterns and costs amongst rheumatoid arthritis (RA) patients in Korea, specifically patients on biologic disease-modifying antirheumatic drugs (bDMARDs) since major reimbursement guideline changes in 2013. **METHODS:** Descriptive retrospective analysis of the HIRA health insurance claims database. Patients' baseline demographics, clinical characteristics and persistence, and RA-related annual reimbursement costs per-patient were evaluated. Total per-patient costs were calculated in addition to components of cost relating specifically to hospitalizations, joint replacements, outpatient attendances, bDMARD administrations, serious infections and monitoring. Drug costs were not evaluated as a component of cost. RA-diagnosed patients aged 18+ and initiated on or switched bDMARD were included, indexed between Dec 2013 and Dec 2014 with a 12-month follow-up. An exchange rate of ₩1=€0.00078 was used. **RESULTS:** In total, 2,835 bDMARD patients were identified, of which 2,173 were initiators (21.4% etanercept, 20.6% adalimumab, 16.1% tocilizumab) and 662 switchers (35.5% tocilizumab, 22.8% rituximab, 12.5% golimumab). Mean (SD) age was 54.04 (12.71), 16.1% were male and mean (SD) Charlson comorbidity score was 3.69 (1.71), across all patients included. Over half of initiators (58.6%) and switchers (50.6%) persisted on the index bDMARD for 12 months. Annual mean RA-related per-patient costs for (initiators, switchers) were ₩9,446,105 (€7,368), ₩9,701,216 (€7,567) in total within the follow-up period: hospitalizations accounted for ₩923,826 (€721), ₩1,128,228 (€880); joint replacements ₩126,096 (€98), ₩176,800 (€138); hospital outpatient attendance ₩186,053 (€145), ₩183,024 (€143); bDMARD infusions ₩12,804 (€10), ₩17,538 (€14); bDMARD subcutaneous injections ₩4,538 (€4), ₩1,857 (€1); serious infections ₩330,494 (€258), ₩414,137 (€323); and monitoring costs ₩212,500 (€166), ₩233,646 (€182). **CONCLUSIONS:** This is the first Korean study demonstrating real world treatment patterns and costs (over ₩9,000,000 [€7,000] per-patient per year) of treating RA patients with bDMARDs since 2013 reimbursement guideline changes, and therefore is informative to physicians in Korea.

PMS76

REAL-WORLD COSTS OF RHEUMATOID ARTHRITIS IN A SPECIALIZED CENTER IN BOGOTÁ COLOMBIA: RESULTS OF A REGISTRY DURING FIVE YEARS

Santos-Moreno P[1], Villarreal L[1], Aza A[1], Jaimes H[1], Jaimes J[1], Castro C[2], Buitrago-Garcia D[2]
[1]Biomab, center for rheumatoid arthritis, bogota, Colombia, [2]SIIES investigation and research, Colombia, bogota, Colombia

OBJECTIVES: Many studies have investigated socioeconomic and cost issues in rheumatoid arthritis (RA); the introduction of TNF blockers and other biological therapies since 2000 has proven efficacy, and however it has been associated with high costs compared with established DMARDs. The aim of this study was to analyze the health costs of RA therapy and the effectiveness of therapy evaluated by DAS28 over a 5 year period from the perspective of the health care system. **METHODS:** The data of this study was taken from a registry in a RA specialized center in Colombia. We selected patients who had moderate/severe disease activity and had a minimum of 12 follow visits during 2012-2016. These patients were followed-up under strictly T2T standards. Clinical follow-up was done according to DAS28. Therapy had to be adjusted with DAS28 $>$ 3.2 unless patient's conditions don't permit it. The cost analysis was made considering the cost of medications, consultation with a multidisciplinary team, laboratory and radiological tests. The effectiveness was measured by improvement in DAS28. **RESULTS:** Between 2012 and 2016 1220 patients meet the inclusion criteria, 83% were female, mean age was 62 $\pm$ 10. 776 patients were receiving conventional DMARDs and 444 biological therapies; DAS28 average was 4.5 $\pm$1.0 at beginning; after 5 years 864 patients achieved remission/low disease activity: 70% were receiving DMARDs and 30% biological therapy. The average year costs of therapy during 5 years in order to achieve remission/LDA in the group receiving DMARDs was $423.313 US dollars, while the average costs to achieve remission/LDA in the group receiving biological therapy was $2.392.197 US dollars. **CONCLUSIONS:** The results of this registry shows that conventional DMARDs therapy can achieve remission/LDA at a considerably lower costs compared to biological therapy (five/six times) saving costs for the health system over the years.

PMS77

UTILIZATION INDICATORS OF SPECIALIZED THERAPEUTIC SERVICES (NUMBER OF CASES AND VISITS) IN HUNGARIAN HOME CARE

Járomi M[1], Bibó AZ[1], Gyuró M[1], Juhász K[2], Sebestyén A[1], Endrei D[1], Boncz I[1], Horváth L[1], Molics B[1]
[1]University of Pécs, Pécs, Hungary, [2]Baranya County Government Office, Pécs, Hungary

OBJECTIVES: The primary aim of our study was to analyze the therapy services by speciality focusimg the number of cases and visits in Hungarian home care. **METHODS:** Our data came from the database of the National Health Insurance Fund, as the single home health financing agency, which was queried through the Central Statistics Office. The period examined was the year of 2013. The following indicators were analyzed: number of visits, type of visits, number of cases, visits per case. **RESULTS:** The total number of cases in home care amounted to 133.342, the number of visits amounted to 1.298.834 in 2013. Within home care, the number of cases managed by specialized therapeutic service accounted for 64.428 (48.32%). Within this service, the number of cases treated by physiotherapy amounted to 57.509 (43.1%). The number of cases managed by physicotherapy accounted for 6.555 (4.9%), and that of treated by speech therapy amounted was 364 (0.3%). The total number of visits to therapy services by speciality was 532.205 (40.98%). Within these services, physiotherapy amounted to 462.759 (35.6%), physicotherapy accounted for 65.656 (5.0%) and speech therapy amounted to 3.881 (0.3%) visits. The number of visits per case in physiotherapy was 8.04, in physicotherapy, it was 10, and in speech therapy, it was 10.7 visits per case. **CONCLUSIONS:** Within home care, therapy services by speciality play an essential role in the health care of Hungary, among which the request of physiotherapy is extremely high. The number of cases and visits justifies the need of this type of service, currently maximized centrally, to receive more support.

PMS78

UTILIZATION AND FINANCIAL INDICATORS OF SPA SERVICES IN THE SOUTH DANUBIAN REGION, HUNGARY

Varga V, Bibó AZ, Hanzel A, Kerner Á, Elmer D, Ács P, Endrei D, Boncz I, Horváth L, Molics B
University of Pécs, Pécs, Hungary

OBJECTIVES: Aim of our study was to analyze the utilization and health insurance of physiotherapy-type spa services in Hungary and focusing the datas of the South-Danubian region. **METHODS:** Our data were obtained from the Central Bureau of Statistics. The list of spa and other medical care treatment contained 11 activities. The examined period was the year 2014. **RESULTS:** The number of treatments offered by 11 spa funded by the National Health Insurance Fund were 6.839.546. The first three most common treatments included: 1. pool with medicinal water therapy 2.076.148 (30.36%); 2. medical massage 1.642.037 (24.01%); 3. underwater group physiotherapy 686.773 (10.04%). 11.41% of all procedures were enlisted in the South-Danubian region (780.477 treatments), where the most common were: 1. pool with medicinal water therapy 194,976 (24.98%); 2. medical massage 179.003 (22.94%); 3. underwater group physiotherapy 87.176 (11.17%). Sequence of treatments in relation to the Social Insurance (thousand HUF): 1. medical massage 933.229 (21.71%); 2. pool with medicinal water 686.826 (15.98%); 3. complex bath medical-care 621.361 (14.45%). The total National Social Insurance subsidy was 4.299.171, of which 564.838 (13.14%) were in the South-Danubian region. The region's most supported treatments include (thousand HUF): 1. complex bath medical-care 155.707 (27.57%); 2. medical massage 10.334 (18.29%); 3. mud pack 71.613 (12.68%). In the region studied, the majority of patients receiving the above therapeutic possibilities were between 50-79 years of age. **CONCLUSIONS:** There were no differences in the sequence of the most common treatments between the national and South-Danubian region, while there was a significant difference in Social Insurance subsidy. In the South-Danubian region, complex spa medical-care had an extremely high financing rate, while underwater group physiotherapy and pool treatments with medicinal water receive relatively less support reducing overhead costs. Being aware of data can be essential in the organization of regional spa services.

OBJECTIVES: The primary aim of our study was to analyze the therapy services by speciality focusing the number of patients and visits in Hungarian home care. **METHODS:** Our data came from the database of the National Health Insurance Fund, as the single health financing agency, which was queried through the Central Statistics Office. The period examined was the year of 2013. The following indicators were analyzed: number of visits, type of visits, number of patients, visit per case. **RESULTS:** The total number of patients in home care amounted to 59.072, the number of visits amounted to 1.298.834 in 2013. Within home care, the number of patients managed by specialized therapeutic service accounted for 31.739 (53.7%). Within this service, the number of patients treated by physiotherapy amounted to 27.228 (46.1%). The number of patients managed by physicotherapy accounted for 4.340 (7.3%), and that of treated by speech therapy amounted was 171 (0.3%). The total number of visits to therapy services by speciality was 532.205 (40.98%). Within these services, physiotherapy amounted to 462.759 (35.6%), physicotherapy accounted for 65.656 (5.0%) and speech therapy amounted to 3.881 (0.3%) visits. The number of visits per case in physiotherapy was 16.99, in physicotherapy, it was 15.1, and in speech therapy, it was 22.7 visits per case. **CONCLUSIONS:** Within home care, therapy services by speciality play an essential role in the health care of Hungary, among which the request of physiotherapy is extremely high. The number of patients and visits justifies the need of this type of service, currently maximized centrally, to receive more support.

PMS80

EPIDEMIOLOGICAL CHARACTERISTICS OF PATIENTS WITH RHEUMATOID ARTHRITIS IN A SPECIALIZED CENTER IN BOGOTA COLOMBIA

Santos-Moreno P[1], Villarreal L[1], Aza A[1], Jaimes H[1], Jaimes J[1], Castro C[2], Buitrago-Garcia D[2]
[1]Biomab, center for rheumatoid arthritis, bogota, Colombia, [2]SIIES investigation and research, Colombia, bogota, Colombia

OBJECTIVES: Rheumatoid arthritis (RA) is a chronic, autoimmune disease manifesting as joint inflammation that, can lead to joint damage, destruction, and disability: RA can affect approximately 1% of the population, with a peak incidence between the ages of 35 and 50 years (1). The objective of this study is to describe the major clinical and epidemiological characteristics in a descriptive cohort of RA patients, in a specialized RA clinic. **METHODS:** We conducted a cross-sectional study, the data was taken from a registry of RA specialized center in Colombia. These patients were followed-up under strictly treat to Target (T2T) standards; clinical follow-up was done according to DAS28; herapy had to be adjusted with DAS28 $>$ 3.2 unless patient's conditions don't permit it. Epidemiology descriptive was done. **RESULTS:** 5214 patients were included in our registry during a 5 year follow-up. The mean age of patients was 64 $\pm$ 10 years old, 82% were woman and 18% men. The serum rheumatoid factor and anti-citrullinated protein antibodies were positive in 80% of our patients, 4205 (80%) were under conventional DMARDs. In regards of comorbidities 30% of patients had osteoarthritis, 20% hypertension, osteoporosis 12%, 4% diabetes, Sjogren's syndrome 3%, cerebrovascular disease 1%, and chronic renal disease 1.3%. Mean DAS28 was 3.7 $\pm$1, regarding disease activity 50% of patients were in remission 12% low disease activity, 31% moderate disease activity and 7% in severe disease activity. **CONCLUSIONS:** The characteristics of the patients in this epidemiological study are similar to others reported in other studies(1), also this data is evidence that may support other research projects in the Colombian context. References 1. Bautista-Molano W, Fernández-Avila D, Jiménez R, Cardozo R, Marín A, Soler MdP, et al. Epidemiological Profile of Colombian Patients With Rheumatoid Arthritis in a Specialized Care Clinic. Reumatología Clínica (English Edition). 2016;12(6):313-8.

WHEN CLINICAL AND VALUE EVIDENCE DO NOT STATISTICALLY COINCIDE

Campbell JD[1], Ollendorf D[2], Whittington MD[3], Segel C[2], Synnott PG[2], Liu S[2], Chapman RH[2], Kumar V[2], McQueen RB[3]
[1]University of Colorado Anschutz Medical Campus, Denver, CO, USA, [2]Institute for Clinical and Economic Review, Boston, MA, USA, [3]University of Colorado Anschutz Medical Campus, Aurora, CO, USA

OBJECTIVES: We provide a US case of TNF inhibitors (adalimumab, certolizumab pegol, etanercept, golimumab (iv), and infliximab) in rheumatoid arthritis (RA) where head-to-head clinical evidence did not achieve statistical significance but head-to-head cost-effectiveness evidence achieved variation on probabilistic separation. **METHODS:** We conducted a systematic literature review using best practices for search strategy development and article retrieval. We identified studies that included TNFs in combination with conventional disease-modifying anti-rheumatic drugs such as methotrexate. A network meta-analysis of direct and indirect clinical evidence comparisons across TNFs also used in an economic model primarily included: 1. American College of Rheumatology (ACR) ACR20, 50, and 70, representing at least 20%, 50%, or 70% improvement in tender/swollen joint counts; and 2. The Sharp Score, a measure of radiographic joint damage. We developed an economic model consistent with RA evidence and its uncertainty to generate probabilistic sensitivity analysis findings with adalimumab as the primary comparator. Outputs from the US payer perspective were lifetime costs, quality-adjusted life years (QALYs), and incremental net monetary benefit (INMB), estimated using a willingness-to-pay of $150,000/QALY. The Bayesian credible intervals from the network meta-analysis clinical measures and INMB were used to identify statistically significant differences across TNFs as compared to adalimumab. **RESULTS:** At the 95% credible level, no observed differences were detected across the TNFs in comparison with adalimumab for the clinical measures of ACR improvement or Sharp Scores. When this same level of clinical uncertainty was propagated through to cost-effectiveness findings, the INMBs showed separation with high levels of likelihood for two of four TNFs. Specifically, certolizumab pegol, etanercept, golimumab (iv), and infliximab had 50%, 97%, 59%, and 99.9% probability respectively, of achieving a favorable INMB as compared to adalimumab. **CONCLUSIONS:** Findings suggest decision makers may gain value efficiencies even when statistical separation in clinical outcomes is not observed.

PMS82

ASSESMENT OF KNOWLEDGE REGARDING OSTEOPOROSIS AMONG FEMALE PATIENTS ATTENDING GYNECOLOGICAL WARDS IN DIFFERENT HOSPITALS OF QUETTA, PAKISTAN

Haq N, Kanwal H, Nasim A, Shah A, Yasmin R
University of Balochistan, Quetta, Pakistan

OBJECTIVES: The study aimed to investigate knowledge regarding osteoporosis among female patients attending gynecological wards in different hospitals of Quetta, Pakistan. **METHODS:** A cross sectional study was conducted on female patients in gynecological wards in different hospitals of Quetta from March to October 2016. Knowledge was assessed by a pre-validated questionnaire containing 20 questions regarding osteoporosis, its symptoms and causes. A score level of $<$11 was considered as poor knowledge while $\geq$11 was regarded as adequate knowledge All the analysis was done by using SPSS vs 20. **RESULTS:** A total of 289 female patients were included in the study during the study period. Majority (n= 285, 98.6%) were married with the age group between 26-35 years. Most of the patients (n=259. 86.9%) have not been previously diagnosed of bone related problem or osteoporosis. Overall mean knowledge score related to osteoporosis were 12.61 $\pm$ 3.528 (max 20). Majority of respondents 213 (73.7%) had adequate knowledge regarding osteoporosis. Majority (n=117, 40.5%) were not aware about the early symptoms of the disease **CONCLUSIONS:** The study concluded that although females had adequate knowledge regarding osteoporosis, yet they were not aware with the early symptoms of the disease that can lead to develop the disease in them and condition could become worsen if not diagnosed at earlier stages, therefore, awareness programs should be conducted for better understanding of the disease condition.

SENSORY SYSTEMS DISORDERS – Clinical Outcomes Studies

PSS1

INCIDENCE RATES OF COMORBIDITIES AMONG PATIENTS WITH PSORIASIS IN THE UNITED STATES

Feldman SR[1], Hur P[2], Zhao Y[3], Tian H[4], Wei Z[5], Wang X[5], Herrera V[3]
[1]Wake Forest Baptist Medical Center, Winston-Salem, NC, USA, [2]University of Maryland School of Pharmacy, Baltimore, MD, USA, [3]Novartis Pharmaceuticals, East Hanover, NJ, USA, [4]Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA, [5]KMK Consulting, Inc., Morristown, NJ, USA

OBJECTIVES: Psoriasis (PsO) is associated with a substantial comorbidity burden. However, limited data on comorbidity incidence are available for PsO patients in the US. This study compared the incidence of newly diagnosed comorbidities among PsO patients versus demographically matched controls. **METHODS:** PsO patients $\geq$20 years old with $\geq$1 inpatient or $\geq$2 nonrule-out PsO diagnoses (ICD-9-CM code 696.1) were identified in the Truven Health MarketScan Commercial and Medicare Supplemental Databases (January 2000–September 2015), with the first PsO diagnosis as the index date. Controls without PsO diagnosis were matched 1:1 to PsO patients on birth year, gender, and geographical region. All individuals were required to have $\geq$24 months of continuous enrollment prior to index date, and patients with a comorbidity of interest in the prior 24 months were excluded from analysis. Individuals were followed post-index until loss to follow-up, end of continuous enrollment, or end of study period. Incidence rates of PsO-related comorbidities were compared between the PsO and control groups. Hazard ratios were estimated using Cox proportional hazards models adjusted for baseline characteristics including comorbidities and insurance plan type. **RESULTS:** A total of 114,824 PsO patients and matched controls were included; mean age was 53 years and 46% were male. Incidence rates were higher for comorbidities among PsO patients including cardiovascular and metabolic diseases, autoimmune conditions, depression, anxiety, and lymphoma (all $P<0.05$). The most common comorbidities in both groups were hyperlipidemia (PsO vs control, incidence rate per 1000 person-years: 127.5 vs 102.8), hypertension (94.3 vs 80.6), depression (33.3 vs 24.9), anxiety (32.3 vs 25.1), and obesity (33.1 v. 24.1). In adjusted Cox models, PsO patients were more likely to develop all comorbidities described compared with matched controls, with all hazard ratios >1 (all $P<0.05$). **CONCLUSIONS:** Compared with demographically matched non-PsO controls, PsO patients were more likely to develop PsO-related comorbidities.

PSS2

RISK OF INCIDENT UVEITIS IN PEOPLE WITH PSORIASIS: A NATIONWIDE COHORT STUDY

Chi C[1], Wang J[2], Lin Y[3], Chen Y[4], Hsu T[5], Wang S[6], Tung T[5]
[1]Chang Gung Memorial Hospital, Linkou, Taoyuan, Taiwan, [2]National Taiwan University, Taipei, Taiwan, [3]Chang Gung Memorial Hospital, Chiayi, Puzih, Taiwan, [4]Taipei City Government, Taipei, Taiwan, [5]Cheng Hsin General Hospital, Taipei, Taiwan, [6]Far Eastern Memorial Hospital, New Taipei, Taiwan

OBJECTIVES: To evaluate the risk of uveitis in people with psoriasis. **METHODS:** We used Taiwan's National Health Insurance Research Database to conduct a

retrospective cohort study, and identified 147,954 people with psoriasis (including 10,107 with concomitant psoriatic arthritis and 137,847 without psoriatic arthritis) and 147,954 nonpsoriatic controls. We used the Cox proportional hazard model to assess the hazard ratio (HR) for incident uveitis in people affected by mild and severe psoriasis with and without psoriatic arthritis with reference to nonpsoriatic controls. **RESULTS:** The severe psoriasis with psoriasis arthritis group had the greatest risk of incident uveitis in comparison to nonpsoriatic controls (adjusted HR 2.40 (95% confidence interval (CI) 1.90–3.02)). The severe psoriasis without psoriasis arthritis and mild psoriasis with psoriasis arthritis groups also had an increased risk of incident uveitis (adjusted HR being 1.42 (95% CI 1.23-1.64) and 1.42 (95%CI 1.03-1.96), respectively). On the other hand, the mild psoriasis without psoriatic arthritis group did not have an increased risk for incident uveitis (adjusted HR 1.09 (95% CI 1.00–1.20). **CONCLUSIONS:** People with severe psoriasis and those with mild psoriasis but with psoriatic arthritis have an increased risk of uveitis. Clinician may use this finding as a guide for uveitis risk stratification in patients with different inflammatory presentations on the spectrum of psoriatic disease.

PSS3

RISK OF SECOND PRIMARY CANCER IN PEOPLE WITH NON-MELANOMA SKIN CANCER: A NATIONWIDE COHORT STUDY

Wang S[1], Chi C[2], Zhao Z[1], Tung T[3]
[1]Far Eastern Memorial Hospital, New Taipei, Taiwan, [2]Chang Gung Memorial Hospital, Linkou, Taoyuan, Taiwan, [3]Cheng Hsin General Hospital, Taipei, Taiwan

OBJECTIVES: To assess the risk of second primary cancer in people with non-melanoma skin cancer (NMSC). **METHODS:** By using data from the National Health Insurance Research Database, we conducted a population-based cohort study to assess the risk of incident second primary cancer in people affected by NMSC. **RESULTS:** We identified 505 subjects with NMSC and 2,020 matched controls. After adjustment for potential confounders including age, sex, urbanization, and Charlson comorbidity index, people who had NMSC had a 1.43-fold (95% CI: 1.05-1.96) risk for the development of second primary cancer as compared with control group. Men with NMSC had a 2.99-fold (95% CI 1.00-9.10) risk for second primary cancer involving the lip, oral cavity, and pharynx and a 3.51-fold (95% CI 1.21-10.17) risk for second primary cancer involving the genitourinary organs when compared to the control group. By contrast, women with NMSC did not have an increased risk of second primary cancer. **CONCLUSIONS:** This study confirmed Asians with NMSC have an increased risk of second primary cancer, but the clinical presentations are different from those in Caucasians. Our findings can be a useful reference for health care for people diagnosed with NMSC.

PSS4

DIAGNOSIS AND TREATMENT HISTORY BEFORE PSORIASIS DIAGNOSIS AMONG PATIENTS WITH MODERATE-TO-SEVERE PSORIASIS

Feldman SR[1], Zhao Y[2], Hur P[2], Liu JS[3], Herrera V[2]
[1]Wake Forest Baptist Medical Center, Winston-Salem, NC, USA, [2]Novartis Pharmaceuticals, East Hanover, NJ, USA, [3]Harvard University, Cambridge, MA, USA

OBJECTIVES: Psoriasis patients often experience delay in diagnosis. This study examined the diagnoses of skin diseases and treatments before receiving psoriasis diagnosis among patients with moderate-to-severe psoriasis. **METHODS:** Adult patients with at least 2 psoriasis diagnoses (ICD-9-CM code: 696.1) between 01/1998 and 03/2015 were identified in the OptumHealth Reporting and Insights claims database. The index date was the first psoriasis diagnosis date. Eligible patients had continuous eligibility during the 3 years before (baseline period) and 5 years after the index date. Patients with moderate-to-severe psoriasis were identified if they had $\geq$1 systemic therapy or phototherapy during the 5-year post-index period. Diagnoses of other skin diseases, time from the first skin disease diagnosis to the first psoriasis diagnosis and treatments for skin diseases were described over the baseline period **RESULTS:** The study included 1,098 patients with a mean age of 53 years and 46% female. Common psoriasis-related comorbidities during the baseline period were hyperlipidemia (41%), hypertension (38%), and diabetes (14%). During the baseline period, 474 (43%) patients had $\geq$1 diagnosis of other skin disease, with the most common including contact dermatitis and other eczema (29%), dermatophytosis (13%), and atopic dermatitis and related conditions (7%). The average time from the 1st skin disease diagnosis to the 1st psoriasis diagnosis was 15.9 months. Among patients with a skin disease diagnosis, 91% received treatments related to skin diseases with the most commonly used being steroids (topical: 77%, non-topical: 24%) and antifungals (topical: 39%, oral: 23%). **CONCLUSIONS:** A high proportion of moderate-to-severe psoriasis patients had diagnoses for other skin diseases and was treated with steroids or antifungals before receiving the 1st psoriasis diagnosis. The high rates of other skin disease diagnoses at baseline suggested that some patients may be misdiagnosed. Future studies assessing the association between these skin diseases and psoriasis are warranted.

PSS5

PREVALENCE OF GINGIVITIS AMONG PATIENTS ATTENDED DENTAL DEPARTMENT OF SANDMAN PROVISIONAL HOSPITAL IN QUETTA, PAKISTAN

Haq N, Khan S, Nasim A, Yasmin R, Haider S, Razaque G, Ahmed N
University of Balochistan, Quetta, Pakistan

OBJECTIVES: The aim of this study was to check prevalence of Gingivitis among patients attended dental department of Sandman Provisional hospital Quetta, Pakistan. **METHODS:** The retrospective based descriptive study was done and data was collected from patients records for the period of 16 months i.e.: January 2015 to April 2016. The record of patients attended dental department of hospital having any dental disease were included in study. To study population descriptive and cross tabulation were performed and data in this study was analyzed using IBM SPSS v.20. **RESULTS:** Three thousand four hundred six (3406) patient's record data were analyzed during the study period, majority (n=1159, 34.9%), of respondents had age ranges between 17 – 26 years with male dominancy, (n= 1746, 51.3%). Results shows that overall prevalence of Gingivitis was 89.6% (n=3052) among all the dental diseases recorded for the patients. Age group was significantly ($P < 0.001$) associated with the type of different diseases. **CONCLUSIONS:** The present study revealed that the Gingivitis was most prevalent disease in dental patients, it is recommended that conscious efforts should be taken including oral health awareness programs and seminars regarding oral health in city.

SENSORY SYSTEMS DISORDERS – Cost Studies

PSS6

AFLIBERCEPT FOR THE TREATMENT OF NEOVASCULAR AGE-RELATED MACULAR DEGENERATION: A BUDGET IMPACT ANALYSIS UNDER THE PERSPECTIVE OF BRAZILIAN PUBLIC HEALTH CARE SYSTEM

Oliveira LE[1], Caires AL[2], Abreu GR[3], Nita ME[4]
[1]Secretaria Estadual Saude Mato Grosso, Cuiabá, Brazil, [2]Secretaria Estadual de Saúde, Belo Horizonte, Brazil, [3]Federal University of Bahia, Salvador, Brazil, [4]USP and FIPE/HAOC, Sao Paulo, Brazil

OBJECTIVES: Age-related macular degeneration (AMD) is a chronic disease that can lead to blindness. The Brazilian public healthcare system (SUS) provides free of cost those drugs incorporated to its Pharmaceutical Assistance Program. The goal of this study is to determine the budget impact of aflibercept for SUS as compared with bevacizumab and ranibizumab. **METHODS:** We have undertaken a budget impact analysis (BIA) following the Brazilian Ministry of Health (MOH) guidelines. The Brazilian population data was obtained from Instituto Brasileiro Geografia Estatística (IBGE) and epidemiological data from Brazilian Society of Retina and Vitreous (SBRV), with the prevalence of 10%. All drugs had their posology based on their Brazilian labels. The prices (ex-factory, maximum price for MOH, and negotiated prices) were from SUS. And other costs from SUS administrative databases, SIGTAP (for medical office, diagnosis tests and pharmaceutical application costs, etc.). We simulated various scenarios of diffusion rates from 10% to 70% penetration. **RESULTS:** We have estimated that about 126,266 Brazilians are potential patients in the first year and 133,826 in the 5th year. The annual cost of treatment, using the maximum price for MOH, with aflibercept was R$ 20,809.81 (USD$ 6,120.00) for the first year, R$ 17,836.98 (USD$ 5,245.00) (from 2nd to 5th year); bevacizumab was R$ 15,536.64 (USD$ 4,519.00); and ranibizumab R$ 36,410.64 (USD$ 10,708.00). The total annual budget impact for SUS in the 10% scenarios was R$ 480 MI (USD$ 141 MI) for ranibizumab and R $280 MI (USD$ 82 MI) for aflibercept, considering that it was R$219MI (USD$ 64 MI) for bevacizumab. **CONCLUSIONS:** Under the perspective of Brazilian SUS, ranibizumab had the higher costs, bevacizumab had similar efficacy with lowest costs, and aflibercept had also similar efficacy with intermediated costs between ranibizumab and bevacizumab. Thus, a strong price negotiation is recommended due to large budget impact on SUS.

PSS7

COST-EFFECTIVENESS AND BUDGET IMPACT ANALYSIS OF CLOSTRIDIAL COLLAGENASE OINTMENT COMPARED WITH MEDICINAL HONEY FOR TREATMENT OF PRESSURE ULCERS

Mearns ES[1], Liang M[2], Limone B[2], Miller JD[3], Gilligan AM[4], Waycaster CR[5]
[1]Truven Health Analytics, An IBM Company, PHILADELPHIA, PA, USA, [2]Truven Health Analytics, An IBM Company, Cambridge, MA, USA, [3]Truven Health Analytics, an IBM Company, Cambridge, MA, USA, [4]Truvan Health Analytics, Ann Arbor, MI, USA, [5]Smith & Nephew Inc., Fort Worth, TX, USA

OBJECTIVES: To assess the cost-effectiveness and economic impact of enzymatic debridement with clostridial collagenase ointment (CCO) compared with medicinal honey (MH) for pressure ulcer (PU) treatment from a US payer/Medicare perspective in the hospital outpatient department (HOPD) setting. **METHODS:** A budget impact analysis using Markov health state transitions was developed using a 1-week cycle length across a 1-year time period to estimate the potential economic impact (expressed in 2016 US dollars) after increasing the market share of PU patients treated with CCO. The three health states were: (1) inflammation/senescence; (2) granulation/proliferation (ie, patients achieving 100% granulation); and (3) epithelialization. Data sources included the US Wound Registry, Medicare fee schedules, and published clinical and cost studies about PU treatment. **RESULTS:** In the base-case analysis over a 1-year time horizon, CCO was the economically dominant strategy (ie, simultaneously conferring greater benefit at less cost). Patients treated with CCO experienced 22.7 QALWs at a cost of $6,161 over one year, while MH patients experienced 21.9 QALWs at a cost of $7,149. Patients treated with CCO achieved 11.5 granulation weeks and 6.0 epithelization weeks compared with 10.6 and 4.4 weeks for MH, respectively. The number of clinic visits was 40.1 for CCO vs 43.4 for MH, and number of debridements was 12.3 for CCO compared with 17.6 for MH. Assuming a patient population of 1000 patients, for every 1% of patients shifted from MH to CCO, a cost savings of $9883 over one year is observed by the payer. Probabilistic sensitivity analyses determined CCO to be dominant in 72% of 10,000 iterations and cost-effective in 91%, assuming a benchmark willingness-to-pay threshold of $50,000/quality-adjusted life year ($962/QALW). **CONCLUSIONS:** The results of these economic analyses suggest CCO is a cost-effective, economically dominant alternative to MH in the treatment of patients with PUs in the HOPD setting.

PSS8

ESTIMATING THE ECONOMIC IMPACT OF OPEN-ANGLE GLAUCOMA THERAPY OPTIONS: A SYSTEMATIC REVIEW

Serbin M, Devine B
University of Washington, Seattle, WA, USA

OBJECTIVES: To conduct a systematic review of the economic impact on glaucoma-associated services, comparing topical medications ("drop") vs. laser trabeculoplasty (LT), or any glaucoma surgery ("non-drop") therapies. **METHODS:** We used a structured search of Pubmed to retrieve randomized controlled trials, cohort or case-control studies, and economic models published between January 1996 and August 2016. Inclusion criteria required a direct comparison of a drop vs. non-drop treatment. We extracted data on healthcare resource use and direct costs of glaucoma associated services (ophthalmologist visits, surgical procedures, medications, exams and other services); and indirect costs (production loss and absenteeism) of topical medications drop vs. non-drop therapies. **RESULTS:** Twelve studies met the inclusion criteria (eight economic models, three retrospective cohort studies and one prospective case series). Analyses were from eight countries across four continents (North America, South America, Europe and Africa). Of the non-drop therapies included in the review, LT was the comparator in six studies, traditional surgical procedures were comparators in four, minimally invasive surgeries in one study; and one study assessed either surgery or laser procedures compared with drops. In four studies, the comparison between drops and LT were made in a primary glaucoma diagnosis population, with the other eight in populations with more advanced or refractory disease. All 12 publications reported direct costs, only two of the twelve included indirect costs or reported health care resource utilization. Potential cost-savings with non-drop treatments was seen in eight of the twelve studies, including all four studies comparing a primary laser procedure to initiation of drop therapy. **CONCLUSIONS:** Open-angle glaucoma treatment using non-drop therapies may have the potential to be cost-effective when compared to drop therapy for both initial- and drop-refractory treatment for open-angle glaucoma. However, variability between studies and numerous potential intra-study limitations does not allow for a consensus recommendation and supports the need for further evaluation.

PSS9

TREATMENT PATTERNS AND TOTAL HEALTHCARE COSTS OF METASTATIC MERKEL CELL CARCINOMA IN THE UNITED STATES

Steuten L[1], Fedorenko CR[1], Sun Q[1], Garmo V[2], Phatak H[2], Sullivan SD[3], Nghiem P[3], Ramsey SD[1]
[1]*Fred Hutchinson Cancer Research Center, Seattle, WA, USA,* [2]*EMD Serono, Inc., Rockland, MA, USA,* [3]*University of Washington, Seattle, WA, USA*

OBJECTIVES: This study describes treatment patterns and total direct healthcare costs among Medicare enrollees diagnosed with advanced Merkel cell carcinoma (aMCC), a rare neuroendocrine carcinoma of the skin. **METHODS:** Surveillance, Epidemiology and End Results (SEER)-Medicare data were used to describe treatment patterns and costs, and 12-month total healthcare costs for patients aged ≥65 years diagnosed with aMCC from 2006-11. Patients were required to have non-HMO Medicare eligibility for ≥12 months before and ≥4 months after diagnosis. Chemotherapy within 4 months after diagnosis was considered first-line treatment. Second-line treatment was assessed from 6 weeks after first chemotherapy up to death or disenrollment. Median per-patient total direct healthcare costs within 12 months post-diagnosis, including diagnostics and imaging, treatment procedures, inpatient and outpatient visits, hospice, home healthcare and durable medical equipment for any condition were calculated in 2015 dollars. **RESULTS:** We identified 154 patients diagnosed with aMCC. At diagnosis, mean age was 81 (SD=7.5) years; 32% were women; 39% (N=60) were stage IIIb and 61% (N=94) were stage IV. Within 4 months after diagnosis, 83% (N=128) of patients received treatment, of which 45% (N=70) received surgery, 44% (N=67) radiation therapy and 38% (N=58) chemotherapy. Second-line chemotherapy was identified in 31% (N=18) of patients receiving first line chemotherapy. Median total 12-month direct healthcare costs were $46,081 (IQR=$37,488) per patient. Patients receiving no treatment had the lowest median total healthcare costs ($29,256; IQR=$13,387), followed by patients receiving surgery and/or radiation but not chemotherapy ($45,775; IQR=$37,110); costs were highest in patients receiving chemotherapy, either alone or combined with radiation and/or surgery ($54,672; IQR=$70,635). **CONCLUSIONS:** Most aMCC patients receive initial treatment including surgery, radiation and/or chemotherapy and approximately one-third of the latter receive second-line chemotherapy. Total 12-month direct healthcare costs are highest in patients receiving chemotherapy alone or combined with radiation and/or surgery.

PSS10

COSTS OF NONSURGICAL DEFECT SCARS TREATMENT SCHEME AFTER SURGERY ON MAMMARY GLANDS IN REAL LIFE PRACTICE

Rybchynskyy H
Lviv state oncology regional diagnostic and treating centre, Lviv, Ukraine

OBJECTIVES: Hypertrophic scars and keloids have high influence on quality of life for women after surgery and lead to strong psychosocial impairment. There are numbers of invasive and non-invasive options available for the plastic and aesthetic surgery both to prevent and to treat abnormal scar formation. The objective of this study was to estimate costs of treatment scheme of scars after surgery on mammary glands in real life practice and assess consumption of medicine in out-patient care in Ukraine. **METHODS:** We analyzed 47 medical records of women with scars after surgery on mammary glands at Lviv State Regional Oncology Diagnosing and Treating Centre in 2015 in Ukraine (Lviv Region population 2,5 mln people). We calculated the average costs of medicine treatment course per patient for 3 month duration; and we analyzed the direct cost of treatment using weighted average prices from Morion company database (Ukraine) as of December 1, 2016 (1 USD= 26 UAH) from patients' perspective. **RESULTS:** The main effectiveness outcomes in the scheme are lower recurrence rates, satisfied patients, absence of additional surgery of defect scars, and short time presence in hospital (Monstrey S., Middlekoop E. et al., 2014). The sample included 47 women with age ranging from 19 to 41 years. The treatment included: dexamethasone solution for injection, local anesthetic (2% lidocaine), silicone patch, elastic bandage. An average costs were 57.86 USD per one woman for treatment course for 3 month. **CONCLUSIONS:** The costs of the treatment are high because they are the patient`s out-of-pocket expenses. The analysis shows the actual topic for research of women health and optimization of treatment regimens after surgery.

PSS11

EVALUATION OF THE CHANGE IN VISUAL ACUITY AND RELATED CLINICAL RESOURCE USE IN THE 12 MONTHS PRIOR TO AND POST INTRAVITREAL SURGERY USING THE FLUOCINOLONE ACETONIDE IMPLANT

Holden SE[1], Currie CJ[1], Beiderbeck A[2], Yang Y[3]
[1]*Pharmatelligence, Cardiff, UK,* [2]*Alimera Sciences Ophthalmologie GmbH, Berlin, Germany,* [3]*Birmingham & Midland Eye Centre, Birmingham, UK*

OBJECTIVES: To assess visual acuity (VA) and healthcare resource use and costs of treating diabetic macular oedema (DMO) before and after treatment with fluocinolone acetonide (FAc) intravitreal implant in routine practice. **METHODS:** The retrospective ILUVIEN Clinical Evidence study collected data from patient medical records in multiple ophthalmology centres in the UK. Data were collected on patients with DMO prescribed FAc implant in the 12 months before and after implant. Costs were attributed to healthcare resource use using standard UK healthcare costing methods (2014/15 prices). **RESULTS:** 178 people contributing 196 treated eyes were included in the study. Mean age was 68.4 years; 67 (38%) were female. Median (interquartile range, IQR) VA was 0.70 (0.50–1.00) LogMAR units at implant, improving to 0.60 (0.38–0.90) LogMAR units at 12 months post implant ($p<0.001$). 45% and 20% of patients achieved an improvement in ETDRS score of 5 and 15 letters, respectively, at 12 months. The mean (standard deviation, SD) number of anti vascular endothelial growth factor (anti-VEGF) injections per treated eye in the 12 months prior to implant was 2.8 (2.6), decreasing to 0.6 (1.4) in the same period after implant (unit cost £747 for ranibizumab, £1,012 for aflibercept and £246 for bevacizumab). The corresponding figures for other steroid injections were 0.2 (0.4) before and 0.1 (0.4) after implant (unit cost £1,066 for dexamethasone and £197 for triamcinolone). 20 (10%) and 18 (9%) eyes underwent macular laser therapy (unit cost £137) before and after implant, respectively. Mean (SD) costs of these treatments were £2,049 (£1,869) before and £543 (£1,177) after implant ($p<0.001$). The unit cost of administering the FAc implant was £5,696. **CONCLUSIONS:** An improvement in visual acuity was observed at 12 months. Excluding the cost of the FAc implant, healthcare costs associated with treatment were significantly reduced in the 12 months post implant.

PSS12

COST-EFFECTIVENESS OF SECUKINUMAB IN MODERATE TO SEVERE PSORIASIS COMPARED WITH OTHER BIOLOGICS IN GERMANY

Graham CN[1], McBride D[2], Miles L[1], Gilloteau I[3], O'Neill CB[4], Neidhardt K[5], Augustin M[6]
[1]*RTI Health Solutions, Research Triangle Park, NC, USA,* [2]*RTI Health Solutions, Manchester, UK,* [3]*Novartis Pharma AG, Basel, Switzerland,* [4]*Novartis Ireland Ltd, Elm Park, Ireland,* [5]*Novartis Pharma GmbH, Nuernberg, Germany,* [6]*University Clinics of Hamburg, Hamburg, Germany*

OBJECTIVES: Secukinumab (SEC) 300 mg, a fully human interleukin-17A antibody, has demonstrated superior and sustained efficacy in adults with moderate to severe psoriasis compared with ustekinumab (UST), etanercept (ETN), and placebo. This analysis compared the cost per responder of SEC as first biologic treatment with adalimumab (ADA), infliximab (INF), ETN, and UST. **METHODS:** A 52-week decision tree, reflecting response to treatment (defined as Psoriasis Area Severity Index [PASI] reduction of < 50%, 50-74, 75-89, and ≥ 90 ["PASI≥90"]), led into a Markov model with health states related to treatment continuation, drop-out, and death. Responders (i.e., PASI≥75 and PASI≥90) at week 16 continued initial treatment. Sustained response was defined as 16-week response maintained at week 52. Nonresponders and drop-outs were switched to standard of care. A 10-year German health care system perspective with 3% discount rates was adopted. Clinical data came from a mixed-treatment comparison; 2016 resource unit costs from national sources; and adverse events and discontinuation rates from literature. We calculated cost per PASI≥90 responder over week 16 and over week 52, as well as per sustained responder between weeks 16 and 52. Sensitivity analysis, excluding co-pays, was conducted. **RESULTS:** SEC had the lowest cost per PASI≥90 responder over 16 weeks (€17,907) compared with UST (€18,027), ADA (€23,418), INF (€28,416), or ETN (€33,939). Over 52 weeks, costs per PASI≥90 responder ranged from €42,078 (SEC) to €69,968 (ETN). Likewise, SEC had the lowest cost per sustained 52-week PASI≥90 responder (€22,514) and UST the highest (€31,107). SEC dominated all other biologics on the cost-effectiveness frontier. Sensitivity analysis supported robustness of results. **CONCLUSIONS:** SEC treatment of moderate to severe psoriasis is cost-effective, reducing cost per responder compared with other biologic treatments over 10 years in Germany.

PSS13

COST-EFFECTIVENESS ANALYSIS OF RANIBIZUMAB PRN (AS NEEDED) IN WET AGE-RELATED MACULAR DEGENERATION IN CHINA

Hong Y[1], Yang Y[2], Zhang J[1], Fu M[1], Yi X[1], Han S[3], Shi LW[1]
[1]*Peking University, Beijing, China,* [2]*Nanjing University of Chinese Medicine, Nanjing, China,* [3]*School of Pharmaceutical Sciences, Peking University, Beijing, China*

OBJECTIVES: Ranibizumab (RBZ) was the first available anti-vascular endothelial growth factor treatment in China. Monthly treatment is recommended per label; however, pro re nata (PRN) (as needed) is the most widely used dosing regimen in local

routine clinical practice. This study aimed to assess the cost-effectiveness of RBZ-PRN compared to best supportive care (BSC) with the recently revised 2016 manufacturer price from a societal perspective. **METHODS:** A 10-year MS-Excel Markov model with 5 visual acuity levels and 1 death state was used. Two wAMD eye types, predominantly classic (PC) and minimally classic/occult (MC/OC) eyes were analyzed separately given the differences in treatment response observed in clinical trials. Transition probabilities, treatment frequencies and adverse event data were sourced from clinical trials (MARINA, TAP, SUSTAIN, MONT BLANC). Direct medical costs (3.5% discount) were obtained from China's national claims database; utilities (3.5% discount) were from a time-trade-off study. Direct non-medical and indirect costs were sourced from a local disease burden study. One-way and probabilistic sensitivity analyses were performed on baseline age, time horizon, treatment duration, blinding costs and utilities etc. **RESULTS:** Assuming a cost-effectiveness threshold of

PSS14

THE COST-EFFECTIVENESS OF ORAL ALITRETINOIN IN PATIENTS WITH SEVERE CHRONIC HAND ECZEMA IN THE HEALTHCARE SYSTEM OF SOUTH KOREA

Nam J, Cho E

Sookmyung Women's University, Seoul, South Korea

OBJECTIVES: Patients with severe chronic hand eczema (CHE) refractory to steroids have few therapeutic options. Recently, alitretinoin has been suggested as a new treatment option for those patients and its cost-effectiveness has been accepted in European countries. However, the cost-effectiveness outcomes of using alitretinoin have rarely been examined in other countries. Our study aims to assess the cost-effectiveness of alitretinoin compared to previous supportive care from the societal perspective of South Korea. **METHODS:** A markov model was constructed to project the incremental cost effectiveness ratio (ICER) per quality-adjusted life-year (QALY) for every 12-week up to 20 years. Clinical effectiveness outcomes were drawn from previous clinical studies. Costs and utilization patterns of medications were obtained from the survey and focus group interviews with dermatologists and pharmacists. The EQ-5D values were mapped from the Dermatology Life Quality Index according to patients' Physician Global Assessment scores. All costs were converted to 2016 January US dollars of 2016 January. One-way sensitivity analyses regarding discount rate, alitretinoin price, definition of relapse, utility values, and the number of treatment terminated patients were performed. Both costs ($) and QALY were annually discounted at 5% rate. **RESULTS:** The use of alitretinoin treatment over the supportive care during 3 years yielded in the ICER of $15,854/QALY. The ICER values kept decreasing from $31,350/QALY to $8,917/QALY as the time horizon extended from 1 to 20 years. These results were robust to all sensitivity analyses with ICERs between $8,525/QALY and $24,386/QALY during 3 years. **CONCLUSIONS:** Our study projected the cost-effectiveness of using alitretinoin and the results showed that alitretinoin was highly cost effective for patients with severe CHE refractory to topical steroids in South Korea considering the ICER value lesser than the GDP per capita.

PSS15

A COST-PER-RESPONDER ANALYSIS OF SECUKINUMAB COMPARED WITH USTEKINUMAB THROUGH 52 WEEKS IN GERMANY: RESULTS FROM THE CLEAR STUDY OF PATIENTS WITH MODERATE TO SEVERE PSORIASIS

Augustin M[1], Graham CN[2], Miles L[2], Gilloteau I[3], O'Neill CB[4], Neidhardt K[5], McBride D[6]

[1]*University Clinics of Hamburg, Hamburg, Germany,* [2]*RTI Health Solutions, Research Triangle Park, NC, USA,* [3]*Novartis Pharma AG, Basel, Switzerland,* [4]*Novartis Ireland Ltd, Elm Park, Ireland,* [5]*Novartis Pharma GmbH, Nuernberg, Germany,* [6]*RTI Health Solutions, Manchester, UK*

OBJECTIVES: Secukinumab (SEC) 300 mg, a fully human interleukin-17A antibody, has demonstrated sustained superior efficacy over ustekinumab (UST) 45/90 mg, an anti-interleukin-12/23 antibody, through 52 weeks in adults with moderate-to-severe psoriasis. This analysis compared the cost per responder of SEC versus UST over 1 year from a German payer perspective. **METHODS:** A 52-week decision-tree model reflecting response to treatment, defined as Psoriasis Area Severity Index (PASI)-reduction of < 50, 50-74, 75-89, and $\geq 90\%$ from the CLEAR head-to-head study comparing SEC to UST, evaluated cost per responder (PASI75, PASI90, and PASI100). Responders at week 16 continued initial treatment. Nonresponders and drop-outs were switched to standard of care. Resource unit costs for 2016 were derived from national sources; adverse events and discontinuation rates, from published literature. No discount was applied. Analyses were conducted for responders over week 16 and over week 52, as well as for those with sustained response between weeks 16 and 52. Deterministic sensitivity analyses were conducted to evaluate the impact of drug costs only. **RESULTS:** Estimated cost per PASI90 responder was lower for SEC than for UST over 16 weeks (SEC: €15,648; UST: €16,645), over 52 weeks (SEC: €35,668; UST: €49,280), and for 52-week sustained response (SEC: €19,017; UST: €23,800). Overall, PASI75 and PASI100 results also were lower for SEC than for UST. Time in PASI90-99 or PASI100 was longer with SEC than with UST (0.31 vs. 0.24 years and 0.40 vs. 0.20 years, respectively). Sensitivity analyses confirmed the robustness of results: cost per responder remained lower for SEC than for UST. **CONCLUSIONS:** The strong and sustained efficacy of SEC compared to UST in the treatment of moderate to severe psoriasis reduces the cost per responder over 1 year in Germany.

PSS16

PHARMACOECONOMIC ANALYSIS OF DEXAMETHASONE INTRAVITREAL IMPLANT FOR THE TREATMENT OF DIABETIC MACULAR EDEMA IN RUSSIA

Kolbin A[1], Galankin T[1], Kaleev AI[2]

[1]*First Pavlov State Medical University of St. Petersburg, Saint Petersburg, Russia,* [2]*Allergan CIS SARL, Moscow, Russia*

OBJECTIVES: Diabetic macular edema (DME) is one of the leading causes of vision loss in older adults in Russia, as well as in the United States. Sustained-release dexamethasone intravitreal implant blocks production of the vascular endothelial growth factor (VEGF) and other inflammatory mediators, inhibits leukostasis, and enhances the barrier function of vascular endothelial cell tight junctions. It was approved for the treatment of DME in Russia in 2016. This is the first pharmacoeconomic evaluation of Ozurdex use in treatment of DME in Russia. **METHODS:** VEGF inhibitors ranibizumab and aflibercept were used as comparators; the mean average best corrected visual acuity (BCVA) improvement was chosen as a primary efficacy endpoint. Thorough literature search was conducted, 12 appropriate randomized clinical trials (RCTs) and 4 observational studies were retrieved. Cost-utility and cost-effectiveness analyses were implemented based on decision tree model. The main scenario incorporated weighted efficacy of dexamethasone, ranibizumab and aflibercept obtained in a Bayesian network meta-analysis of RCTs; an alternative scenario exploited effectiveness of Ozurdex estimated in observational studies. A three year model horizon was used. Probabilistic sensitivity analysis using Monte Carlo simulation was used to estimate uncertainty range for incremental cost-effectiveness and cost-utility ratios (ICER and ICUR). **RESULTS:** Total direct costs of dexamethasone, ranibizumab and aflibercept were 274 729, 792 662 and 1 060 918 rubles accordingly. In the main scenario ICERs for ranibizumab and aflibercept were 2 130 143 and 1 767 862 rubles for three line BCVA improvement; and ICURs were 39 258 845 and 33 667 235 rubles accordingly for 1 additional QALY, which exceeds 1 341 308 rubles society willingness to pay threshold based on per capita gross domestic product. Sensitivity analysis demonstrated low level of uncertainty of these estimates. **CONCLUSIONS:** Dexamethasone intravitreal implant is pharmacoeconomically useful for patients with DME in Russia.

PSS17

COST-EFFECTIVENESS OF TARGETED THERAPY FOR MODERATE-TO-SEVERE PLAQUE PSORIASIS: AN ANALYSIS BASED ON AN INSTITUTE FOR CLINICAL AND ECONOMIC REVIEW (ICER) REPORT

Hendrix N[1], Ollendorf D[2], Chapman RH[2], Loos A[2], Liu S[2], Kumar V[2], Linder JA[3], Pearson SD[2], Veenstra DL[1]

[1]*University of Washington, Seattle, WA, USA,* [2]*Institute for Clinical and Economic Review, Boston, MA, USA,* [3]*Northwestern University, Chicago, IL, USA*

OBJECTIVES: To determine the likelihood of cost-effectiveness, assessed by cost per quality-adjusted life year (QALY), for several targeted therapies approved to treat moderate-to-severe plaque psoriasis in the United States. Currently marketed drugs included were apremilast, adalimumab, etanercept, infliximab, ustekinumab, secukinumab, and ixekizumab; the newly-approved drug brodalumab was also included. **METHODS:** We constructed a Markov model to simulate the flow of patients from first-line therapy to either second-line therapy or no treatment and, for patients receiving second-line treatment, from second-line therapy to no treatment. Patients were assumed to change treatment if they failed to achieve a 75% improvement in Psoriasis Area Severity Index (PASI-75) over baseline or if their response fell below PASI-75. The wholesale acquisition cost for each drug was discounted by a class-specific, empirically-derived rebate percentage. Brodalumab's price was set to equal the average of secukinumab and ixekizumab, the other two IL-17 agents. Health-related utility on first-line treatment was derived from improvement in PASI score from baseline; second-line treatment used a weighted average of utility on targeted therapy, with a 5% decrement to represent loss of efficacy in patients with prior targeted therapy. We conducted a probabilistic sensitivity and net monetary benefit analysis to estimate likelihood of cost-effectiveness. **RESULTS:** Over a ten year time horizon, at a willingness-to-pay of $100,000/QALY, secukinumab, ixekizumab, and brodalumab – all IL-17 agents – had a combined probability of 51% of being most cost-effective, while apremilast and infliximab had 11% and 7% probability, respectively. The class-wide probability of cost-effectiveness for IL-17 drugs rose to 94% when willingness-to-pay is $150,000/QALY. **CONCLUSIONS:** At and above the $100,000/QALY threshold often cited for the United States, the three IL-17 agents in this study are likely to be the most cost-effective first-line agents.

PSS18

A COST-EFFECTIVENESS AND VALUE OF INFORMATION ANALYSIS OF ALTERNATIVE TREATMENTS FOR PRIMARY AXILLARY HYPERHIDROSIS IN SECONDARY CARE

Rice S[1], Moloney E[1], Stoniute J[1], Wade R[2], Llewellyn A[2], Jones-Diette J[2], Wright K[2], Layton A[3], Levell N[4], Stansby G[5], Woolacott N[2], Craig D[1]

[1]*Newcastle University, Newcastle upon Tyne, UK,* [2]*University of York, York, UK,* [3]*Harrogate and District NHS Foundation Trust, Harrogate, UK,* [4]*Norfolk and Norwich University Hospital, Norwich, UK,* [5]*Freeman Hospital, Newcastle upon Tyne, UK*

OBJECTIVES: To determine the most cost-effective sequence of interventions for the management of refractory primary hyperhidrosis in secondary care in the UK NHS, and to establish the expected value of undertaking additional research on clinical outcome and utility parameters. **METHODS:** A de novo probabilistic model was developed, which modelled sixty-four different treatment sequences for axillary hyperhidrosis. Treatments included: aluminium chloride, medication(M), botulinum toxin(BTX), iontophoresis(I) sponge, curettage(C) and endoscopic thoracic sympathectomy(E). A 48-year time horizon was used, with health outcomes expressed as QALYs. The perspective was that of the UK NHS and Personal Social Services. Sensitivity analyses were conducted, alongside both the population expected value of perfect- and partial perfect-information (EVPPI) for model parameters. These were calculated for different willingness to pay thresholds (WTP), incidence rates and effectiveness of treatments. Costs were calculated in GBP (£) for the 2015 price year. **RESULTS:** Base-case results indicated that IBMCE was the most cost-effective sequence; ICER of £9,304/QALY; probability cost-effective 0.8. The next most cost-effective sequences involved medication moving

before BTX or disappearing from the sequence. This reflects the uncertainty in the effectiveness estimate of medication vs placebo. Most sensitivity and scenario analyses had little effect on the results. The population EVPPI for medication vs placebo and for curettage vs BTX effectiveness was > £3 million for all scenarios; unless the incidence of axillary hyperhidrosis was 0.5% and WTP was £20,000/QALY. **CONCLUSIONS:** The analysis found that the treatment sequence IBMCE was most cost-effective. Despite the limited evidence, iontophoresis and BTX maintained their position as first- and second-line treatment options in the majority of cost-effective sequences. The value of information analysis suggested that whilst further research of medication vs placebo may be of value, with medication either coming before BTX in the sequence or dropping out altogether.

PSS19

ASSESSING HOSPITAL UTILIZATION OF PATIENTS DIAGNOSED WITH EPIDERMOLYSIS BULLOSA

Belk K, Craver CW
Vizient Inc., Mooresville, NC, USA

OBJECTIVES: Epidermolysis Bullosa (EB) is a group of rare genetic diseases that affects 20 out of every million live births in the United States. Although there are many different variations of EB all have extremely fragile skin that blisters and tears with only minor friction or trauma. EB may also affect internal organs and body systems. The objective of this analysis is to describe EB patients utilizing acute care hospital services and examine drivers of utilization. **METHODS:** A retrospective descriptive study was conducted on a cross-section of EB discharges in the MedAssets health system data for inpatient (N=114) and outpatient (N=866) visits from October 2015 through December 2016. Multivariable logistic regression was used to identify significant drivers of inpatient admission. **RESULTS:** The sample included 431 unique patients from 111 hospitals with an average age of 22.0 years. The population included slightly more females (53.4%) than males and had few comorbidities with an average Charlson comorbidity score of 0.76. The most common comorbid conditions were chronic pulmonary disease (14.4%) and renal disease (10.7%). Disease complications included anemia (24.2%), nutritional deficiencies (12.8%), feeding difficulties such as dysphagia or esophageal obstruction (12.0%), skin infections (5.2%) and other infections (6.0%) such as pneumonia and sepsis. While 26.8% of the sample had a single visit during the study period, 4.8% had five or more visits. Utilization was primarily outpatient (88.4%). The average inpatient length of stay was 11.8 days with average cost $43,309. The largest predictors of inpatient admission were skin (OR=7.8, p<.0001) and other infections (OR=28.8, p<.0001), diabetes with complications (OR=8.1, p=.0302), and nutritional deficiencies (OR=5.1, p<.0001). **CONCLUSIONS:** EB patients have few non-disease related comorbidities but many disease related complications. Hospital utilization is primarily outpatient based, however disease complications may lead to lengthy and costly inpatient admissions.

SENSORY SYSTEMS DISORDERS – Patient-Reported Outcomes & Patient Preference Studies

ADHERENCE AND PERSISTENCE AMONG U.S. PATIENTS INITIATING SECUKINUMAB FOR THE TREATMENT OF MODERATE TO SEVERE PLAQUE PSORIASIS

Feldman SR[1], Zhao Y[2], Gray S[3], Montejano LB[3], Lin F[2], Herrera V[2]
[1]*Wake Forest Baptist Medical Center, Winston-Salem, NC, USA,* [2]*Novartis Pharmaceuticals, East Hanover, NJ, USA,* [3]*Truven Health Analytics, an IBM Company, Ann Arbor, MI, USA*

OBJECTIVES: Secukinumab is highly effective for the treatment of moderate to severe plaque psoriasis in clinical trials. Little is known regarding how secukinumab is used long term in a real world setting. This study examined adherence and persistence to secukinumab among patients with plaque psoriasis. **METHODS:** Adults with ≥ 1 plaque psoriasis diagnosis since January 1, 2014 who initiated secukinumab between January 1, 2015 and April 30, 2016 (first claim=index) with ≥ 6 months of pre-index continuous enrollment in the MarketScan® Commercial and Medicare Supplemental Databases were selected. Adherence was measured by the proportion of days covered (PDC) with secukinumab. Persistence was defined as the number of days from index until a gap of ≥ 90 days without secukinumab (discontinuation), or the end of follow-up if no discontinuation was observed. Further analysis was conducted for non-mutually exclusive subgroups based on available post-index follow-up (≥3, ≥6, ≥9 and ≥12 months respectively). **RESULTS:** A total of 1,504 secukinumab patients were examined, with mean age 48.6 years and 54% male. Among all patients, 1,087 (72%), 724 (48%), 355 (24%), and 69 (5%) had ≥3, ≥6, ≥9 and ≥12 months of post-index follow-up, respectively. The estimated PDC was 0.79 for all patients and 0.72 for those with ≥12 months of follow-up. Overall, 87% of patients persisted on secukinumab, with a mean of 154 days (standard deviation [SD]: 104) persistence prior to discontinuation. Among patients with ≥ 12 months follow-up, 74% were persistent, and the mean days to discontinuation were 295 [SD: 123]). **CONCLUSIONS:** Patients with plaque psoriasis initiating secukinumab were generally adherent to therapy as evidenced by PDC of nearly 80%. Almost three-quarters of patients persisted on treatment over 12 months.

PSS21

OBSERVATIONAL STUDY COMPARING TREATMENT PERSISTENCE IN BIOLOGIC-NAIVE PSORIASIS PATIENTS INITIATING APREMILAST OR ETANERCEPT

Clancy Z, Tencer T, Kaura S, Li S
Celgene Corporation, Summit, NJ, USA

OBJECTIVES: Currently, no comparative data have been published on the persistence among biologic-naive patients with psoriasis who are being treated with apremilast vs. etanercept in a real-world setting. We assessed real-world treatment persistence over 12 months in patients with psoriasis in the United States who were initiated on apremilast or etanercept. **METHODS:** This descriptive, observational, retrospective cohort study was conducted using MarketScan Commercial and Medicare Supplemental Databases (2013-2016). Adults with ≥2 diagnosis codes for psoriasis (ICD-9: 696.1; ICD-10: 40.0) who were initiated on apremilast or etanercept treatment were selected. The index date was defined as the first apremilast or etanercept prescription date, and patients were required to be continuously enrolled for ≥12 months pre-index and ≥12 months post-index. Time to treatment discontinuation was evaluated descriptively using Kaplan-Meier curves, and defined as the end of days' supply before at least a 60-day gap without medication. At 12 months post-index, the percentage of patients persisting on drug was assessed. **RESULTS:** A total of 1,101 patients initiated on apremilast treatment and 687 initiated on etanercept treatment met the inclusion criteria and had similar baseline characteristics. Mean enrollment follow-up time was 493 days for apremilast and 586 days for etanercept. At 12 months post-index, persistence on the initiated drug was not significantly different between the apremilast and etanercept cohorts (39.5% [apremilast] vs. 35.8% [etanercept]; P=0.109). **CONCLUSIONS:** While apremilast showed numerically higher treatment persistence compared with etanercept, the difference was not statistically significant. Further analyses are needed to explore the impact of higher persistence on clinical effectiveness, that is, to describe the benefit patients are receiving from staying on treatment.

PSS22

A REVIEW OF VISION-RELATED UTILITY VALUES AND THEIR SUITABILITY FOR USE IN COST-EFFECTIVENESS MODELS IN AGE-RELATED MACULAR DEGENERATION

Herring W[1], Carrico J[1], Mladsi D[1], Pierson RF[2], Lofland JH[3]
[1]*RTI Health Solutions, Research Triangle Park, NC, USA,* [2]*Janssen Global Services, LLC, Raritan, NJ, USA,* [3]*Janssen Global Commercial Strategic Organization, Horsham, PA, USA*

OBJECTIVES: While therapies for wet age-related macular degeneration (AMD) are well established, therapies in development for dry AMD would be without precedent. Economic evaluations of wet AMD therapies typically have relied on health states and utility values defined by visual acuity (VA), but the mechanisms of dry AMD can impair visual functioning without impairing VA. Our objective was to assess the suitability of VA-based utilities used in wet AMD for use in economic evaluations in dry AMD. **METHODS:** This study reviewed four AMD utility studies and five wet AMD model structures and compared them with two guideline-based visual impairment definitions and the target populations for ongoing clinical trials in dry AMD. A crosswalk of VA ranges and associated utility values was developed to visualize alignment across studies. The AMD utility studies were assessed to determine whether they considered non-VA measures of visual functioning, included dry AMD patients, or controlled for dry AMD severity. **RESULTS:** Lack of alignment in VA ranges was identified: none of the utility studies or model structures were aligned with guideline-based visual impairment definitions, and three of the five model structures used health state definitions that were not aligned with VA-based utility values. The utility studies were all conducted at least ten years ago, and only one utility study considered the interaction of VA and other visual functioning measures. While the utility studies all included dry AMD patients, the percentages of patients with dry AMD were low; moreover, dry AMD severity levels, when reported, were not aligned with dry AMD clinical trial populations. **CONCLUSIONS:** Substantial limitations and inconsistencies were observed in utility values for wet AMD, and key data gaps were identified related to dry AMD. Studies designed specifically for dry AMD are needed to support economic evaluations of future dry AMD therapies.

PSS23

DOES THE CHOICE OF TARIFF MATTER? A COMPARISON OF EQ-5D-5L UTILITY SCORES USING CHINA, UK AND JAPAN TARIFFS ON A PSORIASIS VULGARIS SAMPLE IN MAINLAND CHINA

Li S
Shandong University, Jinan, China

OBJECTIVES: To compare and analyze the differences of EQ-5D-5L values derived from UK, Japan and China preference weights using a sample of patients with psoriasis vulgaris in Mainland China. **METHODS:** A convenience sampling framework was adopted and a face-to-face interview approach was used for data collection. The Friedman Test and The Wilcoxon signed-rank tests were used to examine the differences of EQ-5D-5L utility scores derived from three tariffs. The ICCs and Bland-Altman plots were used to study the agreement among the three EQ-5D-5L scores. The Spearman's rho correlation coefficients was adopted to examine the correlation between EQ-5D-5L utility scores and a series of quality of life scores measured based on Visual Analogue Scale (VAS) scores, Psoriasis Area Severity Index (PASI) scores, and Psoriasis Disability Index (PDI) scores. The differences on quality of life scores between different severities of psoriasis vulgaris were tested by using the Mann-Whitney U test. **RESULTS:** A total of 350 patients (aged 16 years or older) were recruited. There were significant differences among the three national tariff sets. The EQ-5D-5L scores using the China weights yielded the largest range (0.30–1.00), whereas those scores derived from Japan and UK preference weights had smaller range (0.45-1.00 and 0.34–1.00, respectively). Overall, three tariffs showed excellent agreement (ICC>0.90). The EQ-5D-5L scored using the China tariff had better discriminated validity than the other two tariffs. **CONCLUSIONS:** Three country-specific EQ-5D-5L tariffs have shown a high level of agreement based on psoriasis vulgaris patients in Mainland China. Having said that the Chinese-specific tariff had the best the best discriminated validity. It is recommended that the country-specific tariff is preferred for use in Mainland China. if not available, the value sets should be developed, or we also can use UK or other country tariffs with same cultural background. However, more research needs to be done.

PSS24

FACTORS INFLUENCING PATIENT SATISFACTION WITH LOWER REMOVABLE DENTURE

Bratus-Hrynkiv R, Kordiyak A
Danylo Halytskyi Lviv National Medical University, Lviv, Ukraine

OBJECTIVES: To determine correspondence between clinician's and patient's appreciation of existing removable dentures and to assess the main determinants of patient satisfaction with the aim of improving treatment outcomes. **METHODS:** This cross-sectional study was conducted over a three-year period among 115 patients with mandibular single remaining teeth, who wore lower removable clasp-retained and overdentures. After detailed examination these patients—67 females (58,3%), 48 males (41,7%) of mean age 63.5 years (SD 13.0), were categorized in Class III—substantially compromised dental status (American College of Prosthodontists Classification System,2002), ranks of retention and stabilization of a lower denture on its foundation were determined. Oral Health Self-Assessment was aided by the validated translation of the 5-item structured questionnaire (G.D.Slade,2007). Data were analyzed using Spearman's rho in the SPSS (Statistical Package for Social Sciences) for Windows software (version 12.0). **RESULTS:** Patient dissatisfaction was the most frequently associated with chewing pain (28%) and interrupted meals (27%). These reported causes of denture discomfort were followed by a need of treatment (19%), avoiding speech and laughing (16%) and difficulty relaxing—10% cases. A statistically significant positive correlation was found between the high scores of lower denture instability and chewing pain (rho=0,67), need of treatment (rho=0,48), while stronger-to-weak negative correlation—with interrupted meals (rho=-0,35), avoiding speech and laughing (rho=-0,27) and difficulty relaxing (rho=-0,14). **CONCLUSIONS:** Denture clinical scores and patient perceived comfort have multilateral correlation. In each clinical case attainable prosthodontic goals are helpful in increasing patient satisfaction and improving treatment outcomes.

PSS25

DEVELOPMENT AND VALIDATION OF THE IMPACT ASSESSMENT FOR ROSACEA FACIAL REDNESS (IA-RFR)

Ferrusi IL[1], Ahluwalia G[1], Andrae DA[2]
[1]*Allergan plc, Irvine, CA, USA,* [2]*Allergan plc, Austin, TX, USA*

OBJECTIVES: Persistent facial erythema (redness) associated with rosacea has considerable psychosocial impacts that are important components of treatment evaluation. This report describes the development and validation of a patient-reported outcomes (PRO) measure to assess impacts of rosacea facial redness. **METHODS:** The Impact Assessment for Rosacea Facial Redness (IA-RFR) questionnaire was developed consistent with FDA guidance and ISPOR recommendations for validating PROs. The conceptual framework and questionnaire items were generated by literature review, patient concept elicitation interviews (N=31 adults, moderate to severe rosacea-associated erythema; Clinician Erythema Assessment [CEA] grade $\geq$3), and expert opinion. Cognitive interviews (N=20) were conducted to guide revisions. Reliability and validity were examined in a phase 2b study (N=356 adults; 80.1% female; 91.3% Caucasian; CEA severity: 82.0% moderate, 18.0% severe) of oxymetazoline hydrochloride cream 1.0% for treatment of moderate to severe facial erythema associated with rosacea. Test-retest reliability was examined on days 14 and 28 (predose) among patients with the same CEA response. **RESULTS:** Four distinct impact domains were identified, comprising 8 items: Self-perception (self-conscious, low self-esteem, bothered by appearance); Emotional functioning (embarrassment, worry); personal Grooming (avoidance of products, use of cover-up products); and Social functioning (unwanted comments). The IA-RFR and its domains had acceptable Cronbach coefficients ($\alpha \geq 0.83$), with the exception of personal Grooming (Cronbach α=0.018). Test-retest reliability was high (intraclass correlation coefficients $\geq$0.80) in 2 different analysis populations. Correlations of items within their respective domains established adequate convergent validity for Self-perception ($r \geq 0.73$) and Emotional domain items (r=0.72). Known groups validity was shown for IA-RFR overall, Emotional domain, and worry scores, each of which was significantly higher ($P < 0.05$) among patients with more vs less severe erythema (CEA score). **CONCLUSIONS:** The IA-RFR is a novel tool for assessing the impact of rosacea facial redness that is grounded in patient experience and demonstrates acceptable measurement properties in adults with rosacea.

PSS26

PATIENT-RATED IMPACT ASSESSMENT FOR ROSACEA FACIAL REDNESS (IA-RFR): RESULTS OF TWO PHASE 3 PIVOTAL TRIALS OF OXYMETAZOLINE CREAM 1% VS VEHICLE

Ferrusi IL[1], Ahluwalia G[1], Andrae DA[2]
[1]*Allergan plc, Irvine, CA, USA,* [2]*Allergan plc, Austin, TX, USA*

OBJECTIVES: Persistent erythema associated with rosacea has considerable psychological and social impacts that are important to assess when evaluating treatment efficacy. Two phase 3 pivotal trials examined efficacy and safety of oxymetazoline for treatment of moderate to severe persistent facial erythema associated with rosacea. This report describes Impact Assessment for Rosacea Facial Redness (IA-RFR) outcomes from both trials. **METHODS:** In 2 identically designed trials (REVEAL 1 and 2), eligible patients were randomized 1:1 to vehicle or oxymetazoline hydrochloride cream 1.0% (oxymetazoline) applied to the face (QD, 29 days). The impact of erythema associated with rosacea was evaluated using the 8-item IA-RFR, a validated, patient-rated scale. Each item was rated on a 5-point scale (0–4; higher scores indicate more negative impact). Patients completed the IA-RFR at baseline and at hour 6 on follow-up days 1, 15, and 29. Differences between oxymetazoline-group and vehicle-group changes from baseline in IA-RFR total score and Self-perception, Emotional functioning, personal Grooming, and Social functioning domain scores were compared using the van Elteren test. Analyses of item-level changes are ongoing. **RESULTS:** IA-RFR assessments included 440 patients in REVEAL 1 (oxymetazoline, n=222; vehicle, n=218) and 443 patients in REVEAL 2 (oxymetazoline, n=223; vehicle, n=220). In REVEAL 1, median change from baseline to day 29 was significantly greater with oxymetazoline vs vehicle for total IA-RFR (−0.60 vs −0.50; P=0.045), personal Grooming (−0.50 vs 0.00; P=0.021), and 1 Self-perception item (self-consciousness; −1.0 vs −1.0; P=0.024). In REVEAL 2, median change from baseline to day 29 was numerically greater for oxymetazoline vs vehicle for the total IA-RFR score (−0.70 vs −0.60). Pooled data analyses are forthcoming. **CONCLUSIONS:** Patients with moderate to severe persistent facial erythema associated with rosacea reported greater improvements in impacts of rosacea facial redness when treated with oxymetazoline compared with patients who received vehicle.

PSS27

GEOGRAPHIC ATROPHY DISEASE BURDEN: NEED FOR BETTER CHARACTERIZATION

Schmier J[1], Rajput Y[2], Patel SS[3], Singh RP[4], Nielsen JS[5]
[1]*Exponent, Alexandria, VA, USA,* [2]*Genentech, Inc., South San Francisco, CA, USA,* [3]*West Texas Retina Consultants, Abilene, TX, USA,* [4]*Cole Eye Institute, Cleveland, OH, USA,* [5]*Wolfe Eye Clinic, Wolfe Surgery Center, West Des Moines, IA, USA*

OBJECTIVES: To identify knowledge gaps around the burden of illness of geographic atrophy (GA), we conducted a literature review and used findings to guide interviews with GA patients, caregivers, and healthcare providers (HCPs) who treat GA patients. **METHODS:** Peer-reviewed publications describing the use of an instrument, survey, or other assessment tool to report the impact of GA were identified using PubMed (January 2000 to September 2015), a pearl-growing approach, and independent internet searches. Patients with symptomatic GA ($n = 8$), their caregivers ($n = 6$), and HCPs ($n = 5$) were interviewed using tailored guides to identify topics that would further help understand the burden of illness of GA. **RESULTS:** Only 1 out of 318 articles reviewed reported GA-specific findings; other articles reported data for advanced age-related macular degeneration (AMD) and did not differentiate between advanced AMD and GA. A single study described direct medical costs in GA, but there were no GA-specific data on indirect costs related to caregiving, transportation, or lost income. Studies on the mental health burden of GA were lacking. Patients reported that GA affected household chores, visiting restaurants, social outings, sports and outdoor hobbies, participating in religious activities, and long-distance travel. Patients also reported direct out-of-pocket expenses for low vision aids. Caregivers reported modifying schedules, providing transportation, and other assistance. HCPs identified mental health issues and variable compliance with low vision aids as relevant to GA patients. **CONCLUSIONS:** The literature review found very little published information on the impact of GA. There is no consensus on the dimensions of functioning relevant to GA patients or the instruments used to assess them. The interviews highlight the impact of GA on patients' and caregivers' social functioning, quality of life, mental health, indirect resource use, and out-of-pocket costs and provides guidance for designing future burden of GA studies.

PSS28

THE IMPACT OF SOCIOECONOMIC AND CLINICAL CHARACTERISTICS ON HEALTH-RELATED QUALITY OF LIFE IN PATIENTS WITH PSORIASIS: AN INTERNET-BASED CROSS-SECTIONAL SURVEY

Jung S[1], Suh D[2], Kim C[3], Lee S[2]
[1]*Sookmyung women's University, Seoul, South Korea,* [2]*Chung-Ang University, Seoul, South Korea,* [3]*Catholic University College of Medicine, Seoul, South Korea*

OBJECTIVES: To determine socioeconomic and clinical characteristics affecting health-related quality of life (QOL) in patients with psoriasis. **METHODS:** A cross-sectional study was conducted between March-June 2015 using data obtained via an Internet-based survey from a psoriasis patients group in Korea. The surveyinstrument included questions regarding demographic, socioeconomic, and clinical characteristics as well as QOL. Patients' QOLimpairment was classified as severe if the dermatology life quality index scores were $\geq$11. Factors influencing the impairment were identifiedusing multivariable logistic regressionanalysis. **RESULTS:** Of the 299 respondents, 161 (53.8%) exhibited severe QOL impairment. Patients' dermatology life quality index scoreswere significantly influenced by gender; annual income; neck psoriasis; psoriasis-relatedresignation from work; and use of oral and herbal medications. QOL in women was two times moresignificantly impaired than that of men (odds ratio(OR)= 2.00, 95% confidence interval(CI):1.05–3.80). Patients who had psoriasis on the neck had significantly impaired their QOL compared to those who had psoriasis on other areas of their bodies (OR=2.30, 95%CI:1.20–4.43). In regards to socioeconomic status, patients who earned >40 million KRW (approximately 34,000 USD; high-income group)showed less impairment in their QOL than those who earned less (OR=0.47, 95%CI:0.28–0.80).Patients who had severe QOL impairment used oral (OR=2.04, 95%CI:1.20–3.44) or herbal(OR=1.86, 95%CI:1.04–3.34) medications more often than patients whose QOL impairment was less severe. **CONCLUSIONS:** QOL in patients with psoriasis was significantly associated with demographic and socioeconomic characteristics and working status. The presence of psoriasis on exposed areas may exert a significant effect on patients' QOL and working status. It is recommended that a study evaluating the impact of psoriasis on patient productivity be performed in the future.

PSS29

SYSTEMATIC PSYCHOMETRIC EVALUATION OF DISEASE SPECIFIC HEALTH-RELATED QUALITY OF LIFE INSTRUMENTS IN ACNE VULGARIS

Asiri IM[1], Pathan FS[1], Franic DM[2]
[1]*University of Georgia, Athens, GA, USA,* [2]*The University of Georgia, Athens, GA, USA*

OBJECTIVES: Acne vulgaris is a chronic skin condition affecting two-thirds of adults and four-fifths of adolescents with significant impact on their health

related quality of life (HRQOL). The objective of this study was to compare and contrast the psychometric properties of acne vulgaris specific HRQOL instruments. **METHODS:** Comprehensive literature review was conducted to identify self-administered instruments in English with at least one publication citing psychometric properties in a peer-reviewed journal. Selected instruments were evaluated based on eight measurement standards: conceptual model, versatility (age, severity, and gender), practicality, breadth, depth, reliability (internal consistency and test-retest), construct validity (convergent and divergent), and responsiveness. **RESULTS:** Seven instruments were evaluated: Acne Disability Index (ADI), Cardiff Acne Disability Index (CADI), Acne-Quality of Life (Acne-QOL), Acne Quality of Life Scale (AQOL), Acne Quality of Life Index (Acne-QOLI), 4-item index of Acne-Quality of Life (Acne-Q4), and Acne Symptoms and Impact Scale (ASIS). All evaluated instruments were designed to be self-administered, versatile (used in men and women, adolescents and adults of varying acne severity), and brief (completed in 5 to 15 minutes), except for ADI. Data to support construct validity was only available for three instruments: CADI, Acne-QOL and ACNE-QOLI, with no data reported for ADI. Depth data was missing for all scales with variability in reliability data reported. Internal consistency and test-rest was reported in most cases for total scores: ADI, CADI, AQOL and Acne-QOLI all meeting study criterion for group level decision making (>=.70) (total score), and similarly for Acne-QOL (3/4 scales). **CONCLUSIONS:** Acne-QOL (21 items) was the most widely used instrument, while ADI (48 items) was the longest. Results of the study show strongest support for Acne-QOL, Acne-QOLI, and ASIS, with the latter meeting most study criteria. Instrument choice must also consider study objective, group versus individual level decision making, and domains considered important.

PSS30

DIFFERENTIAL EFFECTS OF SECUKINUMAB VS. USTEKINUMAB FOR TREATMENT OF MODERATE TO SEVERE PSORIASIS ON WORK PRODUCTIVITY AND ACTIVITY IMPAIRMENT: A STRUCTURAL EQUATION MODELLING APPROACH USING THE CLEAR 52-WEEK STUDY

Puig L[1], Griffiths CE[2], Zhao Y[3], Gilloteau I[4], Guana A[5], Houghton K[6], Stull DE[7]
[1]*Hospital de la Santa Creu i Sant Pau, Barcelona, Spain,* [2]*The University of Manchester, Manchester, UK,* [3]*Novartis Pharmaceuticals, East Hanover, NJ, USA,* [4]*Novartis Pharma AG, Basel, Switzerland,* [5]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA,* [6]*RTI Health Solutions, Research Triangle Park, NC, USA,* [7]*RTI Health Solutions, Durham, NC, USA*

OBJECTIVES: Moderate-to-severe psoriasis is associated with great impairment in activity and work productivity. However, the causal pathways involving treatment and psoriasis-related symptoms on work productivity and activity impairment (WPAI) are unknown. This analysis examined the differential direct and indirect effects of secukinumab vs. ustekinumab on psoriasis symptoms and patient-reported WPAI at 52 weeks. **METHODS:** Clinical and patient-reported outcomes from CLEAR, a head-to-head, phase 3b study comparing the efficacy and safety of secukinumab vs. ustekinumab in moderate-to-severe psoriasis patients, were examined. Key variables in the analysis included Psoriasis Area and Severity Index (PASI) 50/75/90/100 response (percent improvement from baseline), patient-reported symptoms (pain, itching, scaling), and the WPAI at Week 52. Structural equation modelling (SEM) was used to demonstrate that treatment and selected disease covariates affect WPAI indirectly by first improving symptoms. Model fit was evaluated for each PASI response. Standardized coefficients (β ranging -1 to +1) compared the strength of relationships between covariates. **RESULTS:** Fit of all models to the data was excellent (comparative fit index=0.98). The greater likelihood for secukinumab to achieve PASI 50/75/90/100 response directly resulted in less activity impairment (β=-0.37, -0.35, -0.22, -0.15, respectively) and work impairment (β=-0.37, -0.33, -0.24, -0.15, respectively) than ustekinumab (all $P<0.05$). Secukinumab directly improved scaling, and indirectly improved pain and itching, which directly resulted in lower activity impairment and work impairment and indirectly resulted in lower absenteeism. The indirect effects on WPAI resulted from the correlation of absenteeism with activity impairment and work impairment, and correlation of pain and itch with scaling. Results were similar for all PASI levels. **CONCLUSIONS:** SEM allows a detailed understanding of the differential direct and indirect effects of secukinumab vs. ustekinumab on multiple patient-relevant outcomes simultaneously. Secukinumab treatment results in lower activity impairment and work impairment through greater improvements in psoriasis symptoms and greater PASI response vs. ustekinumab.

SENSORY SYSTEMS DISORDERS – Health Care Use & Policy Studies

PREVIOUS TREATMENTS FOR PLAQUE PSORIASIS AMONG U.S. PATIENTS INITIATING SECUKINUMAB

Feldman SR[1], Zhao Y[2], Gray S[3], Montejano LB[3], Lin F[2], Herrera V[2]
[1]*Wake Forest Baptist Medical Center, Winston-Salem, NC, USA,* [2]*Novartis Pharmaceuticals, East Hanover, NJ, USA,* [3]*Truven Health Analytics, an IBM Company, Ann Arbor, MI, USA*

OBJECTIVES: Secukinumab was approved in January 2015 to treat moderate-to-severe plaque psoriasis. The previous treatment of secukinumab patients has not been examined in real world. This study evaluated treatments received by patients with psoriasis prior to secukinumab initiation. **METHODS:** Adults with plaque psoriasis after January 2014 who initiated secukinumab 1/1/2015-4/30/2016 were selected from the MarketScan® Research Databases. Systemic (biologic and non-biologic), topical and non-pharmacological plaque psoriasis treatments utilized prior to secukinumab initiation were measured two ways. First, all treatments used in the 6 months before the first secukinumab claim (index) were flagged. Subsequently, the one prescription filled closest to index was determined, as an indicator of what treatment patients used just prior to initiating secukinumab. **RESULTS:** Patients initiating secukinumab (N=1,504) had a mean age of 48.6 years and were 54% male. Over the 6-months pre-index, 82.7% of patients were prescribed biologic and/or non-biologic systemic therapy. For the 59.2% of patients with ≥1biologic claims, the most common biologics were ustekinumab (22.9%), adalimumab (21.6%), and etanercept (11.8%). Non-biologic systemic agent claims were observed for 51.4% of patients, with 31.2%, 16.4%, 2.7%, and 18.6% for systemic steroids, apremilast, acitretin, and other systemic agents (methotrexate, cyclosporine), respectively. Among the 26.1% of patients with a biologic claim closest to index, the most commonly prescribed were ustekinumab (9.6%), adalimumab (9.1%), and etanercept (6.0%). About 26% of patients had claim(s) for non-biologic systemic agents closest to index, with 7.4% using apremilast; 31% had a claim for topical agents, 2.6% had photo therapy or laser treatment, 6% had multiple treatments on the same day (e.g., systemic plus topical agents), and 8.4% had no treatment. **CONCLUSIONS:** Some patients used secukinumab as the first-line biologic treatment, but over 80% of patients utilized systemic therapy for plaque psoriasis prior to starting secukinumab, with many having biologic exposure prior to secukinumab initiation.

PSS32

REAL-WORLD HEALTHCARE RESOURCE UTILIZATION IN URTICARIA PATIENTS NEWLY TREATED WITH OMALIZUMAB IN THE UNITED STATES

Ke X[1], Kavati A[2], Wertz D[1], Huang Q[1], Wang L[1], Willey VJ[1], Stephenson JJ[1], Ortiz B[2], Paknis B[2], Bernstein JA[3], Beck LA[4]
[1]*HealthCore Inc., Wilmington, DE, USA,* [2]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA,* [3]*Bernstein Clinical Research Center, LLC, Cincinnati, OH, USA,* [4]*University of Rochester Medical Center, Rochester, NY, USA*

OBJECTIVES: To assess healthcare resource utilization (HCRU) among urticaria patients prior to and after omalizumab initiation in a real-world environment. **METHODS:** This retrospective observational cohort study utilized US claims data from the HealthCore Integrated Research Database between 09/20/2013 and 04/30/2016. The study population consisted of urticaria patients newly treated with omalizumab (defined as ≥4 omalizumab claims within the first 6 months post-index period; index date=first omalizumab claim date between 03/21/2014 and 10/31/2015), aged ≥12 years, and with ≥6 months pre- and ≥12 months post-index healthcare insurance enrollment. Descriptive and inferential statistics were used to compare all-cause and urticaria-related HCRU within 6 months pre-index (baseline) to months 1-6 and 7-12 post-index. **RESULTS:** The study identified 298 urticaria patients newly treated with omalizumab with a mean (SD) age of 43.5 (±13.64) years, of which 70.8% were female. The number of patients with all-cause and urticaria-related inpatient hospitalizations remained very low (n≤10) and was similar across the baseline and post-index periods (for all comparisons, $p>0.05$). Patients with all-cause emergency department (ED) visits decreased from 19.8% (n=59) to 14.4% (n=43) (p=0.066) and 10.7% (n=32) (p=0.001) across the baseline, months 1-6, and months 7-12 time periods, respectively. Similarly, a significant trend was observed for urticaria-related ED visits (for all comparisons, p=0.002). The number of all-cause and urticaria-related outpatient services and pharmacy claims increased significantly in the post-index period, mainly in months 1-6, when compared to those at baseline (for all baseline to months 1-6 comparisons, $p<0.05$). **CONCLUSIONS:** Study results showed that urticaria patients newly treated with omalizumab had fewer ED visits and similar inpatient hospitalizations in the post-index period, when compared to those at baseline, in a real-world clinical setting. The observed increase in post-index outpatient and pharmacy claims likely reflect the requirement that omalizumab be administered in a healthcare provider setting.

PSS33

HEALTHCARE UTILIZATION AND EXPENDITURES OF COMMERCIAL/MEDICARE AND MEDICAID PATIENTS WITH HIDRADENITIS SUPPURATIVA

Kimball A[1], Marvel J[2], Vlahiotis A[3], Willson TM[3], Sainski-Nguyen A[4]
[1]*Harvard Medical Faculty Physicians at Beth Israel Deaconess Medical Center, Inc, Boston, MA, USA,* [2]*Novartis, East Hanover, NJ, USA,* [3]*Truven Health Analytics, an IBM Company, Cambridge, MA, USA,* [4]*Truvan Health Analytics, Ann Arbor, MI, USA*

OBJECTIVES: To understand healthcare resource utilization (HCRU) and expenditures in the hidradenitis suppurativa (HS) Commercial/Medicare and Medicaid populations, before and after the first HS diagnosis (index date). **METHODS:** Retrospective analysis of healthcare claims from the MarketScan Commercial and Medicaid Multi-State Databases identified patients aged ≥12 years old with ≥3 inpatient (IP) or outpatient (OP) medical claims with a HS diagnosis between January 1, 2009 and December 31, 2014. All-cause costs included any HCRU. HS-specific costs were identified by the presence of a HS diagnosis, boils, fistula, abscesses, or a HS-specific procedure on the claim. HCRU included IP, OP, and pharmacy utilization. **RESULTS:** A total of 16,489 patients, 11,325 Commercial/Medicare and 5,164 Medicaid patients, were identified. All-cause IP services increased between the pre and post-index period for the Commercial/Medicare (10.0% to 13.1%) and Medicaid (17.2% to 19.0%) cohorts. The proportion of patients with HS-specific OP services increased in the post-index period for both Commercial/Medicare (41.2% increase) and Medicaid (34.3% increase) patients. Prior to the index date, OP pharmacy utilization was already above 90% for both cohorts. After index, total all-cause costs increased in the Commercial/Medicare ($10,646 to $15,525) and Medicaid ($9,703 to $13,167) cohorts. HS-specific OP costs more than tripled in both cohorts (Commercial/Medicare: $609 to $2,514, Medicaid: $404 to $1,354), and total HS-specific costs increased in the Commercial/Medicare ($1,349 to $4,428) and the Medicaid ($859 to $2,662) cohorts. **CONCLUSIONS:** For this debilitating disease with significant unmet need, all-cause and HS-specific utilization and healthcare costs substantially increased following diagnosis of HS; the majority of costs were

attributable to OP services, while the cost increases were driven by inpatient services.

PSS34
ECONOMIC EVALUATION OF FUSIDIC ACID IN ADD ON PROTOCOL FOR TRAETMENT OF SOFT TISSUE TOPICAL INFECTIONS IN IRAN
Soleymani F, Seyedifar M
Tehran University of Medical University, Tehran, Iran (Islamic Republic of)
OBJECTIVES: The most pathogenic factors in hospital infections become resistant to antibiotics mostly because of the inappropriate use of them. Considering the risk of increased microbial resistance to Mupirocin, it seems necessary to have another medical treatment for controlling and treating topical infections. This study is conducted to evaluate the economic evaluation of adding Fusidic acid to the current treatment protocol. **METHODS:** A decision tree model with cost-minimization analysis used from the payer's perspective. The model was used for 1,000 hypothetical patients, half of whom assumed as burn patients and the rest as other topical infection and impetigo. The cost of Mupirocin and Fusidic acid was taken from the price list of IrFDA, and the manufacturer respectively. Considering the importance of costs due to microbial resistance and consequence side effects, the costs of systemic antibiotic treatment and hospitalization were calculated as well. One-way sensitivity analysis was performed. **RESULTS:** The treatment cost of 1,000 patients was estimated at 33805.5 US$ with Mupirocin arm and 11869.5 US$ with Mupirocin and Fusidic acid arm (50/50 ration for burn vs other hospital wards).Since the efficacy of the both drugs are reported to be equal, the lower cost in the arm with Fusidic acid means that this option is cost saving in comparison with Mupirocin alone (cost reduction 21.9 US$ per patient). **CONCLUSIONS:** Based on this findings, adding Fusidic acid to current treatment reduced costs dramatically. Therefore, it seems that it is economically reasonable that insurance companies support the prescription and use of Fusidic acid as the second line of treatment for skin infections, which will lower the costs and the risk of antimicrobial resistance as well as improvement in the quality of life of patients.

PSS35
LONG-TERM TREATMENT PATTERNS AMONG PATIENTS WHO DEVELOPED MODERATE-TO-SEVERE PSORIASIS
Feldman SR[1], Zhao Y[2], Hur P[2], Liu JS[3], Herrera V[2]
[1]*Wake Forest Baptist Medical Center, Winston-Salem, NC, USA,* [2]*Novartis Pharmaceuticals, East Hanover, NJ, USA,* [3]*Harvard University, Cambridge, MA, USA*
OBJECTIVES: To describe the treatment patterns since diagnosis among patients who developed moderate-to-severe psoriasis. **METHODS:** Using the OptumHealth Reporting and Insights claims database between January 1998 and March 2015, adult patients with ≥2 psoriasis diagnoses and receiving ≥1 systemic (non-biologic or biologic) therapy or phototherapy during the 5 years after the first psoriasis diagnosis date (study period) were selected. Patients were required to have continuous insurance coverage during the 3 years before (baseline period) and 5 years after the index date. During the study period, the percentage of patients who re-initiated the same treatment after a gap of >90 days, changed therapy (initiated a different treatment, added a different agent to the existing treatment, or discontinued an agent from the existing treatment) were examined for the 1st, 2nd, 3rd, 4th and 5th treatment. **RESULTS:** The sample included 1,098 patients with a mean age of 53 years and 46% female. Common psoriasis-related comorbidities over the baseline period included diabetes (14%), depression (10%) and coronary heart disease (10%). Over the study period, 48%, 27%, 16% and 11% of moderate-to-severe psoriasis patients received at least 2, 3, 4, and 5 systemic or phototherapy treatments, respectively. The most common treatment sequences included UVB only (26%), systematic non-biologic only (18%) and biologic only (7%). Overall, the rate of re-initiation was 21% for the 1st treatment, 17%, 21%, 14%, and 12% for 2nd, 3rd, 4th, and 5th treatment, respectively. The rate of therapy change was 27% for the 1st treatment, 39%, 39%, 50%, and 45% for 2nd, 3rd, 4th, and 5th treatment, respectively. **CONCLUSIONS:** Almost half of the moderate-to-severe psoriasis patients received more than 1 treatment during the 5 years after diagnosis. Overall, high rates of re-initiation and therapy change suggested substantial unmet needs in this population.

PSS36
COMPARISON OF TREATMENT PATTERNS AMONG MODERATE-TO-SEVERE PSORIASIS PATIENTS RECEIVING PHOTOTHERAPY, NON-BIOLOGIC AND BIOLOGIC THERAPIES
Feldman SR[1], Zhao Y[2], Hur P[2], Liu JS[3], Herrera V[2]
[1]*Wake Forest Baptist Medical Center, Winston-Salem, NC, USA,* [2]*Novartis Pharmaceuticals, East Hanover, NJ, USA,* [3]*Harvard University, Cambridge, MA, USA*
OBJECTIVES: To compare time on treatment and time to the next treatment initiation among patients receiving phototherapy, systemic non-biologic therapy (NBT), and biologic therapy after psoriasis diagnosis. **METHODS:** Adults with ≥2 psoriasis diagnoses and ≥1 systemic or phototherapy claim over the 5 years (study period) after the first psoriasis diagnosis date were selected from a claims database (01/1998-03/2015). Up to 5 treatments (phototherapy, NBT, and biologics) over the study period were assessed. A new treatment was identified as initiating a different treatment, re-initiating the same treatment after a gap of 90+ days, adding a different agent to the existing treatment, or discontinuing an agent from the existing treatment. Time on treatment, time to therapy change, and time from end of treatment to the next treatment initiation were examined. **RESULTS:** A total of 1,098 adults were included with a mean age of 53 years, 54% men, and 38% having preferred provider organization plan. A total of 44%, 38%, and 17% patients received phototherapy, NBT, and biologics as initial treatment, respectively. The mean time (months) on 1st treatment was significantly longer for biologics (20.4), compared with NBT (10.4) and phototherapy (5.2). Similarly, the mean time (months) to therapy change was longer for biologics (16.4) compared to phototherapy (7.0) and NBT (9.9). The mean time (months) from end of 1st treatment to 2nd treatment initiation was longer for phototherapy (9.5) and NBT (6.8) compared to biologics (4.0) (all $p<0.05$). Similar patterns were observed for some of the subsequent treatments. For all treatments except phototherapy, the mean time on treatment decreased from 1st to subsequent treatments. **CONCLUSIONS:** Among patients with moderate-to-severe psoriasis, those on biologics generally stayed on treatment longer. After discontinuing the 1st treatment, biologics users moved faster to the next treatment. Time on treatment was shorter for later treatments than 1st treatment.

UPDATING RISK ENGINE FOR DIABETES PROGRESSION AND MORTALITY IN THE UNITED STATES: INTERNAL VALIDATION
Shao H[1], Fonseca V[2], Stoecker C[1], Shi L[1]
[1]*Tulane University School of Public Health and Tropical Medicine, NEW ORLEANS, LA, USA,* [2]*Tulane University School of Medicine, New Orleans, LA, USA*
OBJECTIVES: Most of the current diabetes prediction models heavily relied on the UKPDS risk engine and Framingham equation, which used data from 1970s on European populations. This study aimed to update a risk engine using a cohort of patients with type 2 diabetes in the United States (US). **METHODS:** A total of 21 equations for forecasting diabetes-related microvascular and macrovascular events, hypoglycemia, mortality, and progression of diabetes risk factors were estimated using data on 10,251 patients from the Action to Control Cardiovascular Risk in Diabetes (ACCORD) trial. Left truncated proportional hazard model or accelerated failure time model was applied to fit each event equation using diabetes duration as time index, and a large variety of distributions including Weibull and Gompertz distribution were tested. 10-folds cross-validation or bootstrapped validation was applied to account for overfitting issue. Predicted cumulative incidence rates was plotted against the observed cumulative incidence to serve as internal validation. **RESULTS:** The model's forecast fell within the 95% confidence interval for the observed events at each time point up to 40 years diabetes duration. Our model prediction provides accurate prediction according to the internal validation process, and good face validity on risk factors were established by endocrinologists. Severe hypoglycemia was found to be an important risk factor for congestive heart failure (CHF), myocardial infarction (MI), angina, revascularization surgery, and diabetes-related mortality. Racial factor was included in more than half of the events equations. **CONCLUSIONS:** The updated risk engine for the US diabetes cohort has a good internal validity to simulate events that closely match observed outcomes in the ACCORD trial. With extrapolation over lifetime, a simulation model based on the updated risk engine can also predict a range of long-term outcomes, thus assist making clinical and policy decisions. We are currently conducting external validation of this updated risk engine.

DIPEPTIDYL PEPTIDASE-4 INHIBITORS AND RISK OF HEART FAILURE IN TYPE 2 DIABETES: A SYSTEMATIC REVIEW AND META-ANALYSIS OF RANDOMIZED AND OBSERVATIONAL STUDIES
Li L, Li S, Deng K, Liu J, Sun X
West China Hospital, Sichuan University, Chengdu, China
OBJECTIVES: To examine the association between dipeptidyl peptidase-4 (DPP-4) inhibitors and the risk of heart failure or hospitalization for heart failure in patients with type 2 diabetes. **METHODS:** We searched Medline, Embase, CENTRAL and ClinicalTrials.gov to identify randomized controlled trials (RCTs) and non-randomized studies of adults with type 2 diabetes that compared DPP-4 inhibitors against placebo or active anti-diabetic medications, and explicitly reported the outcome of heart failure or hospitalization for heart failure. Paired reviewers independently screened for eligible studies, assessed risk of bias, and extracted data. Data from trials and observational studies were pooled separately; quality of evidence was assessed by the GRADE approach. **RESULTS:** A total of 55 studies involving 1,846,133 patients were eligible, including 43 RCTs (n=68,775) and 12 observational studies (nine cohort studies, and three nested case-control studies; n=1,777,358). There was low-quality evidence regarding risk of heart failure between DPP-4 inhibitor use versus control (38 trials, odds ratio (OR) 0.97, 95% confidence interval (95% CI) 0.61 to 1.56); risk difference 2 fewer (95% CI 19 fewer to 28 more) events per 1000 patients over five years). There was moderate-quality evidence for an increased risk of hospital admission for heart failure in patients treated with DPP-4 inhibitors versus control (five trials, OR 1.13, 95% CI 1.00 to 1.26; RD 8 more (0 more to 16 more)). The observational studies provided effect estimates generally consistent with trial findings, but with very low-quality evidence. **CONCLUSIONS:** The relative effect of DPP-4 inhibitors on the risk of heart failure is uncertain, given the relatively short follow up and low quality of

evidence. Both RCTs and observational studies, however, suggest that these drugs may increase the risk of hospitalization for heart failure in type 2 diabetes patients with existing cardiovascular diseases or multiple risk factors for vascular diseases relative to no use.

PDB3

EFFECTS OF SODIUM GLUCOSE CO-TRANSPORTER-2 INHIBITORS ON URINARY TRACT INFECTIONS AND GENITAL INFECTIONS IN PATIENTS WITH TYPE 2 DIABETES: A SYSTEMATIC REVIEW AND META-ANALYSIS

Liu J, Li L, Li S, Deng K, Sun X
West China Hospital, Sichuan University, Chengdu, China

OBJECTIVES: To systematically assess the impact of sodium glucose co-transporter-2 inhibitors (SGLT2) inhibitors treatment on urinary tract infections (UTIs) and genital infections in patients with type 2 diabetes. **METHODS:** We searched PubMed, EMBASE, the Cochrane Central Register of Controlled Trials (CENTRAL), and ClinicalTrials.gov for randomized controlled trials (RCTs) that compared SGLT2 inhibitors with placebo or active antidiabetic drugs with a duration of 12 weeks or longer, among patients with type 2 diabetes. Paired reviewers independently screened citations, assessed risk of bias, and extracted data. We pooled effect estimates using Mantel-Haenszel relative risk with 95% confidence intervals, and used the GRADE method to rate the quality of evidence. **RESULTS:** In total, 77 RCTs involving 50,820 participants were included. The pooled analyses showed no significant difference in urinary tract infections (UTIs) between SGLT2 inhibitors versus control (2,526/29,086 vs. 1,278/14,940; risk ratio (RR) 1.06, 95% confidence interval (CI) 0.99 to 1.13, low quality evidence), but suggested increased risk of genital infections with SGLT2 inhibitors (1,521/24,017 vs. 216/12,552; RR 3.83, 95% CI 3.34 to 4.40, RD 521 more, 95% CI 431 more to 626 more per 1000 over 5 years; high quality evidence). Dapagliflozin - an individual drug of SGLT2 inhibitors - showed increased risks of UTIs (RR 1.34, 95% CI 1.11 to 1.62) and genital infections (RR 3.80, 95% CI 2.57 to 5.62), as well as events suggestive of UTIs (RR 1.33, 95% CI 1.10 to 1.61; high quality evidence) and of genital infections (RR 4.50, 95% CI 3.24 to 6.25; high quality evidence). **CONCLUSIONS:** The impact of SGLT2 inhibitors on the risk of UTIs remains uncertain, high quality evidence shows a clinically important increase in the risk of genital infections in type 2 diabetes patients using this drug class.

PDB4

THE ASSOCIATION OF DIPEPTIDYL PEPTIDASE-4 INHIBITORS USE WITH JOINT PAIN AMONG US ADULTS WITH TYPE-2 DIABETES MELLITUS

Rai P, Zhao X, Sambamoorthi U
West Virginia University, School of Pharmacy, Morgantown, WV, USA

OBJECTIVES: Few recent studies have reported that the use of dipeptidyl peptidase-4 inhibitors (DPP4Is), a class of antidiabetic agents, may be associated with joint pain. The purpose of this study was to examine the association of DPP4i use with joint pain in Type 2 Diabetes Mellitus (T2DM) patients. **METHODS:** This was a retrospective cross-sectional study. We used data from 2012 and 2014 Medical Expenditure Panel Survey. The study sample consisted of adults (>= 40 years) with T2DM (n=4,559). DPP4Is were identified from prescription drug files. Joint pain was identified from medical conditions files using ICD9CM codes. Chi-square test and logistic regression were used to examine the association between DPP4I use and joint pain. **RESULTS:** Among adults with T2DM, 69.9% (N = 3,185) reported physician-diagnosed joint pain and 7.4% were DPP4I users. There was no statistically significant difference in DPP4I use among those with and without joint pain (7.8% vs 6.3%). Even after adjusting for other factors that may affect DPP4I use, there was not a statistically significant difference in DPP4I use among T2DM adults with and without joint pain (AOR= 1.04, 95% CI= 0.74-1.48). Adults with prescription insurance (AOR= 1.76, 95% CI= 1.01-3.04) and public health insurance (AOR= 1.76, 95% CI= 1.02-3.03) were significantly more likely to use DPP4I as compared to those with no prescription insurance and private health insurance, respectively. Adults who had a heart disease were significantly more likely to use DPP4Is as compared to those who did not have heart disease (AOR= 1.59, 95% CI= 1.18-2.15). **CONCLUSIONS:** DPP4I use was not affected by the presence of joint pain. However, we found that adults with heart disease were more likely to use DPP4I, despite studies reporting an association between DPP4I use and heart failure.

STUDY ON CO-MORBIDITIES IN PATIENTS WITH TYPE II DIABETES MELLITUS

Khatri B
Acharya and BM Reddy College of Pharmacy, Bangalore, India

OBJECTIVES: Study of co-morbidities in patients with type II diabetes mellitus is important as co-morbidities increase the disease burden and cost. It results in poor quality of life and reduced life expectancy. Studies have shown that diabetes is associated with different diseases such as hypertension, cardiovascular diseases, chronic kidney disease, dyslipidemia, tuberculosis, anemia, depression etc. **METHODS:** The study was of prospective and observational type. It was conducted in a teaching hospital in South India for a period of 5 months from July 2016 to November 2016. All the patients diagnosed with type II diabetes mellitus with medical history of it since more than 1 year were included in the study. **RESULTS:** Out of the total 62 patients, majority (56%) were males. The median age was 52. Majority of the patients (27%) had a single co-morbidity, 18% had two co-morbidities and very few patients had three or more co-morbidities. Hypertension (38%) was the most common co-morbidity. Other co-morbidities found were cardiovascular diseases (11%), chronic kidney disease (9%), depression (6%), tuberculosis (6%), anemia (4%) hypothyroidism (3%) etc. **CONCLUSIONS:** Co-morbidities were common in patients with type II diabetes mellitus. Proper selection of antidiabetic drugs considering co-morbidities can provide better outcome and prevent further complications in patients.

IMPACT OF LONG-TERM OPIOID MEDICATION USE ON SUBSEQUENT TYPE 2 DIABETES MELLITUS RELATED HOSPITALIZATIONS

Atreja N[1], Fleming ML[2], Johnson ML[2], Chen H[1], Zhivan N[1], Todd KH[2]
[1]*University of Houston, Houston, TX, USA,* [2]*College of Pharmacy, University of Houston, Houston, TX, USA*

OBJECTIVES: Patients' adherence to antihyperglycemic medication is an essential component in achieving adequate glycemic control. Non-adherence can lead to macro vascular and micro vascular complications among patients with type 2 diabetes mellitus (T2DM). According to SAMSHA's opioid use guideline, prescription opioid use can negatively impact chronic asymptomatic medication therapy. Thus, antihyperglycemic medication adherence may decrease and subsequently lead to T2DM related hospitalizations. **METHODS:** This was a retrospective cohort analysis using 2003-2004 Truven MarketScan® commercial claims databases. T2DM patients greater than 18 years who were prescribed prescription opioids were included. Adherence to antihyperglycemic medications was calculated among long-term (≥ 90 days) opioid users and short-term (< 90 days) opioid users. Medication adherence (PDC) was estimated with PDC ≥0.80 considered adherent. Subsequent T2DM related hospitalizations was estimated using a cox proportional hazard regression model, comparing long-term and short-term prescription opioid users. **RESULTS:** After inclusion criteria was applied, data on 22,212 patients were observed, out of which 7,462 (33.66%) were long-term opioid users. During the 6-month follow-up, risk of T2DM related hospitalization was lower among long-term opioid users with150 days or less during follow-up (HR = 0.73, 95% CI = 0.69-0.78) as compared to short-term prescription opioid users. Risk of T2DM related hospitalization was higher among patients with long-term prescription opioid use greater than150 days during the follow-up (HR = 1.25, 95% CI = 0.69- 2.28) as compared to short-term opioid users. Follow-up antihyperglycemic adherence (HR = 1.44, 95% CI = 1.25-1.64) was a significant predictor of T2DM related hospitalization when assessed as a mediator. **CONCLUSIONS:** Patients who were concomitantly prescribed long-term prescription opioids and antihyperglycemic medications were at a lower risk of T2DM related hospitalizations as compared to patients who were prescribed short-term prescription opioids. Use of prescription opioids over a longer duration did not negatively impact T2DM related hospitalizations when prescribed concomitantly in this study.

REAL-WORLD EVIDENCE OF PREVALENCE OF CARDIOVASCULAR DISEASE AMONGST TREATED DIABETES POPULATION IN 2016

Khamis ZJ, Merali T
Drug Intelligence Inc., Toronto, ON, Canada

OBJECTIVES: 2016 Canadian guidelines for the management of Type 2 Diabetes (T2D) recommend evaluation of cardiovascular comorbidities as a priority for patients not at glycemic target, and recommend preferentially using an anti-hyperglycemic agent with demonstrated cardiovascular outcome benefit for this population. The objective of this research was to determine, in the treated Type 2 Diabetes patient population, the prevalence of pre-existing cardiac comorbidities. **METHODS:** This study used PRIME, a proprietary database of chart audit abstractions collected through regular survey of primary care physicians. The data includes demographic details, risk factors, comorbidities, lab values (e.g. A1c) and pertinent details of the patients' pharmacological management for T2D including sequencing of treatments. Clinical cardiovascular disease was defined as per trials evaluating anti-hyperglycemic agents for cardiovascular outcome benefit, i.e. history of myocardial infarction, coronary artery disease, stroke, angina or peripheral artery disease. **RESULTS:** 2,039 patients treated for Type 2 Diabetes in 2016 were reviewed. Of these, 19% (95% CI 17%-20%) had clinical cardiovascular disease, as defined above. Amongst the older diabetic population, over age 65, the rate of cardiovascular disease was higher at 26% (n=1,056; 95% CI 23%-29%). **CONCLUSIONS:** 19% of treated Type 2 Diabetes patients have a cardiovascular comorbidity which elevates their risk of cardiac mortality. In addition, cardiac risk factors such as hypertension, high cholesterol and obesity are highly prevalent in this population. This data suggests that there is significant need for cardiovascular protection in diabetic patients.

INDIVIDUALIZED TREATMENT GOALS FOR OPTIMAL LONG-TERM HEALTH OUTCOMES AMONG ADULT VETERANS WITH TYPE 2 DIABETES MELLITUS

Shi Q[1], Shi L[2], Fonseca V[3]
[1]*Tulane University, New Orleans, LA, USA,* [2]*Tulane University School of Public Health and Tropical Medicine, NEW ORLEANS, LA, USA,* [3]*Tulane University School of Medicine, New Orleans, LA, USA*

OBJECTIVES: Considerable confusions have resulted from changes of treatment goals in a number of new guidelines, based on limited and conflicting evidence that comes from randomized clinical trials. To assess the individualized treatment goals (HbA1c, blood pressure, LDL-C) for patients with type 2 diabetes mellitus (T2DM) in real-world settings. **METHODS:** US Veterans Affairs (VA) electronic medical records database was extracted between January 2005 and December 2015. Adult T2DM patients (>18 years old) who had ≥2-year enrollment and ≥2 HbA1c, LDL-C and BP lab tests were selected. Patients with history of complications were excluded. Second-degree polynomial and splines were applied in the longitudinal regression models to identify heterogeneity of treatment goals in their associations with risk of diabetes related complications and mortality. Demographic characteristics, medical history, and medication use patterns were controlled in the regression models. **RESULTS:** 132,994 patients were selected, with 62.68 years

old (SD=10.96) and 6.72 (SD=6.68) years of follow-up. In general population, HbA1c=6.00% (SD=0.22), LDL-C=107.85 mg/dl (SD=8.71) and BP=136.45/98.15mmhg (SD=3.03/2.43) were associated with lowest mortality risk. As of achieving lowest risk of microvascular and macrovascular complication, the optimal HbA1c were higher than the level for mortality. The optimal LDL-C levels were similar between complication and mortality risks, while lower SBP and higher DBP were associated with better outcomes. The optimal treatment goals differed between age and race subgroups. Compare with older counterparts, lower LDL-C and SBP goals were identified in younger patients. Compared with white counterparts, lower LDL-C levels were identified for lowest mortality rate among blacks and Hispanic patients. **CONCLUSIONS:** Individualized treatment goals were identified for diabetes management in the US veterans. In addition to meeting general ADA recommended goals for better quality of care and population health management, health system may identify individualized treatment goals for their own patients with T2DM.

PDB9

COMPARISON OF LONG-TERM DATA ON CARDIOVASCULAR OUTCOMES IN PATIENTS WITH TYPE 2 DIABETES RECEIVING LIRAGLUTIDE WITH ESTIMATES BASED ON RISK FACTORS

Kragh N[1], Lloyd A[2], Skovgaard R[3], Henry T[2], Pitcher A[2]
[1]*Novo Nordisk A/S, Søborg, Denmark,* [2]*IMS Health, London, UK,* [3]*Novo Nordisk Canada Inc., Mississauga, ON, Canada*

OBJECTIVES: To compare rates of cardiovascular outcomes observed in a recent long-term study with rates expected based on subjects' demographic and risk factors. **METHODS:** The LEADER trial (Marso 2016) evaluated cardiovascular event rates in 9340 patients with Type 2 diabetes mellitus at high risk of cardiovascular disease with median follow up of 3.8 years. Patients were randomised to liraglutide 1.8mg daily or placebo in addition to standard of care (SoC). Demographic, glycaemia, lipid and blood pressure data observed in LEADER were used to predict event rates in the Core Diabetes Model (CDM) using a risk equation (UKPDS68 - Clarke 2004) commonly used to model long term outcomes in diabetes. Events predicted by the CDM were compared with events observed in LEADER. An iterative total error reduction process was used to calibrate the CDM to replicate observed event rates. Risk ratios were calculated comparing event rates observed in LEADER with those predicted by UKPDS68. **RESULTS:** Risk ratios for events observed in LEADER compared to those predicted by UKPDS68 for MI were 0.641 and 0.690 for liraglutide and SoC respectively; Stroke 1.173 and 1.190; heart failure 0.775 and 0.820; CV death 0.912 and 1.000; non-CV death 0.245 and 0.254. Values <1 indicate fewer events were observed in LEADER than predicted by UKPDS68. Smaller risk ratios for liraglutide than SoC indicate lower risk with liraglutide. Sensitivity analysis using alternative risk equations gave similar results. **CONCLUSIONS:** Rates of MI, heart failure and CV and non-CV death - though not stroke - were lower in patients receiving liraglutide in LEADER than would be expected based on published risk equations. Equivalent reductions were not observed in patients receiving SoC. Liraglutide 1.8mg prevented more cardiovascular events than can be explained by the impact of therapy on diabetes risk factors alone.

PDB10

ACHIEVEMENT OF DIABETES-RELATED QUALITY MEASURES IN PATIENTS TREATED WITH EXENATIDE ONCE-WEEKLY IN A REAL-WORLD SETTING

Singhal M[1], Schauerhamer M[1], Wittbrodt E[2], Unni S[1], Hurd J[2], McAdam-Marx C[1]
[1]*University of Utah, Salt Lake City, UT, USA,* [2]*AstraZeneca, Fort Washington, PA, USA*

OBJECTIVES: Diabetes quality measures reflect attainment of diabetes treatment goals that are associated with improved long-term outcomes. This study identified associations between exenatide once weekly (ExQW) use and common US diabetes quality measure performance in a real-world setting. **METHODS:** A historical cohort study of type 2 diabetes patients ≥18 years who initiated ExQW between February 1, 2012 and March 31, 2013 (index date) was conducted in a national medical record database. Patients initiating insulin therapy on index date were excluded. We identified the proportion of patients achieving quality measure targets for A1C (<7%, <8%, <9%) overall and by pre-index insulin use and BP target (<140/90 mmHg) at 12 months. **RESULTS:** This study included 792 ExQW patients. Baseline mean (SD) age was 57.2 (10.6) years, A1C was 8.3% (1.5) and 48.9% were male. Insulin was prescribed pre-index date for 334 (42.2%) patients (Pre-Ins); 458 (57.8%) had no insulin prescription before index (No-Ins). A1C quality target attainment improved significantly at follow-up vs baseline; A1C <7.0% was 31.7% vs 15.3%; A1C <8.0% was 61.4% vs 45.1%; and A1C <9.0% was 79.4% vs 71.1% (p< .001 for all). In the Pre-Ins and No-Ins groups, the proportion with A1C <7.0% at follow-up vs baseline was 20.4% vs 11.7% and 40.0% vs 17.9%; A1C <8.0% was 51.2% vs 38.6% and 68.8% vs 49.8% while A1C <9.0% was 72.7% vs 63.5% and 84.3% vs 76.6%, respectively (p< 0.001 for all). Overall, 76.2% had follow-up BP <140/90 mmHg vs 75.3% at baseline (p=0.544). **CONCLUSIONS:** ExQW was associated with a significant increase in the proportion of patients attaining diabetes quality measures for A1C overall and by baseline insulin use. Goal attainment was consistently lower for patients treated with insulin, possibly because they were more difficult to treat. BP goal attainment, which was high at baseline, did not change.

PDB11

REAL WORLD EFFECTIVENESS OF DULAGLUTIDE AMONG PATIENTS WITH TYPE 2 DIABETES

Mody R[1], Yu M[2], Fernandez L[3], Shui A[4], Kallenbach L[4], Slipski L[4], Piras de Oliveira C[3]
[1]*Eli Lilly and Company, Indianapolis, IN, USA,* [2]*Eli Lilly and Company, Toronto, ON, Canada,* [3]*Lilly USA, Indianapolis, IN, USA,* [4]*Practice Fusion, San Francisco, CA, USA*

OBJECTIVES: Dulaglutide is a once weekly GLP-1 receptor agonist (RA) indicated for the treatment of type 2 diabetes (T2D). The objective of this retrospective observational study was to assess the change in HbA1c among patients with uncontrolled T2D initiating dulaglutide. **METHODS:** This analysis included adults with T2D with an initial dulaglutide prescription (index date) between November 2014 and February 2016 using data from the Practice Fusion electronic health record database, which includes >25 million patients (6.7% of US ambulatory care). Patients with ≥1 diagnosis of T2D, naïve to dulaglutide with ≥1 HbA1c result in the 6-month baseline and in the 3 to <6 months post-index period were included. Uncontrolled T2D was defined as baseline HbA1c ≥7%. **RESULTS:** We identified 734 patients initiating dulaglutide, 187 (25.5%) with baseline HbA1c <7% and 547 (74.5%) with HbA1c ≥7%. At baseline, uncontrolled patients were 48% female, 51% and 49% were prescribed dulaglutide 1.5 mg and 0.75 mg, respectively, with mean±SD age 59.0±10.4 years, BMI 35.9±7.2 kg/m2, and HbA1c 8.8±1.5%. During post-index period, the mean reduction in HbA1c was 0.8±1.5%; mean reductions of 0.6±1.5% and 0.9±1.4% were observed among patients with a prior prescription for GLP-1 RA versus those without, respectively (p=.017). Additionally, significant differences in mean HbA1c reduction between subgroups by age (≥65 years vs <65 years: -0.6±1.3% vs -0.8±1.5%; p=.028) and baseline HbA1c (7 to <8% vs 8 to <9% vs ≥9%: -0.1±0.9% vs. -0.6±1.2% vs -1.6±1.8%; p<.001) were observed. There were no significant differences in mean HbA1c reductions between subgroups by gender, race, ethnicity, BMI, previous insulin prescription or oral antidiabetic medications, and dulaglutide dose. **CONCLUSIONS:** In real-world settings, patients with uncontrolled T2D demonstrated an improvement in their glycemic control within 6 months of initiating dulaglutide.

PDB12

EFFECTIVENESS OF A COMMUNITY-BASED TYPE 2 DIABETES SELF-MANAGEMENT EDUCATION PROGRAMME IN THE STATE OF PENANG, MALAYSIA

Wong YY[1], Hassali MA[1], Neoh CF[2], Saleem F[3], Kong DC[4]
[1]*Universiti Sains Malaysia, Penang, Malaysia,* [2]*Universiti Teknologi MARA, Puncak Alam, Malaysia,* [3]*University of Baluchistan, Quetta, Pakistan,* [4]*Monash University, Victoria, Australia*

OBJECTIVES: To assess the effectiveness of a structured, group-based type 2 diabetes self-management education (T2DSME) programme on participant's health outcomes. **METHODS:** A pre-post study design was employed. Adults diagnosed with Type 2 diabetes were invited to attend weekly, group-based self-management education offered in local community halls (average 2.5-hour per session for 6 consecutive weeks). The programme was developed by a multidisciplinary healthcare team (i.e. pharmacist, diabetic nurse educator, dietitian, physiotherapist and medical doctor). Empowerment philosophy and Bandura's self-efficacy theory were applied. Participant's clinical [HbA1c, fasting glucose, blood pressure, lipids, weight, body mass index (BMI) and waist circumference] and humanistic (knowledge related to diabetes management, self-care behaviours, self-efficacy and quality-of-life) outcomes were assessed at baseline, post 2-month and post 6-month of the programme. **RESULTS:** A total of 46 participants consented to the programme; 39 (84.8%) attended three or more sessions. After 2-month, participants demonstrated significant improvement in low-density lipoprotein cholesterol ($p = 0.001$), knowledge related to diabetes management ($p = 0.025$) and certain self-care behaviours including blood glucose monitoring ($p < 0.001$) and foot care ($p = 0.024$). The aforementioned outcomes were also maintained at 6-month. However, participants did not maintain the decreasing trend of HbA1c observed at 2-month with significant HbA1c increase reported at 6-month compared to 2-month ($p < 0.001$). At 6-month, other positive outcomes observed were improvement in high-density lipoprotein cholesterol ($p = 0.029$) and quality-of-life ($p = 0.010$). No significant differences were found in other outcomes (i.e. fasting glucose, blood pressure, triglycerides, weight, BMI, waist circumference, self-efficacy, diet, medication-taking and exercise components of self-care behaviour) between baseline, post-2 month and post-6 month of the programme. **CONCLUSIONS:** Findings suggest that short-term structured T2DSME may improve patient's clinical and psychosocial outcomes. However, self-management education should be reinforced in a continuous manner to help patients in sustaining good glycaemic control.

PDB13

A FIRST LOOK: REAL-WORLD COMPARISON OF UTILIZATION AND EFFECTIVENESS OF ALBIGLUTIDE AND LIRAGLUTIDE IN TYPE 2 DIABETES MELLITUS PATIENTS IN THE UNITED STATES

Buysman EK[1], Sikirica MV[2], Thayer SW[1], Bogart M[3], DuCharme M[1], Joshi AV[2]
[1]*Optum, Eden Prairie, MN, USA,* [2]*GlaxoSmithKline, Collegeville, PA, USA,* [3]*GlaxoSmithKline, Research Triangle Park, NC, USA*

OBJECTIVES: To compare treatment patterns and glycemic control following initiation of albiglutide versus liraglutide, among US commercially insured patients with T2DM. **METHODS:** Adult commercial health plan enrollees with T2DM with ≥ 1 pharmacy claim for albiglutide or liraglutide between 29-July-2014 and 31-December-2015 were included; the date of first fill was the index date. Patients were observed for 6 months prior to (baseline) and 6 and 12 months after the index date (follow-up). Inclusion criteria were baseline and follow-up continuous plan enrollment and evidence of T2DM. Patients with a type 1 diabetes diagnosis and ≥1 insulin prescription, gestational diabetes, or pregnancy were excluded. Patient demographic and clinical characteristics were used in 1:1 propensity score matching of albiglutide and liraglutide users. Outcomes were measured at 6 months (HbA1c, treatment patterns) and 12 months (treatment patterns). **RESULTS:** 2,213 patients were identified in each post-matched cohort with the following baseline characteristics: age 52.4±8.9 vs 52.4±9.1 years, 53.6% vs 52.8% male, Quan-Charlson score 0.61±1.0 vs 0.64±1.1, and diabetes complications severity index 0.68±1.1 vs 0.68±1.2, respectively in the albiglutide and liraglutide cohorts. At 6 months, average adherence (Proportion-of-Days-Covered) was 0.69±0.29 vs 0.64±0.29 (p<0.001), and

discontinuation was 33.2% vs 37.8% (p=0.002), for albiglutide and liraglutide, respectively. 11.7% of albiglutide users filled only a single index prescription vs 18.7% on liraglutide (p <0.001). The HbA1c subgroup (n=244 each) had similar characteristics with baseline HbA1c of 8.8±2.0 vs 8.6±1.8, and a decrease in HbA1c from baseline of 1.0±1.7 vs 1.0±1.6 (p=0.847) was observed for albiglutide and liraglutide, respectively. The 12-month analysis showed no significant differences in adherence or persistence. **CONCLUSIONS:** This comparative assessment of albiglutide vs liraglutide in US commercial claims shows that albiglutide patients experienced statistically significant improvements in adherence and persistence. Both groups demonstrated similar reductions in HbA1c levels 6 months after initiation of either medication.

PDB14

A RETROSPECTIVE REAL-WORLD STUDY OF DAPAGLIFLOZIN VERSUS OTHER ORAL ANTIDIABETIC (OAD) THERAPIES ADDED TO METFORMIN IN PATIENTS WITH TYPE 2 DIABETES (T2D) AND HYPERTENSION

Huang H[1], Bell K[2], Gani R[3], Tugwell C[2], Eudicone J[4], Krukas M[1]
[1]QuintilesIMS, Cambridge, MA, USA, [2]AstraZeneca, Wilmington, DE, USA, [3]Quintiles, Reading, UK, [4]Astrazeneca, Wilmington, DE, USA

OBJECTIVES: Dapagliflozin is shown to be effective in improving glycemic control and blood pressure for patients with T2D and hypertension in randomized trials. This study used real-world electronic medical record (EMR) data to compare outcomes among T2D patients with hypertension treated with dapagliflozin (D) + metformin (M), with or without other OAD (D+M±OAD), versus metformin with other OAD (M+OAD). **METHODS:** Adult patients with T2D on metformin and either dapagliflozin (±OAD) or other OAD as add-on therapy from 01/01/14 to 02/28/15 were identified in a US EMR database, with the date of first prescription for D (D+M±OAD) or other OAD (M+OAD) as the index date. Patients were observed for 12 months before the index date (baseline) and 12 months after (follow-up). Patients were required to have ≥1 diagnosis for hypertension or a prescription for ACE inhibitor or ARB during baseline. Outcomes included change in A1C, systolic and diastolic blood pressure (SBP/DBP), and weight from baseline to follow-up. **RESULTS:** A total of 421 D+M±OAD patients (mean±SD age 56.5±10.4 y, 46.8% women) and 469 M+OAD patients (age 57.0±11.8 y, 43.9% women) were identified. Mean baseline A1C was 8.8% for D+M±OAD and 8.7% for M+OAD (p=0.64). DPP-4i (39% for D+M±OAD and 49% for M+OAD, p<0.01) and sulfonylureas (38% for D+M±OAD and 42% for M+OAD, p=0.22) are common OADs during baseline. Compared with M+OAD patients, D+M±OAD patients had a greater reduction in A1C (mean −1.2% vs −0.6%, p<0.01), SBP (−4.6 vs −1.1 mmHg, p=0.01) and DBP (−2.7 vs –0.6 mmHg, p<0.01) from baseline to follow-up. Change in weight was not significantly different (-1.6 vs. -0.9 kg, p=0.06). **CONCLUSIONS:** In clinical practice, patients receiving D+M±OAD had greater reductions in A1C and BP versus patients on M+OAD among T2D patients with hypertension. This study supports the use of dapagliflozin as add-on therapy to metformin for such patients.
