OBJECTIVES: Type 2 diabetes mellitus (T2DM) is a chronic disorder and requires lifelong treatment. It poses significant burden on healthcare costs. This study was carried out with an aim to assess the efficacy and safety of once weekly dulaglutide for patients with T2DM. **METHODS:** An extensive literature search was done in Pubmed, Cochrane central register and other databases for clinical trial (CTs) comparing the efficacy and safety of dulaglutide with other oral hypoglycaemic agents or placebo in the treatment of T2DM from inception to 14th April, 2016 by two independent reviewers. A total of 12 RCTs including total of 8870 patients comparing dulaglutide (4598 patients) to Control (4272 patients) are pooled in the present analysis. Quality of included studies was determined by Cochrane risk of bias tool. Cochrane Q (p <0.05) or I2 test (>50%) was used to assess the heterogeneity. Subgroup analysis was performed. All analyses were performed using Comprehensive Meta-analysis. **RESULTS:** Fixed effect model was used for pooled analysis as no significant heterogeneity was observed. The pooled Weighted Mean Difference (WMD = -0.40, 95% CI -0.43 to -0.36, p = 0.00) shows, dulaglutide significantly lowered HbA1c over control (placebo, metformin, and liraglutide) as well as fasting plasma glucose (FPG) and body weight (WMD = -0.18, 95% CI -0.22 to -0.12, and -0.24, 95% CI -0.3 to -0.2, p = 0.00, respectively). Moreover, Dulaglutide significantly increasing 55% and 33% to achieve HbA1c <7% and <6.5% respectively and significantly decreasing the incidence of hypoglycemia (12%) as compared to control. **CONCLUSIONS:** The finding of our study reveals the beneficial effects of dulaglutide with respect to HbA1c, FPG and weight reduction in comparison to other oral hypoglycaemic agents. Dulaglutide also demonstrate satisfactory safety profile.

PDB17

ORAL ANTI-DIABETIC DRUGS ARE NOT ASSOCIATED WITH CARDIOVASCULAR MORTALITY: A SYSTEMATIC REVIEW WITH META-ANALYSIS

Goyat R, Kelley G
West Virginia University, School of Pharmacy, Morgantown, WV, USA

OBJECTIVES: There is a rising uncertainty related to cardiovascular safety of oral hypoglycemic agents (OHAs). Recently, the Food and Drug Administration (FDA) revised regulatory guidelines for anti-diabetic drug approval with respect to cardiovascular safety, to be within a predefined margin of statistical certainty. Therefore, objective of the study is to conduct a systematic review with meta-analysis to assess the impact of oral anti-diabetic agents marketed post FDA regulation, on the cardiovascular safety. **METHODS:** The inclusion criteria were: (1) randomized controlled trial, (2) study participants were adult humans with type-2 diabetes mellitus (T2DM) with or without cardiovascular risk factors, (3) who are taking at least one oral anti-diabetic drug, (4) the study outcome was cardiovascular mortality, and (5) published studies in English language since March 31, 2016. PubMed, Scopus and clinical trial registries were searched based on a search criteria decided a priori. Odds ratio was calculated for each result and pooled using random-effects models. Non-overlapping 95% confidence intervals (CI) were considered statistically significant. Heterogeneity was estimated using Q and I2 with alpha values ≤0.10 for Q considered statistically significant. **RESULTS:** Of the 431 studies reviewed, 46,291 participants (24,439 treatment, 21,852 control) nested within 10 studies were included. Mean HbA1c in treatment group was 7.68 (SD ± 0.79) and in the control group was 7.7 (SD ± 0.83). Overall, there was no significant association between the OHAs and cardiovascular mortality (OR = 0.89, 95% CI 0.74, 1.06, Q = 21.65, p<0.01, I2 = 58.43). **CONCLUSIONS:** The results of the current study suggest that OHAs are not associated with cardiovascular mortality, although, the confidence interval is very narrow and close to being significant. A network meta-analysis is needed to better understand this important issue of cardiovascular safety of oral hypoglycemic agents.

PDB18

THE IMPACT OF RAS-MODIFYING MEDICATIONS ON THE RISK OF PULMONARY INFECTIONS IN HYPERTENSIVE PATIENTS WITH TYPE 1 DIABETES

Bang SI, Soto M, Rodgers K, McCombs J
University of Southern California, Los Angeles, CA, USA

OBJECTIVES: Patients with Type 1 Diabetes (T1D), have an immune system with a lower ability to respond to infection.Studies have shown that RAS-modifying medications (angiotensin converting enzyme [ACE] inhibitors and angiotensin receptor blockers [ARBs]) may reduce the risk for pulmonary infections. The aim of this study was to assess the impact of T1D and RAS therapy on pulmonary complications in patients with hypertension (HTN). **METHODS:** A retrospective analysis was conducted using claims data from a US commercial insurance company. The study groups consisted of patients taking either: ACE inhibitors, ARBs, or control (diuretics or calcium-channel blockers). Hazard ratios (HR) were estimated using Cox analyses to determine the impact of ACE inhibitors and ARBs on incidence of pulmonary complications controlled for diagnosis of T1D as a risk factor. The event included influenza, pneumonia, tuberculosis (TB), and Streptococcal sore throat (SSR). Initial drug model tested whether the risk of the events is impacted if the patient started with ACE inhibitors or ARBs while duration model tested whether everyday use of the medications delays the events. **RESULTS:** A total of 11,602 T1D patients and 154,083 non-diabetic patients using HTN drugs were identified. In initial drug model, T1D patients were at increased risk for influenza (HR=1.171, p<.0001) and pneumonia (HR=1.612, p<0.0001). Duration model showed that T1D patients were associated with increased risk of influenza (HR=1.235, p=0.0005), pneumonia (HR=1.680, p<.0001), and SSR (HR=1.223, p=0.0442). Patients treated with ACE inhibitors had lower incidence of pneumonia by 17% (HR =0.829, p<.0001) and TB by 30% (HR=0.698, p=0.0343), and ARBs exhibited a lower risk of pneumonia by 13% (HR=0.865, p<.0001) compared to control drugs. Duration model exhibited similar trends for each drug class. **CONCLUSIONS:** T1D was associated with increased risk of influenza and pneumonia. The use of RAS-modifying medications reduced the risk and delays onset of the diseases.

PDB19

INCREASED RISK OF AUTOIMMUNE DISEASE IN PATIENTS WITH TYPE 1 DIABETES AND THE IMPACT OF RAS THERAPY

Bang SI, Soto M, Rodgers K, McCombs J
University of Southern California, Los Angeles, CA, USA

OBJECTIVES: Patients with type 1 diabetes (T1D) often develop other autoimmune disorders. Studies have shown that RAS-modifying medications (angiotensin converting enzyme [ACE] inhibitors and angiotensin receptor blockers [ARBs]) suppresses certain immune functions and inhibits inflammatory or autoimmune diseases. This study aims to assess the impact of T1D and hypertension (HTN) therapy on autoimmune diseases and potential benefits of using ACE inhibitors and ARBs. **METHODS:** A retrospective analysis was conducted using claims data from a US commercial insurance company (2007-2013). The study groups consisted of HTN patients taking either: ACE inhibitors, ARBs, or control (diuretics or calcium-channel blockers). Cox analyses and ordinary least squares (OLS) regression were performed to determine the impact of T1D on incidence of autoimmune diseases and estimate the extent to which an additional day of ACE inhibitors or ARBs provides additional benefit relative to a day of control drugs. Incidence and time to event were measured for multiple sclerosis [MS] (ICD-9 340.xx), systemic lupus erythematus [SLE] (ICD-9 710.0), and rheumatoid arthritis [RA] (ICD-9 714.xx). **RESULTS:** A total of 6,276 T1D patients and 147,097 non-diabetic patients were identified. OLS regression showed that patients with T1D patients were at increased risk for all three diseases (p<.0001) while Cox model failed to find any effect. ARBs are calculated to be more effective at preventing onset of disease compared to control drugs. ARBs can delay disease onset by up to 12 days (MS 11.627, p=0.0061; SLE 11.420, p=0.0071; RA 11.504, p=0.0069) whereas ACE inhibitors reduce the time to event by 8 days (MS -8.208, p=0.0026; SLE -8.174, p=0.0027; RA -7.610, p=0.0054). **CONCLUSIONS:** This study showed that T1D was associated with increased risk of other autoimmune diseases. The use of ARBs delayed onset of the diseases. Further studies with improved model may identify potentially valuable role of RAS therapy.

PDB20

AUTOIMMUNE DISEASE TIME TO DIAGNOSIS REDUCED IN PATIENTS WITH TYPE 2 DIABETES AND DELAYED WITH CONTINUOUS RAS THERAPY

Soto M, Bang SI, McCombs J, Rodgers K
University of Southern California, Los Angeles, CA, USA

OBJECTIVES: As the population of patients with type 2 diabetes (T2D) grows, it is important to look at the influence that it has on the onset of other disease. Autoimmune disease may be of particular interest because of the chronic low-grade inflammation in diabetic patients and connections to an imbalance in the Renin-Angiotensin System (RAS). This study aims to determine if RAS-modifying medications (angiotensin converting enzyme [ACE] inhibitors and angiotensin receptor blockers [ARBs]) have a beneficial impact on autoimmune disease in emerging T2D patients with hypertension (HTN) controlling for T2D and other factors. **METHODS:** A retrospective analysis was conducted using claims data from a US commercial insurance company (2007-2013). The study groups consisted of HTN patients taking either: ACE inhibitors, ARBs, or control (diuretics or calcium-channel blockers). Cox analyses were performed to determine the impact of ACE inhibitors and ARBs on incidence of autoimmune disease controlled for comorbidities, demographics, and diagnosis of T2D as a risk factor. Incidence and time to diagnosis were measured for multiple sclerosis [MS] (ICD-9 340.xx), systemic lupus erythematus [SLE] (ICD-9 710.0), and rheumatoid arthritis [RA] (ICD-9 714.xx). **RESULTS:** A total of 28,656 new T2D patients and 147,097 non-diabetic patients were identified. Patients with emerging T2D were not at increased risk for MS (HR 1.147, p=0.4384) or SLE (HR 1.254, p=0.0706) but were for RA (HR 1.299, p<.0001). There was however a significantly faster progression of the disease in all three autoimmune diseases in patients with T2D. RAS-modifying anti-hypertensives did not reduce incidence of disease but did delay disease onset with continued use. **CONCLUSIONS:** T2D has been shown to impact a variety of disease in incidence, severity, and onset; autoimmune disease may soon be included on this list. ACE inhibitors and ARBs may help delay the progression of MS, SLE and RA.

PDB21

INCIDENCE OF TUBERCULOSIS AND PNEUMONIA IN A NEWLY DIAGNOSED TYPE 2 DIABETIC POPULATION AND THE IMPACT OF RAS THERAPY

Soto M, Bang SI, McCombs J, Rodgers K
University of Southern California, Los Angeles, CA, USA

OBJECTIVES: Increased risk of tuberculosis (TB) is associated with diabetes in countries with low-income and high prevalence of both diseases. Pneumonia has also been associated with diabetes diagnosis. This study aims to investigate the impact of pulmonary complications in population with hypertension (HTN) and the possibility of using RAS-modifying medications (angiotensin converting enzyme [ACE] inhibitors and angiotensin receptor blockers [ARBs]) to delay their emergence. **METHODS:** A retrospective analysis was conducted using claims data from a US commercial insurance company. The study groups consisted of patients taking either: ACE inhibitors, ARBs, or control (diuretics or calcium-channel blockers). Hazard ratios (HR) were calculated using Cox analyses to determine the impact of ACE inhibitors and ARBs on incidence of TB and pneumonia. Initial drug model was tested to measure the extent to which the risk of the events is impacted if the patient started are ACE inhibitors or ARBs, and duration model tested whether everyday use of HTN medications delays the events. **RESULTS:** A total of 29,850 new T2D patients and 154,083 non-diabetic patients were identified. In initial drug model, emerging T2D patients were at increased risk for pneumonia (HR=1.188, p<.0001), but were not for TB (HR=1.425, p=0.0745). Patients treated with ACE inhibitors had lower incidence of pneumonia by 17% (HR=0.833, p<.0001) and TB by 33% (HR=0.667, p=0.0097), and ARBs patients exhibited a lower risk of pneumonia by 11% (HR=0.888, p<.0001) compared to patients treated with control drugs. In duration model, T2D patients were at increased risk for pneumonia by 12% (HR=1.124, p<.0001) and TB by 49% (HR=1.487, p=0.454). The rate at which drug therapy delays disease onset is significantly higher for ACE inhibitors and ARBs compared to control. **CONCLUSIONS:** Pneumonia and TB are part of a growing list of complications linked to emerging T2D. ACE inhibitors and ARBs may help delay the progression of pulmonary infections.

PDB22

EFFICACY AND SAFETY OF ALBIGLUTIDE IN THE TREATMENT OF TYPE II DIABETES MELLITUS: A META-ANALYSIS OF RANDOMIZED CONTROLLED TRIALS

Esam H[1], Pagada A[1], Rai MK[2]
[1]*Tata Consultancy Services (TCS), Thane, India,* [2]*Tata Consultancy Services, Mumbai, India*

OBJECTIVES: This meta-analysis was carried out to assess the efficacy and safety of albiglutide (30mg subcutaneous injection administered once a week) compared to any control intervention (other anti-diabetic medication, or placebo) among patients with T2DM. **METHODS:** Literature searches were conducted in Pubmed, Embase and The Cochrane library databases. In addition, Clinicaltrials.gov was also searched to obtain additional information. Studies retrieved from the databases were screened and data were extracted by single reviewer, then cross checked for accuracy by second reviewer. Randomized controlled trials assessing the efficacy and safety of albiglutide among T2DM patients with ≥18 years old were included in this meta-analysis. Data were pooled using random-effect model (RevMan5.3). **RESULTS:** Of the 323 studies retrieved through database search, 10 (N=5613) met the eligibility criteria. Albiglutide was found to be effective in reducing glycated hemoglobin (HbA1c) (weighted mean difference [WMD], -0.62; 95% confidence interval [CI], -0.91 to -0.32; n=10), and fasting blood glucose (FBG) levels (WMD, -1.51; 95% CI,-1.81 to -1.8; n=6) than the control intervention. No significant differences were observed in hypoglycemia (risk ratio [RR], 1.01; 95% CI, 0.73 to 1.4; n=9), hypertension (RR, 1.04; 95% CI, 0.68 to 1.58; n=3), coronary artery disease (RR, 0.73; 95% CI, 0.33 to 1.63; n=6), unstable angina (RR, 0.49; 95% CI;0.16 to 1.49; n=4), and any gastrointestinal (GI) events (RR, 1.10; 95% CI, 0.79 to 1.53; n=5) between two groups. But, there was more than two fold increased risk of developing injection site reactions in the albiglutide group when compared to the control group (RR, 2.31; 95% CI 1.13 to 4.72; n=9). **CONCLUSIONS:** Meta-analysis suggests that albiglutide is effective and safe among patients with T2DM. However, albiglutide appears to be associated with the risk of injection site reactions. In future more well designed randomized controlled trials with long-term follow-up are needed to establish this.

PDB23

IMPACT OF PAST COMPLIANT BEHAVIOR AND SEVERITY OF DISEASE ON THE ADHERENCE TO ANTI-DIABETIC MEDICATIONS: A RETROSPECTIVE CLAIMS DATABASE STUDY

Upadhyay N
University of Houston, Houston, TX, USA

OBJECTIVES: Adherence to anti-diabetic medications has always been a concern due to its importance in diabetes management. Adherence to medication can depend on the patients' compliant behavior and the patients' perception of the severity of their diabetes. This study aims to assess the effect of past compliant behavior and severity of diabetes on patients' adherence to their anti-diabetic medications. **METHODS:** This is a retrospective database study of continuously enrolled (2009-2010) Texas Medicare Advantage Plan enrollees (≥60 years) with ICD-9 diagnosis codes for diabetic disorders. Patients were followed for one and a half year to measure their adherence to antidiabetic medication. Prescription claims for biguanides, diuretics, and sulfonylureas were utilized to determine medication adherence using medication possession ratio (MPR). The MPR 365 days following index date was used as a proxy measure of past compliance. Severity was assessed based on the presence of diabetic neuropathy (DN) in first 365 days of follow-up, with patients having DN being categorized as severe. The impact of patients' past compliant behavior and the presence of DN was assessed on the adherence during the 180 days after the compliance measurement period using multivariable logistic regression analysis. **RESULTS:** A total of 1,635 diabetic patients were identified with mean age 73.3 (+\-7) years of which 58.9% were female. Almost 10% had diabetic neuropathy, and 66.5% patients were adherent to their medication in first 365 days of follow-up. Logistic regression showed that patients with DN were more likely to be adherent compared to the patients without DN (OR=3.46, 95% CI [1.91-6.26]); similarly, patients who were compliant to their medication in past were more likely to be adherent to their medications (OR=1.45, 95% CI [1.10-1.92]). **CONCLUSIONS:** Severity of diabetes (presence of DN) and previous compliant behavior is positively associated with the adherence to anti-diabetic medications.

PDB24

RISK OF HEART FAILURE HOSPITALIZATION AMONG USERS OF DIPEPTIDYL PEPTIDASE-4 INHIBITORS COMPARED TO SULFONYLUREA IN PATIENTS WITH TYPE II DIABETES

Dawwas G, Park H
University of Florida, Gainesville, FL, USA

OBJECTIVES: Recent post-secondary analysis of clinical trials suggested an increased risk of heart failure (HF) with Dipeptidyl Peptidase-4-inhibitors (DPP-4-inhibitors) but the risk remains uncertain. The aim of this study is to assess the risk of HF-hospitalization with the use of DPP-4-inhbitors vs. sulfonylurea in patients with type-II diabetes. **METHODS:** A retrospective cohort analysis using Truven Health-Commercial database was conducted among patients aged >=18 years who had type-II diabetes (ICD-9: 250.x0 or 250.x2). Patients who initiated either DPP-4-inhbitors or sulfonylurea, had no prior use for at least 6 months, and had at least one additional prescription following initiation between January 2008 to December 2015 were included. Patients with a diagnosis of type-I-diabetes, gestational-diabetes, or end-stage-renal-disease prior the index-date (treatment initiation) were excluded. Follow-up continued until the occurrence of first HF-hospitalization, end of enrollment or, end of study period. Cox proportional hazards model after propensity-score matching was used to compare the risk of HF-hospitalization between patients with DPP-4-inhibitors and those with sulfonylurea. **RESULTS:** A total of 127,945 new-users of DPP-4-inhbitors [follow-up: Mean (+/- SD):110 days(+/-121)], and 373,208 new-users of sulfonylurea [105 days (+/-114)] were identified. Incidence rates of HF were 101 and 115 per 10,000 person-years in the DPP-4-inhbitors and the sulfonylurea groups, respectively. After matching on propensity-score (n=127945 each) and adjusting for risk factors, DPP-4-inhibitors group experienced 30% risk reduction in HF-hospitalization compared to the sulfonylurea group (HR: 0.70, 95%CI [0.64, 0.77]). Subgroup analysis showed a significant decrease in the risk of HF in patients without any history of cardiovascular disease (CVD) (n=234,299) HR: 0.63, 95%CI [0.56, 0.71]. However, there was no statistically significant difference in the risk of HF between the two groups in patients with prior CVD diagnosis (n=21,591) HR: 0.83, 95%CI [0.69, 1.00]. **CONCLUSIONS:** After adjusting for risk factors, the use of DPP-4-inhbitors was associated with reduced risk of HF compared to sulfonylurea.

DIABETES PREVALENCE IN BRAZIL: A SYSTEMATIC REVIEW AND META-ANALYSIS

Laranjeira FO[1], Fonseca M[2], Tannus G[3]
[1]*Axia.Bio Life Sciences International, São Paulo, Brazil,* [2]*Federal University of São Paulo, São Paulo, Brazil,* [3]*Axia.Bio Life Sciences International, Miami, FL, USA*

OBJECTIVES: Worldwide diabetes prevalence is around 9%, affecting approximately 415 million people. In Brazil, although there are several epidemiological studies on this subject, the prevalence of diabetes is still matter of debate. Our

objective is to investigate the prevalence of diabetes in Brazil **METHODS:** We performed a systematic review on the prevalence of diabetes in Brazil. Potentially relevant studies were identified through an exhaustive search in MEDLINE, SciELO, LILACS, Ministry of Health and hand-search. Inclusion criteria were cross-sectional population-based, censuses, surveys or cohorts studies where diabetes diagnosis, regardless if type 1 or type 2, was self-reported (SR) or confirmed by blood glucose testes (BGT), in the Brazilian population. We conducted a meta-analysis to provide the current best prevalence estimate, using a random effects model. Descriptive analysis of studies and a comparison between self-reported and BGT studies were performed. **RESULTS:** Among the 968 located references, we included 28 studies. Thirteen were population-based studies with national representation and 15 were studies with local/regional representation. Fifteen studies were SR and 13 relied on BGT to confirm diagnosis. On SR studies, the mean prevalence was 6.25% (95% CI 5.75% - 6.74%; I2 50%) and on studies confirmed by BGT, the mean prevalence was 10.05% (95% CI 6.41% - 13.68%; I264%). From 24.0% to 50.4% of interviewed people were unaware of their diabetes diagnosis. **CONCLUSIONS:** Diabetes is a global health challenge. Our findings suggest that there is a difference between the prevalence reported by SR studies and those where diagnosis is confirmed by BGT. A significant number of people are unaware of their condition therefore increasing the awareness about diabetes, screening, diagnosis and care is critical. Our estimates constitute a valuable tool for policy and decision-making process, mainly in developing countries.

PDB26

PREVALENCE OF DIABETIC RETINOPATHY IN TYPE-2 DIABETES IN RELATION TO, RISK FACTORS, SEVERITY, IN THE REGION OF WARANGAL, INDIA-A HOSPITAL BASED PROSPECTIVE STUDY

Ravi Theja K
TALLA PADMAVATHI COLLEGE OF PHARMACY, WARANGAL, India

OBJECTIVES: (1) To assess prevalence of diabetic retinopathy in Diabetes Mellitus in Warangal region, (2) To assess the various risk factors in diabetic retinopathy patients, (3) To find out effect of duration of Diabetes Mellitus on severity of Diabetic Retinopathy. **METHODS:** The study was a Hospital-based, Prospective observational study. Conducted on 452 diabetic male and female volunteers that fulfilled the inclusion criteria, with their proper consent for 6 months. All are underwent detailed ophthalmoscopic examinations for Diabetic Retinopathy, out of which 223 patients developing the Diabetic Retinopathy. The International Clinical Diabetic Retinopathy and Diabetic Macula edema Disease Severity Scale was followed to categorize Retinopathy in different stages. **RESULTS:** We observed that overall, prevalence of DR in Diabetic patients of Warangal region was 49.34%. Prevalence of Non-Proliferative DR, Proliferative DR and Macular edema were 31.19%, 10.8% and 7.3% respectively, Statistically significant variables on student t-test, chi square test and Univariate analysis, associated with increased risk of diabetic retinopathy were gender men at greater risk ($P<0.0001$), longer duration of diabetes15 years ($P<0.0001$), use of insulin ($P< 0.0001$), age >60 years of DM (OR 1.83, 95% CI 1.25-2.68), Patient with age group 40-60 years are at greater risk for Macular edema showed a statistically significant (OR 1.18, 95% CI 0.18-2.01), Also Poor FBS are at greater risk (OR 0.34, 95% CI O.15-0.77). **CONCLUSIONS:** This study concluded that prevalence of DR in DM patients of Warangal region 49.34% and that it increased with age, duration of DM and poor glycemic control and needs early detection and appropriate treatment to prevent blindness due to this condition.

ASSOCIATIONS BETWEEN ANTIDIABETIC AGENTS AND CANCER PROMOTION: A REAL-WORLD COHORT STUDY IN SHANGHAI, CHINA

Ye J[1], Shi L[2], Ye L[1], Qian J[3]
[1]*Fudan University, Shanghai, China,* [2]*Tulane University School of Public Health and Tropical Medicine, NEW ORLEANS, LA, USA,* [3]*Shanghai Hongkou Center for Diasease Control and Prevention, Shanghai, China*

OBJECTIVES: To evaluate the effect of metformin and sulfonylurea on the cancer promotion among naïve users of anti-diabetic medications as compared to nonusers. **METHODS:** A community population based retrospective diabetes cohort was extracted from the Shanghai Community Diabetes Management System database, which is a patient registry from general practices, with which included 2353 newly onset type 2 diabetes aged ≥ 35years during 2006-2010. Patients were grouped by the initial therapy at registry entry into no use of antidiabetic medications (n=722), metformin monotherapy (n= 374), sulfonylurea monotherapy (n=653), metformin and sulfonylurea combination therapy (n=302), and other medication therapy (n=302). Comparisons between monotherapy and nonuse of medication were analyzed by both intention-to-treatment and per-protocol analyses, usinging Cox proportional hazards models in adjusted hazard ratio (aHR) and 95% CI. **RESULTS:** A total of 94 incident cancers were diagnosed during a median follow-up time of 5 years. Compared with nonusers, sulfonylurea monotherapy was associated with significantly lower risk of cancer promotion (adjusted HR0.53 [95%CI: 0.31-0.91]). Similar association for metformin was not statistically significant (aHR0.57 [95%CI: 0.30-1.09]). **CONCLUSIONS:** The real-world evidence suggested that the use metformin or sulfonylurea was at least not associated with cancer promotion, in a cohort of newly onset T2DM patients.

PDB28

INCRETIN TREATMENT AND RISK OF CANCER IN PATIENTS WITH TYPE 2 DIABETES MELLITUS: SYSTEMATIC REVIEW AND META-ANALYSIS OF RANDOMIZED AND OBSERVATIONAL STUDIES

Deng K, Li L, Liu J, Sun X
West China Hospital, Sichuan University, Chengdu, China

OBJECTIVES: Increasing numbers of studies have suggested cancer risk related to the incretin treatment. This study was conducted to assess cancer risk associated with the use of incretin-based treatment in patients with type 2 diabetes mellitus (T2DM). **METHODS:** We systematically searched MEDLINE, EMBASE, the Cochrane Central Register of Controlled Trials (CENTRAL) and ClinicalTrials.gov for randomized controlled trials(RCTs) and observational studies comparing incretin treatment with placebo or active anti-diabetic drugs used in T2DM patients. Paired reviewers conducted the literature screening, risk of bias assessment and data extraction independently. We analyzed and reported the results separately by different study designs. **RESULTS:** 130 RCTs and 7 cohort studies were included. 130 RCTs with low to moderate risk of bias enrolled 113176 patients, of which the pooled estimates showed no statistical difference of cancer risk between incretin treatments and controls (OR: 0.99, 95%CI: 0.90-1.09). Five pre-specified subgroup analyses suggested no significant interactions. Of the 7 cohort studies included (moderate to high risk, 466693 T2DM patients), pooled estimates of the unadjusted data showed no statistical difference of cancer risk between incretin treatment and comparators (RR=0.74, 95%CI: 0.38-1.42). Subgroup differences were not detected (P=0.75). Pooled estimates of adjusted data showed no significant differences either (aHR=0.80, 95% CI: 0.59-1.07). **CONCLUSIONS:** Current evidence suggests that incretins, compared to other active anti-diabetic drugs, do not increase the risk of cancer in T2DM patients, but further observational studies are still warranted to confirm the findings.

PDB29

MODELING INDIVIDUAL PATIENT BLOOD GLUCOSE LEVELS AS A STOCHASTIC PROCESS: AN OBSERVATIONAL STUDY USING LABORATORY DATA FROM HOSPITALS IN JAPAN

Iwasaki K[1], Oh A[2], Hiroi S[2]
[1]*Milliman, Tokyo, Japan,* [2]*Takeda Pharmaceutical Company Limited, Chuo-ku, Japan*

OBJECTIVES: Stabilizing glucose levels in patients with diabetes is important in order to prevent hypoglycemia. Studies using Real World Data exist that describe the correlation between the treatment and incidence of hypoglycemia. The incidence rate is so small that significant results could only be achieved with a large sample size; such data cannot be obtained in Japan. The objective of this study is to examine the correlation between treatment type and blood glucose level. We may find significant results because the number of data points describing blood glucose is greater than the number of data points showing complications or hypoglycemia. **METHODS:** We analyzed health insurance claims data and laboratory data provided by Medical Data Vision Co., Ltd. We selected Type 2 diabetes patients having both anti-diabetic drug claims and glucose measurements. We applied a Wiener process to each patient and estimated both drift μ and infinitesimal variance σ2. We then built a linear regression model with σ as the explained variable, and sex, age, and dummy variables for each anti-diabetic drug treatment or combination of treatments as explanatory variables. We compared the coefficients of the dummy variables. **RESULTS:** Data from April 2008 to September 2016 were used. 5,807 Type 2 diabetes patients were selected. The coefficient of insulin was 23.0 mg/dl (p value was <.0001), which was far larger than that of all of the other anti-diabetics. The second largest coefficient was that of sulfonylureas, 6.5 mg/dl (p values was <.0001). The smallest coefficient was that of glitazone, which was -4.4 mg/dl (p value was <.0001). **CONCLUSIONS:** We obtained a set of significant results on the variance of the blood glucose by type of treatment. This study suggests that the patients should choose the anti-diabetic drug within the allowance of the variation of the blood glucose.

DIABETES/ENDOCRINE DISORDERS – Cost Studies

PDB30

THE ADOPTION OF IGLARLIXI FOR THE TREATMENT OF TYPE 2 DIABETES MELLITUS IN PATIENTS PREVIOUSLY EXPOSED TO INSULIN MIGHT GENERATE SAVINGS FROM THE FIRST YEAR

Afonso M[1], Fan T[2], Kowal S[3], Ferrufino C[4], Lovato E[5], Van Vleet J[2], Lew E[1]
[1]*Sanofi, Chilly-Mazarin, France,* [2]*Sanofi, Bridgewater, NY, USA,* [3]*IMS Health, Seattle, WA, USA,* [4]*IMS Health, Fairfax, VA, USA,* [5]*IMS Health, London, UK*

OBJECTIVES: IGlarLixi 100/33 (fixed-ratio combination of insulin glargine/lixisenatide) demonstrated that a higher proportion of IGlarLixi-treated patients achieved HbA1c targets with a beneficial effect on body weight and no additional risk of hypoglycaemia at week 30, compared to insulin glargine in clinical trials. The objective of this analysis, funded by Sanofi, was to estimate the annual budget impact of adopting IGlarLixi for the treatment of patients with T2DM uncontrolled with less than 60 IU/day of basal insulin, from a US commercial payer perspective. **METHODS:** An Excel-based budget impact model assuming 1,000,000 hypothetical US health plan members in 2017 was developed. The proportion of diagnosed T2DM eligible to receive IGlarLixi was based on published literature and market research. The comparators and market share were derived from a PharMetrics database analysis. The model assumes 0.55% IGlarLixi adoption rate from other available regimens. Drug costs were calculated using published wholesale acquisition costs. Healthcare resource use and costs were derived from a combination of published literature and national fee schedules. A one-way sensitivity analysis varying all model parameters was also conducted. **RESULTS:** The model estimates that 9,658 patients were eligible to start treatment with IGlarLixi in the first year. In the projected scenario a budget impact of -$16,824 (-0.29%) was observed, corresponding to a cost savings of $0.01 per member per month (PMPM). Adopting the Medicare perspective, more patients would be eligible to IGlarLixi leading to higher savings: $0.03 PMPM, corresponding to a budget impact of -$41,720 between the scenarios: projected and without IGlarLixi. Sensitivity analyses showed that the results are most influenced by the projected market shares of IGlarLixi and its daily cost. **CONCLUSIONS:** IGlarLixi's adoption as a treatment option for T2DM patients uncontrolled on less than 60 IU/day of basal insulin shows potential to provide budget savings in the first year.

PDB31

ECONOMIC IMPACT OF SWITCHING HIGH-DOSE INSULIN-TREATED PATIENTS WITH T2D TO HUMAN REGULAR U-500 INSULIN MONOTHERAPY WITH 3-ML PENS

Chen J[1], Klein T[2], Jackson JA[3], Peng X[1], van Brunt K[4], Perk S[2], Murphy DR[2]
[1]Eli Lilly and Company, Indianapolis, IN, USA, [2]Medical Decision Modeling Inc., Indianapolis, IN, USA, [3]Lilly USA, LLC, Indianapolis, IN, USA, [4]Eli Lilly & Company, Erl Wood Manor, UK

OBJECTIVES: To evaluate the pharmacy budget impact of switching severely insulin-resistant patients with type 2 diabetes (T2D) requiring >200 units of daily insulin on basal-bolus regimens or human regular U-500 insulin (U-500R) 20-ml vials to U-500R 3-mL pens from the United States (US) commercial payer and Medicare perspectives. **METHODS:** A budget impact model was used to compare pharmacy costs with and without the U-500R pen over a 3-year period. A hypothetical US commercial plan and a Medicare cohort were evaluated separately. T2D prevalence/incidence rates and historical treatment data were used to estimate the number of U-500R–eligible patients. Market share and product substitution rates were projected based on estimates from IMS LifelinkTM. These projections were used to allocate the eligible population to each comparator for scenarios with and without the U-500R pen. Pharmacy costs were estimated using average total daily doses (TDDs) from published data for U-500R/comparators. Copays, coinsurance, deductible, and member distribution by cost-sharing types were considered. Extensive sensitivity analyses were performed. **RESULTS:** For the US commercial cohort (1,000,000 members), introduction of U-500R pens yielded estimated total cost savings of $730,769 with incremental cost savings per treated member per month (PTMPM) of $54.55 and per member per month (PMPM) of $0.020. For the Medicare cohort, the estimated cost savings were $54,072,594 (total), $49.00 (PTMPM), and $0.040 (PMPM). Although the results were sensitive to U-500R TDD relative to comparators, cost-sharing composition, and rates of uptake from U-500R vials and from comparators, sensitivity analyses showed cost savings with the U-500R pens in all cases for both cohorts. **CONCLUSIONS:** Incremental switching of high-dose insulin-treated patients with T2D to U-500R pens was estimated to reduce costs from US commercial payer and Medicare perspectives, resulting in pharmacy budget benefits across a wide range of market factors, TDD requirements, and cost-sharing schemes of insurance plans.

PDB32

BUDGET IMPACT ANALYSIS OF INSULIN DEGLUDEC COMPARED TO INSULIN GLARGINE U100 FOR TYPE 1 DIABETES MELLITUS IN THE BRAZILIAN PUBLIC HEALTHCARE SYSTEM

Alves JS, Gonçalves Td, Griciunas F
Novo Nordisk, São Paulo, Brazil

OBJECTIVES: To evaluate direct and indirect costs and associated budget impact of insulin degludec (IDeg) compared to insulin glargine U100 (IGlar U100) in the treatment of Type 1 Diabetes Mellitus patients in a basal-bolus regimen (T1DM) in Brazilian Public Healthcare System. **METHODS:** A 5-year budget impact model was developed to evaluate direct and indirect costs associated with the treatment of T1DM in Brazil. Annual treatment costs for IDeg and IGlar were calculated based on basal and bolus insulin dosing, needles, hypoglycaemic events, self-monitoring blood glucose tests, routine medical appointments and productivity loss attributed to hypoglycaemia. Clinical inputs were derived mainly from meta-analyses of randomized clinical trials. Unit costs were derived from official pricing and procedures reimbursement lists in the public healthcare perspectives (i.e. CMED, BPS and SIGTAP). To estimate the budget impact, a 1,000 hypothetical cohort population with T1DM is assumed and market-share of insulins derived from market data. Currency rate is 1.00USD-3.36BRL. Univariate deterministic sensitivity analysis was performed to stress robustness of main variables. **RESULTS:** Annual treatment costs per patient with T1DM were **8,505.16**BRL for IDeg and **9,011.35**BRL for IGlar U100. In the baseline scenario, the treatment of T1DM with IDeg is associated with **506.19**BRL of annual cost reductions per patient. Main variables driving this reduction are basal/bolus insulin dose and needles and fewer hypoglycaemic events. Overall budget impact is **-101,238**BRL and **-506,192**BRL at Year 1 and 5, respectively. During 5 years, **2,489** hypoglycaemic events can potentially be avoided. As we used a budget impact approach, HRQoL benefits were not estimated. **CONCLUSIONS:** The introduction of IDeg in the Brazilian public healthcare system is associated with potential economic savings when compared to IGlar U100 and can positively increase according to the proportion of patients treated with IDeg. Budget-holders can either save resources or treat more patients when managing T1DM.

PDB33

A COMPARISON OF TRENDS IN INSULIN PRICES AND THE GROSS DOMESTIC PRODUCT IN THE US (1983 - 2016)

Sultan I[1], Amamoo JJ[1], Gannu L[1], Seoane-Vazquez E[2]
[1]MCPHS University, Boston, MA, USA, [2]Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA

OBJECTIVES: Diabetes is one of the most prevalent chronic diseases in the Unites States (US). Newer analogs are generally more expensive than older insulin formulations. The increase in prices of insulin products have resulted in increased third party payer expenditures and out-of-pocket costs. This study assessed the increase in insulin prices and the gross domestic product (GDP) in the US in the period 1983-2016. **METHODS:** The average wholesale prices (AWP) of insulin were collected from the RedBook (Truven Health). The GDP per capita, a common measure of the economic growth of nation, was derived from The World Bank. Insulin products were classified according to their duration of action: ultra-short acting, short acting, intermediate acting, long acting, and premixed insulin. The annual compound annual rate growth (CARG) for the AWP prices of insulin products were calculated and compared to the CARG of the GDP. **RESULTS:** Ultra short acting insulin products had an annual CARG price range from 14.1% to 16.5% compared with an annual CARG GDP range of 2.1% to 3.3%. For short acting insulin products, the annual CARG price range was 9.3% to 24.7% compared with an annual CARG GDP range of 2.8% to 3.8%. Intermediate acting insulin products had an annual CARG price range of 8.5% to 23.8% compared to the annual CARG GDP of 3.5% to 15.4%. Long acting insulin products had an annual CARG price range of 17.5% to 18.4% compared to an annual CARG GDP range 2.3% to 3.4%. Premixed insulin products had an annual CARG price range of 0.0% to 15.1% compared to the annual CARG GDP range of 2.9 % to 6.3%. **CONCLUSIONS:** Insulin prices increased faster than the GPD. The highest price increases were observed in ultra short acting insulin products, while the lowest price increases occurred in long acting insulin products.

PDB34

FDA APPROVAL AND PRICE ANALYSIS FOR GLUCAGON-LIKE PEPTIDE- RECEPTOR AGONIST (GLP-1 RA) FOR T2DM AND OBESITY: A DESCRIPTIVE STUDY (DURING THE PERIOD OF 2005-2016)

Alzarea AI[1], Simonetti J[2], Zaghloul I[3], Tyrrell B[1], Mekary RA[1]
[1]MCPHS University, Boston, MA, USA, [2]Harvard Vanguard Medical Associates, Boston, MA, USA, [3]MCPHS university, Boston, MA, USA

OBJECTIVES: To describe trends in the Average Wholesale Price (AWP) per Define daily dose (DDD) and year of therapy at the market entry of all U.S. Food and Drug Administration (FDA)-approved GLP-1RA drugs. **METHODS:** The FDA-approved GLP-1RA drugs were collected from the Drugs@FDA database. Their DDD was extracted using the WHO anatomical therapeutic chemical classification and their AWP/unit price and market status from the RED BOOK Online(R). Descriptive statistics and liner regression were used to compare drugs' approval status, approval dates, and AWP prices/30 DDD using SAS 9.3. **RESULTS:** There were 15 dosage forms and strengths of approved GLP-1RA medications including 5 active ingredients(86.7%) and two combinations with insulin(13.3%). Exenatide(40.0%), Liraglutide(13.3%), Lixisenatide(13.3%), Albiglutide(6.7%), and Dulaglutide(13.3%) were the approved active ingredients. Exenatide was the first approved in 2005. The combination of each of Liraglutide and Lixisenatide with insulin was the last approved (late 2016). About half (53.3%) of these drugs included a box warning about thyroid C-cell tumor in animals. GLP-1RA drugs' indications were T2DM (93.3%) and chronic weight management (6.7%) for adults only. Their route of administration was subcutaneous. Their usage frequency was once daily (40.0%), twice daily (26.7%), and once weekly (33.3%). No generics were found for GLP-1RAs with 4.2% being repackaged. Their collected AWP prices ranged from $216.35 to $1609.71 and their effective dates ranged from 05/23/2005 to 01/01/2017. The median price/30 DDD was $476.69 (range=$216.35-$1609.71). A significant direct association was found between drugs' prices/30DDD and their effective dates after inflation adjustment (slope =0.17; 95%CI=0.12-0.22). Similar associations were found for Exenatide, Liraglutide, Albiglutide, and Dulaglutide (All P-values<0.05). **CONCLUSIONS:** Five active ingredients and two combinations with insulin were approved by the USFDA. Their indications were T2DM and chronic weight management for adults only. GLP-1RAs prices/DDD were directly associated with the progress of time owing to the lack of generics.

A STUDY ON THE VARIATION IN THE COST OF ORAL HYPOGLYCEMIC AGENTS IN INDIAN PHARMACEUTICAL MARKET

Vk S[1], Tiwari P[2]
[1]SAS NAGAR, PUNJAB, India, [2]National Institute of Pharmaceutical Education and Research, Mohali, India

OBJECTIVES: To analyze the variation in the cost of single drug formulations (SDFs) as well as fixed-dose combinations (FDCs) of oral hypoglycemic agents (OHAs) in Indian pharmaceutical market. **METHODS:** A screening for the SDFs as well as FDCs of OHAs was performed using online version of Current Index of Medical Specialties (CIMS) and Drug Today (Volume 2, July-September 2016). The cost of 10 units of tablets or capsules in Indian rupee (INR) of SDFs and FDCs of all brands were captured. Some FDCs of OHAs were excluded because APIs of FDCs were not available as an individual formulation in the market or costs were not available in the latest edition of Drug Today and CIMS. Percentage cost variation and average cost of SDFs and FDCs were calculated and compared. **RESULTS:** 9 single drugs in 20 different doses and 23 FDCs are available in Indian market. The variation in the cost of the SDFs is in the range of 55-1376%. Vildagliptin 50mg tablets have a least variation of 55%, while Glimepiride 2mg tablets showed highest variation of 1376%. Further, the variation in the cost of the FDCs of OHAs was in the range of 23-927%. The FDC of Glimepiride+Metformin (2+500mg) showed maximum variation of 927% while, Vildagliptin+Metformin (50+1000mg) tablets have the least variation of 23 %. Out of selected 23 FDCs, 19 have lower and only 4 have higher average cost than SDFs. **CONCLUSIONS:** Compared to the SDFs, FDCs having least variation in the cost and less average cost.

PDB36

PREDICTION OF LONG TERM OUTCOMES OF TYPE 2 DIABETES IN CHILEAN POPULATION FROM THE PERSPECTIVE OF PUBLIC HEALTH SYSTEM

Rojas R[1], Vargas C[1], Balmaceda C[1], Espinoza MA[2]
[1]Pontificia Universidad Catolica de Chile, Santiago, Chile, [2]Honorary Visiting Fellow Centre for Health Economics, University of York, York, UK

OBJECTIVES: To estimate economic and health related quality of life consequences of newly diagnosed type 2 diabetes patients in Chile. **METHODS:** A Discrete Event Simulation (DES) model was built using the parametric equations of United Kingdom Prospective Diabetes Study (UKPDS) outcomes model 2. The

aim was to predict time to event from diagnosis to the occurrence of disease complications and death. Individual risk profile from newly diagnosed patients from the 2010 Chilean national health survey were used for the estimation. Health related quality of life were measured using quality adjusted life years (QALY). Costs were estimated using the normative tariff of the Chilean public payer. Cost and QALYs were discounted at an annual rate of 3%. **RESULTS:** The average expected cost of a newly diagnosed patient considering only the treatment and no complications is USD 12,300. The average expected QALYs of a newly diagnosed patient considering only the treatment and no complications is 17,08 QALY. The occurrence of a complication as heart failure is expected to rise the average expected cost of a patient without complications to USD 16,500 (increment of 34%) and to reduce the average expected QALYs to 14.85 (reduction of 13%). The occurrence of a complication as renal failure is expected to rise the average expected cost of a patient without complications to USD 99,500 (increment of 708%) and to reduce the average expected QALYs to 11.31 (reduction of 33,7%). **CONCLUSIONS:** Due to the high impact of complications on expected cost and QALYs, funding decisions for type 2 diabetes treatments should be based on the patient risk profile at the moment of diagnosis and not as a general rule.

PDB37

A REAL WORLD ANTI-DIABETES MEDICATION COST COMPARISON BETWEEN PREMIXED INSULIN ANALOGS AND LONG-ACTING INSULIN ANALOGS IN CHINESE PATIENTS WITH TYPE-2 DIABETES: A RETROSPECTIVE DATABASE STUDY

Gao Y[1], Wang K[2], Chen Y[2], Shen L[2], Hou J[2], Xuan JW[3], Liu B[4]
[1]Shanghai Centennial Scientific Ltd, Shanghai, China, [2]Lilly Suzhou Pharmaceutical Company, Ltd., Shanghai, China, [3]Sun Yat-sen University, Guangzhou, China, [4]Department of Health Economics, School of Public Health, Fudan University, Shanghai, China

OBJECTIVES: To assess and compare per-day anti-diabetic medication cost among Chinese type-2 diabetes mellitus (T2DM) insulin naïve patients who initiated premixed insulin analogs (premix) or long-acting insulin analogs (long-acting). **METHODS:** Data were obtained from an electronic medical record database between 2010.01.01~2015.06.30 covering medical encounter records from all general hospitals in a district from Shanghai, China. Insulin naïve T2DM patients who aged ≥ 18 years, were treated with oral anti-diabetic drug (OAD) only during baseline period (3 months prior to insulin initiation), and initiated premix or long-acting were included. Patients were followed until index insulin discontinuation or 12 months after initiation, whichever came first. T-test and generalized linear models adjusting for propensity score (PS) (including baseline demographics, number of OAD classes, comorbidities, costs, and healthcare resource utilization) were used to test the difference between two insulin groups. **RESULTS:** A total of 570 and 185 patients were identified for premix and long-acting groups, with mean (SD) age 63.0 (12.8) and 61.1(11.9) (p=0.08) and male 47.4% and 51.4% (p=0.35), respectively. During baseline, 19.3% premix users and 12.4% long-acting users had T2DM-related hospitalizations (p=0.03); the average number of T2DM-related outpatient visits were 0.98 and 1.23 times for premix and long-acting groups, respectively (p=0.07). During the follow-up period, per-day insulin dose averaged 31.7 and 15.3 international unit for premix and long-acting groups, respectively. Compared with premix users, mean per-day cost for long-acting users was 37.3% higher (15.3 vs 11.2 Chinese Yuan (CNY), mean difference (MD)[95% CI]): 4.2[3.2,5.1]) for overall anti-diabetes medication, 81.3% higher (3.3 vs 1.8 CNY, MD[95% CI]: 1.5[0.8, 2.2]) for OAD, and 28.6% higher (12.0 vs 9.3 CNY, MD[95% CI]: 2.7[2.1, 3.3]) for insulin. Results were consistent after PS was adjusted. **CONCLUSIONS:** Among Chinese T2DM insulin naïve patients, those who were initiated premix insulin had lower per-day antidiabetic medication cost than those initiated long-acting insulin.

PDB38

CHARACTERISTICS AND COSTS OF PATIENTS WITH TYPE 2 DIABETES AUGMENTING METFORMIN WITH DAPAGLIFLOZIN VERSUS GLIPIZIDE: AN ANALYSIS OF COMMERCIAL CLAIMS DATA

Bell K[1], Meyers J[2], Candrilli SD[2], Ajmera MR[2]
[1]AstraZeneca, Wilmington, DE, USA, [2]RTI Health Solutions, Research Triangle Park, NC, USA

OBJECTIVES: To compare demographics, clinical characteristics, and health care costs among patients with type 2 diabetes (T2D) augmenting metformin monotherapy with dapagliflozin versus glipizide using a large administrative claims database. **METHODS:** Patients in the Truven MarketScan Commercial Claims and Encounters and Medicare Supplemental and Coordination of Benefits databases with a prescription for dapagliflozin or glipizide on or after January 1, 2014, were identified (date of first observed prescription termed index date). Patients were required to have metformin monotherapy for ≥30 days pre-index date, concomitant metformin and dapagliflozin/glipizide for ≥30 days post-index date, 12 months pre- and post-index date continuous health plan enrollment, ≥1 T2D diagnosis, and no diagnoses of gestational or type 1 diabetes. Dapagliflozin patients were matched 1:1 to glipizide patients using propensity scores. Demographics, clinical characteristics, and all-cause health care costs during the 12 months post-index date were reported. **RESULTS:** A total of 364 dapagliflozin patients were matched to 364 glipizide patients. Mean (SD) patient age and Charlson Comorbidity Index score were 53.7(8.6) years and 2.5(1.5) among dapagliflozin patients and 54.3(10.5) years and 2.6(1.6) among glipizide patients. A total of 54.4% of dapagliflozin and 62.1% of glipizide patients were women, and 27.5% of dapagliflozin and 31.6% of glipizide patients had a diagnosis of obesity at any point during the pre- or post-index date period. Mean (SD) all-cause medical (excluding pharmacy) costs during the 12-month post-index date period were $5,278($11,455) among dapagliflozin patients versus $10,013($34,885) among glipizide patients (P=0.015), while pharmacy costs were $6,387($11,353) among dapagliflozin patients versus $4,003($12,752) among glipizide patients (P=0.008). Mean (SD) total all-cause costs during the 12-month post-index date period were $11,665($17,526) among dapagliflozin patients and $14,016($41,597) among glipizide patients (P=0.322). **CONCLUSIONS:** Despite similar demographic and clinical characteristics, dapagliflozin patients accrued statistically significantly lower medical and numerically lower total costs compared with glipizide patients.

PDB39

THE RELATIONSHIP BETWEEN HYPOGLYCEMIA SEVERITY AND WORK PRODUCTIVITY LOSS AND COSTS AMONG TYPE 2 DIABETES PATIENTS

Pawaskar M[1], Iglay K[2], Witt EA[3], Rajpathak S[1], Engel SS[2], Williams LK[4]
[1]Merck & Co., Inc., North Wales, PA, USA, [2]Merck & Co., Inc., Kenilworth, NJ, USA, [3]Kantar Health, Princeton, NJ, USA, [4]Henry Ford Health System, Detroit, MI, USA

OBJECTIVES: Hypoglycemia can result in productivity loss and increased healthcare resource use in patients with type 2 diabetes (T2D). Previous research has focused on severe hypoglycemic events, this study sought to estimate work productivity loss and costs associated with hypoglycemic events of all levels of severity. **METHODS:** We identified adults with T2D who responded to the 2013 U.S. National Health and Wellness Survey. The study population included patients who reported a diagnosis of T2D and current treatment with an antihyperglycemic agent. Respondents were categorized into one of 3 groups based on whether an event occurred in the preceding 3 months: no hypoglycemic event (NE), non-severe event (NSE), or severe event (SE). Among those who reported hypoglycemia, SE was defined as requiring third-party assistance. Work productivity loss was measured using the Work Productivity and Activity Index. Direct costs were estimated from self-reported healthcare use. Indirect costs were calculated by combining data from the Bureau of Labor Statistics and productivity loss. Multivariable regression models were used to adjust for baseline differences in patient characteristics. **RESULTS:** Of 3,630 respondents, 47.6% reported a NSE and 4.7% reported a SE. Increasing severity of hypoglycemia was associated with an increase in mean absenteeism (NE=5.7%, NSE=4.0%, SE=15.3%; p-trend <.01), presenteeism (NE=17.7%, NSE=18.7%, SE=31.1%; p-trend < .01), overall work impairment (NE=21.4%, NSE=20.8%, SE=37.9%; p-trend <.01), and activity impairment (NE=35.2%, NSE=38.6%, SE=49.9%; p-trend <.01). Hypoglycemia severity was also associated with higher mean indirect costs (NE=$7,247.8, NSE=$7,493.1, SE=$12,166.6, p-trend=.008) and direct costs (NE=$6,908.3, NSE=$7,131.8, SE=$15,410.4, p-trend<.001). **CONCLUSIONS:** This study suggests that hypoglycemia severity is associated with an increase in work productivity loss and higher costs. Hypoglycemia can pose a significant economic burden on patients, employers and healthcare systems and varies by the severity of hypoglycemic events.

PDB40

ASSESSING THE ECONOMIC BURDEN OF TYPE 2 DIABETES IN CHINA REFLECTING THE CURRENT STANDARD OF THE DISEASE MANAGEMENT AND FOR IMPROVED MANAGEMENT SCENARIOS USING A MODELING APPROACH

Foos V[1], Lamotte M[1], McEwan P[2], Jiang X[3], Zhang YL[3], Qu S[4], De Moor R[1], Ramos M[1], Xiong T[4], Wang K[3]
[1]IMS Health, Zaventem, Belgium, [2]Health Economics and Outcomes Research Ltd, Cardiff, UK, [3]Lilly Suzhou Pharmaceutical Company, Ltd., Shanghai, China, [4]IMS Health China, Shanghai, China

OBJECTIVES: Recent estimates from the Diabetes-Atlas have quantified the total annual expenditures of diabetes in China between ¥354 to ¥611 Billion-Chinese-Yuan (BN-CNY) (2015). The objective of our study was to employ a modeling approach to re-estimate the annual cost burden based on the current standard of type-2-diabetes (T2D) management (status quo (SQ)) in China and a series of hypothetical improved management strategies. **METHODS:** The QuintilesIMS-CORE-Diabetes-Model (CDM) was used to evaluate the economic burden of T2D in China based on assumptions reflecting the current SQ of T2D-management and a number of step-wise-improvements. SQ was defined as a scenario in which T2D diagnosis is delayed by 4-years, treatment escalation to maintain glucose control occurs at a 9%-HbA1c-threshold, and an overall 60% adherence rate (AR). Step-wise-improvements considered immediate diagnosis, declining levels of HbA1c-escalation-thresholds to 8.0% and 7.0% and improvements in AR to 80% and 100%. The CDM was applied on per-capita level to project lifetime costs and clinical outcomes of newly diseased T2D individuals in the Chinese setting. Model outcomes were subsequently annualized and extrapolated to Chinese-national-level considering the total number of diagnosed T2D individuals in China. **RESULTS:** The total annual direct cost attributable to diagnosed T2D in China reflecting current SQ-management was estimated at 611 BN-CNY. Scenarios exploring step-wise-improvements from SQ estimated annual net-savings of ¥32, ¥33, ¥57, ¥69 and ¥73 BN-CNY for scenarios exploring immediate diagnosis, threshold reductions to 8.0% and 7.0% and AR increased to 80% and 100%, respectively. Net-savings resulted from reduced costs to treat diabetes complications (¥36, ¥63, ¥117, ¥134 and ¥154 BN-CNY) and excess treatment costs alongside step-wise-improvements (¥3, ¥30, ¥61, ¥66 and ¥81 BN-CNY). Per-capita life-expectancy was increased by 0.26, 0.69, 1.30, 1.48 and 1.68 years, respectively. **CONCLUSIONS:** Improved T2D-management-strategies can help to decrease the financial burden of the disease and increase life-expectancy of T2D individuals.

PDB41

AN ACTUARIAL ANALYSIS OF DIABETES PAYER ADDRESSABLE BURDEN

Pratt WS[1], Ashpole K[1], Zhao Z[2], Mitchell B[2], Gregor K[1]
[1]Optum Inc., Eden Prairie, MN, USA, [2]Eli Lilly and Company, Indianapolis, IN, USA

OBJECTIVES: The goal was to describe health plan financials, from an actuarial perspective, for members with Type 1 Diabetes (T1DM) and Type 2 Diabetes (T2DM), including members with serious emergent hypoglycemic events. **METHODS:** Payer Addressable Burden (PAB) describes the cost of care curve and identifies opportunities to address those costs. Medical and prescription claims

were evaluated using Symmetry® Episode Treatment Groups®, which is an episode grouper that combines related services into medically relevant and distinct units. Claims data were taken from a proprietary database, which contained 27 million commercial and MAPD members. Three 12-month periods were assessed (April 2013 to March 2016). Three levels of costs were described: diabetes-specific (dPAB), selected comorbidities (cPAB), and total (tPAB). **RESULTS:** The average annual number of diabetes members was 1,181,848. Demographics included: female (49%), <65 yo (54%), commercial benefits (53%), T2DM (92%), ≥1 serious emergent hypoglycemic event (1.5%). High diabetes prevalence resulted in a high level of financial risk. Episodic dPAB was not remarkable compared to tPAB. Comorbidities were associated with higher dPAB, and vice versa. Pharmacy was a proportional driver of cost and trend. Members with T1DM and hypoglycemic events were associated with generally higher episodic dPAB, cPAB, and tPAB than their counterparts. Annual average dPAB and tPAB for members with hypoglycemic events was three times higher than for their non-hypoglycemic counterparts. Members with hypoglycemic events cost 4% to 5% of dPAB and tPAB PMPM for diabetes members. **CONCLUSIONS:** Actuaries prioritize the cost of the "member with diabetes" over the cost of "diabetes in the member." Actuaries are more likely to focus on T2DM members than T1DM members, will note the larger medical cost offset opportunity with tPAB, will take interests in the interplay between diabetes and comorbidities, and will explore potentially favorable returns on investments in members at risk for hypoglycemic events.

PDB42

COST AND HEALTHCARE USE IMPLICATIONS OF BARIATRIC SURGERY VS LIFESTYLE/MEDICAL INTERVENTION FOR TYPE 2 DIABETES

Banerjee S[1], Garrison L[2], Flum D[2], Arterburn D[3]
[1]Boston University School of Medicine, Boston, MA, USA, [2]University of Washington, Seattle, WA, USA, [3]Group Health Research Institute, Seattle, WA, USA

OBJECTIVES: Bariatric surgery has been shown to be more effective than intensive lifestyle and medical intervention (ILMI) for weight loss and diabetes control. We sought to compare the 2-year cost and healthcare utilization of patients with obesity and Type 2 diabetes mellitus (T2DM) randomized into either Roux-en-Y gastric bypass (RYGB) surgery or an IMLI. **METHODS:** This analysis is based on two-year follow-up of a small randomized controlled trial (RCT) with additional data from a larger cohort of patients (N=1,808). Adult patients with body mass index of 30–45 kg/m2 currently on T2DM medications were recruited from Group Health Cooperative between July 2011 and June 2012. The study sample included 745 patients with non-missing outcomes during the study period. We were primarily interested in comparing the cost and healthcare utilization outcomes for patients randomized into either RYGB (N=15) or ILMI (N=17). **RESULTS:** After 2 years of follow-up in the randomized trial, there were no significant differences in health care costs for RYGB patients compared to those undergoing ILMI. There was evidence of pharmacy cost reduction for RYGB vs. ILMI patients – by about $900 in year 2 vs. year 0; this was, however, counteracted by higher inpatient and emergency room costs for surgery patients in the two follow-up years relative to the year before surgery. Median total cost for non-randomized patients was higher by more than $600 in year 0 and by almost $1000 in year 2 compared to randomized patients. **CONCLUSIONS:** This study suggests bariatric surgery is not cost-saving in the short term compared to ILMI. Moreover, the costs of patients who enter into RCTs of bariatric surgery may be quite different from that of those who do not enter RCTs, suggesting that caution is needed when using data from bariatric RCTs to draw inferences about the general population of patients with obesity.

PDB43

PRESCRIPTION PATTERNS AND COSTS OF ANTIDIABETIC MEDICATIONS IN A LARGE GROUP OF PATIENTS

Machado-Alba J[1], Gaviria-Mendoza A[2], Sanchez-Duque J[1], Medina-Morales D[2]
[1]Universidad Tecnológica de Pereira-Audifarma S.A., Pereira, Colombia, [2]Audifarma S.A, Pereira, Colombia

OBJECTIVES: To determine the prescription patterns of antidiabetic medications and the variables associated with their use in a Colombian population. **METHODS:** A cross-sectional study using a systematized database of approximately 3.5 million affiliates of the Colombian Health System. Patients of both genders and all ages treated uninterruptedly with antidiabetic medications for three months (June–August 2015) were included. A database was designed that included sociodemographic, pharmacological, comedication, and cost variables. IBM® SPSS® Statistics software, version 23.0, was used for the data analysis. **RESULTS:** A total of 47,532 patients were identified; the mean age was 65.5 years, and 56.3% were women. Among the patients, 56.2% (n=26,691) received medication as monotherapy. The most prescribed medications were metformin, 81.3% (n=38,664), insulins, 33.3% (n=15,848), and sulfonylureas, 21.8% (n = 10,370). Insulin analogs comprised 72.3% (n=11,462) of those with insulin therapy. The mean prescribed daily dose to defined daily dose ratio was: 0.75 for metformin, 0.85 for glibenclamide and 1.30 for total insulin. Among the patients, 92.8% received comedications, including antihypertensives (79.7%), hypolipemiants (65.5%), antiplatelet drugs (56.3%), analgesics (33.9%), antiulcerants (33.1%), and thyroid hormone (17.3%). The cost per 1,000 inhabitants/day was $1.21 USD for metformin, $3.89 USD for insulins, and $0.02 USD for glibenclamide. The estimated annual cost of human insulin was $198,355 USD, whereas that of the analogs was $4,746,780 USD. The average cost per unit of insulin was $0.002 USD and $0.02 USD for human insulin and the insulin analogs, respectively. **CONCLUSIONS:** Generally, rational prescription habits predominated, however in some cases an overuse of comedications (such as antiulcer drugs) and a large group of patients with high cost formulations were observed. Subsequent effectiveness and cost-benefit analyzes are required.

PDB44

EFFECTIVENESS AND COST-EFFECTIVENESS OF A TWO-YEAR SHORT MESSAGING SERVICE (SMS) INTERVENTION FOR PROFESSIONAL DRIVERS WITH PRE-DIABETES

Wong CK[1], Siu S[2], Wong CK[2], Yu EY[1], Lam CL[1]
[1]The University of Hong Kong, Hong Kong, Hong Kong, [2]Tung Wah Eastern Hospital, Hong Kong Island, Hong Kong

OBJECTIVES: An observational post-randomized controlled trial (RCT) design was adopted to evaluate the long-term sustainability and maintenance of improved glycemic control, lipid profile, and reduced progression to diabetes at 3-year following a 2-year intervention of short messaging service (SMS). **METHODS:** We performed a naturalistic follow-up to the 104 participants of SMS intervention, a 2-year RCT comparing SMS to non-SMS for professional drivers with pre-diabetes (ClinicalTrials.gov Identifier: NCT01556880). Primary outcome of this post-RCT study was cumulative incidence of diabetes whereas secondary outcomes were the change in biometric data over a 5-year period. Proportional Cox regression model was constructed to estimate hazard ratio (HR) of SMS for progression to diabetes. Incremental cost-effectiveness ratio for the SMS versus non-SMS was expressed in cost (2015 price in US dollar) per quality-adjusted life-year (QALY). Uncertainty about ICER was incorporated using bootstrapping. **RESULTS:** After a mean 57-month follow-up, 19 (18.3%) were lost to follow-up after the RCT period. No significantly greater benefit of SMS over 5-year period was observed in weight, body mass index, glycemic control, and lipid profile and diabetes risk scores. Thus no significant effect of SMS on reduction in diabetes was observed in overall (HR: 1.184; 95%CI: 0.612-2.288) and pre-defined subgroups. In term of cost-effectiveness, there were no significant differences in total costs (SMS: $880.21; non-SMS: $1327.51; difference: -447.30 95%CI: -447.30-488.38) and QALYs (SMS: 3.69; non-SMS: 3.68; difference: 0.01 95%CI: -0.01-0.04) between groups. Probabilities that SMS was cost-effective compared with non-SMS at a willingness-to-pay threshold of $10,000 and $50,000 per QALY gained were 87.3% and 87.5%, respectively. **CONCLUSIONS:** Based on post-RCT data, SMS intervention preserved the clinical benefits within the 3-year after intervention but it failed to translate from treatment efficacy to long-term effectiveness beyond 3 years. However, SMS was effective for delaying the diabetes progression, making it cost-effective over the 5-year period.

PDB45

COST-EFFECTIVENESS OF LONG-ACTING INSULIN ANALOGUES VERSUS INTERMEDIATE/LONG-ACTING HUMAN INSULIN FOR TYPE 1 DIABETES OVER 10 YEARS: A NATION-WIDE LONGITUDINAL COHORT FROM TAIWAN

Lee T[1], Kuo S[2], Yang C[1], Ou H[3]
[1]Institute of Clinical Pharmacy and Pharmaceutical Sciences, College of Medicine, National Cheng Kung University, Tainan, Taiwan, [2]Division of Metabolism, Endocrinology & Diabetes, Department of Internal Medicine, University of Michigan Medical School, Ann Arbor, MI, USA, [3]Department of Pharmacy, College of Medicine, National Cheng Kung University, Tainan, Taiwan

OBJECTIVES: To evaluate the cost-effectiveness of long-acting insulin therapy (LAIT) versus intermediate-acting insulin therapy (IAIT) for type 1 diabetes (T1DM) up to a follow-up of 10 years in a real-world healthcare setting. **METHODS:** This trial-based cost-effectiveness analysis was conducted in the propensity-score matched cohorts retrieved from the population-based, universal health insurance administrative database in Taiwan. Patients with T1DM who received their first basal insulin prescription within Jan 2004-Dec 2008 were identified and followed up until Dec 2013 to determine if they occurred diabetes-related complications, including cardiovascular, microvascular complications, hospitalized hyperglycemia, and outpatient or hospitalized hypoglycemia. Outcomes were measured in the number needed to treat (NNT) of each diabetes-related complication and of hyper- and hypoglycemia, total medical costs, cost per case of diabetes-related complication prevented, and cost per case of hyper- or hypoglycemia prevented. Baseline cost difference was considered. Probabilistic sensitivity analysis (PSA) was performed by nonparametric bootstrap method to consider the sampling uncertainty. **RESULTS:** Compared to IAIT, LAIT significantly reduced risks of any diabetes-related complications and hypoglycemia, and incurred the reduced total medical costs. The NNT for using LAIT versus IAIT to avoid one case having any diabetes-related complications and hypoglycemia were 10 (over 3.62 years) and 12 (over 5.84 years), respectively. The incremental medical costs for LAIT versus IAIT were -$1,382 and -$1,418 from a payer and a healthcare sector perspective, respectively. In the reference case analysis, IAIT is dominated by LAIT from both a payer and a healthcare sector perspective. PSA indicated that LAIT possessed a high likelihood as a cost-saving or highly cost-effective intervention. **CONCLUSIONS:** Over 10 years, the greater costs of LAIT for patients with T1DM are largely offset by savings arising from averted diabetes-related complications and hypoglycemia compared to IAIT, which suggests that use of LAIT for T1DM represents a good value for money.

PDB46

CLARIFYING CONCLUSIONS FROM A COST-EFFECTIVENESS ANALYSIS OF THE DIABETES PREVENTION PROGRAM (DPP) AND ITS OUTCOMES STUDY (DPPOS)

Alolayan SO[1], Rittenhouse B[2]
[1]MCPHS University, Boston, MA, USA, [2]MCPHS UNIVERSITY, Boston, MA, USA

OBJECTIVES: Clarify ambiguous and conflicting conclusions of a published Diabetes Prevention Program (DPP) and DPP Outcomes Study (DPPOS) cost-effectiveness study of placebo, metformin, individual and group lifestyle (ILS and GLS) interventions and indicate the degree of uncertainty around them by performing a probabilistic sensitivity analysis (PSA). **METHODS:** We took various types of cost (inside and outside DPP) and effectiveness (QALYs) numbers from the original publication and reproduced the original deterministic ICER results. We

then explored how the significant ambiguity of the original paper's conclusions could be clarified by using a net benefit (NB) formulation and the cost-effectiveness plane. We also explored uncertainty through a PSA, assigning probability distributions for costs and outcomes and doing a simulation, producing net benefit results for each set of drawn values and constructing cost-effectiveness acceptability curves and frontiers (CEAC/Fs). **RESULTS:** The NB formulation and the cost-effectiveness plane clearly indicated that GLS dominates or is cost-effective relative to the other three interventions for any likely WTP threshold (if that GLS alternative is eliminated, ILS is shown to be the cost-effective alternative, ICER= $17,692). Metformin is only the cost-effective alternative if the WTP is quite low (less than $1665/QALY). The PSA and CEAC/F analyses show that the GLS intervention probability of being cost-effective varies, but GLS is the clear optimal choice throughout (and beyond) a wide range of "reasonable" WTP values ($10,000 – $200,000/QALY). Its conditional probabilities of being cost-effective are P(CE|WTP=$1600) = 0.34); (P(CE|WTP=$100,000) = 0.66). **CONCLUSIONS:** The original paper's ambiguous/conflicting conclusions (e.g. "policies should support the funding of intensive lifestyle and metformin interventions") obscure the simplicity of the results. The value of various depictions of deterministic and probabilistic results is shown by clarifying the original results – if these data reflect the performance of the interventions accurately, GLS is the cost-effective alternative in diabetes prevention.

PDB47

COST-EFFECTIVENESS OF TREATMENT PATHWAYS WITH DESIPRAMINE, DULOXETINE, GABAPENTIN, AND PREGABALIN FOR THE LONG-TERM TREATMENT OF PAINFUL DIABETIC NEUROPATHY

Ruiz-Negron N, Nelson R, Bellows BK
University of Utah, Salt Lake City, UT, USA

OBJECTIVES: Patients with painful diabetic neuropathy (PDN) often do not respond to treatment and require frequent therapy switches. The objective of this study was to determine the cost-effectiveness of all possible PDN treatment pathways with desipramine (DES), duloxetine (DUL), gabapentin (GABA), and pregabalin (PRE) over a 10-year time horizon from a third-party payer perspective. **METHODS:** A microsimulation health-state transition model was created to estimate the direct healthcare costs and quality-adjusted life-years (QALYs) in 10,000 hypothetical patients with moderate-to-severe PDN. The model compared each of the 24 possible PDN treatment pathways, which consisted of initial treatment with DES, DUL, GABA, or PRE followed by therapy switches to remaining agents after therapy failure or serious adverse events. Medication adherence values and pain relief scores were specific to each treatment and thus changed as patients progressed through each pathway. Healthcare costs and health state utilities were assigned based on pain response (i.e. moderate-to-severe vs. mild) and were derived from national sources and published estimates. **RESULTS:** Five treatment pathways were not dominated (listed in order of increasing cost): 1) DES/DUL/GABA/PRE, 2) DUL/DES/GABA/PRE, 3) DUL/GABA/DES/PRE, 4) DUL/PRE/DES/GABA and 5) DUL/PRE/GABA/DES. Mean costs ranged from $29,200 to $35,700. Mean QALYs ranged from 3.09 to 3.13. Using DES/DUL/GABA/PRE as the reference, DUL/DES/GABA/PRE had the lowest incremental cost-effectiveness ratio ($1,190 per QALY gained). Deterministic sensitivity analyses showed the model was most sensitive to changes in health state utilities, medication adherence, and pain relief threshold. Probabilistic sensitivity analyses estimated that DUL/DES/GABA/PRE was cost-effective in 66% and 73% of the simulations at willingness-to-pay thresholds of $50,000 and $100,000 per QALY gained, respectively. **CONCLUSIONS:** Initiating treatment with DUL followed by DES, GABA, and PRE (in that order) after therapy failure appears to be the most cost-effective PDN treatment pathway. These results could help guide provider and third-party payer decisions surrounding PDN therapy management.

PDB48

ECONOMIC EVALUATION OF DIABETES EARLY TREATMENT IN CHINA

Guan HJ, Han S, Shi LW
School of Pharmaceutical Sciences, Peking University, Beijing, China

OBJECTIVES: As of 2015, 114 million people have diabetes in China. However, only 38.6% of people with diabetes are aware that they have diabetes; merely 25.8% of people with diabetes are taking diabetes medicaitons. Insufficient treatment and delayed insulin initiation are key challenges for diabetes management in China. This study is to evaluate the long-term impact on health outcomes and medical costs of early treatment among people with type 2 diabetes (T2DM) in China. **METHODS:** This study compares the health outcomes and medical costs between early treatment (defined as patient receiving diabetes treatment at baseline HbA1c 7.5%) versus current practice (treatment at baseline HbA1c 9.0%) over 30-year time horizon based on CORE Diabetes Model. The baseline individual characteristics, risk factors, treatmet effect and meidcal costs are extracted from large scale studies in China. Costs and health outcomes are discounted at 3% annually. **RESULTS:** Health outcomes: early treatment is associated with less cumulative incidences of diabetes-related complications – myocardial infarction (MI), neuropathy, foot ulcer, retinopathy, congestive heart failure (CHF) reduces by 3.75%, 3.17%, 2.11%, 1.92%, 0.30%, respectively; increased expected life years by 0.371 (15.208 vs 14.837), and quality adusted life years by 0.260 QALYs (10.855 vs 10.595). Medical costs: early treatment saves total direct medical costs, anti-diabetic medication cost, and complication cost by CNY 6,533 (201,774 vs 208,307), CNY 493 (54,911 vs 55,404), and CNY 6,986 (101,098 vs 108,084), respectively per patient. Sensative analysis demonstrated the robustness of the study results. **CONCLUSIONS:** Diabetes early treatment is associated with long-term improvements in health outcomes and savings in medical costs for people with T2DM in China. The new evidence suggests that early intervention is a cost-saving strategy in diabetes management in China, which will contribute in achiveing the golas set in Healthy China 2030.

PDB49

PHARMACOEPIDEMIOLOGICAL AND PHARMACOECONOMIC STUDY OF CO-MORBIDITIES IN DIABETES MELLITUS

venkateswararao.R cI
chalapathi institue of pharmaceutical sciences, krishna (dt), IN, India

OBJECTIVES: The aim of the study was to determine in Study cost of illness and cost of utility analysis in the population. And decreasing the economic burden of the treatment by following the life style modifications. **METHODS:** study involving cohort study design. Totally of 132 diabetic patients are included. In-patients and out patients of medical and surgical department in RDT hospital, Bathalapalli – a secondary level referral hospital at rural Anantapur, AP are involed in the study period of 6 months range from August 2012 to January 2013. All in patients and out Patient who are diagnosed as Diabetic type-II, Continuing anti diabetic drugs for their diabetes management are included and Patient who are diagnosed as Diabetic type-I and pregnancy and pediatric patients were excluded. **RESULTS:** A totally of 132 diabetic patients, in which male and famales are near by equal in number. Based upon the comorbidity conditions most of the subjects (69%) were suffering with diabetes+hypertension. Most of the subjects(9.9%) having comorbidity conditions of diabetes+ hypertension+acute renal failureand these people are spending more money to the treatment. The average utility of drugs is more for the combination of Met+Glib+Ins than metformin+glibenlamide .Chalrson Co morbidity Index is more for the people are present in the age group of 61-70 years. cost of hospitalization with co morbidities is more(95515rs) for DM+ HTN. **CONCLUSIONS:** Finally we concluded that, anantapur is a rural area, most of people are with poor knowledge and lack of awareness. By applying all those patients in Charlson Co morbidities index we found, patient's economic status through year wise. It says many of the diabetic patients facing economic burden, especially daily wager are feeling much difficulty to face even therapy cost also. In co morbidities side we noticed most of the patients are Diabetic with hypertension, they are 55% in my study population.

PDB50

CORRELATION BETWEEN MANUFACTURING COMPANIES AND COST VARIATION OF ANTIDIABETIC DRUGS IN UKRAINE

Ivko T[1], Tamara Germanyuk TG[2]
[1]*National Pirogov Memorial Medical University, Vinnitsya, Ukraine,* [2]*National Pirogov Memorial Medical University, Vinnytsya, Ukraine*

OBJECTIVES: Investigate correlation between the number of manufacturing companies and the percentage of cost variation of antidiabetic drugs in Ukraine. **METHODS:** 1) retrospective analysis of 1792 inpatient's medical histories with T2DM; 2) frequency analysis of the used treatment regimens; 3) ATC/DDD-methodology. **RESULTS:** The retrospective analysis showed that monotherapy was used in 25 % of cases. Of these, 16 were treated by metformin, 5 % – glimepiride, 4% – gliclazide. So, metformin, glimepiride and gliclazide have been selected for the research. Pharmaceutical assortment of peroral antidiabetic drugs, manufacturers, minimum and maximum costs of generics in pharmaceutical market of Ukraine have been established in price list of the largest national distributor. According to the ATC/DDD-methodology DDD of metformin is 2000 mg, gliclazide – 60 mg, glimepiride – 2 mg. The investigated period was 2011-2014. As a result of ATC/DDD-analysis it has been found that the cost of DDD of monotherapy with metformin ranges from 1,28 to 1,55 UAH (in minimum costs of generics) and 3,05-5,46 UAH (in maximum costs of generics), with glimepiride – 0,66-1,06 and 1,88-3,42, respectively, with gliclazide – 0,31-1,26 and 1,62-3,97 UAH, respectively. The number of manufacturing companies of metformin was 7-9, glimepiride – 8-9, gliclazide – 3-5. Spearman rank correlation of the investigated treatment regimens indicates the weak negative association between the number of manufacturing companies and the percentage of cost variation ($p>0.05$). **CONCLUSIONS:** Our results showed a weak negative association between the number of manufacturing companies and the percentage of cost variation of peroral hypoglycemic drugs that were selected for the investigation. Probably, it is associated with small number of manufacturers of antidiabetic drugs in the pharmaceutical market of Ukraine and, maybe, distortion of lows of the market and competition in condition of political and economic instability of the country.

PDB51

COST-EFFECTIVENESS OF GENETIC SCREENING FOR MATURITY ONSET DIEBETES OF THE YOUNG (MODY)

Carter HE[1], Hollingworth SA[2], Duncan EL[1], Brown MA[1], Davis E[3], Graves N[1], Johnson SR[4]
[1]*Queensland University of Technology, Kelvin Grove QLD, Australia,* [2]*The University of Queensland, Woolloongabba QLD, Australia,* [3]*Princess Margaret Hospital for Children, Subiaco WA, Australia,* [4]*Lady Cilento Children's Hospital, South Brisbane QLD, Australia*

OBJECTIVES: Maturity onset diabetes of the young (MODY) is a genetic form of diabetes for which 13 genes are known to be responsible. Many subtypes of MODY can be treated with oral medication instead of insulin injections, which results in improved metabolic control, quality of life and cost savings. Massively parallel sequencing (MPS) enables the simultaneous sequencing of all 13 genes for a fraction of the cost of traditional Sanger sequencing. We conducted a cost utility analysis of genetic screening (targeted MPS) for MODY in a paediatric population presumed to have type 1 diabetes (T1D), where the underlying prevalence of MODY has been calculated as 2.6%. **METHODS:** A Markov decision model was developed to estimate the incremental costs and quality-adjusted life years (QALYs) of genetic screening for MODY compared with standard care over 50 years' follow up. The probabilities and quality of life weightings (utility) of long term diabetic complications were estimated from published data and population

statistics. Costs were estimated from the perspective of the Australian health care system. **RESULTS:** Genetic screening for MODY at diabetes diagnosis was more effective and less costly than standard care, with 1.39 QALYs gained and AU$1.4 million (US$1.05 million) saved per 1,000 patients. The costs of the screening program were fully offset within four years. A sensitivity analysis revealed that genetic screening remained dominant until the MODY prevalence fell below 0.7%. **CONCLUSIONS:** Screening for MODY in the paediatric diabetes population would reduce health system costs and improve patient quality of life. Our results were robust to assumptions around the underlying MODY prevalence and make a compelling argument for routine genetic screening in all children with presumed T1D.

PDB52

COST-UTILITY OF DAPAGLIFLOZIN VERSUS DPP4 INHIBITORS IN PATIENTS WITH TYPE 2 DIABETES MELLITUS IN COLOMBIA

Ordoñez JE
Universidad del Rosario, Bogotá, D.C., Colombia

OBJECTIVES: To determine the cost-utility of dapagliflozin versus DPP4 inhibitors (DPP4i) (saxagliptin) as add on to metformin for the treatment of patients with type 2 diabetes mellitus (T2DM) who failed monotherapy. **METHODS:** A cost-effectiveness analysis was made by a discrete events model at the patient's level that simulates the incidence of the complications of the disease, and it considers a time horizon of 20 years. The model perspective is from the Colombian health system. The main outcomes are the quality-adjusted life years (QALY) and the economic results of the disease and it complications. Direct costs were updated to the year 2016 and a discount rate of 5 % was applied, both for costs and for health outcomes. The risks of developing complications were taken from the risk formulas of UKPDS68 and UKPDS66. **RESULTS:** Dapagliflozin is dominant over DPP4i in terms of QALY. The treatment with dapagliflozin generates fewer events of fatal nephropathy and amputation than DPP4i. The final stage of chronic kidney disease (CKD) and amputation generate -0.263 and -0.280, respectively, which is why dapagliflozin contributes 0.36 more discounted QALY per patient than DPP4i. Similarly, the high cost of hemodialysis in these patients means that the total treatment discounted costs with dapagliflozin are lower than those of the DPP4i strategy. In the willingness to pay curves, dapagliflozin has a probability of 71 % of being the choice strategy with any availability value to pay. **CONCLUSIONS:** From the perspective of the Colombian health system, dapagliflozin is a dominant strategy versus DPP4i in patients with T2DM who fail to control adequately with metformin monotherapy. Dapagliflozin has a great impact over CKD and QALYs.

PDB53

DAPAGLIFLOZIN VERSUS SULFONYLUREA IN PATIENTS WITH TYPE 2 DIABETES MELLITUS IN COLOMBIA: COST-EFFECTIVENESS ANALYSIS

Ordoñez JE
Universidad del Rosario, Bogotá, D.C., Colombia

OBJECTIVES: To determine the cost-effectiveness of dapagliflozin versus sulfonylureas for the treatment of patients with type 2 diabetes mellitus (T2DM) who have failed metformin monotherapy. **METHODS:** A cost-effectiveness analysis was made by a discrete events model at the patient's level that simulates the incidence of the complications of the disease, and it considers a time horizon of 20 years. The model perspective is from the Colombian health system. The main outcomes are the quality-adjusted life years (QALY) and the economic results of the disease and it complications. Direct costs were updated to the year 2016 and a discount rate of 5 % was applied, both for costs and for health outcomes. The risks of developing complications were taken from the risk formulas of UKPDS68 and UKPDS66. **RESULTS:** Dapagliflozin is not inferior than sulfonylureas in terms of health outcomes of HbA1c, cholesterol and HDL. Patients with dapagliflozin lost weight (-3.22 kg) and decreased more the systolic blood pressure (-4.3 mmHg); they also had fewer hypoglycemic events (3.5 %) than patients with sulfonylureas (40.8 %), with US $ 1,660 savings. Dapagliflozin generates more 0.41 discounted QALY than sulfonylureas and has an ICER of US $ 6,144 per patient. In the willingness to pay curves, dapagliflozin has a 65.5 % probability of being the choice strategy with a willingness to pay value of US $ 6,049, which is the value of a GDP per capita in Colombia. **CONCLUSIONS:** From the perspective of the Colombian health system, dapagliflozin is a cost-effective strategy versus sulfonylureas in patients with T2DM inadequately controlled with metformin monotherapy; dapagliflozin has a great impact over patient weight loss and a decreased systolic blood pressure, as well as fewer hypoglycemic events.

PDB54

COST-UTILITY OF EXENATIDE VERSUS INSULIN GLARGINE IN PATIENTS WITH TYPE 2 DIABETES MELLITUS IN COLOMBIA

Ordoñez JE
Universidad del Rosario, Bogotá, D.C., Colombia

OBJECTIVES: To determine the cost-effectiveness of exenatide versus insulin glargine as adjuncts to metformin for the treatment of patients with type 2 diabetes mellitus (T2DM) who have failed monotherapy. **METHODS:** A cost-effectiveness analysis was made by a discrete events model at the patient's level that simulates the incidence of the complications of the disease, and it considers a time horizon of 20 years. The model perspective is from the Colombian health system. The main outcomes are the quality-adjusted life years (QALY) and the economic results of the disease and its complications. Direct costs were updated to the year 2016 and a discount rate of 5 % was applied, both for costs and for health outcomes. The risk to develop complications were taken from the risk formulas of UKPDS68 and UKPDS66. **RESULTS:** Exenatide generates fewer events of congestive heart failure and deaths due to macrovascular events as well as a 4.5 kg weight loss and a decreased of 4 mmHg in systolic blood pressure versus insulin glargine. Exenatide contributes 1.24 more discounted QALY per patient compared to insulin glargine and has an ICER of US $ 3,953 per patient, which is lesser than one per capita GDP in Colombia (US $ 6,049). In the willingness to pay curves, exenatide has a 61 % probability of being the choice strategy with a willingness to pay of one GDP per capita in Colombia. **CONCLUSIONS:** From the perspective of the Colombian health system, exenatide is a highly cost-effective strategy versus insulin glargine in patients with T2DM who cannot be adequately controlled with metformin monotherapy, with a great impact over their weight loss and QALY.

PDB55

THE IMPACT OF GLP-1 INDUCED NAUSEA AND VOMITING ON WORK PRODUCTIVITY AND HEALTH-RELATED QUALITY OF LIFE IN PATIENTS WITH T2DM

McLeod L[1], Sikirica MV[2], Davenport E[1], Sweeney CT[1], Joshi AV[2]
[1]*RTI Health Solutions, Research Triangle Park, NC, USA,* [2]*GlaxoSmithKline, Collegeville, PA, USA*

OBJECTIVES: To assess the impact of GLP-1–induced nausea and vomiting on patients with T2DM using the 'Nausea and Vomiting Questionnaire' (NVQ) and additional questionnaires designed to gather information on health-related quality of life (HRQOL) and work productivity. **METHODS:** A non-interventional, cross-sectional survey, was administered to T2DM patients. Screened respondents provided demographics, self-reported clinical and treatment information, and nausea- and/or vomiting-related resource utilization. Inclusion required T2DM diagnosis, age 18+ years and GLP-1 agonist treatment (among other criteria). Question S14 ("In the past 7 days, have you had any nausea or vomiting after using your GLP-1 medicine?") designated eligibility for the impact survey. Enrolled participants also completed four patient-reported outcome (PRO) measures, including: NVQ, Functional Living Index–Emesis (FLIE), Work Productivity and Activity Impairment: Specific Health Problem (WPAI:SHP), and the MOS SF-12. Descriptive statistics were tabulated for all screener (eligible and ineligible responders) and survey questions (eligible only). **RESULTS:** Overall, 1,026 respondents completed screening, including 204 enrollees reporting nausea and/or vomiting in the past 7 days. Eligible patients were 66% male, white (84%), non-Hispanic (75%), average (SD) age 41(11) years, with a diagnosis of T2DM between 3 and 9 years ago (53%) and 90% were first time GLP-1 users. Respondents (>60%) reported that nausea and/or vomiting (at its worst) impacted their relationships, work productivity, eating, sleeping, and amount of energy spent during the past 7 days. Respondents indicated using prescription (32%) and over-the-counter medications (26%) to treat nausea/vomiting. The questionnaire scores were: NVQ mean (SD) score = 52.3 (22.5), WPAI absenteeism/presenteeism/productivity loss = 22.8 (25.2) / 56.0 (27.6) / 62.2 (29.9), and SF-12 Mental / Physical = 42.7 (8.3)/ 44.6 (7.2) for the overall group. **CONCLUSIONS:** This survey study shows that although there was a significant impact of nausea and vomiting on work productivity, the impact on HRQoL was relatively modest.

DIABETES/ENDOCRINE DISORDERS – Patient-Reported Outcomes & Patient Preference Studies

UNIVERSAL MEDICATION SCHEDULE PRESCRIBING IMPROVES ADHERENCE TO DIABETES MEDICATIONS AMONG PATIENTS WHO ARE AT RISK FOR NON-ADHERENCE

Jiang J[1], Taitel MS[1], Patel D[2], Smith-Ray R[1], Wolf M[2]
[1]*Walgreen Co., Deerfield, IL, USA,* [2]*Northwestern University Feinberg School of Medicine, Chicago, IL, USA*

OBJECTIVES: The Universal Medication Schedule (UMS) standardizes prescriptions by explicitly stating when to take the medicine (i.e., morning, noon, evening, bedtime). We estimated the impact of UMS prescribing on medication adherence among patients initiating oral diabetes medication. **METHODS:** This retrospective cohort study included adults with an initial fill of an oral diabetes medication at Walgreens pharmacy between January- June 2014. Adherence was measured using Proportion of Days Covered (PDC) over 12-months. Optimal adherence (OA) was determined by PDC $\geq$ 80%. Patients received a proxy designation of low education when >= 10% of their census tract reported <9th grade education; all others were designated as standard education. Generalized estimating equations (GEEs) were used to compare whether UMS prescriptions were associated with better adherence compared to non-UMS prescriptions. Analyses were conducted for the overall sample and subgroups of patients age 65+, multi-daily dosing, and by designated education groups. **RESULTS:** The study cohort included 484,758 patients with 559,293 medications. Patients with low education (N=119,091) were prescribed 139,979 medications; among them, 74,263 required multi-daily dosing and 22,667 were age 65+. Patients designated as standard education (N=365,667) were prescribed 419,314 medications; among them, 201,336 required multi-daily dosing, and 75,024 were age 65+. GEE models showed that low education patients who received UMS prescriptions were significantly more likely to have OA compared to low education patients who received non-UMS prescriptions (RR 1.04, 95% CI 1.02-1.07, p=0.001). The effect was largest for patients over 65 contending with multi-daily regimens (RR 1.14, 95% CI 1.07-1.21, p<0.001). Patients designated as standard education were more likely to achieve OA following UMS prescriptions (RR 1.02, 95% CI 1.01-1.03, p=0.001), but there were no significant differences among subgroups. **CONCLUSIONS:** This study demonstrated that UMS prescribing is significantly associated with higher adherence to oral diabetic medications for older adults with low education who received a multi-daily regimen.

PDB57
A QUALITATIVE STUDY OF BASAL INSULIN USE BEHAVIORS IN PATIENTS WITH TYPE 2 DIABETES
Kern DM[1], Stephenson JJ[1], Freeman EC[2], Raval A[1], Bae J[2]
[1]HealthCore Inc., Wilmington, DE, USA, [2]Eli Lilly and Company, Indianapolis, IN, USA
OBJECTIVES: To better understand type 2 diabetes (T2D) patients' experiences with using basal insulin. **METHODS:** This was a qualitative focus group study among patients with T2D who were current basal insulin users. The HealthCore Integrated Research Database was used to identify currently-active, commercially-insured, survey-eligible patients based on claims from 1/1/2015-12/31/2015. Patients with Cincinnati and NYC zip codes were invited to participate in 90-minute focus groups conducted by an experienced moderator. Two focus groups (six individuals each) were conducted in Cincinnati and two in NYC. The focus group proceedings were audio and video recorded and transcribed. Patients' insights regarding basal insulin administration, prescription fill patterns, and overall basal insulin use experiences were grouped into common themes to provide a deeper understanding of the issues surrounding the use of basal insulin. **RESULTS:** Of 24 participants, 58% were female, mean age 52.1 years, and mean time since T2D diagnosis 11.9 years. The majority of participants reported that their insulin prescription fills contained more drug than needed and reported having 'left over' insulin at the end of their refill period. Nearly everyone reported using the entire amount of insulin in each vial/pen before opening a new one. This led to stockpiling of insulin over time if filled regularly; skipping a refill occasionally if they had enough supply from prior fills to cover the month; or delaying their refill until all medication was used. Missing a dose was considered a rare occurrence and was mainly due to a change in routine or environment. Adjusting their insulin dose within ±5 units was common and typically done in response to a blood sugar reading, healthy/poor eating, exercising, or a general feeling of well-being. **CONCLUSIONS:** Insulin filling behaviors are complex and depend on multiple factors. Inconsistent filling patterns may not be a true reflection of their adherence to insulin therapy.

PDB58
A MOTIVATIONAL INTERVIEWING (MI) INTERVENTION BY PHARMACY STUDENTS TO PREVENT MEDICATION DISCONTINUATION
Abughosh SM[1], Wang X[1], Serna O[2], Esse T[2], Mann A[2], Essien EJ[1], Fleming ML[1]
[1]University of Houston, Houston, TX, USA, [2]Cigna HealthSpring, Houston, TX, USA
OBJECTIVES: To evaluate the influence of an MI telephonic intervention by pharmacy students on discontinuation of angiotension-converting enzyme inhibitors (ACEIs)/angiotensin receptor blockers (ARBs) among Medicare Advantage Plan (MAP) patients with diabetes mellitus (DM) hypertension (HTN). **METHODS:** A randomized trial was conducted among patients with DM and HTN enrolled in a Texas MAP. Patients who filled an ACEI/ARBs during June, 2014 and had a 6-month proportion of days covered (PDC) <0.80 in the previous 6-months were determined non-adherent (n=5,851) and randomized to intervention or control groups. The intervention was a phone call by pharmacy students on rotation at the MAP followed by 5 monthly follow-up calls. Prior to implementing calls, 11 participating students attended a 3-day MI training. Patients receiving calls were randomly selected from those randomized to intervention until 250 was reached; 500 controls were randomly selected from controls. Refill data during the 6 months following initial call were evaluated to examine discontinuation defined as no record of a ACEIs/ARBs. A multivariate logistic regression model with an outcome of discontinuation vs. not was constructed to control for imbalances in baseline characteristics including age, gender, number of other medication, regimen complexity, low income subsidy (LIS) status, prescriber specialty, comorbidities, 6-month prior hospitalization, baseline 6-month PDC, and Centers for Medicare and Medicaid Services risk score. **RESULTS:** 743 patients were included in the multivariate model. Patients completing ≥ 3 calls were less likely to discontinue (OR: 0.29; 95% CI: 0.15-0.54; p<0.001) and patients with higher baseline PDC were less likely to discontinue (OR: 0.34; 95% CI: 0.22-0.52; p<0.001). Heart failure patients were more likely to discontinue (ORs: 2.31; 95% CI: 1.34-3.98; p=0.002). **CONCLUSIONS:** The MI telephone intervention was beneficial in decreasing discontinuation 6-months following initial call. Future research should examine the sustainability of intervention effect for longer periods and its influence on clinical outcomes.

PDB59
EVALUATION OF EXERCISE COMPLIANCE AND ITS CONFOUNDING FACTORS AMONG DIABETES PATIENTS IN SOUTHERN PUNJAB, PAKISTAN
Gillani AH[1], Mohamed Ibrahim MI[2], Aziz MM[1], Wajid M[1], Fang Y[1]
[1]Xi'an Jiaotong University, Xi'an, Shaanxi, P. R. China, Xi'an, China, [2]Qatar University, Doha, Qatar
OBJECTIVES: Non pharmacological treatment play a pivotal role in the diabetes care and management thus the aim of this study was to evaluate the exercise compliance and its confounding factors among diabetes patients in southern Punjab, Pakistan. **METHODS:** A cross-sectional, descriptive study was conducted from December 2015 to March 2016. Systemic random sampling technique was used to select the diabetic patients from three government hospitals and three private clinics. At least half hour rigorous walk/day, 5 days a week was set as minimum criteria for exercise compliance. Data was summarized by descriptive statistics. Bivariate and multivariable analysis was done to assess the factors independently associated with exercise compliance. Variables with P≤0.25 in bivariate analysis were used in multivariable logistic regression. Complete analysis was done on SPSS for Windows, Version 16.0 (SPSS, Chicago, IL, USA) **RESULTS:** A total of 299 patients participated in the study. Mean age± SD of the respondent's was 48.8±14.6 years and mean duration ± SD of disease was 9.08±6.9 years. Out of 299, 169 (56.5%) were males, 270 (90.3%) were married and 124 (41.5%) were under primary level of education. Family history of 204 (68.2%) patients was positive for diabetes. Out of total, 176 (58.8%) fulfilled the criteria for the compliance. Age (AOR=0.971 95% CI=0.951, 0.991 p=0.006), duration of disease more than 15 (AOR=3.418, 95% CI=1.252, 9.329 p=0.016) and believe that exercise will lead to weight loss (AOR=4.978, 95% CI=2.725, 9.093 p=0.00) were significantly associated with exercise compliance. Insignificant positive linear correlation was seen between exercise compliance and blood glucose level (r=0.11 p=0.057) **CONCLUSIONS:** Young age, more duration of disease and believe that exercise will lead to weight loss are deriving factors for the exercise compliance. Hence educating the patients on health benefits of exercise will improve compliance.

PDB60
THE ASSOCIATION BETWEEN PATIENT-PHYSICIAN COMMUNICATION AND COST-RELATED MEDICATION NON-ADHERENCE AMONG DIABETIC U.S. MEDICARE BENEFICIARIES
Zhang J, Meltzer D
The University of Chicago, Chicago, IL, USA
OBJECTIVES: Twenty-six percent of the elderly did not take medications as prescribed due to a cost barrier. Patient-physician communication plays a critical role in managing patients with chronic conditions. There is tremendous potential to reduce cost-related medication non-adherence (CRN) by improving patient-physician communication. We aimed to evaluate the association between patient-physician communication and CRN in several relationship domains. **METHODS:** The 2012 Medicare Current Beneficiaries Survey (MCBS) was utilized, including patients who self-reported having diabetes. Those who did not have a regular healthcare provider or a clinic to go to when sick or in need of health advice were excluded. Six questions in patient-physician communications were extracted. We developed six multivariate logistic regression models with each of these communication domain questions as independent variables, CRN (yes/no if delayed in filling prescription, did not refill prescription, skipped doses, or split medications due to cost) as the dependent variable, adjusted for patient's age, gender, race, ethnicity, Medicare-Medicaid dual eligibility, and comorbid conditions. **RESULTS:** Among the 2,316 Medicare patients with diabetes, 464 (20%) reported CRN. Controlling for other covariates, patients with doctors who seemed to be in a hurry were 88% (p<0.01) more likely to report CRN; patients with doctors who did not explain medical problems were 54% (p=0.01) more likely, while patients who had health problems that should be discussed but were not were 52% (p<0.01) more likely. Patients with doctors who often acted as though she/she was doing the patient a favor by talking to the patient were 82% (p<0.01) more likely to report CRN; patients with doctors they did not have confidence in were 98% (p<0.01) more likely; and patients with doctors whom they could not depend on to feel better physically and emotionally were 38% (p=0.02) more likely to report CRN. **CONCLUSIONS:** Poor patient-physician communication is a strong risk factor for CRN.

PDB61
USING MODIFIABLE BEHAVIORAL CHARACTERISTICS TO IDENTIFY HOMOGENOUS GROUPS OF NON-ADHERENT DIABETIC PATIENTS: A CLUSTER ANALYSIS APPROACH
Mhatre SK[1], Sawant RV[1], Sansgiry SS[2]
[1]University of Houston, Houston, TX, USA, [2]College of Pharmacy, University of Houston, Houston, TX, USA
OBJECTIVES: To classify non-adherent diabetic patients into homogenous clusters of similar modifiable behavioral characteristics among beneficiaries enrolled in Medicare Advantage Prescription Drug Plan (MA-PD) in southeastern Texas. **METHODS:** Pharmacy claims from year 2014 were used to identify patients using oral anti-diabetics [OADs]. Non-adherence was measured as proportion of days covered [PDC] score <0.8 for all OADs together. A survey questionnaire to measure adherence related modifiable behavioral characteristics was developed using several validated instruments including Belief in Medicine questionnaire, Satisfaction with OAD Agents Scale, and Morisky 8-itme Medication Adherence Scale. Items from the questionnaire were then reduced to five constructs (used as variables) based on prior literature: perceived necessity, perceived concerns, satisfaction, intentional non-adherence and unintentional non-adherence. The surveys were introduced via telephone to previously identified non-adherent patients in the beginning of 2015. Construct reliability was assessed using cronbach's alpha. A two-step cluster analysis was then performed to group the patients into homogenous clusters. Analysis were conducted using SAS and SPSS statistical software. **RESULTS:** A total of 160 responses were obtained. Based on construct reliability estimates, four variables (perceived necessity, perceived concerns, satisfaction, and unintentional non-adherence) were used for cluster analysis. A 5-cluster model with lowest BIC, 'good' cluster quality and cluster average silhouette (cohesion and separation) of around 0.8 was obtained. The most important variables for cluster determination was perceived concerns followed by unintentional non-adherence and satisfaction; perceived necessity was the least important variable. Based on the results, the clusters were labelled as follows: cluster 1, concerned non-adherents; cluster 2, unsatisfied non-adherents with low perceived necessity; cluster 3, forgetful non-adherents with low satisfaction; cluster 4, forgetful non-adherents; and cluster 5, mysterious non-adherents. **CONCLUSIONS:** Based on the behavioral characteristics of patients in the five distinct identified clusters, managed care organizations can design targeted interventions to address the problem of non-adherence.

PDB62
PREDICTORS OF MEDICATION ADHERENCE AMONG PATIENTS WITH TYPE II DIABETES MELLITUS IN PAKISTAN – A PILOT STUDY
Iqbal Q[1], Bashir S[2], Godman BB[3]
[1]University of Balochistan, Quetta, Pakistan, [2]University of Sargodha, Sargodha, Pakistan, [3]Strathclyde Institute of Pharmacy and Biomedical Sciences, University of Strathclyde, Glasgow, UK
OBJECTIVES: This study aims to assess the predictors of medication adherence in Type II Diabetes Mellitus (T2DM) patients of Quetta city, Pakistan. **METHODS:** The

study was designed as a questionnaire based, cross sectional analysis. Three hundred T2DM patients attending public and private hospitals were targeted for data collection. In addition to demographic and disease related information, Drug Attitude Inventory and Michigan Diabetes Knowledge Test were used to assess medication adherence and diabetes related knowledge respectively. Treatment satisfaction was assessed by patient's experience towards health care professionals and available facilities. Descriptive statistics were used to elaborate patients' demographic and disease related characteristics. Binary logistic regression was used to predict factors independently associated with medication adherence. SPSS v. 20 was used for data analysis and $p < 0.05$ was taken as significant. **RESULTS:** Patients in the current study reported moderate adherence with mean score of 4.94 ± 2.72. Age, gender, education, diabetes-related knowledge and treatment satisfaction were significantly associated ($p<0.05$) with medication adherence. The created model showed a significant goodness of fit as the Omnibus Test of Model Coefficient was highly significant (Chi square =11.342, $p = 0.001$, $df = 4$). Knowledge score had significant association (adjusted OR= 2.232, 95 % CI = 1.345 – 1.766, $P < 0.001$) with medication adherence. An increase in knowledge score of one point was associated with an increase in being good adherence to a factor of 2.232 provided controlling other confounding variables. **CONCLUSIONS:** The study presents a model that is associated with medication adherence of patient with T2DM, where disease-related knowledge shaped as a predictor. The healthcare practitioners and system should formalize and acknowledge patient education as key component of therapeutic plans.

PDB63

ESTIMATING A MINIMALLY IMPORTANT DIFFERENCE OF THE EQ-5D-5L INDEX SCORE IN ADULTS WITH TYPE 2 DIABETES

McClure NS, Al Sayah F, Ohinmaa A, Johnson JA
School of Public Health, University of Alberta, Edmonton, AB, Canada

OBJECTIVES: To estimate the minimally important difference (MID) of the EQ-5D-5L index score in a population-based sample of adults with type 2 diabetes, and examine whether this estimate varies by the baseline index score and direction of change in health status. **METHODS:** Data were from baseline and one-year follow-up of an ongoing cohort of adults with type 2 diabetes in Alberta, Canada. The MID was estimated first by the instrument-defined approach, which used the difference between the baseline EQ-5D-5L index scores and the index scores of simulated single-level transitions. Then, by the anchor-based approach, which categorized one-year changes in depressive symptoms (Patient Health Questionnaire 8 items, "PHQ8"), diabetes-related distress (Problem Areas in Diabetes 5 items, "PAID5") as well as physical and mental health functioning (SF-12 physical and mental health composite scores, "PCS, MCS") into: no change (<½ standard deviation (SD)), small change (≥½ and ≤1 SD), and large change (>1 SD). The MID estimates were calculated for all change, by the direction of change (improvement versus deterioration), and for defined patient subgroups. **RESULTS:** Average age of participants (N=1927) was 64.5 years (SD 10.8) with 45% female. Participants had diabetes for 12.6 (10.0) years, and reported 4.2 (2.3) comorbidities. Based on the instrument-defined approach, the MID estimate was 0.043 for all change, and 0.040 and 0.045 for improvement and deterioration respectively. Using small change in anchors, the change in EQ-5D-5L was 0.042 for all change, while improving or deteriorating change scores yielded MID estimates of 0.034 and 0.049 respectively. MID estimates were consistent across subgroups; however, there is evidence of higher MID estimates for lower baseline index scores. **CONCLUSIONS:** The MID estimates of the EQ-5D-5L index score in adults with type 2 diabetes ranged between 0.03 and 0.05. These estimates were consistent across subgroups, but varied by baseline index score and the direction of change.

PDB64

HEALTH-RELATED QUALITY OF LIFE IN CHINESE WOMEN WITH GESTATIONAL DIABETES

Ming W, Chen H, Wu Y, Liu Y, Chen H, Ding W, Wu H, Meng T, Shen Y, Wang Z, Huang X, Wang Z
The First Affiliated Hospital of Sun Yat-sen University, Guangzhou, China

OBJECTIVES: The incidence of gestational diabetes (GDM) is increasing in China. Understanding the changes in the health-related quality of life (HRQOL) during pregnancy is essential to assess the efficacy of the initial GDM treatment strategy. We aimed to investigate the HRQOL in women with gestational diabetes in China and to examine which patient characteristics are associated with quality of life. **METHODS:** A cross-sectional study was conducted in a university hospital, one of the largest public healthcare provider in South China. A sample of 233 EQ-5D-5L and medical records of women at their antenatal clinic visit during August 2016 to December 2016 were recorded. Outcome measures included HRQOL and pregnancy-related complications. **RESULTS:** We collected 233 women data (Age 32.8±5.55, gestational age 34.17±5.15 weeks). Of the 233 inpatient cases, 25 were diagnosed with GDM (10.7%). Mean HRQOL was 0.87±0.12 in the GDM group with initial treatment and 0.83±0.14 in the non-GDM group (P=0.16). Multipara was significantly associated with high (≥75th percentile) HRQOL (OR 2.06; 95% CI 1.20-3.54). Mean HRQOL was 0.86±0.14 for multipara and 0.81±0.13 for primipara ($P<0.01$). In reverse, multiple births with a lower HRQOL 0.78±0.10 ($P<0.01$). **CONCLUSIONS:** The mean HRQOL was higher in the GDM group that had undergone initial treatment than in the non-GDM group, which means the efficacy of the initial GDM treatment was high and the HRQOL outcomes even better those of the healthy pregnancy group. The lifestyle modification and diet advice could be potentially useful for pregnant women. However, we should conduct a multi-center study with a larger sample size to support the findings. Multipara was associated with a high HRQOL whereas primipara and multiple births were related to a relatively lower HRQOL in Chinese women during pregnancy.

PDB65

USING LATENT CLASS ANALYSIS TO ANALYZE HETEROGENEITY IN BARRIERS AND FACILITATORS FOR DIABETES SELF-MANAGEMENT AMONG PATIENTS WITH TYPE II DIABETES

Zhou M, Bandeen-Roche K, Bridges JF
Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, USA

OBJECTIVES: The aim of this study is to analyze heterogeneity in barriers and facilitators for diabetes self-management among patients with type II diabetes. **METHODS:** A nationally representative survey was conducted among patients with type II diabetes in the US. 11 factors were selected through robust mixed-methods and represented both known barriers and facilitators of patients' diabetes management. Respondents were asked to evaluate the impact of each factor on their diabetes self-management on a five-point LIkert scale ranging from "strong negative" to "strong positive". We examined the overall rating distribution for each factor and analyzed heterogeneity using latent class analysis (LCA). Sociodemographics, health status, and personality variables were included in the model to identify class characteristics. **RESULTS:** 549 respondents completed the survey. Four classes were found in LCA. Factors were most likely to be rated as "positive" among respondents in class 1 (46.4% of sample). Class 2 (24.0%) had higher probabilities to rate all factors negatively than other groups. Class 3 (18.6%) rated most factors "strong positive", and class 4 (11.1%) rated almost all factors "no impact". Patients who were older, Asian, had bachelor degree, and had hemoglobin A1c below 7% were more likely to be in class 1 ($p<0.05$). Patients who were younger, non-Asian, disabled, had fair or poor health, had hemoglobin A1c above 7%, reported not being optimistic about future, or had not been actively improving health were more likely to be in class 2 ($p<0.05$). Asians and those who did not actively improve health were also likely to be in class 3 ($p<0.05$). Patients who were Asian, had low income, stated being optimistic about future, or reported not having self-control were likely to be in class 4 ($p<0.05$). **CONCLUSIONS:** Responses to Likert scale questions are confounded by individual heuristics and personalities. Respondents tend to use part of the scale regardless of questions.

PDB66

PATIENT PERSPECTIVE ON THE IMPACT OF INSULIN RESUSPENSION ON DIABETES MANAGEMENT AND HEALTH-RELATED QUALITY OF LIFE

Bain SC[1], Brod M[2], Basse A[3], Hansen BB[3], Mithal A[4]
[1]*Institute of Life Sciences, Swansea University, Swansea, UK,* [2]*The Brod Group, Mill Valley, CA, USA,* [3]*Novo Nordisk A/S, Søborg, Denmark,* [4]*Medanta, The Medicity, New Delhi, India*

OBJECTIVES: When required, adequate resuspension of insulins is important for safe and efficacious insulin administration. No published evidence of the patient perspective on insulin resuspension (IR) exists. The objectives of this study were to investigate type 2 diabetes (T2D) patients' perspectives on IR and its impact on diabetes management and health-related quality of life (HRQoL). **METHODS:** Nine semi-structured focus groups were held in the US, Mexico, Netherlands, and Turkey. Respondents were eligible if aged ≥ 18 years, had T2D, currently using modern premixed insulin for at least three months, and not taking any other injections to treat any disease, including diabetes. Transcripts were analyzed utilizing adapted grounded theory qualitative research methods. The videos of respondents' demonstrations of IR technique were reviewed and compared with the manufacturer's instructions. **RESULTS:** Sixty-four respondents participated in the focus groups. Eighty-nine percent (n=51/57) reported learning about IR from a healthcare provider with 55% (n=18/33) receiving clear instructions. Fifty-four percent (n=21/39) reported resuspending exactly as taught. Despite respondents receiving IR education and believing that they are resuspending as they should, 2% of respondents (n=1/63) demonstrated IR per the manufacturer's instructions. Twenty-six percent (n=10/38) reported being worried about the negative consequences of not resuspending insulin. Forty-two percent (n=10/24) reported being concerned about whether the insulin would be effective after missing or skipping IR. Sixty-seven percent reported believing that IR has no impact on their diabetes (n=10/15). Twenty-seven percent (n=4/15) reported experiencing negative consequences (e.g., jitteriness) due to inadequate IR. **CONCLUSIONS:** Most respondents did not resuspend per manufacturers' guidance and are unaware of their inadequate technique, which may explain the minimal impacts reported on HRQoL and diabetes management. Standard education may not be sufficient to ensure adequate IR. Thus, additional resources from healthcare professionals are required for education at treatment initiation and additional monitoring during follow-up visits.

PDB67

ASSOCIATION BETWEEN WEIGHT LOSS AND PRO AND QOL MEASURES IN PATIENTS WITH TYPE 2 DIABETES MELLITUS – A SYSTEMATIC LITERATURE REVIEW

Spoorendonk JA[1], GAO C[2], Ploug UJ[3], Alleman CJ[1]
[1]*Pharmerit International, Rotterdam, The Netherlands,* [2]*Novo Nordisk (China) Pharmaceuticals Co., Beijing, China,* [3]*Novo Nordisk A/S, Søborg, Denmark*

OBJECTIVES: In most patients with type 2 diabetes mellitus (T2DM), therapy starts with adjusting lifestyle and weight control. Evidence showed that newer anti-diabetic therapy, such as incretin peptides (e.g. GLP-1 RAs), can regulate body weight. This study examined the evidence on the impact of weight loss in people with T2DM and its consequences on endpoints measured by Patient-Reported Outcomes (PROs), such as health-related quality-of-life (HRQOL). **METHODS:** A systematic literature review was carried out with two independent reviewers to collect clinical trial and real-world evidence regarding the effects of weight loss on PRO results. Data sources included Embase, Medline and Cochrane without time limitation. Additionally, conference proceedings were searched (2013-2015). **RESULTS:** The review identified 20 relevant RCTs and observational studies reporting 23 associations between weight loss and PROs. These studies described associations/correlations via Spearman or Pearson regression coefficients, logistic

regression analysis or odds ratio. Twenty-one associations described a positive correlation (implying a beneficial effect of weight loss on PRO results), on two occasions no relationship was found. Most commonly reported PRO measure was the Impact of Weight on Quality of Life(-Lite) (IWQOL) with scales in physical function, self-esteem, sexual life, public distress, and work. All 7 studies showed a positive association between weight loss and IWQOL scores. For the Medical Outcomes Survey, Short Form 36 (SF-36); 5 of the 7 studies observed a beneficial association between weight loss and HRQOL. Additionally, positive associations were found between weight loss and PROs for depression (2 studies), health satisfaction (2), treatment satisfaction (1), activities of daily living or well-being (2) and diabetes specific questionnaires (2). **CONCLUSIONS:** Almost all studies observed a positive (i.e. beneficial) correlation between weight loss and PRO results in patients with T2DM. Overall, identified studies suggest that weight loss has a beneficial effect on HRQOL, depression, health satisfaction, and treatment satisfaction.

PDB68

PSYCHOMETRIC EVALUATION OF THE NV QUESTIONNAIRE IN PATIENTS WITH T2DM RECEIVING A GLP-1 AGONIST

McLeod L[1], Sikirica MV[2], Qin S[1], Joshi AV[2], Sweeney CT[1], Blum SI[2]
[1]*RTI Health Solutions, Research Triangle Park, NC, USA,* [2]*GlaxoSmithKline, Collegeville, PA, USA*

OBJECTIVES: To assess and provide an initial psychometric evaluation of the Nausea and Vomiting Questionnaire (NVQ) in patients with type 2 diabetes mellitus (T2DM) receiving a glucagon-like peptide-1 agonist (GLP-1) therapy. **METHODS:** Data were collected from a non-interventional, cross-sectional study via a web-based survey administered to patients self-reporting a diagnosis of T2DM, who experienced nausea and/or vomiting after initiating treatment with a GLP-1 (within prior 6 months). In addition to the NVQ, subjects also completed the Functional Living Index-Emesis (FLIE), Work Productivity and Activity Impairment (WPAI:SHP) and MOS SF-12 instruments to assess convergent validity. Analyses included descriptive statistics, classical test theory psychometric analyses and exploratory factor analysis. **RESULTS:** A total of 204 subjects [mean age (SD): 41.3 (11.0), 65.7% male; 84.3% white] met eligibility criteria, for which 200 completed the survey and were included in the pre-specified analyses. Of the eligible subjects: 111 (54.4%) experienced nausea alone, and 83 (40.7%) experience both nausea and vomiting. Most subjects (86.8%) had used a GLP-1 for 3 months or less. Response distribution frequencies demonstrated endorsement of all response categories and no evidence of meaningful floor/ceiling effects. All inter-item Spearman correlation coefficients were between r=0.30-0.76. EFA results based on evaluation of the scree plot, factor loadings, and inter-factor correlations, recommended the use of one-factor solution, with all items' loadings $\geq$0.75, supporting a unidimensional total impact score. Internal consistency reliability (Cronbach's alpha) for the total impact score was α=0.96. Results from construct and known-groups validity were supportive of the pre-specified hypotheses, with most correlations moderate to strong. **CONCLUSIONS:** The results from these preliminary psychometric analyses support the use of the NVQ as a reliable and valid measure to assess the impact of nausea and vomiting among T2DM patients who have initiated GLP-1 agonist treatment. Further evaluation in a longitudinal study is needed to assess responsiveness.

PDB69

A SYSTEMATIC REVIEW OF TREATMENT SATISFACTION MEASURES: THE CASE OF TYPE 2 DIABETES TREATED WITH ORAL THERAPY

Wang Y[1], Franic DM[2]
[1]*The University of Georgia, Athens, GA, USA,* [2]*University of Georgia, Athens, GA, USA*

OBJECTIVES: There has been increased interest in assessing patient satisfaction with consumers taking a more active role in the healthcare, its association with adherence, and its measurement is recommended by National Committee for Quality Assurance (NCQA). The aim of this study was to compare and contrast the psychometric properties of self-reported satisfaction measures designed for patients with type 2 diabetes treated with oral therapy. **METHODS:** Comprehensive literature review was conducted to identify self-reported instruments in English, published in peer-reviewed journals. Psychometric properties evaluated included: conceptual model, practicality ($\leq$15minutes to complete), breadth, depth (floor and ceiling effects $\leq$15%), reliability (internal consistency and test-test reliability $\leq$ .70), construct validity (convergent and divergent), and responsiveness. **RESULTS:** Six instruments were identified for evaluation: Diabetes Medication Satisfaction Measure (Diab-MedSat), Diabetes Medication System Rating Questionnaire (DMSRQ), Diabetes Medication System Rating Questionnaire-Short Form (DMSRQ-SF), Diabetes Treatment Satisfaction Questionnaire status version (DTSQs), Diabetes Tablet Treatment Questionnaire (DTTQ), and Perceptions About Medications for Diabetes (PAM-D). The most widely used instrument is DTSQ. All instruments except for DTTQ met conceptual model criterion, and all met the practicality criterion. Diab-MedSat, DMSRQ and DMSRQ-SF encompassed the broadest aspects of satisfaction (impact on quality of life and satisfaction with efficacy, side effects, convenience, and overall). Four of six instruments met study criterion for construct validity: Diab-MedSat, DTSQs, DMSRQ and DMSRQ-SF; with three meeting reliability criterion for group level decision making, including DMSRQ, DMSRQ-SF and PAM-D. All instruments except DTTQ met the criterion of responsiveness. **CONCLUSIONS:** Overall, no instruments showed ideal psychometric properties with DMSRQ and DMSRQ-SF fairing best, meeting almost all study criteria, followed by Diab-MedSat. In most cases, scales failing study criteria did so due to missing data. Instruments varied considerably in domains covered (breadth) and use in mixed diabetes populations (oral medication and insulin); therefore consideration of study objective is also critical in scale selection.

PDB70

PRESCRIPTION TREND FOR THE TREATMENT OF DIABETES MELLITUS AND ASSOCIATION WITH THE HEALTH RELATED QUALITY OF LIFE

Shah A
Rutgers University, New Brunswick, NJ, USA

OBJECTIVES: Treatment adherence is known to be associated with the health related quality of life (HRQoL). However, little is known about the association of HRQOL and the treatment type for Type 2 Diabetes Mellitus (T2DM). So, the objectives of this study were: 1. to determine the trend in prescriptions and non pharmacological treatments for T2DM and, 2. to examine the association of HRQoL with the treatment type. **METHODS:** Cross sectional data for the years 2010 to 2014 from the Medical Expenditure Panel Survey (MEPS) were used. The study population consisted of individuals (age $\geq$ 12 years) with self reported non gestational T2DM (n = 9210). Non pharmacological treatment was defined as the lifestyle modification: diet changes and/or physical activity. Weighted proportion of T2DM patients prescribed particular class of medicines was calculated. Multinomial logistic regression was performed to determine the association between HRQoL and type of treatment, controlling for the disease severity, comorbidities, age, sex, race/ethnicity, employment status, insurance plan, physician specialty, socio economic status and survey year. **RESULTS:** The use of metformin and sulfonylureas decreased over the time, 38.1% and 20.3% to 33.7% and 16.3% respectively. Thiazolidinedione usage increased (8.4% - 11.2%). Insulin usage was found to be constant over the time. Overall usage of pharmacologic treatment found increased (51.2% - 70.1%) and non pharmacological treatment usage found to be decreased (31.5% - 26.9%). The odds of good QoL is 11% higher for the Sodium-glucose co transporter 2 inhibitors compared to metformin, (OR: 1.11, 95% CI = 1.07 - 1.22), and 23% higher when non pharmacologic treatment administered simultaneously with pharmacological treatment, after controlling for the mentioned covariates. **CONCLUSIONS:** This study provides current trend in the prescription pharmacologic and non pharmacologic treatments for T2DM. The decreased usage of non pharmacological treatment forms suggests need for promoting its usage in the diabetic population.

PROFILE AND PREDICTORS OF HEALTH RELATED QUALITY OF LIFE AMONG TYPE II DIABETES MELLITUS PATIENTS IN QUETTA CITY, PAKISTAN

Iqbal Q[1], Bashir S[2]
[1]*University of Balochistan, Quetta, Pakistan,* [2]*University of Sargodha, Sargodha, Pakistan*

OBJECTIVES: This study aims to assess the profile and predictors of Health-Related Quality of Life (HRQoL) in Type II Diabetes Mellitus (T2DM) patients of Quetta, Pakistan. **METHODS:** The study was designed as a questionnaire based, cross sectional analysis. 300 Type II diabetic patients attending public and private hospitals were targeted for data collection. In addition to demographic and disease related information, Euroqol Quality of Life was used to measure HRQoL. Moreover, Drug Attitude Inventory and Michigan Diabetes Knowledge Test were used to assess medication adherence and diabetes related knowledge respectively. Treatment satisfaction was assessed by patient's experience towards health care professionals and available facilities. Descriptive statistics were used to elaborate patients' demographic and disease related characteristics. Binary logistic regression was used to predict factors independently associated with HRQoL. SPSS v. 20 was used for data analysis and $p < 0.05$ was taken as significant. **RESULTS:** Patients in the current study reported poor HRQoL with mean score of 0.48 $\pm$ 0.36. Age, duration of disease, number of prescribed drugs, medication adherence and treatment satisfaction were significantly associated ($p<0.05$) with HRQoL in the cross tabulation analysis. The significant variables were entered into the model that showed significant goodness of fit with highly significant Omnibus Test of Model Coefficient (Chi-square =12.983, p = 0.030, df = 4). Medication adherence was reported as a significant predictor of HRQoL with an increase of one adherence score was associated with improvement of HRQoL by a factor of 1.75 provided other variables remain constant. **CONCLUSIONS:** The study presents a model that is associated with HRQoL of patient with T2DM, where medication adherence shaped as a predictor of HRQoL. Healthcare professionals should pay special attention on patients' medication taking behaviour and should put their efforts in explaining the benefits of the medication adherence to the patients

PDB72

ASSESSMENT OF HEALTH RELATED QUALITY OF LIFE (HRQOL) USING EQ-5D IN DIABETICS, PRE-DIABETICS AND GENERAL POPULATION IN CHINA

Feng S[1], Long E[2], Hu M[1], Zhou N[1], Yang N[1]
[1]*Sichuan University, Chengdu, China,* [2]*Sichuan Provincial People' s Hospital, Chengdu, China*

OBJECTIVES: to assess and compare the health related quality of life (HRQoL) among diabetics, pre-diabetics and general population in China **METHODS:** Questionnaire was designed and pre-tested which included 2 parts: Sociodemographic information and EQ-5D-5L with VAS. Face-to-face survey was conducted to sampled 420 diabetes patients from tertiary hospitals in sichuan China and 420 general people from communities and parks(exclude people who claimed diabetes); telephone survey was conducted to 420 sampled people who took physical examination in tertiary hospitals in the past 2 months and found intermediate hyperglycaemia. Differences between groups were compared by chi-square test,one-way analysis of variance (ANOVA) ,Kruskal-Wallis test or student's t test. **RESULTS:** Effective information of 403 diabetics, 404 prediabetics and 398 general people was collected. The average age of sampled diabetics was 62.18$\pm$11.3 with mean BMI 24.57$\pm$4.05 kg/m2, the average age of pre-diabetics was 53.29$\pm$9.21 with mean BMI 23.73$\pm$2.99 kg/m2, and the average age of general population was 58.94$\pm$12.48 with mean BMI was 23.67$\pm$4.24kg/m2. EQ-5D index of diabetics, pre-diabetics and general people were 0.849, 0.911 and 0.864, and EQ-VAS scores were 68.34 77.45 and 73.76. The percentage of self-assessed problematic mobility, self care, usual activities, pain/discomfort and anxiety/depression were 16.33%, 3.02%, 11.81%, 56.78%, and 44.72% in diabetics group. 5.94%, 0.99%, 3.47%, 37.13% and 27.97% in pre-diabetics group, and 13.15%, 2.48%,7.94%, 51.12%, 41.94% in general group. **CONCLUSIONS:** There was a general decline trend of HRQoL

and all 5 dimensions from general people to diabetes patients, while pre-diabetics had better HRQoL than general people. The common self-assessed problematic dimensions among 3 groups were pain/discomfort and anxiety/depression, and the status of pain/discomfort was worse than anxiety/depression. Further and larger longitudinal studies are needed to confirm these findings.

EVALUATION OF BARRIERS TO EFFECTIVE INSULIN THERAPY AMONG TYPE 2 DIABETES MELLITUS PATIENTS

Ahmad M[1], Nazir K[1], Masood I[1], Haq N[2], Adnan[2]
[1]The Islamia University of Bahawalpur, Bahawalpur, Pakistan, [2]University of Balochistan, Quetta, Pakistan

OBJECTIVES: The current study aims to evaluate the hurdles responsible for delayed insulin therapy among type 2 diabetic patients in Punjab, Pakistan **METHODS:** . A cross-sectional study was conducted on 250 physicians and 400 patients from hospitals and private clinics of three cities including Bahawalpur, Multan and Lahore through questionnaires designed and validated with the help of extensive literature review, expert opinions and pilot study **RESULTS:** The hurdles from physician side were due to the issues regarding patient themselves not willing to switch to insulin (72%, n=180), patient needle phobia (70.8%, n=177), unavailability of insulin in rural areas (65.2%, n=163), insulin proper storage issue is problematic (66.8%, n=167), insulin initiation requires proper education, training and counseling (70.4%, n=176) and high cost of insulin treatment (64.8%, n=162). On the other side, among patients the barriers include patient perception factors like they have updated knowledge about disease management (82%, n=328), high cost of insulin (56.6%, n=226), failed to manage disease with oral medication and lifestyle modification (52.2%, n=209) and one of their relative died of insulin (98%, n=392), administrative factor like they cannot spare enough time to perform insulin injection (56.7%, n=227) were observed **CONCLUSIONS:** Based on the findings of this study main key barriers oberved were, patients' hesitation to switch from oral therapy, needle phobia, unavailability of insulin in rural areas, insulin storage issues lack of education, training and counseling to use insulin, high cost, sociel pressure amd carrying and injecting insulin openly. On the basis of these observations, these issues and barriers can be handled by developing better strategies and measures. Government should make sure the availability of insulin in rural areas. Psychological issues should be addressed as a disease and treated accordingly. Patients should be educated about insulin proper administration and usage and newer interventions should be carried out to help them.

PDB74

ASSESSMENT OF NEW ONSET DIABETES AND STATIN MEDICATION UTILIZATION

Barr P, Patel B
Indegene, Kennesaw, GA, USA

OBJECTIVES: This study retrospectively examines medical records of patients newly diagnosed with type 2 diabetes mellitus. We assess potential contributing factors and statin use, while evaluating patients' current diabetes control compared to national standards. **METHODS:** A United States retrospective medical chart review of 1000 randomly selected adult patients with new onset diabetes, identified from 5 Accountable Care Organizations (ACOs), was conducted. Patients had a current diagnosis of diabetes (ICD-9 codes 250.00-250.93) in the study timeframe of January 1st 2013-December 31st 2014, and had at least one recorded follow-up visit after diagnosis. Patient demographics, comorbidities, blood pressure control, LDL screening and A1c level data were collected from the medical record and analyzed using t-tests or chi-square tests where appropriate. Analyses were stratified by statin use and A1c levels. **RESULTS:** The sample was 51% male and 49% Caucasian with a mean age of 66 ± 12.7 years. A total of 501 (50.1%) diabetes patients were on a statin by the end of the study period. Patients on a statin were significantly more likely to have blood pressure below 130/80 (p=0.032) and LDL below 100 md/dl (p=0.018) than patients not on a statin. No significant difference in age, gender or A1c level was present between statin and non-statin use patients. Out of 978 total patients that had a recorded A1c level in their medical chart, 794 (81%) patients had a recent A1c level at 8% or less. Statin usage was comparable between ≤ 8% and > 8% A1c groups of patients, with Atorvastatin and Simvastatin being the most common statins used. **CONCLUSIONS:** In this real-world observational study, only 50% of diabetes patients were on a statin. Diabetes patients taking a statin were more likely to have their blood pressure and LDL levels within national controls, compared to diabetes patients not on a statin.

PDB75

EVALUATION OF NEW ONSET DIABETES IN PRE-DIABETIC PATIENTS TAKING STATIN MEDICATION

Barr P, Patel B
Indegene, Kennesaw, GA, USA

OBJECTIVES: This study evaluates new onset diabetes and related outcome variables over a 24 month period in pre-diabetic patients taking a statin medication. **METHODS:** A United States retrospective medical chart review of 1000 randomly selected pre-diabetic adult patients, among 5 Accountable Care Organizations (ACOs) (200 per site), was conducted. Patients were taking one of the following statins: Rosuvastatin, Atorvastatin, Simvastatin and Pitavastatin, for 12 months prior to the start of the study. Patients also had documentation of at least one of the following to confirm pre-diabetic status: metabolic syndrome, fasting blood glucose of >100 mmol/L, A1c of >6%, or BMI >30 kg/m2. Patient characteristics were collected over 24 months (April 1, 2014 – April 1, 2016). **RESULTS:** The sample was 51% male, and 49% white, with a mean age of 62.3 ± 12.3 years. Of the 1000 patients initiated into the study, 146 were lost to follow up. The final cohort consisted of 854 patients with 24 months of data. BMI (p=0.033) and weight (p=0.0016) values were significantly higher among Rosuvastatin patients while fasting blood glucose levels were significantly higher among Simvastatin patients (p=0.0001. A total of 61 (7.1%) patients had a diagnosis of diabetes by the end of the study period. Most of these patients (42.6%) were taking Simvastatin before diagnosis of diabetes, and only 9 (14.7%) patients discontinued statin use, changed statin dose, or switched to a different statin after their diagnosis. **CONCLUSIONS:** In this real-world retrospective observational study, only 61 pre-diabetic patients taking a statin for at least 12 months prior to the start of the study ended up with a diagnosis of diabetes. With recent concerns regarding the link between statin use and diabetes risk, this study suggests that further research into the relationship between diabetes and statin use is necessary to improve patient health management and outcomes.

PDB76

CHOICE OF INJECTABLE THERAPY IN THE TYPE 2 DIABETES TRAJECTORY: SOCIO-DEMOGRAPHIC AND CLINICAL CHARACTERISTICS

Reges O[1], Feldman B[1], Gofer I[1], Karpati T[1], Leibowitz M[1], Balicer RD[2], Curtis BH[3], He X[4], Rubin G[5], Strizek AA[3], Leventer-Roberts M[1]
[1]Clalit Health Services, Tel Aviv, Israel, [2]Clalit Research Institute, Tel Aviv, Israel, [3]Eli Lilly and Company, Sydney, Australia, [4]Eli Lilly and Company, Indianapolis, IN, USA, [5]Eli Lilly and Company, Israel, Ra'anana, Israel

OBJECTIVES: Injectable therapy is required when patients with Type 2 Diabetes do not achieve glycemic control despite previous dietary and lifestyle modifications combined with oral antidiabetic therapy. The objective of this study was to compare socio-demographic and clinical characteristics of patients who initiated insulin versus glucagon like peptide-1 injectable therapy (GLP-1 RA) in a real world setting. **METHODS:** All patients who initiated insulin or GLP-1 therapy in 2010-2014 were identified in the Clalit data warehouse. Socio-demographic, clinical, and concurrent medication data were extracted in prior proximity to the time of therapy initiation (index-date). **RESULTS:** A total of 49,807 patients were identified: 41,049 receiving insulin and 8,758 GLP-1 RA. The duration of diabetes prior to injectable therapy initiation was similar (8 years). Insulin initiators, compare to GLP-1 RA initiators, were older (age 63 vs. 58); less obese [mean BMI: 29.0 (95%CI: 25.7-32.9) vs. 34.6 (95%CI: 31.6-38.4)]; had higher Charlson Comorbidity Index (47% vs. 30% index≥5) and were more likely to have HgbA1c>9.0% (50% vs. 38%), all comparisons p<.05. **CONCLUSIONS:** Clear differences were identified in the population prescribed insulin compared to that prescribed GLP-1 RA. Analyses are ongoing to further understand the impact of these characteristics on glycaemic control and other outcomes among these individuals.

PDB77

RACIAL AND REGIONAL VARIATION IN DISEASE PROGRESSION AND OUTCOMES AMONG VETERANS ADHERENT TO THEIR INITIAL ORAL ANTIDIABETIC MEDICATION

Gatwood J[1], Chisholm-Burns M[2], Davis R[3], Thomas F[3], Potukuchi P[4], Hung A[5], Kovesdy C[4]
[1]University of Tennessee Health Science Center, Nashville, TN, USA, [2]The University of Tennessee Health Science Center College of Pharmacy, Memphis, TN, USA, [3]University of Tennessee Health Science Center, Memphis, TN, USA, [4]Memphis VA Medical Center, Memphis, TN, USA, [5]Vanderbilt University School of Medicine, Nashville, TN, USA

OBJECTIVES: To investigate whether racial disparities and regional variation in outcomes and disease progression exist among veterans with incident diabetes mellitus (DM) who were initially adherent to oral antidiabetic medications (OAD). **METHODS:** The VA Corporate Data Warehouse was used to identify the first diagnosis for uncomplicated DM during 2002-2014. OAD use was assessed by proportion of days covered (PDC) for the first year of therapy using outpatient VA pharmacy records, and those with a PDC>80% were deemed adherent. Changes in clinical measures and the odds of cardiovascular outcomes, cerebrovascular events, revascularization, and microvascular complications were assessed during the first year of therapy with a focus on differences among races and geographic regions while controlling for baseline demographic and clinical characteristics. **RESULTS:** A total of 159,032 veterans were identified, and 62.5% were initially adherent to OADs. Significant improvement was observed across nearly all clinical measures, regardless of patient race or location, including an unadjusted mean reduction of 0.7% in hemoglobin A1C (p<0.0001). Less than 1% were diagnosed with a cardiovascular, cerebrovascular, or microvascular complication or required revascularization; African Americans had a lower adjusted odds of revascularization (OR: 0.59; 95% CI: 0.378-0.915) while those residing in Western states had higher odds of these procedures (OR: 1.6; 95% CI: 1.02-2.48). Microvascular complications were slightly more evident and differences in the adjusted odds of disease were observed in multiple races and regions but were again especially prominent among African Americans (neuropathy [OR: 0.92; 95%CI: 0.846-0.997], nephropathy [OR: 2.0; 95% CI: 1.825-2.262], and retinopathy [OR: 1.4; 95%CI: 1.24-1.50]) and veterans residing in Western states (neuropathy [OR: 0.83; 95%CI: 0.753-0.917] and retinopathy [OR: 1.5; 95%CI: 1.28-1.65]). **CONCLUSIONS:** Disparities in macro- and microvascular complications among patients with DM may begin to develop within the first year of OAD therapy, and additional attention may be warranted among particular sections of the population.

PDB78

A1C LEVELS AND FACTORS ASSOCIATED WITH GLYCEMIC CONTROL AMONG PATIENTS WITH DIABETES MELLITUS IN THE US

Liu S, Benjamin N, Popelar B
Xcenda, LLC, Palm Harbor, FL, USA

OBJECTIVES: To investigate A1C levels among patients with diabetes mellitus (DM) in the US and understand factors associated with glycemic control. **METHODS:** This

cross-sectional analysis utilized National Health and Nutrition Examination Survey data (2011-2014) and evaluated A1C levels and factors associated with glycemic control among patients with DM via multivariate logistic regression. Chi square and t-test were used to compare patient characteristics between A1C level groups (<7% vs. ≥7%). Eligible predictors ($p<0.2$) were included in a multivariate logistic regression model to determine the association between glycemic control and patient characteristics. **RESULTS:** Of the 1,326 patients identified with DM from 2011-2014 (mean age 61.2 years; 49.8% female), half (50.2%) achieved the American Diabetes Association (ADA) A1C target of <7%. Similarly, 60.9% and 54.3% of patients with DM achieved blood pressure (<130/80 mmHg) and lipid targets (<100mg/dL), respectively. Bivariate analysis suggested that age, gender, ethnicity, health insurance status, body mass index (BMI), and time since DM diagnosis were significantly associated with A1C level. After adjusting for covariates, patients with DM who were female, older, insured, non-Hispanic whites with a BMI from 25.0 to 29.9 and a recent DM diagnosis (<5 years) were more likely to meet the ADA A1C target of <7%. **CONCLUSIONS:** The current study highlights the importance of integrated, comprehensive DM care, given that almost half of patients with DM still do not achieve A1C, blood pressure, or lipid target levels suggested by ADA guidelines.

PDB80

INSULIN UTILIZATION PATTERN AMONG PATIENTS WITH DIABETES MELLITUS WHO INITIATED INJECTABLE GLUCAGON THERAPY

Ali AK, Marmaduke DQ
Eli Lilly and Company, Indianapolis, IN, USA

OBJECTIVES: To describe the extent of insulin therapy use among patients with diabetes mellitus (DM) who started injectable glucagon in the United States. **METHODS:** Patients with DM (ICD-9-CM 250*) who initiated injectable glucagon therapy between 2004 and 2012 in Truven Health MarketScan® database were included in the study. Insulin treatment pattern was characterized within 12 months after glucagon initiation date (index date), and included patients who continued insulin therapy (continued); those who stopped therapy and didn't have a record of insulin prescription during the study follow up (discontinued); those who changed insulin (switched); and those who added another insulin therapy (augmented). Switched therapy defined by a gap of ≥30 days between first and second insulin with no record of first insulin after switch date, otherwise the patient is classified under augmented therapy group. **RESULTS:** A total of 164,511 patients with DM initiated injectable glucagon (median age 46 years, 52% females). About 30% (n=49,710) of patients were treated with insulin (50% females), corresponding to 77% insulin human (IH); 16% short-acting insulin (SI); 1% intermediate-acting insulin (II); and 6% long-acting insulin (LI). The majority (76%) of insulin users have augmented treatment with other insulin (n=37,821), especially among IH users (96%); 4% of SI; and <1% of II and LI users. About 19% have discontinued therapy (n=9,456), corresponding to 54% SI; 24% LI; 17% IH; and 5% II users. Approximately 4% switched insulin type (n=1,937), mostly from SI (69%); LI (17.3%); IU (9.2%); and II (4.6%). Only 1% of patients have continued insulin therapy after initiating injectable glucagon, corresponding to 56% SI; 24% LI; 16% IH; and 4% II users. **CONCLUSIONS:** Utilization of insulin varied by type, and experience with injectable glucagon appears to affect future insulin use. More research is needed to understand the drivers for insulin discontinuation and other anti-diabetes medication substitution following glucagon treatment.

PDB81

UTILIZATION PATTERN OF INJECTABLE GLUCAGON AMONG INSULIN INITIATORS WHO EXPERIENCED SEVERE HYPOGLYCEMIA

Ali AK, Marmaduke DQ
Eli Lilly and Company, Indianapolis, IN, USA

OBJECTIVES: Injectable glucagon was approved in the United States in 1998 for the treatment of severe hypoglycemia in patients with diabetes mellitus (DM) and as a diagnostic aid in gastrointestinal radiologic examinations. This study describes the patterns of glucagon utilization in patients with DM who initiated insulin therapy in the United States. **METHODS:** Patients with DM (ICD-9-CM 250*) who initiated insulin therapy between 2004 and 2012 in Truven Health MarketScan® database were included in the study. The extent of injectable glucagon use was measured during 12 months after insulin initiation date (index date) stratified by severe hypoglycemia events that occurred any time after the index date. Severe hypoglycemia was defined as hypoglycemia events that required hospitalization or emergency room visit. Duration of glucagon use was determined by the number of days between prescription initiation and end of day supply. **RESULTS:** A total of 1,487,601 patients with DM started insulin therapy (median age 61 years, 51% females). Among them, 1.6% (n=23,191) started injectable glucagon therapy. The vast majority of glucagon users continued therapy for a median of 3 days (49% females). Among 89,059 insulin initiators with severe hypoglycemia (mean age 63 years, 56% females), only 1.7% (n=1,510) started glucagon injection. The median duration of glucagon use among those with severe hypoglycemia was 2.7 days (52% females). **CONCLUSIONS:** Utilization of injectable glucagon among insulin-treated patients who experienced severe hypoglycemia appears to be low. More research is needed to explore factors determining utilization patterns in this group of patients with DM.

PDB82

UTILIZATION AND COST OF DIABETIC MEDICATIONS AMONG US MEDICARE PART D BENEFICIARIES

Zhao J[1], Carlson AM[2]
[1]*University of Minnesota College of Pharmacy, minneapolis, MN, USA,* [2]*Data Intelligence Consultants, LLC, Eden Prairie, MN, USA*

OBJECTIVES: The total cost of diabetes in the United States in 2012 has been estimated at $245 billion. with notable expenditures for prescription medications to treat diabetes. This study evaluates the diabetes medication prescribing patterns of US health care providers. **METHODS:** Medicare Part D 2013 Prescriber Public Use File was used for analysis. Diabetes medications were identified using drug name and the chemical ingredient information available in the data file. Diabetes-related brand/generic medication prescribing patterns were determined for providers by specialty type, diabetes drug class, and geographic region. Multivariate logistic regression model examined the association between geographic regions and generic prescribing patterns. **RESULTS:** In 2013 the total cost paid for all prescriptions in Medicare PartD program was $80.9 billion; diabetes-related medications accounted for 11% ($8.6 billion). Insulin products accounted for 63% of the total diabetes drug cost; other brand name hypoglycemic drugs accounted for 27% of the total diabetes drug cost and generic drugs accounted for 10% of diabetes drug cost. The most prescribed generic medication was metformin, accounting for 4% of the total diabetes drug costs. The brand drug Januvia® (sitagliptin) accounted for $1.3 billion or 15% of diabetes drug cost. Primary care providers (e.g. family practice, pediatrics, nurse practitioner) accounted for 89% of the total diabetes drug claim counts. In the multivariate model, the odds of prescribing generic drugs was higher in the West region (adjusted odds ratio (AOR)=1.18, 95% CI=1.16-1.19), compared with the South region. Primary care providers have higher odds of prescribing generic drugs (AOR=1.50, 95%CI=1.52-1.49) compared to Specialists. **CONCLUSIONS:** Diabetes care, as evidenced by prescription medication prescribing, is largely provided by family practice physicians. Generic medications contribute only 10% of all diabetes drug costs. Insulin and brand name product prescribing have a dramatic effect on total costs of diabetes medications.

PDB83

CHARACTERISTICS ASSOCIATED WITH TYPE 2 (T2) HIGH VOLUME (HV) BASAL INSULIN DIABETES PATIENTS IN THE US

Weatherall J[1], Weng W[2], Liang Y[3]
[1]*Novo Nordisk Inc., Plainsboro, NJ, USA,* [2]*Novo Nordisk, Inc., Plainsboro, NJ, USA,* [3]*Truven Health, New York, NY, USA*

OBJECTIVES: The aim of this study was to characterize T2 patients over 18 years of age defined by their insulin usage (Low Volume (LV) ≤80 units a day or High Volume (HV) >80 units a day). **METHODS:** Data from Truven Market Scan in 2012-2013 was applied. Truven Market Scan is a US patient level database from self-insured employers that is updated annually. Patients with ≤10 units a day or >300 units a day were excluded. All other T2 patients with at least 6 months of valid basal insulin claims were included. Descriptive statistics were performed for socio-economic characteristics such as age, gender, weight and region as well as for diabetes related outcomes such as comorbidities. **RESULTS:** Among 45785 insulin users included in the analysis, 9.54% were HV. The average DACON for the HV users was 129.6 U whereas the average DACON of LV users was 35.01 U. Of these HV users, 61.38% were male vs. the 56.87% of LV users that were male. The biggest discrepancy when comparing across regions was for the North East where 19.77% of all patients were HV users and 12.18% of all patients were LV users. HV users also tend to be more overweight or obese; (26.39% for HV users vs. 18.3% for LV users). A greater percentage of HV users had more hyperlipidemia (78.26% HV vs. 72.35% LV) as well as hypertension (83.6% HV vs. 78.16% LV). Other socio-economic factors and diabetes related co-morbidities did not exhibit any indication of possible differential trends. **CONCLUSIONS:** Initial summary evidence suggests that HV users are male, overweight/obese and experience hyperlipidemia/hypertension. Some HV patients may benefit from a pen that goes up to 160 units; which may allow for transition from BID to QD dosing.

PDB84

AN INTRODUCTIVE ANALYSIS ON THE ECONOMIC BURDEN OF DIABETES IN ITALY

D'Ausilio A[1], Aiello A[1], Kornfeld M[2], Toumi M[3]
[1]*Creativ Ceutical, Milan, Italy,* [2]*Creativ-Ceutical, Paris, France,* [3]*Aix-Marseille University, Marseille, France*

OBJECTIVES: Diabetes mellitus (DM) is the second most expensive chronic disease in Italy after cancer with total direct costs over €9 billion (2012), 70% of which attributable to hospitalizations and 30% to drug treatments. The objectives of the present study were to assess the trend in pharmaceutical and hospital expenditure of diabetes in Italy during 2013-2015. **METHODS:** Antidiabetic drugs consumption and expenditure indicators in the last available three years (2013-2015) were analyzed from the Observatory on the Use of Medicines (OSMED) published reports, to determine trends in consumption and expenditures. Data before 2013 were inconsistent and therefore excluded from the analysis. Consumption was determined according to defined daily dose (DDD)/1,000 inhabitants. Expenditure was referred to per-capita spending on territorial drugs. Data on hospital discharge for diabetes (main cause, i.e. DRGs 294-295) from the Health Ministry were matched with last published DRGs Tariffs to estimate the hospitalizations costs. **RESULTS:** In Italy, consumption of antidiabetic drugs per DDD/1,000 inhabitants was respectively, 62.8 in 2013 and 62.6 in 2015 while per-capita expenditures were €13.63 in 2013 and €14.26 in 2015. Surprisingly a slight decrease in the off-patent antidiabetic drugs consumption was observed in the period 2013 to 2015 for Italy, representing 59.5% of DDD and 20.1% of total drug expenditure in 2013 vs 59.4% DDD and 19.6% of total drug expenditure in 2015. Hospitalizations and related costs for diabetes showed a reduction in the analyzed period with 19,199 admissions (Day-hospitals 6.2%) for a cost of €27,029,044 in 2013 vs. 16,762 admissions (Day-hospitals 5.6%) equal to €23,497,024 in 2015. **CONCLUSIONS:** Despite the limitations, the data show a stable trend in diabetes expenditure with a slight increment in per-capita expenditures, probably due to introduction of new expensive drugs, and a reduction in hospital admissions leading to a decrease in hospitalization costs.

PDB85

EVALUATION OF STATIN THERAPY PRESCRIBING AMONG HOSPITALIZED PATIENTS WITH TYPE 2 DIABETES MELLITUS: FINDINGS FROM TWO MALAYSIAN TERTIARY HOSPITALS

Elnaem MH[1], Nik Mohamed MH[1], Huri HZ[2], Azarisman SM[1]
[1]International Islamic University Malaysia, Kuantan, Malaysia, [2]University of Malaya, Kuala Lumpur, Malaysia

OBJECTIVES: The data regarding statin therapy prescribing among Malaysian patients with type 2 diabetes mellitus (T2DM) is lacking. This study was aimed to describe the prevalence of statin prescribing in Malaysian T2DM patients at two tertiary hospitals in the state of Pahang, Malaysia and to assess the appropriateness of statins prescribing according to the 2015 CPG on the treatment of T2DM. **METHODS:** A cross-sectional study was conducted between September to December 2016. The study involved hospitalized T2DM patients aged between 40 to 75 years without any contraindications to receiving statins. The study protocol obtained an ethical approval from the Malaysian National Medical Research Register. Assessment of current statin prescribing was classified as appropriate (proper statin was prescribed with no drug interactions) or inappropriate (not receiving any statins, although no contraindications) or adjustment needed (drug interactions or renal dose adjustment). **RESULTS:** A total of 393 cases were collected from the two hospitals. The prevalence of statins prescribing was about 65% (257/393). The most commonly prescribed statin was simvastatin 40 mg (53.3%) followed by simvastatin 20 mg (24.1%) and atorvastatin 40 mg (12.4%). The majority of the prescribed statins (82%) were moderate intensity ones. The evaluation of statins prescribing showed that approximately 35% of patients were not prescribed with statins contradictory to the national guidelines. About 26% of the study cases were given drugs that interact with statins. Renal dose adjustment of the given statin was detected in 5% of patients. Finally, one-third of patients were prescribed with appropriate statins. **CONCLUSIONS:** Prescribing of statins during hospitalization need to be improved to ensure eligible T2DM patients receive adequate CVD prophylaxis. Closer monitoring and/or intervention are warranted to assure that hospitalized T2DM patients are taking the proper statin dose without significant drug interactions. All initiatives to enhance statins prescribing should be considered.

PDB87

ASSOCIATION BETWEEN CARDIOVASCULAR COMORBIDITIES AND HEALTH CARE EXPENDITURES AMONG PATIENTS WITH DIABETES

Lin D, Zhang S, Thomas III J
Purdue University, West Lafayette, IN, USA

OBJECTIVES: Cardiovascular (CV) disease is two to four times more prevalent in patients with diabetes than in those without diabetes. This study sought to quantify the impact of CV comorbidities on health care expenditures among patients with diabetes. **METHODS:** A sample was drawn from 2014 Medical Expenditure Panel Survey (MEPS). Adults aged 18 years or older with self-reported diagnosis of diabetes were included. Individuals with missing data on any study covariates were excluded. Patients were classified as having cardiovascular comorbidity if they reported having ever been diagnosed with any of the following conditions: hypertension, coronary heart disease, angina or angina pectoris, heart attack or myocardial infarction, stroke, or other kind of heart disease. A generalized linear model with gamma distribution and log link were used to assess association between CV comorbidity and healthcare costs among patients with diabetes. The model adjusted for age, gender, race, education, family income, insurance coverage, self-perceived health status and duration of diabetes. The MEPS sampling weights were used to adjust for the complex survey design. **RESULTS:** A total of 2,022 individuals met study criteria, and 1,656 (81.9%) had one or more CV comorbidities. Patients with CV comorbidity were older than those without CV comorbidity (62.3 years vs. 52.2 years, $p<0.001$). There was no significant difference in prevalence of cardiovascular comorbidity among males and females (83.6% vs. 80.6%, $p=0.091$). Non-whites had higher prevalence of CV comorbidity than whites (85.2% vs. 80.0%, $p=0.004$). The unadjusted cost associated with CV comorbidity was, mean (95% confidence interval, "C.I."), 7,454 (C.I.=5,541 to 9,366, $p<0.001$) U.S. dollars (USD) per year. After adjusting for study covariates, estimated cost associated with CV comorbidity decreased to 5,287 (C.I.=2,911 to 7,663, $p<0.001$) USD per year. **CONCLUSIONS:** Cardiovascular comorbidity is a significant contributor to healthcare expenditure in patients with diabetes with annual associated cost of 5,287 USD.

PDB88

HEALTH CARE RESOURCE UTILIZATION AND COSTS OF PATIENTS WITH TYPE 2 DIABETES TREATED WITH DULAGLUTIDE VS. EXENATIDE QW OR LIRAGLUTIDE IN THE US

Mody R[1], Alatorre C[1], Yu M[2], Fernandez Lando L[3], Davis B[4], Juneau P[5]
[1]Eli Lilly and Company, Indianapolis, IN, USA, [2]Eli Lilly and Company, Toronto, ON, Canada, [3]Lilly USA, Indianapolis, IN, USA, [4]Truven Health Analytics, Ann Arbor, MI, USA, [5]Truven Health Analytics, Boyds, MD, USA

OBJECTIVES: Fernández Landó et al. [Diabetologia(2016) 59(Suppl 1):S1–S581] showed that patients with type 2 diabetes (T2D) treated with dulaglutide have higher adherence and persistence over 6 months vs. exenatide once weekly (EQW) or liraglutide patients. The objective of this secondary analysis was to describe diabetes-related resource utilization and costs over the same 6-month post-index period. **METHODS:** This analysis utilized Truven Early View data to identify patients newly initiating GLP-1 RAs between 11/2014 and 04/2015. Index treatment was identified in hierarchical order (dulaglutide, albiglutide, EQW, exenatide twice a day, and liraglutide) with no index drug claim in the pre-index period. Patients $\geq$18 years old, with $\geq$1 medical claim with T2D diagnosis and continuous enrollment for 6 months pre- and post-index were included. Diabetes-related medical, pharmacy, and total resource utilization and costs were assessed for a propensity matched sample of patients (dulaglutide vs. liraglutide, dulaglutide vs. EQW). **RESULTS:** The matched cohorts with 2,414 patients per arm for dulaglutide-EQW cohort and 2,037 for dulaglutide-liraglutide cohort were balanced in baseline demographic and clinical characteristics. The mean±SD number of prescriptions for index drug in the post-index period was higher for dulaglutide vs. EQW (4.0±2.0 vs. 2.9±1.9, $p<0.0001$) and dulaglutide vs. liraglutide (4.0±2.0 vs. 3.1±1.7, $p<0.0001$). Dulaglutide patients had similar mean±SD diabetes-related medical costs ($1,093±3,183 vs. $1,164±3,122, $p=0.433$) compared to EWQ patients but higher pharmacy ($4,822±2,830 vs. $4,182±2,744, $p<0.0001$) and total costs ($5,914±4,378 vs. $5,346±4,256, $p<0.0001$), likely in part due to greater number of dulaglutide prescriptions. No significant differences existed between dulaglutide vs. liraglutide patients in diabetes-related medical ($1,154±3,405 vs. $1,246±3,354, $p=0.390$), pharmacy ($4,719±2,784 vs. $4,551±3,091, $p=0.069$), and total costs ($5,873±4,529 vs. $5,797±4,872, $p=0.602$). **CONCLUSIONS:** Dulaglutide patients have similar diabetes-related costs vs. liraglutide, and have higher pharmacy and total costs compared to EQW in part due to higher medication use, consistent with previously demonstrated higher adherence for dulaglutide.

PDB89

INSULIN PRICE INCREASES FROM 2007-2014

Ellyson A, Bennette CS
University of Washington, Seattle, WA, USA

OBJECTIVES: Insulin is a life-saving drug that many patients diabetes require daily. Recent research reports that the price of insulin has soared in the previous decade. The objective of this analysis is to measure changes in the payments for insulin over time and how price is affected by market factors. **METHODS:** Data on average monthly payments for insulin was obtained the Truven Marketscan Commercial and Medicare Claims 2007-2014. The average monthly payment was calculated as expenditures per patient for a thirty-day supply of each drug in each quarter. Expenditures include payments from patients (copayments and coinsurance) and payments from the health plan. Additional data on drug characteristics and market information was also obtained from Redbook and the Food and Drug Administration (FDA) Orangebook and Drugs@FDA database. Prices for individual insulin products will depend on the quantity of prescriptions for product, quality attributes of the product, formulary tiers which vary by insurer, and market competitiveness, measured by the number and prices of competitors. Regression analysis will be used to assess the effect of market changes on insulin price including product fixed effects. **RESULTS:** On average, monthly payments for all insulins increased by 198.8 percent from the first quarter of 2007 to the last quarter of 2014. Insulin analogues accounted for over 86.5 percent of pharmaceutical claims for insulin in the Truven Marketscan Commercial and Medicare Database from 2007-2014. The majority of these price increases were absorbed by payers. Payments made by patients only increased by 36.7 percent. **CONCLUSIONS:** Insulin remains to be an incredibly cost-effective treatment to improve glycemic control among diabetic patients. However, these price increases may enhance the overall burden of illness of diabetes. As the treatment of diabetes becomes more costly, it may be important to consider the willingness of society to pay for a cure or find other treatment options.

PDB90

EFFECTS OF MULTIMORBIDITY ON HEALTH CARE UTILIZATION AND COSTS AMONG PATIENTS WITH DIABETES

Zhong Y[1], Thorat T[1], Zhou FL[2], Ye F[2], Preblick R[2], Lin P[1]
[1]Tufts Medical Center, Boston, MA, USA, [2]Sanofi, Bridgewater, NJ, USA

OBJECTIVES: The combination, not just the count, of comorbidities may influence diabetes care and patient outcomes. This study evaluates the effects of comorbidity clusters on health care utilization and costs among patients with diabetes. **METHODS:** Using the Optum Clinformatics database, we identified patients newly diagnosed with type 2 diabetes in 2013, excluding subjects with any diabetes diagnosis or diabetes medication use in the 12 months prior to the index date. Each patient had $\geq$12 months of continuous enrollment both pre- and post-diagnosis. We categorized patients into five mutually exclusive comorbidity groups using the widely-cited Piette and Kerr framework: none, concordant conditions only (e.g., heart disease), discordant conditions only (e.g., gastrointestinal illness), both, and dominant conditions (e.g., cancer). We compared healthcare utilization and costs in the year following a new diabetes diagnosis across different comorbidity clusters. **RESULTS:** Of the 130,193 patients with newly-diagnosed diabetes, 84% had comorbidities: 7% with concordant conditions only, 24% with dominant conditions, 25% with both concordant and discordant conditions, and 28% with discordant conditions only. Annual health care costs varied significantly by comorbidity type: dominant ($33,152), both ($17,928), discordant only ($8,595), concordant only ($8,518) and no comorbidities ($3,183) ($p<0.001$). Outpatient care accounted for 50%-59% of total costs among patients with any comorbidity (depending on the cluster). Patients with dominant and both concordant and discordant conditions had more inpatient, outpatient and ER visits and more prescriptions than other groups. **CONCLUSIONS:** This study is the first of which we are aware to document substantial cost variation based on the widely-used Piette and Kerr multimorbidity framework among patients with diabetes. We found that patients with dominant and both concordant and discordant comorbidities may incur significantly higher health care costs than those with other comorbidity clusters. Our results may help clinicians tailor comorbidity management plans targeting high-cost patients with diabetes.

PDB91

DELAY IN TREATMENT PROGRESSION AMONGST DIABETICS: A REAL-WORLD ASSESSMENT

Higgins V, Leith A, Benford M, Kelly M, Ellams A, Piercy J
Adelphi Real World, Bollington, UK

OBJECTIVES: To explore clinical inertia implications amongst Dual+ uncontrolled and basal insulin-only uncontrolled patients. **METHODS:** Data were drawn from 2016 Adelphi Diabetes Disease Specific Programme (DSP) in T2DM conducted across 5EU/

USA. The Diabetes DSP is a real-world, cross-sectional survey involving completion of physician-reported forms for their next 10 consulting T2DM patients. The same patients are invited to complete a patient-reported form. Patients were classified in the following groups: [1] 2+ non-insulin regimen HbA1c <8% [2] 2+ non-insulin HbA1c =>8% with no therapy change =>4 months [3] Basal insulin-only HbA1c <8% [4] Basal insulin-only HbA1c =>8%. Adherence measured via the validated, patient-reported Morisky Medication Adherence Scale (MMAS-8). All results p=<0.05. **RESULTS:** A total of 352 specialists, 501 PCPs and 8523 patients were recruited. Of these, there were [1] 2739 Dual+ controlled; [2] 316 Dual+ uncontrolled; [3] 584 Basal controlled; [4] 391 Basal uncontrolled. Dual+ uncontrolled versus controlled patients had consulted most frequently per annum (4.96 vs 4.14), likely been hospitalized (3.5% vs 2.9%) with more frequent hospitalizations per annum (1.18 vs 1.07), physician-belief they require insulin (14.4% vs 1.3%) and are obese/severely obese (41.1% vs 31.1%) with low adherence (44.9% vs 22.9%). Basal uncontrolled versus controlled had consulted more frequently per annum (4.4 vs 4.29), been hospitalized (11.0% vs 9.3%), labelled obese/severely obese (42.1% vs 34.7%). Reasons for highest non-adherence include weight gain (15.1% vs 10.8%), injection aversion (24.0% vs. 16.2%), poor glucose monitoring (27.1% vs 16.2%) and lack of perceived need for medication (14.2% 4.6%). **CONCLUSIONS:** Despite highest healthcare provider contact, higher HbA1c non-control and low adherence, Dual+ uncontrolled patients requiring insulin therapy are not progressing in the treatment paradigm despite physician-acknowledgement this is required. For those who progress to basal insulin-only therapy, despite frequent consultations, weight concerns contribute greatly to non-adherence. Addressing both issues could improve humanistic and economic outcomes.

PDB92

ASSESSMENT OF KNOWLEDGE, ATTITUDE AND PRACTICE AMONG DIABETIC POPULATION: A CROSS-SECTIONAL STUDY

Masood I[1], Hassan A[2], Rauf A[1], Ahmad W[1], Wajid S[1], Manzoor Z[1], Razzaq W[1]
[1]*The Islamia University of Bahawalpur, Bahawalpur, Pakistan,* [2]*Bahawal Victoria Hospital, Bahawalpur, Pakistan*

OBJECTIVES: Objective of study is to assess present knowledge, attitudes, and practices of diabetic patients towards the management of diabetes. **METHODS:** 400 (DM) patients were enrolled in this survey based cross-sectional study and assessed through semi structured questionnaire. **RESULTS:** As 253 (63.2%) patients were from urban so they were illiterate (N=135, 33.8%) while a few were graduate (N=75, 18.8%) and only 11 (2.8%) were post-graduated and also 236 (59%) were having positive family history of disease. Majority of the participants i.e. 377 (94.2%) had poor knowledge about disease. Only 131 (32.8%) patients were having knowledge about random blood sugar level. Most of the participants (N=363, 90.7%) reported that oral hypoglycemic agents and/or insulin is necessary for management of diabetes but they were unable to differentiate their use during either type of diabetes. Majority of the patients, 377 (94.8%) agreed that controlled and planned diet should be followed to control diabetes. Only 185 (46.2%) agreed that upon control of diabetes, the medicines can be stopped immediately while other's response was neutral/disagree and p-value was 0.002. Most of the participants (N=339, 84.8%) agreed that diabetic education programs are necessary for disease management. Regardless of having sufficient knowledge about disease, patient's practice was poor as 265 (66.3%) patients were going for follow-up regularly to physician, 228 (57.0%) reported that they exercise regularly. Only 297 (74.3%) followed a controlled and planned diet while others did not. **CONCLUSIONS:** The study showed low levels of diabetes awareness but positive attitudes towards the importance of DM care and unsatisfactory diabetes practices in Pakistan. Training programs for health professionals and diabetic patients should be conducted in order to improve their management toward the disease.

PDB93

CHARACTERISTICS ASSOCIATED WITH THE CHOICE OF FIRST INJECTABLE THERAPY AMONG US PATIENTS WITH TYPE 2 DIABETES

Yu M[1], Mody R[2], Fernandez L[3], Shui A[4], Kallenbach L[4], Slipski L[4], Piras de Oliveira C[3]
[1]*Eli Lilly and Company, Toronto, ON, Canada,* [2]*Eli Lilly and Company, Indianapolis, IN, USA,* [3]*Lilly USA, Indianapolis, IN, USA,* [4]*Practice Fusion, San Francisco, CA, USA*

OBJECTIVES: The objective of this retrospective observational study was to describe and identify clinical and demographic characteristics associated with the choice of first injectable therapy (glucagon-like peptide-1 receptor agonist [GLP-1-RA] or basal insulin [BI]) among patients with type 2 diabetes (T2D). **METHODS:** This analysis included adults with T2D who initiated GLP-1-RA or BI (index date) between November 2014 and February 2016 using data from the Practice Fusion electronic health record database. Patients with ≥1 diagnosis of T2D, ≥1 office visit between 6 and 18 months prior to the index date and naïve to GLP-1-RAs and BI with ≥1 HbA1c result in the 6-month baseline period were included. Bootstrapped logistic regression was used to identify baseline predictors. **RESULTS:** The study included 3,546 and 7,507 GLP-1-RA and BI initiators, respectively. Descriptive analyses showed that at baseline, GLP-1-RA initiators were significantly younger (mean 58 vs 63 years), had lower HbA1c (mean 8.2 vs 9.1%), lower Diabetes Complications Severity Index (DCSI) scores (mean 1.0 vs 1.7), and higher BMI (mean 36 vs 33 kg/m2) compared to BI initiators. Logistic regression showed patients that were older (odds ratio [OR] = 0.973), of black race (OR=0.579), were smokers (OR=0.713), and had higher HbA1c (OR=0.744) and DCSI scores (OR=0.868) were significantly less likely to be prescribed GLP-1 RA compared to BI. Patients with higher BMI (OR = 1.040), previous prescription of thiazolidinedione (OR=1.879) or sodium glucose cotransporter-2 inhibitor (OR=2.449), and diagnosis of obesity (OR=1.336) were significantly more likely to be prescribed GLP-1-RA. **CONCLUSIONS:** There were clinically relevant differences between the two cohorts, suggesting GLP-1 RAs and BI are prescribed to different types of patients withT2D. Key predictors that may influence the choice of a GLP-1-RA as first injectable were higher BMI and obesity; and for initiating BI were worse glycemic control, older age, and higher disease burden.

PDB94

A COMPARISON OF PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES APPROVED BY THE U.S. FOOD AND DRUG ADMINSTRATION AND HEALTH CANADA

Alotaibi N[1], Tyrrell B[1], Almalki ZS[2], Mekary RA[1]
[1]*MCPHS University, Boston, MA, USA,* [2]*University of Cincinnati, Cincinnati, OH, USA*

OBJECTIVES: The study was conducted to provide a comparative analysis of pituitary and hypothalamic hormones and analogues approved by the US Food and Drug Administration (FDA) and Health Canada (HC). **METHODS:** The World Health Organization (WHO), FDA, and HC websites were used to obtain the data of pituitary and hypothalamic hormones and analogues, approval dates, indications, contra-indications, market status, dosage forms, strengths, and routes of administration. Descriptive statistics and Wilcoxon rank sum test were performed. **RESULTS:** Twenty eight drugs were identified, of which 15 were approved by the FDA and 17 were approved by HC. Among the 13 drugs marketed in both the US and Canada, two drugs were excluded due to missing information. Of the 11 remaining drugs, 9 drugs (82%) were approved by the FDA first, while only 2 drugs (18%) were approved by HC first. The average (±SD) number of approved indications by the FDA (1.82±0.98) was not significantly different from that approved by HC (2.45±1.75) (P-value=0.31). HC approved more indications than the FDA for 3 drugs (Somatropin, Tesamorelin, and Octreotide), and each agency approved different indications in one drug (Nafarelin). HC's average number (±SD) of contraindications (4.27±2.65) was not significantly different from that of the FDA's (3.36±2.10) (P-value=0.07). **CONCLUSIONS:** There were differences in the number of pituitary and hypothalamic hormones and analogues approved by both agencies. Different indications and contraindications were also found for the same drugs comparing both agencies. These differences may lead to different access to treatment options. Hence, communication between the FDA and HC on harmonizing decision-making is needed.

GASTROINTESTINAL DISORDERS – Clinical Outcomes Studies

PGI1

RISK OF CLOSTRIDIUM DIFFICILE INFECTION ASSOCIATED WITH PROTON PUMP INHIBITOR USE AMONG COMMUNITY DWELLING ADULTS WITH GASTROESOPHAGEAL REFLUX DISEASE

Rane P[1], Guha S[2], Garey K[1], Chen H[1], Johnson ML[3], Aparasu RR[3]
[1]*University of Houston, Houston, TX, USA,* [2]*University of Texas Health Science Center, Houston, TX, USA,* [3]*College of Pharmacy, University of Houston, Houston, TX, USA*

OBJECTIVES: There is mixed evidence regarding the risk of C. difficile infection due to use of Proton Pump Inhibitors (PPIs). This study examined the risk of C. difficile infection associated with the use of PPIs among community dwelling adults with Gastroesophageal Reflux Disease (GERD). **METHODS:** The study involved a nested case-control design using Truven Health Analytics 2003-2004 MarketScan database. Participants included adults aged more than 18 years, diagnosed with GERD anytime between January 1, 2003, and December 31, 2004 and no history of C. difficile infection between January 1, 2003 and June 30, 2003. Cases were identified as enrollees with an incident diagnosis of C. difficile infection, between July 1, 2003, and December 31, 2004 (n=97). Four age- and gender-matched controls (n=388) were identified per case using incident density sampling. A conditional logistic regression model stratified on matched case-control sets was used to evaluate the risk of C. difficile infection. **RESULTS:** The study sample consisted of 97 cases diagnosed with C. difficile infection and 388 age- and sex-matched controls. Cases had a higher Elixhauser Comorbidity Index (1.99 versus 0.34, p-value <.0001) compared to controls. The conditional logistic model revealed that the use of PPIs was not significantly associated with risk of C. difficile infection (Odds ratio (OR): 1.24, 95% Confidence Interval (CI): 0.57-2.68). Previous hospitalization (OR: 46, 95% CI: 9.26-228.59), previous antibiotic exposure (low-risk (OR: 1.07, 95% CI: 1.02-1.12), medium-risk (OR: 1.22, 95% CI: 1.09-1.37) and high-risk (OR: 1.27, 95% CI: 1.11-1.46)), abdominal pain (OR: 4.10, 95% CI: 1.73-9.69) and disease severity (OR: 1.22, 95% CI: 1.02-1.46) showed increased risk of C. difficile infection **CONCLUSIONS:** Overall, PPIs were not associated with risk of C. difficile infection among community dwelling adults with an indication for GERD. More research is needed in other healthcare settings to understand PPIs safety profile, especially for long term use.

PGI2

RISK OF PNEUMONIA ASSOCIATED WITH PROTON PUMP INHIBITOR USE AMONG COMMUNITY DWELLING ADULTS WITH GASTROESOPHAGEAL REFLUX DISEASE

Rane P[1], Guha S[2], Garey K[1], Chen H[1], Johnson ML[1], Aparasu RR[3]
[1]*University of Houston, Houston, TX, USA,* [2]*University of Texas Health Science Center, Houston, TX, USA,* [3]*College of Pharmacy, University of Houston, Houston, TX, USA*

OBJECTIVES: Most of the adverse effects of Proton pump inhibitors (PPIs) were evaluated in inpatient setting and limited data exists regarding its adverse effects in community settings. This study examined the risk of pneumonia associated with the use of PPIs in community dwelling adults with Gastroesophageal Reflux Disease (GERD). **METHODS:** The study involved a retrospective cohort study design using Truven Health Analytics 2003-2004 MarketScan database. The study population included adults aged more than 18 years of age, diagnosed with GERD, identified anytime between July 1, 2003, and December 31 2003. The risk of pneumonia during the 12-month follow-up period was modeled using a time-varying Cox proportional model using monthly PPI exposure. Fractional Polynomial Cox proportional model was used to model the risk of pneumonia with cumulative duration of PPI use. Multiple sensitivity analyses were conducted to strengthen the study findings **RESULTS:** Analysis of MarketScan database revealed that there were 89,378 patients with GERD indication and among these, 60,207 (67.36%) patients were PPI users. Patients using PPIs were older, 49.65 (± 10.49) years, compared to patients not using PPIs, 46.93 (± 11.90) years and majority of the GERD patients were females (57.4%). Results from multivariate time varying Cox regression model revealed that PPI use was associated with 53% increased

risk of pneumonia (HR, 1.53; 95% CI, 1.35-1.75). The findings were consistent across multiple sensitivity analyses. Fractional polynomial analysis revealed an initial decreased risk of pneumonia until 175 days of cumulative duration of PPI use and an increased risk after 175 days of cumulative PPI use was observed **CONCLUSIONS:** The study found an increased risk of pneumonia associated with PPI use among community dwelling adults with GERD diagnosis. Due to increasing safety concerns there is a need to be cautious in using PPIs for extended periods.

PGI3

DIAGNOSING NONALCOHOLIC STEATOHEPATITIS (NASH) AMONG PATIENTS WITH NONALCOHOLIC FATTY LIVER DISEASE (NAFLD): FEQUENCY AND PREDICTORS OF NAFLD ACTIVITY SCORE MEASUREMENT

Katz J[1], Heinz S[2], DiBonaventura M[1]
[1]Ipsos Healthcare, New York, NY, USA, [2]Ipsos Healthcare, London, UK

OBJECTIVES: Although largely asymptomatic, nonalcoholic steatohepatitis (NASH) can lead to an increased risk of liver cirrhosis and hepatocellular carcinoma. Improved early detection of NASH can result in reducing a substantial societal burden. Current guidelines suggest the presence of NASH when the patient has a nonalcoholic fatty liver disease (NAFLD) Activity Score (NAS) of 3 or above. NAS score therefore plays an integral role in determining the size of the current NASH population. This study sought to identify the frequency and predictors of NAS measurement. **METHODS:** Data from Ipsos' NASH Therapy Monitor were analysed; the NASH Therapy Monitor is a retrospective medical chart review of NAFLD patients in the US, fielded from September to November 2016. N=174 physicians provided patient demographics, disease status, comorbidities, testing, and treatment data on their most recent 5-10 NAFLD patients. Clinical and economic outcomes were reported descriptively; logistic regression models were conducted to identify factors associated with the likelihood of a complete NAS measurement. **RESULTS:** 1396 NASH patients (57% male; mean age 51.7 years [SD = 12.0], mean BMI=35.0 [SD=9.1]) were included in our analysis. Only 52% of these patients had a complete NAFLD Activity Score (NAS), i.e. steatosis (69%), lobular inflammation (61%) and hepatocyte ballooning (61%) measured. The strongest predictors of a complete NAS measurement [at $p<.05$] were NAFLD fibrosis scores indicating advanced liver fibrosis (odds ratio [OR]=4.2), Medicare B insurance (OR= 2.8), male (OR=2.0), lack of concomitant disorders (OR=1.7), and type 2 diabetes (OR=1.5). Obesity was not associated with a complete NAS measurement. **CONCLUSIONS:** Only half of patients had NAS measurements with elevated NAFLD scores and Medicare B insurance the strongest predictors. As NASH-specific treatment options become available, a greater focus on NAS measurement could have clinical and economic implications by allowing for earlier intervention prior to the onset of disease complications.

PGI4

COMPARATIVE EFFICACY AND SAFETY OF TOFACITINIB AND BIOLOGICS AS INDUCTION THERAPY FOR MODERATELY-TO-SEVERELY ACTIVE ULCERATIVE COLITIS: A SYSTEMATIC REVIEW AND NETWORK META-ANALYSIS

Rubin DT[1], Ashaye AO[2], Zhang Y[3], Xu Y[2], Fahrbach K[2], Chen LA[4], Manuchehri A[5], Kayhan C[6], Woolcott JC[7], Cappelleri JC[8], Healey P[9]
[1]University of Chicago Medicine, Chicago, IL, USA, [2]Evidera Inc., Waltham, MA, USA, [3]Evidera, London, UK, [4]NYU Langone Medical Center, New York, NY, USA, [5]Pfizer Ltd, Tadworth, UK, [6]Pfizer Inc, Collegeville, PA, USA, [7]Pfizer Canada Inc, Kirkland, QC, Canada, [8]Pfizer Inc., Groton, CT, USA, [9]Pfizer Inc, Groton, CT, USA

OBJECTIVES: Tofacitinib is an oral, small molecule JAK inhibitor being investigated for moderately-to-severely active ulcerative colitis (UC). We performed a systematic literature review (SLR) and network meta-analysis (NMA) to compare the efficacy and safety of tofacitinib to available tumor necrosis factor inhibitors [TNFi] and integrin receptor antagonists for induction therapy of adults with moderately-to-severely active UC. **METHODS:** Using indexing and free-text terms, searches were conducted in EMBASE, MEDLINE, CENTRAL, DARE, and CINAHL databases to identify RCTs published as of January 2015. Proceedings of relevant conferences from 2012–2014 were also reviewed. Comparators of interest were infliximab, golimumab, adalimumab, and vedolizumab. Two reviewers independently assessed studies for inclusion, extracted and validated the study/patient data. Fixed- and random-effects Bayesian NMA were conducted to compare efficacy outcomes and rates of adverse events (AEs) at 6-12 weeks in the overall population (TNFi-naïve or exposed) and by prior TNFi exposure. **RESULTS:** Twelve induction trials were identified from the SLR (ACT I & II, EUCALYPTUS, GEMINI-I, PURSUIT SC, TOFACITINIB PHASE II, Feagan 2005, Probert 2003, UC-SUCCESS, ULTRA 1, ULTRA 2, Suzuki 2014) and included in NMA. Unpublished data from tofacitinib phase III induction trials (OCTAVE I & II) were also used in the analysis. Fixed-effects NMA showed tofacitinib 10 mg BID is associated with a higher rate of mucosal healing versus adalimumab 160/80/40mg in the overall population (OR 1.82 [95% CrI: 1.06-3.14]) and versus vedolizumab 300mg in TNFi-exposed patients (OR 3.71 [95% CrI: 1.37-10.64]). A higher rate of clinical remission was seen with tofacitinib 10mg BID versus adalimumab in TNFi-exposed (OR 11.93 [1.84-154.78]). Rates of AEs were similar between tofacitinib 10mg BID and comparators in the overall and TNFi-naïve population. **CONCLUSIONS:** This NMA suggests the novel agent tofacitinib may be more effective than adalimumab and vedolizumab as induction therapy in TNFi-exposed patients with moderately-to-severely active UC.

PGI5

IMPACT OF FOUR-FACTOR PROTHROMBIN COMPLEX CONCENTRATE WITH OR WITHOUT FIBRINOGEN CONCENTRATE ON BLOOD PRODUCT UTILIZATION IN ORTHOTOPIC LIVER TRANSPLANTATION

Colavecchia AC, Cohen D, Harris J, Salazar E
Houston Methodist Hospital, Houston, TX, USA

OBJECTIVES: Major bleeding in orthotopic liver transplantation (OLT) is associated with significant morbidity and mortality. Limited data exists regarding comparative effectiveness of four-factor prothrombin complex concentrate (4PCC) and fibrinogen concentrate (FC) in OLT. This study evaluated the effectiveness of 4PCC and FC on intraoperative blood product utilization during OLT. **METHODS:** A retrospective, observational, single-institution propensity score matched cohort was conducted involving OLTs utilizing 4PCC and/or FC intraoperatively from December 2013 to April 2016. Patients were included if they were greater than 18 years of age and undergoing OLT. Patients were excluded if they received simultaneous heart or lung transplantation, or did not have a documented anesthesia operative note. Greedy propensity score match technique was used to match patients unexposed to exposed patients in a 2 to 1 ratio. The authors hypothesized that intraoperative use of 4PCC with or without FC during OLT would decrease the intraoperative packed red blood cell (pRBC) unit requirements by 2 units compared to patients who did not receive drug exposure. **RESULTS:** During the study timeframe, 212 patients received OLT with 39 4PCC exposures. The matched study population included 39 patients exposed to 4PCC with or without FC, and 78 patients not exposed to 4PCC. After propensity score matching, no factors included in the model were significantly different or had standardized mean differences greater than or equal to 0.11. No statistical difference was found in pRBC or fresh frozen plasma (FFP) utilization in the exposure group compared to the unexposed group (mean pRBC unit: 12.4 ± 8.0 units versus 9.7 ± 5.6 units, p-value=0.058; mean FFP unit: 10.0 units ± 6.3 versus 12.7 ± 9.7 units, p-value=0.119, respectively). **CONCLUSIONS:** Intraoperative use of 4PCC with or without FC did not reduce intraoperative blood product requirements at a single institution.

PGI6

EVALUATION OF CONCOMITANT CORTICOSTEROID AND VEDOLIZUMAB USE IN PATIENTS WITH INFLAMMATORY BOWEL DISEASE (IBD) IN REAL-LIFE CLINICAL PRACTICE

Ylisaukko-Oja T[1], Torvinen S[1], Aaltonen J[1], Vihervaara V[2], Eberl A[3], Nuutinen H[4], Blomster T[5], Jussila A[6], Pajala M[7], Jokelainen J[8], Herrala S[8], Tamminen K[2], Sipponen T[3]
[1]Takeda, Helsinki, Finland, [2]Takeda Oy, Helsinki, Finland, [3]University Hospital and University of Helsinki, Helsinki, Finland, [4]Turku University Hospital, Turku, Finland, [5]Oulu University Central Hospital, Oulu, Finland, [6]Tampere University Hospital, Tampere, Finland, [7]Kuopio University Hospital, Kuopio, Finland, [8]MedEngine, Helsinki, Finland

OBJECTIVES: Corticosteroids (CS) are often used concominantly with biologics in treatment of inflammatory bowel disease (IBD). However, their side-effect profile causes significant clinical and economic burden in long-term treatment. In this study, we investigated the impact of concomitant CS use on vedolizumab treatment persistence in patients with Crohn's disease (CD) and ulcerative colitis (UC). **METHODS:** This was a nationwide (Finland), retrospective, non-interventional, multi-center chart review. From 27 centers, we included adult (≥ 18 years of age) IBD patients who received at least one vedolizumab infusion since 2014. Data were collected from medical charts in a standardized case report form. The key data collection points were at baseline, week 14 and month 6 of vedolizumab treatment. **RESULTS:** 247 patients (CD 108, UC 139) were included. At baseline, 47 (43.5%) CD and 84 (60.4%) UC patients were using CS. Higher percentage of patients using CS at baseline discontinued vedolizumab during the 6-month follow-up compared to CS non-users (CD, 14/47 (29.8%) vs. 13/61 (21.3%); UC, 31/84 (36.9%) vs. 16/55 (29.1%)). Over half of the patients on CS at baseline and who persisted on vedolizumab were able to discontinue CS before 6 months timepoint (CD, 18/33 (54.5%); UC, 37/53 (69.8%)). Among CD patients, CS users had higher baseline disease activity than non-users. Such difference was not observed in UC. CS users had shorter disease duration in both CD and UC. There was no difference in the number of prior TNF-alpha inhibitors between CS users and non-users. **CONCLUSIONS:** Vedolizumab treatment persistence was lower in CS users than in non-users in both CD and UC. The majority of patients on CS at baseline who persisted on vedolizumab were steroid-free by 6 months, potentially relieving the burden of CS-induced side-effects for both patients and society.

PGI7

META-ANALYSIS AND INDIRECT COMPARISON OF MMX-BUDESONIDE AND MMX-MESALAMINE FOR THE TREATMENT OF MILD TO MODERATE ULCERATIVE COLITIS IN ADULT PATIENTS

Yeung P[1], Jen R[2], Vaida F[3]
[1]University of California San Diego, La Jolla, CA, USA, [2]University of British Columbia, Vancouver, BC, Canada, [3]University of California San Diego, San Diego, CA, USA

OBJECTIVES: To compare the efficacy of MMX-budesonide 9 mg QD (MMX-bud) and both MMX-mesalamine (MMX-5ASA) 2.4 gm and 4.8 gm QD for the treatment of active, mild-to-moderate ulcerative colitis using indirect treatment comparison. **METHODS:** A systematic review, meta-analysis and indirect treatment comparison meta-analyses using fixed effect model were conducted for the primary outcome of clinical and endoscopic remission and secondary outcomes for clinical remission, clinical improvement, and endoscopic improvement in 8 weeks. Risk Ratio (RR) estimates and associated 95% confident intervals were presented. **RESULTS:** Five eligible RCTs (3 MMX-bud and 2 MMX-5ASA studies) for the treatment of active ulcerative colitis of 8 weeks were included. At 8 weeks, the primary endpoint (clinical and endoscopic remission) showed no statistical significant difference between MMX-bud 9 mg vs. MMX-5ASA 4.8 gm (RR 1.36, 95%CI, 0.79- 2.34; p = 0.49) and MMX-bud 9 mg vs. MMX-5ASA 2.4 gm (RR 1.42, 95%CI, 0.84-2.41; p =0.41). Two of the corresponding secondary endpoints were not significant: clinical remission (RR 1.31, 95%CI, 0.78-2.17; p= 0.54 and RR 1.33, 95%CI, 0.81-2.19; p= 0.50), and clinical improvement (RR 0.90, 95%CI, 0.64-1.26; p= 0.78 and RR 0.91, 95%CI, 0.64-1.29; p= 0.81). However, MMX-bud is superior than both MMX-5ASA 2.4 gm and MMX-5ASA 4.8 gm in achieving endoscopic improvement (RR 0.62, 95%CI, 0.44-0.86; p= 0.05; RR 0.61, 95%CI, 0.44-0.86; p=0.05). **CONCLUSIONS:** Both MMX-bud and MMX-5ASA were superior to placebo in the treatment of active, mild-to-moderate ulcerative colitis. However, for three outcomes (clinical and endoscopic remission, clinical remission, and clinical improvement), there were no statistically significant between MMX-bud 9 mg and MMX-5ASA for both 2.4 gm and 4.8 gm. Cost of medication therapy for 8

weeks (AWP: Bud-MMX 9 mg $1600, MMX-5ASA 4.8 gm $2117, and MMX-5ASA 2.4 gm $1058) and rebates should be evaluated.

PGI8

IMPACT OF RIFAXIMIN AND LACTULOSE VERSUS LACTULOSE ALONE ON HOSPITALIZATION FOR ACUTE RECURRENT HEPATIC ENCEPHALOPATHY

Hammond DA, Dayama N, Martin BC

University of Arkansas for Medical Sciences College of Pharmacy, Little Rock, AR, USA

OBJECTIVES: Each year, approximately 110,000 hospitalizations for hepatic encephalopathy (HE) occur, totaling almost $1 billion U.S. in health care expenses. Our purpose was to determine if there was a difference in the recurrence of overt HE in the six months following an initial HE event between patients who received preventative therapy with lactulose versus lactulose and rifaximin. **METHODS:** This was a retrospective cohort study that used a 10% random sample of medical and pharmacy claims obtained from the IMS LifeLink PharMetrics Plus database for the study period January 1, 2006 through June 30, 2015. Descriptive analyses were conducted to compare demographic and clinical characteristics between patients who received lactulose or lactulose and rifaximin. Kaplan-Meier curves and a Cox proportional hazard model, adjusting for concomitant medications, comorbidities, and diagnoses related to liver disease were estimated. **RESULTS:** Among patients in the lactulose and rifaximin group (n=169) and the lactulose group (n=437), there was no significant difference in the average age (56.9 vs. 56.0; p=0.792) or Charlson comorbidity index (6 vs. 6; p=0.246). A significantly greater proportion of patients in the lactulose and rifaximin group were on spironolactone (73.4% vs. 61.8%, p=0.007), a proton pump inhibitor (73.4% vs. 61.8%, p=0.007), and ursodiol (16.6% vs. 8.0%; p=0.002). There was no difference in hospitalization for HE between groups (16.0% vs. 15.3%; p=0.841). After adjusting for potential confounders, there was no significant difference in risk for an event between groups (hazard ratio=1.045; 95% confidence interval 0.806-1.28). **CONCLUSIONS:** The addition of rifaximin to lactulose did not alter the proportion of patients who experienced their second overt HE event. This finding differs from previously reported results and may be the result of residual, unobserved confounding.

GENERATION AND TESTING OF OUTCOME INDICATORS FOR NON-ALCOHOLIC STEATOHEPATITIS

Meregalli E[1], Ciaccio A[1], Cortesi PA[1], Okolicsanyi S[1], Gemma M[1], Rota M[2], Giani P[3], Fagiuoli S[3], Belli LS[4], Scalone L[1], Cesana G[1], Mantovani LG[1], Strazzabosco M[5]

[1]*University of Milano-Bicocca, Monza, Italy,* [2]*Mario Negri Institute for Pharmacological Research, Milano, Italy,* [3]*Papa Giovanni XXIII Hospital, Bergamo, Italy,* [4]*Niguarda Hospital, Milano, Italy,* [5]*Yale University School of Medicine, New Haven, CT, USA*

OBJECTIVES: Non-alcoholic steatohepatitis (NASH) is an emerging liver condition arising from a dismetabolic background and potentially leading to cirrhosis, end-stage complications and hepatocellular carcinoma (HCC). Despite many attempts to standardize the clinical management of NASH, international guidelines are poorly translated into clinical practice. Outcome Indicators (OIs) may optimize clinical management of NASH through the measurement, analysis and comparison of centre's results. OIs may also drive the allocation of resources, according to Value-Based Medicine. The aim of this study is to generate and test a set of OIs for NASH. **METHODS:** OIs were generated by a panel of experts via Delphi Consensus method. OIs were tested in a multi-centre, prospective clinical study. **RESULTS:** Seven OIs were generated (median vote 8-9; disagreement index near zero). Three-hundred-and-two patients were enrolled; median follow-up was 23 months. OIs generated are shown below together with the results of clinical validation: OI#1) reduction of body weight by at least 7% and successive maintenance: 14% of patients. OI#2) cardiovascular risk reduction measured by instrumental tests and risk maps: 13%. OI#3) improvement of metabolic syndrome parameters (visceral obesity, triglycerides, HDL cholesterol, blood pressure, fasting glucose levels (according to ATPIII criteria): 21%, 43%, 12.5%, 30% and 66.5%, respectively. OI#4) incidence of cardiovascular accidents: not yet validated. OI#5) survival of patients with advanced fibrosis: 97% at 2 years. OI#6) incidence of cirrhosis: 3.6%. OI#7) incidence of HCC: 2.4%. **CONCLUSIONS:** Seven OIs were generated and tested proving promising in measuring the performance of tertiary Centres dealing with NASH patients. Results obtained could serve as benchmarks for a future extension of the project to a regional/national scale. The analysis of the results also revealed consistent gaps in the current management of NASH, prompting a wide reappraisal of the processes and raising the need for dedicated care units with a multidisciplinary approach.

ASSOCIATION OF SOCIO-DEMOGRAPHICS AND CLINICAL COMPLICATIONS WITH FUTURE MEDICAL EXPENDITURES IN DIVERTICULITIS

Kawatkar AA[1], Chu L[2], Nichol MB[3]

[1]*Kaiser Permanente Southern California, Pasadena, CA, USA,* [2]*Analysis Group, Inc., Los Angeles, CA, USA,* [3]*University of Southern California, Los Angeles, CA, USA*

OBJECTIVES: To evaluate the association of socio-demographics factors and clinical complications at presentation with future medical expenditures in diverticulitis patients. **METHODS:** Using the electronic medical records of the Kaiser Permanente Southern California Health Plan, we identified all adults (18+ years) who had acute diverticulitis (incident cases) during 01/01/2007 to 12/31/2011. Prior to diagnosis of the incident event (index date), patients were required to be a health plan member continuously enrolled for ≥ 12 months (baseline period) without evidence of diverticulitis. Through chart review, we captured the following complications during the incident presentation: abscess, intestinal obstruction, pneumoperitoneum, fistula and peritonitis. We identified medical expenditures (2016 USD) associated with inpatient (IP), emergency department (ED) and outpatient (OP) visits during the one year period after the index date. Total expenditure was the sum of IP, ED and OP expenditure. A generalized linear model with log link and gamma distribution was specified which adjusted for the following covariates: age, race, sex, ethnicity, income, insurance type, Elixhauser comorbidity, and clinical complications. **RESULTS:** We identified 32,884 incident cases: age (mean ± SD), 59 ± 14 years; 58% female; 68% white. The average adjusted total expenditure was $8,848 (95% CI $8,703 to $8,993). Age, race, ethnicity, income, insurance type and multimorbidity were independently associated with future total expenditure. Each identified complication was associated with significantly higher total expenditure: abscess ($7054, ($6171 to $7936)), intestinal obstruction ($4,433 ($3235 to $5632)), pneumoperitoneum ($4,838 ($4131 to $5546)), fistula ($7,083 ($4359 to $9807) and peritonitis ($7,324 ($3510 to $11137)). **CONCLUSIONS:** Presence of complicated diverticulitis was associated with significantly increased expenditure during follow-up. The magnitude of the marginal future expenditure associated with abscess, fistula and peritonitis might offset cost of elective surgical procedures, in patients presenting with such complications.

PGI11

EVALUATION OF AGE, MULTIMORBIDITY AND CLINICAL COMPLICATIONS AS RISK FACTORS FOR URGENT SURGICAL TREATMENT FOR DIVERTICULITIS

Kawatkar AA[1], Chu L[2], Nichol MB[3]

[1]*Kaiser Permanente Southern California, Pasadena, CA, USA,* [2]*Analysis Group, Inc., Los Angeles, CA, USA,* [3]*University of Southern California, Los Angeles, CA, USA*

OBJECTIVES: To evaluate the association of age, multimorbidity and clinical complications at presentation with urgent surgical management of diverticulitis. **METHODS:** We identified all adults (18+ years) who had acute diverticulitis (incident cases) during 01/01/2007 to 12/31/2011 from the Kaiser Permanente Southern California Health Plan. Prior to diagnosis of the incident event (index date), the patients were required to be health plan members continuously enrolled for ≥12 months (baseline period) without evidence of diverticulitis. We defined urgent surgery as a colon surgery performed within 30 days of the index date. Through chart review, we captured the following complications during the incident presentation: abscess, intestinal obstruction, pneumoperitoneum, fistula and peritonitis. A logistic regression model with robust standard errors was specified to predict the probability of receiving urgent colon surgery. The model adjusted for the following covariates: race, sex, and ethnicity with age, Elixhauser comorbidity, and clinical complications as exposures. **RESULTS:** We identified 33,445 incident cases: age (mean ± SD), 59 ± 14 years; 58% female; 68% white. As compared to those in the 18-35 age category, those above 65 years of age had 79% higher odds of receiving urgent surgery (Odds Ratio OR 1.8, 95% CI (1.2 to 2.6)). Compared to patients without comorbidity, those with two or more Elixhauser comorbidities had significantly higher odds of receiving surgery (OR 1.6, (1.3 to 1.9)). The odds of surgery was significantly higher when the patients presented with the following complications: abscess (OR 2.7, (2.0 to 3.7)), intestinal obstruction (OR 4.8, (3.4 to 6.7)), pneumoperitoneum (OR 2.4 (1.8 to 3.2)), and fistula or peritonitis (OR 9.1, (4.9 to 17.0). **CONCLUSIONS:** Presence of complicated diverticulitis significantly increased the likelihood of urgent need for colon surgery. Contrary to expectation, those with multimorbidity as well as older aged patients were also at higher odds of receiving urgent surgery.

PGI12

ASSOCIATION OF CLINICAL COMPLICATIONS AND SURGERY TREATMENT ON RECURRENCE OF ACUTE DIVERTICULITIS

Kawatkar AA[1], Chu L[2], Nichol MB[3]

[1]*Kaiser Permanente Southern California, Pasadena, CA, USA,* [2]*Analysis Group, Inc., Los Angeles, CA, USA,* [3]*University of Southern California, Los Angeles, CA, USA*

OBJECTIVES: To evaluate the association of demographic factors, clinical complications and surgical management of diverticulitis with its recurrence. **METHODS:** We identified all adults (18+ years) who had acute diverticulitis (incident cases) during 01/01/2007 to 12/31/2011 from the Kaiser Permanente Southern California Health Plan. Prior to diagnosis of the incident event (index date), the patients were required to be a health plan member continuously enrolled for ≥ 12 months (baseline period) without evidence of diverticulitis. We defined recurrence as a patient meeting case definition ≥ 30 days after the index date. Through chart review, we captured the following complications during the incident presentation: abscess, intestinal obstruction, pneumoperitoneum, fistula, and peritonitis. Lastly, we identified patients who had colon surgeries within 30 days of the index event. A stratified (by sex) cox proportional model was specified with sociodemographics, Elixhauser comorbidity, clinical complications and surgical management to evaluate the hazard of diverticulitis recurrence. **RESULTS:** We identified 33,442 incident cases: 58% female; 68% white. Mean age (mean ± SD) in females was 61 ± 14 years while in males it was 56 ± 15 years. During a mean (median) of 46 (49) months follow-up, 11,092 patients had a recurrence. In females, the hazard of recurrence increased with complication of abscess (Hazard ratio; (95% CI) 1.4; (1.2 to 1.7)) while surgery reduced the recurrence hazard (0.7; (0.6 to 0.8)). In males, the hazard of recurrence increased with presentation of pneumoperitoneum (1.3; (1.1 to 1.5)) and abscess (1.6; (1.3 to 1.9)) while it decreased with findings of intestinal obstruction (0.6; (0.4 to 0.9)) and with surgery (0.5; (0.4 to 0.7)). Recurrence hazard significantly increased with age in females while it significantly decreased with increasing age in males. **CONCLUSIONS:** We identified significant heterogeneity in the hazard of diverticulitis recurrence by presenting complications and by age, between the sexes.

GASTROINTESTINAL DISORDERS – Cost Studies

COST-MINIMIZATION AND BUDGET IMPACT ANALYSIS OF CERTOLIZUMAB PEGOL FOR THE TREATMENT OF CROHN'S DISEASE FROM THE PERSPECTIVE OF THE BRAZILIAN PRIVATE HEALTHCARE SETTING

Rosim RP[1], Duva AS[1], Ballalai Ferraz AF[1], Valle A[2], Toth E[3], Ferguson S[4], Carmo V. S. É[2]

[1]*QuintilesIMS, São Paulo, Brazil,* [2]*UCB Biopharma SA, São Paulo, Brazil,* [3]*UCB Biopharma Sprl., Brussels, Belgium,* [4]*UCB Pharma Ltd, Slough, UK*

OBJECTIVES: Despite the Brazilian constitution guaranteeing universal access to healthcare, 23% of Brazilians have a private healthcare plan. Drug coverage in the private sector is regulated by the National Agency for Supplementary Health, which in 2011 stated the mandatory cost reimbursement for immunobiologic drugs (bDMARD) for Crohn's disease (CD). Presented here is a Health Technology Assessment (HTA) approach on certolizumab pegol (CZP) for treatment of CD. **METHODS:** Data on utilization of treatment resources and disease-related costs were sourced from a private-sector survey of 36 respondents. In addition, the following DATASUS information was utilized to describe market dynamics: percentage of new patients (31%), switching (5%) and discontinuation (19%). On considering data from systematic reviews (SR), CZP was assumed to have equal efficacy to infliximab (IFX) and adalimumab (ADA); thus, a cost-minimization analysis (CMA) was conducted. For the 10-year CMA, an eight-state Markov model was developed using Microsoft Excel. The transition states were: initial treatment with bDMARD, remission, response, treatment failure, surgery, surgical remission, conventional treatment and death. The data for these states were also from SR. The budget impact analysis (BIA) had a 5-year horizon and calculated the population on immunobiologics based on historical DATASUS percentages. A probabilistic sensitivity analysis was conducted using 1,000 random simulations, with the following variables: relative remission maintenance and risk, patient weight, CZP share, withdrawal, switching and enrollment rates and costs. **RESULTS:** In the CMA, the costs calculated for 10-year treatment were: BRL 149k (IFX); BRL 118k (ADA) and BRL 83k (CZP). The probabilistic sensitivity analysis showed CZP to be less costly than comparators in all simulations. The BIA indicates that CZP provides a cost-saving of BRL 317k for the assumed 100-patient cohort over a 5-year period. **CONCLUSIONS:** CZP was shown to provide a cost-saving option over other anti-TNFs in the Brazilian private healthcare system.

PGI14

INCREMENTAL EXPENDITURES ASSOCIATED WITH RECURRENCE OF DIVERTICULITIS

Kawatkar AA[1], Chu L[2], Nichol MB[3]
[1]*Kaiser Permanente Southern California, Pasadena, CA, USA,* [2]*Analysis Group, Inc., Los Angeles, CA, USA,* [3]*University of Southern California, Los Angeles, CA, USA*

OBJECTIVES: To evaluate incremental expenditures associated with recurrence of diverticulitis and identify the primary driver of the incremental total expenditure. **METHODS:** We conducted a retrospective cohort study on the Kaiser Permanente Southern California Health Plan adults (18+ years) who had acute diverticulitis (incident cases) during 01/01/2007 to 12/31/2011. We identified medical expenditures (2016 USD) associated with inpatient (ip_exp) including emergency department, and outpatient (op_exp) visits during the one year period after the index date for patients without recurrence and one year after the recurrence date for those who had recurrence within one year of the index date. Total expenditure (tot_exp) was the sum of op_exp and ip_exp. A generalized linear model with log link and gamma distribution was specified which adjusted for socio-demographics, insurance, Elixhauser comorbidity, clinical complications at presentation and dummy variable identifying recurrence. To estimate ip_exp, we specified a two part model. **RESULTS:** We identified 30,715 incident cases of whom 14% had a recurrence within a year of their index date. The average adjusted tot_exp was $8,325 (95% CI $8,172 to $8,478) for those without recurrence while it was $11,932 ($11,389 to $12,474) in those who experienced a recurrence. The average adjusted op_exp was $3,559 ($3,516 to $3,601) while ip_exp was $4,776 ($4,644 to $4,908) amongst those without recurrence. For those with recurrence, the estimates for op_exp and ip_exp were $4,335 ($4,208 to $4,463) and $7,380 ($6,931 to $7,830) respectively. The incremental difference in tot_exp was $2,911 ($2,468 to $3,355) higher in those who experienced a recurrence and this difference was predominantly driven by ip_exp $2,056 ($1,703 to $2,409). The incremental difference in op_exp was $685 ($568 to $802) higher in those who had recurrence. **CONCLUSIONS:** The recurrence of diverticulitis was associated with significantly higher total expenditure that was predominantly related to increased hospitalization and emergency department visits.

PGI15

LITERATURE REVIEW ON HOSPITAL COSTS FOR PATIENTS UNDERGOING HEPATIC RESECTIONS

Chen B[1], Cheng H[2], Hsiao C[2]
[1]*Thomas Jefferson University, Philadelphia, PA, USA,* [2]*Global Health Economics and Market Access, Ethicon Inc., Cincinnati, OH, USA*

OBJECTIVES: This study aims to identify the range of direct hospital costs associated with a laparoscopic or open hepatic resections across different countries. **METHODS:** A PubMed search was performed using the keywords: hepatectomy [MeSH] and (cost OR economic OR financial) with results limited to publications of human subject studies in English from 2006 to December 2016. Studies comparing laparoscopy to open surgical techniques for hepatic resections were selected and studies of comparisons other than laparoscopy versus open procedures (e.g. robotic) were excluded. All abstracts were filtered, including meta-analysis, RCTs and observational studies excluding case studies. **RESULTS:** Eighteen of 42 studies identified were relevant for this review. The most common laparoscopic hepatic resection was wedge resection or segmentectomy as reflected that 50% of the articles included were limited to segmentectomy. Direct hospital costs varied dramatically across countries. In North America, the total direct cost (day) ranged from $2,224-$7,577 for open procedures and $2,424-$13,733 for laparoscopy. The cost of operating rooms (minute) ranged from $16-$183 for open procedures and $16-$161 for laparoscopies. The cost for hospital stay (day) ranged from $777-$950 regardless of procedure type. In European countries, the total direct cost (day) ranged from $1,330-$3,255 for open and $1,348-$4,807 for laparoscopy. The cost of operating rooms (minute) ranged from $27-$45 for open procedures and $33-$50 for laparoscopy. The cost for hospital stay (day) ranged from $368-$1,143. In Asia, the total direct cost (day) ranged from $1,028-$1,108 for open and $1,566-$1,866 for laparoscopy. The cost of operating rooms (minute) was approximately $20 regardless of procedure type. **CONCLUSIONS:** There are only limited cost studies published for major hepatic resections. Our results are consistent with recent systematic reviews which reported lower overall total hospital costs for laparoscopy primarily driven by shorter hospital stay.

PGI16

TRAJECTORIES OF EXPENDITURES ASSOCIATED WITH ACUTE GASTROINTESTINAL DISEASES

Kawatkar AA[1], Chu L[2], Nichol MB[3]
[1]*Kaiser Permanente Southern California, Pasadena, CA, USA,* [2]*Analysis Group, Inc., Los Angeles, CA, USA,* [3]*University of Southern California, Los Angeles, CA, USA*

OBJECTIVES: The long term economic burden of diverticular disease is poorly understood compared to other gastrointestinal (GI) diseases. We evaluated the trajectory of expenditures and incremental differences between Diverticulitis (DV), Appendicitis (AP) and Irritable Bowel Syndrome (IBS) in a managed care organization (MCO). **METHODS:** A retrospective cohort study among patients diagnosed with DV, AP or IBS, between 01/01/2002 and 12/31/2012 was conducted. Direct medical expenditures were obtained by weighting resource utilization with nationally representative reimbursement values. Prior to diagnosis of the incident event (index date), patients were required to be health plan members continuously enrolled for $\geq$12 months (baseline); and at least 60 months post index. We identified medical expenditures (2016 USD) associated with inpatient (IP), emergency department (ED) and outpatient (OP) visits during one, three and five year periods, after the index date. Total expenditure was the sum of IP, ED and OP expenditure. A generalized linear model with log link and gamma distribution was specified which adjusted for the following covariates: age, race, sex, ethnicity, insurance type, and Elixhauser comorbidity. **RESULTS:** We identified total of 38,241 patients of which 65% had IBS, 23% had DV and rest had AP. The average adjusted cumulative total expenditure per patient, in year one was $16,502, $13,478, $8509; in year three was $52,205, $76,400, $56,438; and in year five was $115,754, $195,349, and $143,302 in AP, DV and IBS respectively. While the incremental difference between DV and AP was -$7,436 (-$8,043 to -$6,830) in year one; by year three, DV patients had $5,369 ($2,433 to $8,304) higher expenditure and the difference increased to $30,670 ($23,985 to $37,354) by the end of fifth year. **CONCLUSIONS:** The trajectory of expenditure associated with DV suggests that it exerts significantly more economic burden on per patient basis, as compared to other well studied acute GI diseases.

PGI17

PRICE DYNAMICS OF HEPATITIS C VIRUS THERAPIES IN CROATIA

Mance D[1], Mance D[2], Vitezic D[3]
[1]*University of Rijeka, Rijeka, Croatia,* [2]*University of Rijeka, Faculty of Economics, Rijeka, Croatia,* [3]*University of Rijeka, School of Medicine and University Hospital Centre Rijeka, Rijeka, Croatia*

OBJECTIVES: To investigate and explain changes of drug prices for hepatitis C virus (HCV) treatments on the Croatian market. **METHODS:** The study is a retrospective analysis, conducted using publicly available pricing lists from the Croatian National Health Insurance Fund. The encompassed period is from November 2012 to July 2016. **RESULTS:** Pegylated interferon alpha-2a (pegIFN) maintained a constant price for a longer period of time due to the lack of direct competition. Boceprevir (BOC) and telaprevir (TPV) were able to maintain a constant price since their entry on the market up until simeprevir (SIM) entered the EU5 (Germany, France, United Kingdom, Italy, and Spain) market. Consequently, prices of TPV and BOC dropped (6% and 11%, respectively) remaining at that level even after SIM entered the Croatian market. The market entry of sofosbuvir (SOF) and ombitasvir, paritaprevir, ritonavir, and dasabuvir (OBV/PTV/r/DSV) combination therapy was followed by a significant SIM's price reduction (19%) and the ultimate withdrawal of TPV. In July 2016 BOC experienced a significant drop of its price (16%) probably due to the fact that BOC is not the standard of care anymore. On the other hand, the SIM, SOF and OBV/PAR/r/DAS price drop in July 2016 was negligible (<1%). A price reductions, similar to price reductions on USA market, could not be observed on the Croatian market. **CONCLUSIONS:** HCV drug price reductions have not been under direct impact of competition on the Croatian market but they are rather a consequence of competition on the EU5 and USA markets. The Croatian market is a typical market of a small and open economy without independent price setting. The principal reason for that is the Croatian EU membership with the prohibition of price discrimination, as well as a delayed drug introduction to the Croatian market in comparison to USA and EU5 markets.

PGI18

COSTS AND RESOURCE USE ASSOCIATED WITH OPIOID-INDUCED CONSTIPATION (OIC) IN PATIENTS WITH TOTAL HIP OR TOTAL KNEE REPLACEMENT SURGERY IN THE INPATIENT SETTING

Wittbrodt E[1], Gan T[2], Datto C[1], McLeskey C[1], Sinha M[3], Magee G[3]
[1]*AstraZeneca, Wilmington, DE, USA,* [2]*Stony Brook University, Stony Brook, NY, USA,* [3]*Premier Incorporated, Charlotte, NC, USA*

OBJECTIVES: Constipation is a frequent side effect of opioids. Data that describe the incidence of opioid-induced constipation (OIC) and its impact on costs, resource use, and outcomes in inpatients are limited. The objective of this study was to investigate costs and resource use associated with OIC in patients undergoing total hip or total knee replacement surgery. **METHODS:** This retrospective, cohort study used a large hospital administrative database (Premier Healthcare Database) to identify adults discharged after total hip or knee replacement surgery between January 2012 and June 2015 who received an opioid during hospitalization. The OIC cohort was identified using ICD-9 codes and matched 1:1 to patients without OIC using propensity score matching. Adjusted outcomes were estimated using logistic regression analyses for categorical variables, and generalized linear models for continuous variables; $p<0.05$

was considered significant. **RESULTS:** Of 788,488 eligible patients, 40,891 (5.2%) had OIC. Post-match OIC and non-OIC patient characteristics were well-balanced. Adjusted analyses showed that compared with patients without OIC, patients with OIC had longer hospital lengths of stay (OIC 3.6 vs. non-OIC 3.3 days, $p<0.001$), higher costs (OIC $17,479 vs non-OIC $16,265, $p<0.001$), greater risk of ICU admission (OR = 1.12, $p = 0.028$), 30-day readmissions (OR = 1.16, $p<0.001$), and 30-day emergency room visits (OR = 1.38, $p = 0.014$). Standard laxative use was prevalent in both cohorts (>85%), although use of newer, targeted OIC treatments (lubiprostone, methynaltrexone, naloxegol and alvimopan) was rare (<1%). **CONCLUSIONS:** Incidence of OIC in patients undergoing total hip or knee replacement receiving opioids was 5.2% and contributed to significantly greater cost and resource utilization compared with non-OIC patents. The potential impact of OIC therapies on bowel function by measuring pre- and post-operative outcomes can be addressed in future studies.

PGI19

A LITERATURE REVIEW OF THE COST OF OPIOID-INDUCED CONSTIPATION

Kennedy-Martin T[1], Krauter E[2], Cai B[2], Conway P[3], Munro V[4]
[1]*KMHO Limited, Brighton, UK,* [2]*Shionogi Inc, Florham Park, NJ, USA,* [3]*Shionogi Global, London, UK,* [4]*Synergy Health Economics Limited, London, UK*

OBJECTIVES: Opioid-induced constipation (OIC) is a burdensome side effect of opioid therapy that can impact the management of patients and reduce their quality of life. This literature review sought to assess the economic burden of OIC. **METHODS:** Eight databases (MEDLINE, EMBASE, CDSR, DARE, CENTRAL, HTA, NHS-EED, EconLit) were searched to identify published studies that reported the cost of OIC in patients. Recent abstract books from key pain and health outcome congresses were also interrogated. Results were assessed for relevance by two reviewers. **RESULTS:** Of 279 de-duplicated abstracts identified, a full text review found 11 studies that explored the link between OIC and cost. The USA was the country where most studies were undertaken (5 of the 11), there were two studies from Sweden and then one each from the UK, Netherlands/Belgium, Spain and Brazil. Six studies based their cost analysis on retrospective claims data, three on healthcare resource use data and two on information from healthcare professionals. Seven studies undertook cost comparisons for those with versus without OIC; the other studies estimated the direct costs of managing OIC for a specific episode or time period. Studies almost exclusively focused on healthcare costs, with only two including indirect costs; none included costs borne by patients. The cost of managing patients with OIC was consistently higher than managing those without OIC, with the highest total costs among those with severe constipation. Variation in the attributable costs of OIC and differences in study methods limited comparison between studies. **CONCLUSIONS:** The evidence suggests that OIC poses a significant economic burden that could be reduced with more effective treatment. There is a need to undertake further research across geographies to fully understand the costs incurred over time by healthcare systems, employers and patients.

PGI20

COST-EFFECTIVENESS OF VEDOLIZUMAB COMPARED WITH USTEKINUMAB AS TREATMENT FOR PATIENTS WITH MODERATELY TO SEVERELY ACTIVE CROHN´S DISEASE IN THE UNITED STATES

Azzabi Zouraq I[1], Wilson M[2], Hather G[3], Curtis R[4], Luo M[5], Khalid JM[4], Minda K[1]
[1]*Takeda Pharmaceuticals International AG, Zurich, Switzerland,* [2]*RTI Health Sciences, Research Triangle Park, NC, USA,* [3]*Takeda Pharmaceuticals, Cambridge, MA, USA,* [4]*Takeda Development Centre Europe Ltd, London, UK,* [5]*Takeda Pharmaceuticals Inc, Deerfield, IL, USA*

Biologic agents are becoming the mainstay of therapy for patients with moderately to severely active Crohn's Disease (CD). Better understanding of relative cost-effectiveness of drugs with new mechanisms of action is needed to help determine the optimal positioning of these therapies in the treatment algorithm and facilitate resource allocation decisions. **OBJECTIVES:** A cost-utility analysis was conducted to compare vedolizumab (VDZ) versus ustekinumab (UST) for treatment of patients with moderately to severely active CD from a third-party US payer perspective. **METHODS:** A model combining decision-tree and Markov structures was used to predict clinical and economic outcomes at the induction and maintenance phases of treatment. This analysis considered patients who were anti-TNF naïve/non-anti-TNF refractory at the time of VDZ/UST treatment initiation within 5-year, 10-year, and lifetime horizon. Efficacy data were derived from a Bayesian network meta-analysis of VDZ and UST phase 3 trials1; other inputs were obtained from published literature. Only direct healthcare costs were considered. Clinical outcomes were expressed as quality-adjusted life-years (QALYs). Univariate and multivariate probabilistic sensitivity analyses (PSA) were conducted to assess model robustness to parameter uncertainty. **RESULTS:** Patients treated with VDZ accrued more QALYs than patients treated with UST across all time horizons: 2.479 vs. 2.406 at 5 years, 4.308 vs. 4.220 at 10 years, 10.461 vs. 10.326 in lifetime analysis. The estimated cost difference was also in favor of VDZ: -$51,432 at 5 years, -$52,676 at 10 years, -$55,523 in lifetime analysis. Univariate sensitivity analyses suggested that results are mostly sensitive to treatment response; PSA showed that VDZ is dominant in 89.6% of the simulations. **CONCLUSIONS:** The model predicted that VDZ treatment results in a higher number of QALYs gained at lower cost compared with UST in CD patients who had not failed a prior anti-TNF agent. Additional comparative effectiveness studies to confirm these findings are warranted.

PGI21

THE COST-EFFECTIVENESS OF ALBUMIN IN THE TREATMENT OF DECOMPENSATED CIRRHOSIS AND ASCITES REQUIRING LARGE VOLUME PARACENTESIS

Runken MC[1], Carlton R[2], Eaddy M[2]
[1]*Grifols, Inc., Research Triangle Park, NC, USA,* [2]*Xcenda, LLC, Palm Harbor, FL, USA*

OBJECTIVES: Ascites is the most common complication of cirrhosis. Large volume paracentesis has become routine treatment for patients with large ascites. Plasma expanders are recommended in large volume paracentesis to prevent circulatory dysfunction. The objective of this analysis was to evaluate the cost-effectiveness of various US plasma expanders, albumin, saline or no fluid, in patients with decompensated cirrhosis and ascites requiring large volume paracentesis. **METHODS:** A decision tree cost-effectiveness analysis was developed to evaluate the cost-effectiveness of various treatments for decompensated cirrhosis from a US hospital perspective using a 3 month time horizon. The model comparators included available US treatments: albumin, saline, and no fluid. Costs in the model included pharmacy costs and medical costs for the cirrhosis complications of hyponatremia, renal dysfunction, and hepatic encephalopathy. Effectiveness inputs were literature-based and included mortality as well as the rates of medical complications. QALYs were calculated based on health state utilities for decompensated cirrhosis and encephalopathy. The primary model results were incremental cost-effectiveness ratios (ICERs) for cost per life saved and cost per QALY. **RESULTS:** Despite albumin having higher pharmacy costs ($261) than saline ($6) and no treatment ($0), the total cost per patient was lower with albumin ($2,583) than saline ($3,356) and no fluid ($3,907) due to lower medical complication costs with albumin ($2,322) compared to saline ($3,350) and no treatment ($3,907). The results showed that albumin had the highest survival rate (97.9%, 95.7%, and 96.2% for albumin, saline and no fluid) and gained the most QALYs (0.719, 0.698, and 0.701, respectively). In the cost per life saved and cost per QALY analyses, albumin dominated (i.e. more effective and less costly) saline and no fluid alternatives. **CONCLUSIONS:** This analysis suggests that albumin is the most cost-effective treatment for patients with decompensated cirrhosis with ascites requiring large volume paracentesis.

PGI22

THE COST-EFFECTIVENESS OF THE NEW DIRECT ACTING ANTIVIRALS IN THE TREATMENT OF CHRONIC HEPATITIS C GENOTYPE 1 AND GENOTYPE 4: A SYSTEMATIC REVIEW

Alowairdhi M
the University of Toledo, Toledo, OH, USA

OBJECTIVES: The aim of this study is to systematically review the literature on cost-effectiveness studies conducted on the treatments of chronic hepatitis C genotype 1 and genotype 4 globally utilizing the new direct acting antivirals. **METHODS:** Online Database search was performed using PubMed, Embase and CEA Registry for all articles using the keywords "chronic hepatitis C', "cost-effectiveness," "genotype 1", and "genotype 4". That yielded 358 articles. All articles that didn't include one of the new DAA's as a comparator alone or in combination were excluded. Articles that didn't include G1, G4 or treatment-naive population were also excluded. Co-infection was not considered in this review. **RESULTS:** A total of 16 articles were included in this systematic review. Ombitasvir/ Paritaprevir/ Ritonavir/ Dasabuvir was dominant in most cases in treating CHC G1 and G4 patients with SVR above 90%. Sofosbuvir/ Ledipasvir is a competitive alternative. In one study, a head to head comparison revealed that Ombitasvir/ Paritaprevir/ Ritonavir/ Dasabuvir was cost-effective for G1. Studies in other countries (Germany, France, Portugal and UK) revealed similar results with Ombitasvir/Paritaprevir/Ritonavir and Dasabuvir as the cost-effective option. Another study showed that Sofosbuvir and Simeprevir overcame Sofosbuvir/ Ledipasvir superiority in the base case analysis, but in further sensitivity analysis Sofosbuvir/Ledipasvir remained the cost-effective choice in 70% of cases. **CONCLUSIONS:** Ombitasvir/Paritaprevir/Ritonavir/Dasabuvir is the most cost-effective option in the treatment of CHC G1 and G4 , but with the reduction in Sofosbuvir/Ledipasvir price this might overcome the gap between those two drugs. Keeping these two options available for the public is important for financial flexibility within the population. Further studies should be conducted from a societal perspective using real-world data in order to account for the indirect costs associated with each treatment and to reflect the actual cure rate of each population according to its characteristics.

PGI23

PHARMACOECONOMICS EVALUATION OF PEGYLATED INTERFERON FOR CHRONIC HEPATITIS C OF DIFFERENT GENOTYPES—BASED ON CHINESE PATIENTS

Chen PY, Ma AX
China pharmaceutical university, Nanjing, China

OBJECTIVES: This study aimed to perform a pharmacoeconomics evaluation of pegylated interferon α-2a and interferon based on Chinese chronic hepatitis C patients of different genotypes. **METHODS:** The chronic hepatitis C patients were divided into genotype 1 and non-genotype 1. Markov models were built respectively to simulate chronic hepatitis C developmental process of Chinese patients. We had evaluated the cost and utility of pegylated interferon α-2a and interferon by running 50 cycles of the models and deterministic and probabilistic sensitivity analysis were carried out.Initial age of the patients were set to be 40 according to the literature. Efficacy of these two therapies was derived from 19 Chinese randomized controlled trials by making a meta analysis. Utility of different states in the model was obtained from one survey of Chinese chronic hepatitis and the transition probability come from foreign original literature. Resource use and unit cost data were obtained from the literature and validated by Chinese clinical experts. **RESULTS:** Cost-utility analysis results showed that for genotype 1 chronic hepatitis C patients, pegylated interferon α-2a had lower cost (183631.14RMB vs 212703.42RMB) and higher utility (14.06QALY vs 12.32QALY), which proved pegylated interferon α-2a was cost-effective; with regard to non-genotype 1 patients, pegylated interferon α-2a had higher cost (112770.18RMB vs 111025.80RMB) and higher utility (15.01QALY vs 14.51QALY), and the incremental cost-utility ratio was 3488.76RMB/QALY (lower than Chinese threshold), pegylated interferon α-2a was cost-effective. In the sensitivity analysis, the results were similar with base case analysis. **CONCLUSIONS:** Pegylated interferon α-2a is cost-effctive than interferon both for genotype 1 and non-genotype 1 chronic hepatitis C patients in China.

PGI24

COMPARATIVE EFFECTIVENESS OF SURGICAL MANAGEMENT OF COMPLICATED DIVERTICULITIS

Kawatkar AA[1], Chu L[2], Nichol MB[3]
[1]Kaiser Permanente Southern California, Pasadena, CA, USA, [2]Analysis Group, Inc., Los Angeles, CA, USA, [3]University of Southern California, Los Angeles, CA, USA

OBJECTIVES: To identify the average treatment effect (ATE) and the treatment effect in the treated (ATET) of surgical management of complicated diverticulitis compared to medical treatment in terms of total expenditure. **METHODS:** We designed a retrospective cohort study on the Kaiser Permanente Southern California Health Plan adults (18+ years) who had complicated diverticulitis (incident cases) during 01/01/2007 to 12/31/2011. Complicated diverticulitis was defined as presence of either of abscess, intestinal obstruction, pneumoperitoneum, fistula or peritonitis. We identified medical expenditures (2016 USD) associated with inpatient, emergency department and outpatient visits during the one year period after the diagnosis date for patients without surgery and one year after the surgery date for those who had a colon surgery within one month of the index diagnosis. Total expenditure was the summation of all expenditure categories. Using a potential outcomes framework and doubly robust inverse probability weighted regression adjustment model, we evaluated the ATE and ATET of surgical vs medical management of complicated diverticulitis. The covariates adjusted in the model included socio-demographics, insurance, and Elixhauser comorbidity. **RESULTS:** We identified 1320 incident cases of whom 144 had a colon surgery within one month of their index date. The average adjusted total expenditure during follow-up was $36,706 (95% CI $ 32,678 to $40,734) for those with surgery while it was $15,760 ($14,806 to $16,714) in those who did not undergo a colon surgery. The ATE indicated $20,300 ($16,173 to $24,426) higher cost for surgical management of diverticulitis while ATET indicated $19,033 ($15,124 to $22,943) higher cost. **CONCLUSIONS:** Under the strong ignorability assumption, we find little support for heterogeneity of treatment effects since ATE and ATET were nearly similar. For a randomly selected diverticulitis patient presenting with complication and treated with surgery, the expected total expenditure would be $20,300 higher in the first year after such surgery.

PGI25

THE WORK PRODUCTIVITY BURDEN OF OPIOID-INDUCED CONSTIPATION - A LITERATURE REVIEW

Kennedy-Martin T[1], Conway P[2], Munro V[3]
[1]KMHO Limited, Brighton, UK, [2]Shionogi Global, London, UK, [3]Synergy Health Economics Limited, London, UK

OBJECTIVES: Opioid induced constipation (OIC) can impact work productivity so that a person is unable to go to work (absenteeism), or is impaired at work (presenteeism). The objective of this literature review was to identify studies that investigated productivity burden in patients with OIC. **METHODS:** A literature review was undertaken to identify studies in patients with cancer and without cancer that quantified the work productivity burden of OIC. Searches were conducted in August 2016 in bibliographical databases: MEDLINE, EMBASE, CDSR, CENTRAL, DARE, HTA and NHSEED. Abstract books of recent congresses were also searched. Results were assessed for relevance by two reviewers and data extracted. **RESULTS:** 703 de-duplicated abstracts were identified, a full text review identified eight relevant studies. All the studies were quantitative (four included the WPAI questionnaire), most (n=6) were undertaken in the USA and three sourced data from a large international study. In studies including both cancer and non-cancer patients data were sourced from the NHWS, a GP survey, a patient survey and an observational study, all showed a negative impact on productivity in OIC patients (three of these studies reported absenteeism, one presenteeism and one overall work burden). In one, a comparative study using NHWS data, those with OIC had ~25% greater time off work, impairment working and overall work impairment than those without OIC. In the non-cancer population data came from a large international longitudinal study (two studies), the NHWS and a patient survey. Studies reported a negative impact on productivity in patients with OIC (absenteeism and presenteeism in three studies, overall productivity burden in one). **CONCLUSIONS:** This review identified a small number of studies on the productivity impact of OIC. The findings from these studies suggest that OIC has a detrimental impact on both absenteeism and presenteeism. Larger studies are however needed to confirm these findings.

PGI26

ECONOMIC BURDEN OF MAJOR COMPLICATIONS IN PATIENTS UNDERGOING LOWER ANTERIOR RESECTION SURGERY: A REAL-WORLD DATABASE STUDY

Wei D[1], Roy S[2], Goldstein LJ[3], Kalsekar I[1]
[1]Johnson & Johnson Co., New Brunswick, NJ, USA, [2]Ethicon Inc, Somerville, NJ, USA, [3]Johnson & Johnson, Markham, ON, Canada

OBJECTIVES: To estimate economic burden of three major complications: anastomotic leak (AL), bleeding and infection, in patients undergoing lower anterior resection (LAR) surgery. **METHODS:** The Premier Perspective® Database containing billing data from over 600 hospitals in the U.S was used. Included patients were >18 years of age and had an elective LAR from 2008 to 2014. AL, bleeding and infection, were identified using ICD-9 diagnosis codes. Generalized Estimating Equations (GEE) models were used to estimate impact of each complication on length of stay (LOS), operating room time (ORT) and hospital costs (HC) after controlling for patient, procedure, and hospital factors. GEE accounted for the clustering of patients within hospitals; separate models were run for each complication. **RESULTS:** A total of 13,789 patients underwent LAR with an average age of 62.1 (range: 18-89) years. Incidence of AL, bleeding and infection was 12.7%, 9.1% and 5.6% respectively. On average, the LOS, ORT and HC of the LAR patients were 6.4 (SD: 4.8) days, 235.2 (SD: 215.9) minutes, and $19,030 (SD: $15,846). In the GEE models, LOS was 80.8% (95% CI: 74.2%-87.6%), OPT 9.7% (6.7%-12.8%), and HC 58.5% (51.9%-65.4%) higher in patients who had AL than those who did not have AL. Similarly, LOS, OPT and HC were 35.3% (29.3%-41.6%), 10.7% (7.7%-13.8%), and 36.7% (29.7%-44.0%) higher in patients with bleeding. Consistent results were observed for infection with 115.3% (102.6%-128.8%), 11.0% (6.1%-16.2%), and 106.0% (91.5%-121.7%) higher LOS, OPT and HC in patients with infection compared to those who did not incur an infection. The differences of all measures between patients with a complication and those without it were statistically significant ($p<0.0001$). **CONCLUSIONS:** This study demonstrates that complications such as AL, bleeding and infection occur frequently in LAR and are associated with significant economic burden.

PGI27

EVIDENCE MAP OF ECONOMIC BURDEN STUDIES IN PANCREATITIS SINCE 1960

Martin A
Crystallise Ltd., East Tilbury, UK

OBJECTIVES: To create an evidence map of studies reporting the direct and indirect costs and resource use associated with different types of pancreatitis, and the geographical settings in which these studies were conducted. **METHODS:** We searched the heoro.com database (www.heoro.com) for costs and resource use studies in pancreatitis published between 1960 and 1st December 2016. We analysed the abstracts identified by the search to determine the different types of economic burden outcomes cited across the range of geographical locations, subtypes of pancreatitis and interventions. We presented the findings as an evidence map. **RESULTS:** We found a total of 197 abstracts. Of these, 180 reported resource use data from at least 32 countries, 95 reported direct costs from 19 countries and 11 reported indirect costs from 7 countries. Most studies (65) were conducted in the United States, with 21 abstracts from China, 16 from the UK, 11 from Germany, 10 from Italy, 8 from the Netherlands and 6 each from Japan and Spain. Acute severe necrotising pancreatitis was the focus of 51 studies, mainly from China and the US, chronic pancreatitis in 47 studies, mainly from the US, biliary pancreatitis in 48 studies, mainly from the US, China and Italy, and alcoholic pancreatitis in 19 studies, mainly from the US and UK. Interventions studied included surgical, endoscopic and nutritional interventions, lithotripsy and radiotherapy. Pharmaceutical interventions evaluated included octreotide, gabexate, antibiotics and protease inhibitors. **CONCLUSIONS:** As with many diseases, there is a relative lack of published data on indirect costs of pancreatitis, and two-thirds of studies reporting direct cost data were from four jurisdictions: the US, China, the UK and the Netherlands.

PGI28

THE EFFECT OF COMORBIDITIES ON HOSPITALISATION AND MISSED WORK AMONG NON-ALCOHOLIC FATTY LIVER DISEASE (NAFLD) PATIENTS

Heinz S[1], Katz J[2], DiBonaventura M[2]
[1]Ipsos Healthcare, London, UK, [2]Ipsos Healthcare, New York, NY, USA

OBJECTIVES: Non-alcoholic fatty liver disease (NAFLD) and, more specifically, non-alcoholic steatohepatitis (NASH) are expected to become the most frequent indications of liver transplantation. The aim of this analysis was to investigate the burden of NAFLD with respect to hospitalization and work loss in the US. **METHODS:** Data from Ipsos' NASH Therapy Monitor were analysed; the NASH Therapy Monitor is a retrospective medical chart review of NAFLD patients in the US, fielded from September to November 2016. N=174 physicians provided patient demographics, disease status, comorbidities, testing, and treatment data on their most recent 5-10 NAFLD patients. Clinical and economic outcomes were reported descriptively; logistic regression models were conducted to identify factors associated with the likelihood of hospital admission and missed work (i.e., absenteeism). **RESULTS:** N= 1622 patients with NAFLD were included (59% male, mean age 52 years [SD = 8.8], mean BMI=34.8 [SD=11.8]). Of these, 53% had NASH confirmed through a NAFLD Activity Score (NAS) of 4 and above. Subanalysis of patients without missing hospitalization information (n=863) showed that 14% had spent at least one day in hospital because of NASH in the last 3 months; the median length of stay was 4.0 days. Subanalysis of employed patients without missing absenteeism data showed 16% missed work due to NASH in the last 3 months. The strongest predictors of a hospitalization were hepatitis B (odds ratio [OR]=4.9), hepatitis C (OR=4.9), and metabolic syndrome (OR= 2. 8) (all $p<.05$). Similar factors were associated with absenteeism: hepatitis C (OR=9.6), HIV (OR=6.1), and metabolic syndrome (OR=5.2) (all $p<.05$). **CONCLUSIONS:** NAFLD and NASH place a significant burden on the total healthcare system and to society. Hospital stays and loss of productivity may be reducible by prioritising treatment of patients with HCV, HBV and metabolic syndrome to prevent escalation of their condition.

GASTROINTESTINAL DISORDERS – Patient-Reported Outcomes & Patient Preference Studies

PGI29

ADHERENCE TO 5-AMINOSALICYLATES AND ITS RELATION WITH QUALITY OF LIFE AND HEALTH CARE RESOURCE UTILIZATION IN PATIENTS WITH INFLAMMATORY BOWEL DISEASE: EVIDENCE FROM US NATIONAL SURVEY DATA

Agh T[1], Pitter JG[1], Nemeth B[1], Voko Z[2]
[1]Syreon Research Institute, Budapest, Hungary, [2]Eötvös Loránd University, Budapest, Hungary

OBJECTIVES: To evaluate adherence to 5-aminosalicylate (5-ASA) therapy and its association with health-related quality of life (HRQoL) and health care resource utilization in inflammatory bowel disease (IBD). **METHODS:** This was a retrospective study. Data were drawn from the Household Component of the Medical Expenditure Panel Survey (MEPS-HC) for 2010-2014 (178,948 yearly observations). Analysis was limited to data for adults who were identified with IBD (ICD 9 code of 555/556), received 5-ASA for IBD, and were in-scope during all rounds of MEPS-HC. Adherence was quantified as the proportion of days covered (PDC); a PDC ≥0.80 was classified as adherent. HRQoL was assessed with SF-12. Descriptive statistics were calculated, association were analyzed with generalized linear models. **RESULTS:** The study sample consisted of 94 yearly observations (mean±SD age: 49.72±15.79, female: 57.45%); 73.40% of observations were from nonadherent patients. Crude and age-sex

adjusted results indicated that adherence to 5-ASA had a significant association with SF-12 Mental Component Summary (CS) score (both $P<0.01$); in age-sex adjusted analysis the mean difference was 5.81 (95% CI: 1.85-9.77) between adherent and nonadherent patients. Neither analysis found relationship between adherence and SF-12 Physical CS score. For the number of yearly emergency room (ER) visits, crude analysis showed significant association with adherence (yearly ER visit rate ratio in the adherent sample was 31.54% of the rate of the nonadherent sample; 95% CI: 0.10-1.02; P=0.05); its effect was not significant after controlling for age, sex and insurance coverage. In crude and age-sex-insurance adjusted analyses adherence had a significant effect on the number of yearly hospitalizations (both $p<0.01$); no hospitalization occurred in the adherent sample. Adherence showed no relation with yearly number of outpatient visits. **CONCLUSIONS:** Adherence to 5-ASA therapy is poor among adults with IBD. Mental component of HRQoL, and frequency of ER visits and hospitalization are strongly associated with adherence to 5-ASA in IBD.

PGI30

CORRELATES OF TWELVE WEEK TREATMENT ADHERENCE AMONG PATIENTS WITH HEPATITIS C NEWLY INITIATING DIRECT ACTING ANTIVIRAL THERAPIES INCLUDING SOFOSBUVIR CONTAINING, LEDIPASVIR/SOFOSBUVIR AND OMBITASVIR/PARITAPREVIR/RITONAVIR -DASABUVIR REGIMENS

Shcherbakova N[1], Tereso G[2], Colby A[2], D'Angelo L[1]
[1]Western New England University, Springfielld, MA, USA, [2]Health New England, Springfielld, MA, USA

OBJECTIVES: To identify clinical, demographic and healthcare delivery correlates of 12 week treatment adherence among patients initiating direct acting antivirals (DAAs) including sofosbuvir-based (with ribavirin or ribavirin+peginterferon or semeprivir), ledipasvir/sofosbuvir –based and ombitasvir/paritaprevir/ritonavir-dasabuvir –based regimens. **METHODS:** Patients of a regional health plan in Western Massachusetts with $\geq$1 prescription claim for a DAA agent between January 1, 2014 and April 1, 2016, eligible for coverage 6 months before and after DAA initiation were included. The primary outcome was 90 day adherence defined as proportion of days covered (PDC) $\geq$ 90%. Independent variables included baseline comorbidities (HIV, opioid dependence, mental and general health comorbidities), DAA treatment modality (three broad regimens described above), type of insurance coverage (commercial vs Medicaid (MassHealth)), initial prescription cost-sharing, prescriber specialty (gastroenterology/hepatology vs other) and type of dispensing pharmacy (mail-order specialty vs hospital specialty pharmacy). The covariates included age, gender and year of therapy initiation. **RESULTS:** In total, 138 patients were included in the analyses. Overall, 70.3 % of patients had PDC of $\geq$90% with mean (SD) PDC of 73.7% (18.7). The multivariate logistic regression analysis showed that presence of HIV diagnosis ([OR] = 0.14; 95% CI, 0.02-0.91) and type of insurance coverage ([OR] = 7.51; 95% CI, 1.98-28.47) were significantly associated with 90-day DAA adherence. Patients with HIV and those covered by MassHealth were significantly less likely to fill 12 weeks of DAA-based therapy. Type of dispensing specialty pharmacy, prescriber specialty, opioid dependence and cost-sharing were not associated with 90-day adherence in this study ($p>0.05$). **CONCLUSIONS:** With significant expansion of access to DAA therapy among Medicaid patients in Massachusetts in August 2016, additional adherence support is needed to ensure patients complete the course of treatment and achieve treatment response. Prescribers may also consider providing adherence support to patients with comorbid HIV diagnosis to ensure DAA treatment completion.

PGI31

PRO INSTRUMENTS USED IN STUDIES OF HEPATITIS C SINCE 1960

Martin A
Crystallise Ltd., East Tilbury, UK

OBJECTIVES: To create an evidence map of the different patient-reported outcome instruments used in studies of patients with hepatitis C infection and the geographical settings in which these studies were conducted. **METHODS:** We searched the heoro.com database (www.heoro.com) for PRO studies on hepatitis C (including chronic hepatitis C infection) published between 1960 and November 28 2016, and analysed the abstracts identified by the search to determine the different PRO instruments cited across the range of geographical locations. We presented the findings as an evidence map. **RESULTS:** We found a total of 171 abstracts that reported the use of 55 different PRO instruments. Of these 55 instruments, six were specific for liver disease or hepatitis C infection, 38 were general instruments used to evaluate quality of life, utilities or non-disease-specific symptoms such as fatigue, and 11 were specific for other conditions or diseases that were common comorbidities of people with hepatitis C infection. By far the most popular instrument was the SF-36, cited in 80 abstracts, with other tools that can be used to derive utility values, such as the EQ-5D and Health Utilities Index, also being used in several studies. Of the disease-specific instruments, the most widely used was the Chronic Liver Disease Questionnaire, cited in 12 abstracts, followed by the Hepatitis Quality of Life Questionnaire and the Liver Disease Quality of Life Questionnaire. Comorbidities assessed were generally anxiety and depression and HIV co-infection. Sixty studies were conducted in the United States, with 13 abstracts each from Germany and Australia/New Zealand, 11 from Canada and 8 from the United Kingdom. **CONCLUSIONS:** Most studies assessing patient-reported outcomes in hepatitis C have used general rather than disease-specific tools, in particular the SF-36, and were most commonly in a US population.

PGI32

PATIENTS' UNDERSTANDING OF REPORTING STOOL FREQUENCY IN CLINICAL TRIALS

Ly JJ, Durand EM, Gary ST, Tuller JM, Dallabrida SM
ERT, Boston, MA, USA

OBJECTIVES: Clinical trials for gastrointestinal (GI) tract diseases often involve patient-reported outcome (PRO) item, specifically stool frequency, as a primary outcome measure. The aim of this study was to examine patients' understanding of how to accurately report stool count. **METHODS:** 451 participants, including 87 participants diagnosed with at least one of GI related disease (e.g., Gastroesophageal Reflux Disease, Irritable Bowel Syndrome, Ulcerative Colitis, and Crohn's disease), completed an online survey. Participants were asked "If you were participating in a clinical trial that asked you to record the number of stools you had each day and you had a stool and returned to the bathroom 5 minutes later and had a second stool, would you record this as 1 stool or 2 stools?" in a multiple choice format. Demographic information, including age, education level, and household income were also recorded. **RESULTS:** 66.3% of participants with GI related diseases provided the correct answer, 2 stools. 33.7% of participants chose the incorrect answer, where 18.2% indicated that they did not have enough information to answer the question, 9.4% stated that it depended on the amount of stool at each occurrence, and 6.1% chose 1 stool. Participants without GI related disease scored similarly with 66.4% answering correctly. The two groups did not differ in age, education, or household income. **CONCLUSIONS:** Though the majority of the participants answered the question correctly regardless of whether they were diagnosed with a GI related disease, results suggest that a third of participants were not able to determine and accurately record the stool frequency in the given scenario. These findings are consistent with regulatory guidance from the FDA (2012) on providing patients with standardized instructions and training on completing diaries for recording stool frequency.

PGI33

A SYSTEMATIC REVIEW OF THE INFLAMMATORY BOWEL DISEASE QUESTIONNAIRE FOR MEASURING HEALTH-RELATED QUALITY OF LIFE IN PATIENTS WITH ULCERATIVE COLITIS

Yarlas A[1], Sands BE[2], Rubin DT[3], Lindsay J[4], Panes J[5], Vermeire S[6], Chen LA[7], Bayliss M[1], Maher SM[1], Bushmakin AG[8], Cappelleri JC[9], Su C[10], Kayhan C[10], Healey P[8]
[1]Optum, Lincoln, RI, USA, [2]Icahn School of Medicine at Mount Sinai, New York, NY, USA, [3]University of Chicago Medicine, Chicago, IL, USA, [4]Bart's Health NHS Trust, London, UK, [5]Hospital Clinic de Barcelona, Barcelona, Spain, [6]University Hospitals Leuven, Leuven, Belgium, [7]NYU Langone Medical Center, New York, NY, USA, [8]Pfizer Inc, Groton, CT, USA, [9]Pfizer Inc., Groton, CT, USA, [10]Pfizer Inc, Collegeville, PA, USA

OBJECTIVES: Ulcerative colitis (UC), an inflammatory bowel disease, substantially impacts patients' health-related quality of life (HRQL). The Inflammatory Bowel Disease Questionnaire (IBDQ) is a disease-specific measure capturing impact of UC on four domains of functioning and well-being: Bowel symptoms, Systemic symptoms, Emotional function, and Social function. Despite its frequent use in UC clinical trials, there is no recent summary of measurement properties in UC. We conducted a systematic literature review of the reliability, validity, and responsiveness of the IBDQ in UC. **METHODS:** Search strings with relevant terms were entered in PubMed, EMBASE, Cochrane CENTRAL, and BIOSIS Weekly databases. English-language articles reporting on measurement properties of the IBDQ among UC patients were reviewed. Data about specific psychometric properties were extracted and summarized across studies. **RESULTS:** Thirty-seven articles met selection criteria. The abstracted and synthesized evidence support the following conclusions about psychometric properties of the IBDQ in UC: (1) Good internal consistency (Cronbach's $\alpha\geq0.70$) and test-retest reliability (intraclass correlations ≥0.70) for all IBDQ domains; (2) Good convergent validity, based on correlations between IBDQ domains and validated criterion measures of patients' functioning and well-being (mean/median $|r|$=0.52/0.51, 83% of $|r|\geq0.40$) and measures of disease activity (mean/median $|r|$=0.62/0.51, all $|r|\geq0.40$); (3) Good discriminant validity, indicated by effect sizes (Cohen's d) for standardized mean differences in IBDQ domain scores across UC patients grouped by disease activity status (mean/median d=1.7/1.9, 100% of $d>0.50$); and (4) Good sensitivity to change, based on statistically significant treatment-arm differences ($p<0.05$) in IBDQ total scores in 72% of randomized-controlled trials (RCTs) with efficacious treatments. **CONCLUSIONS:** The IBDQ demonstrates good psychometric properties with UC patients. IBDQ domains strongly concord with measures of clinical disease activity. In RCTs, IBDQ scores reflect improvements following efficacious treatment. These results support including the IBDQ as an endpoint in RCTs to evaluate treatment effects on UC patients' HRQL.

PGI34

COMPARISON OF PARTICIPANT CHARACTERISTICS IN THE REAL-WORLD OBSERVATIONAL CONTOR STUDY WITH THOSE IN RANDOMIZED CLINICAL TRIALS (RCT): ARE REAL-WORLD PATIENTS LIKE CLINICAL TRIAL PATIENTS?

Fu A[1], Abel JL[2], Reasner DS[1], Carson RT[2], Martin C[3], Goolsby Hunter A[3], Buzinec P[3], Essoi B[3], Taylor DC[1]
[1]Ironwood Pharmaceuticals, Inc., Cambridge, MA, USA, [2]Allergan plc, Jersey City, NJ, USA, [3]Optum, Eden Prairie, MN, USA

OBJECTIVES: To compare characteristics among irritable bowel syndrome with constipation (IBS-C) or chronic idiopathic constipation (CIC) patients who participated in CONTOR, a real-world longitudinal research platform, with linaclotide randomized clinical trials (RCTs) to assess similarities between real-world and clinical trial patients. **METHODS:** This analysis utilized data from CONTOR compared with data pooled from four linaclotide Phase III RCTs. CONTOR included fully-insured IBS-C/CIC patients aged $\geq$18 years from a large US health plan (identification period: 12/2012-6/2015). Participants' demographics, daily abdominal symptoms (0-10 scale), work productivity (WPAI-SHP), and health status (SF-12v2 Physical/Mental Component Summary scores [PCS/MCS]) were compared between CONTOR participants at baseline (CONTOR-BL), and RCT participants at baseline (RCT-BL) and week 12 (RCT-wk12). Satisfaction with linaclotide was evaluated at CONTOR-BL and RCT-wk12. CONTOR participants were considered linaclotide-treated if they took linaclotide in the week prior to CONTOR-BL. Descriptive analyses were performed. **RESULTS:** Across 2,052 CONTOR and 2,875 RCT participants, age and gender were similar (mean age [years]:

CONTOR: 47; RCTs: 46; Female: CONTOR: 94%; RCTs: 90%). CONTOR abdominal symptoms (pain, discomfort, bloating) were less severe compared to RCTs (CONTOR-BL mean: 2.9, 3.6, 3.9; RCT-BL: 5.6, 6.1, 6.6; RCT-12wk: 3.7, 4.1, 4.7). Mean PCS was similar in CONTOR and RCT populations (CONTOR-BL: 50; RCT-BL: 47; RCT-wk12: 51). Mean CONTOR MCS was worse compared to RCTs (CONTOR-BL: 43; RCT-BL: 47; RCT-wk12: 50). CONTOR participants lost more work time than RCT participants (CONTOR-BL: 3.3%; RCT-BL: 2.3%; RCT-wk12: 1.3%). A greater number of linaclotide-treated patients from CONTOR reported satisfaction with linaclotide (CONTOR-BL (n=354):86%; RCT-wk12 (n=1,637): 67%). **CONCLUSIONS:** CONTOR participants were generally similar to RCT patients at week 12, with some differences in MCS and work productivity. Findings indicate linaclotide RCT results are likely generalizable to real-world IBS-C/CIC patients, with observed differences potentially due to differing RCT and real-world study designs.

PGI35

A LITERATURE REVIEW OF THE QUALITY OF LIFE BURDEN OF OPIOID-INDUCED CONSTIPATION

Kennedy-Martin T[1], Krauter E[2], Cai B[2], Munro V[3], Conway P[4]
[1]*KMHO Limited, Brighton, UK,* [2]*Shionogi Inc, Florham Park, NJ, USA,* [3]*Synergy Health Economics Limited, London, UK,* [4]*Shionogi Global, London, UK*

OBJECTIVES: Opioid-induced constipation (OIC) is a side effect of opioid medication; it has been suggested that it may be more distressing than the pain of the condition itself. The objective of this literature review was to describe studies reporting the quality of life (QoL) burden of OIC. **METHODS:** A literature review was undertaken to identify studies on the QOL burden of OIC. Six electronic databases (MEDLINE, EMBASE, CDSR, DARE, CENTRAL, HTA) were searched to identify published manuscripts that reported the QoL burden of OIC. In addition, recent abstract books from key pain and health outcome meetings were interrogated to identify relevant research presented at congresses. Results were assessed for relevance by two reviewers and data extracted. **RESULTS:** 413 de-duplicated abstracts were identified and a full text review resulted in the selection of 12 manuscripts and one congress abstract (5 noncancer only, 3 cancer only, 5 combined population). Most studies were quantitative (n=12); there was one qualitative study. Five studies compared QoL in patients with OIC versus those without OIC; both generic and disease-specific measures showed QoL to be more impaired in OIC patients. A range of QoL instruments was used with the PAC-QOL (which has not been specifically validated in OIC patients) being the most common (7 studies). A number of key drivers of impaired QoL were identified including high level of constipation, dissatisfaction with laxatives, and increased laxative frequency. **CONCLUSIONS:** The existing evidence shows QoL to be impaired in patients with OIC. More effective treatment of OIC could reduce this burden. Relatively few studies were identified and further international research exploring the impact of OIC on patients over time is recommended. There is also a need to undertake studies to validate the PAC-QOL questionnaire in OIC patients.

PGI36

A REVIEW OF THE QUALITY OF LIFE BURDEN OF NON-ALCOHOLIC STEATOHEPATITIS

Kennedy-Martin T[1], Bae J[2], Paczkowski R[2], Freeman EC[2]
[1]*KMHO Limited, Brighton, UK,* [2]*Eli Lilly and Company, Indianapolis, IN, USA*

OBJECTIVES: Non-alcoholic steatohepatitis (NASH) is an advanced stage of non-alcoholic fatty liver disease (NAFLD). It can lead to the development of cirrhosis, end-stage liver disease, and complications like hepatocellular carcinoma. This literature review was undertaken to understand the quality-of-life (QOL) burden of NASH. **METHODS:** We searched electronic databases (MEDLINE, EMBASE, CDSR, CENTRAL, DARE, HTA) for manuscripts on QOL and NASH published in the last 10 years as well as recent abstracts from ISPOR, ISOQOL and major liver congresses. Results were assessed by two independent reviewers and key QOL data extracted. **RESULTS:** Of 567 de-duplicated references identified, 20 manuscripts remained after review of titles/abstracts and five after full-text review; two additional manuscripts were identified through grey searching, there was one relevant congress abstract. Of the eight included studies, there were five quantitative studies, two clinical trials (herbal medical treatment, YHK and placebo; pioglitazone, vitamin E, and placebo) and one qualitative study. In the quantitative studies QOL was diminished in patients with NASH compared with an age- and sex-matched US population, and compared to those without NASH (SF-36 PCS), but not compared with other chronic liver disease. NAFLD patients with cirrhosis had lower QOL than non-cirrhotic patients. In patients with weight loss, a larger magnitude of QOL improvement was reported in those with NASH versus those without NASH. Neither clinical trial showed a significant QOL change from baseline. A conceptual framework to measure NASH-specific symptoms and impacts was developed in the qualitative study to help guide the development of a patient-reported outcome measure for NASH. **CONCLUSIONS:** NASH negatively impacts QOL, primarily impacting physical functioning and fatigue. However, the evidence base is limited; further studies are needed to understand the longitudinal QOL burden of NASH in different patient populations. There is a need to quantify the impact of future therapies on QOL.

PGI37

UNDERSTANDING THE COST OF CHRONIC IDIOPATHIC CONSTIPATION: EVIDENCE FROM THE BURDEN–CIC (BETTER UNDERSTANDING AND RECOGNITION OF THE DISCONNECTS, EXPERIENCES, AND NEEDS OF PATIENTS WITH CHRONIC IDIOPATHIC CONSTIPATION) STUDY

Harris LA[1], Quigley E[2], Kissous-Hunt M[3], Horn J[4], Hixson MA[5]
[1]*Mayo Clinic Scottsdale, Scottsdale, WA, USA,* [2]*Houston Methodist Hospital, Houston, WA, USA,* [3]*Mount Sinai GI, New York, NY, USA,* [4]*UW Medicine Pharmacy Services, Seattle, WA, USA,* [5]*Synergy Pharmaceuticals Inc., New York, NY, USA*

OBJECTIVES: To assess the impact of chronic idiopathic constipation (CIC) on quality of life (QoL), work productivity, daily activities, and indirect costs in a sample of the US population. **METHODS:** The BURDEN-CIC study utilized the Knowledge Network Panel™ to identify CIC patients, who participated in a 45-minute, 68-question, IRB-approved online survey. Healthcare professionals (HCPs) treating CIC patients participated in a 30-minute, 32-question online survey.**RESULTS:** Over 1,100 CIC patients (mean age, 49 years; female, 70%; severe, 67%) completed the survey. Only 23% of patients felt "in control" of their symptoms, with 39% expressing "acceptance" that CIC was part of daily life. Of HCPs (n=331), 72% stated patients had high levels of frustration regarding CIC and were "stressed" (49%) or "fed up" (43%) regarding current treatments. Sixty percent of all CIC patients and 81% of severe CIC patients reported their symptoms bothersome and impacting QoL; daily activity participation was impacted 4 and 9 days/month, respectively. Most patients had used (62%) or were using (53%) OTC treatments for their CIC, with 16% currently using prescription treatment. Of current prescription therapy patients, 35% felt it was "effective," but only 14% reported "good experience/satisfied." HCPs viewed response (55%), adherence (55%), management of CIC-treatment-related diarrhea (34%), and lack of treatment options (34%) as the greatest challenges in CIC treatment. Mean monthly out-of-pocket costs to manage CIC was $114 (all) and $182 (severe)—ranging from $75 for lifestyle/dietary modifications, $123 for OTCs, and $413 for prescriptions. Workplace productivity was impacted for 8 days/month (all) and 10 days/month (severe) with an average of 5 work days/month missed. Of all CIC patients, 15% had an emergency room visit related to CIC in the past year. **CONCLUSIONS:** CIC patients have low QoL, significant work and daily activity impairments, and high indirect costs, imposing a burden on patients and employers.

PGI38

RELATIONSHIP BETWEEN DAYS AND VOLUME OF PARENTERAL NUTRITION IN PATIENTS WITH SHORT BOWEL SYNDROME AND HEALTH-RELATED QUALITY OF LIFE – A POST HOC ANALYSIS USING SBS-QOL DATA FROM A PHASE III TRIAL

Stellato D[1], Chen K[2], Atwood M[1], Vera-Llonch M[2], Oster G[1]
[1]*Policy Analysis Inc. (PAI), Brookline, MA, USA,* [2]*Shire Human Genetic Therapies, Inc., Lexington, MA, USA*

OBJECTIVES: Short bowel syndrome (SBS) is a rare condition characterized by patient inability to maintain life with oral feeding, which often is treated with parenteral nutrition (PN). While the overall impact of PN on patient health-related quality of life (HRQL) has been reported by others, it is unknown how it varies in relation to days of PN and PN daily volume. **METHODS:** We used SBS-QOL data collected in a randomized, double-blind, placebo-controlled, phase III trial of teduglutide in adult (aged ≥18 years) patients with SBS and intestinal failure (STEPS: NCT00798967; EudraCT2008-006193-15), and its 2-year open-label extension study (STEPS-2: NCT00930644; EudraCT2009-011679-65), to examine the relationship between individual SBS-QOL component scores and days of PN and PN daily volume. Analyses were based on multiple assessments from 86 patients (mean observations per person = 12). **RESULTS:** Mean (SD) age of study participants was 51 (14) years and 47% were women. PN days and PN volume were significantly ($P<0.05$) associated with adverse impacts on everyday activities, leisure activities, social life, and diarrhea/stomal output. PN days alone was significantly ($P<0.05$) associated with adverse impacts on general well-being, diet, eating, and drinking habits, ability to work, physical health, emotional life, gastrointestinal symptoms, and other symptoms/discomfort. Daily PN volume alone was significantly ($P<0.05$) associated with adverse impacts on mobility and self-care activities, sleep, and muscle symptoms. **CONCLUSIONS:** In patients with SBS and intestinal failure, PN adversely impacts HRQL. These adverse impacts are dependent on both PN days and PN volume, and interventions that reduce one or both of these measures accordingly would be anticipated to improve HRQL.

PGI39

THE IMPACT OF PLECANATIDE ON QUALITY OF LIFE FOR PATIENTS WITH CHRONIC IDIOPATHIC CONSTIPATION (CIC): RESULTS FROM TWO PHASE 3 CLINICAL STUDIES

Rao SS[1], Hixson MA[2], Mikhelashvili T[2]
[1]*Medical College of Georgia; Augusta University, Augusta, GA, USA,* [2]*Synergy Pharmaceuticals Inc., New York, NY, USA*

OBJECTIVES: To investigate whether plecanatide, a uroguanylin analog, improved health-related quality of life (HRQoL) in 2 clinical trials of patients with chronic idiopathic constipation (CIC). **METHODS:** Patients meeting modified Rome III CIC criteria were randomized to placebo, plecanatide 3mg or 6mg daily for 12 weeks. The primary endpoint was the proportion of durable overall CSBM responders (≥3 CSBMs plus increase of ≥1 CSBM over baseline in the same week) for ≥9 of 12 treatment weeks, including ≥3 of the last 4 weeks. HRQoL assessments included: Patient Assessment of Constipation-Symptoms (PAC-SYM), PAC-Quality of Life (PAC-QOL), and Treatment Satisfaction. Results are versus placebo. **RESULTS:** Patients (N=2683) had similar baseline characteristics. Pooled efficacy showed significantly greater overall durable CSBM responders with plecanatide 3mg (n=184, 20.5%) and 6mg (n=176, 19.8%) vs placebo (n=103, 11.5%; $P<.001$ both doses). Significant increases in CSBMs were seen during Week 1 and were maintained through Week 12. Plecanatide 3mg and 6mg significantly improved PAC-SYM at Weeks 4, 8 and 12 in both studies, with a mean change differences at Week 12 of –0.22 ($P<.001$) and –0.23 ($P<.001$) [Study 1] and –0.18 ($P=.002$) and –0.15 ($P=.009$) [Study 2]. A similar improvement in PAC-QOL was noted for both doses at Weeks 4, 8 and 12 in both studies; the mean change differences at Week 12 for plecanatide 3mg and 6mg were –0.25 ($P<.001$) and –0.28 ($P<.001$) [Study 1] and –0.20 ($P<.001$) and –0.19 ($P=.001$) [Study 2]. Plecanatide yielded significantly ($P\leq.001$) higher mean treatment satisfaction scores at each assessment point and increased over time. **CONCLUSIONS:** Plecanatide 3mg and 6mg significantly improved bowel symptoms and HRQoL at all time points and increased the proportion of durable overall

CSBM responders. These data suggest plecanatide improves constipation and HRQoL, and therefore may offer a promising new treatment option for CIC patients.

PGI40

CLINICAL, ENDOSCOPIC, AND HISTOLOGIC ACTIVITY PREDICT HEALTH-RELATED QUALITY OF LIFE FOR PATIENTS WITH MILD-TO-MODERATE ULCERATIVE COLITIS TREATED WITH MULTIMATRIX MESALAMINE

Yarlas A[1], Willian MK[2], Nag A[3]
[1]Optum, Lincoln, RI, USA, [2]Willian International, LLC (formerly of Shire), Southeastern, PA, USA, [3]Shire, Lexington, MA, USA

OBJECTIVES: Studies of patients with ulcerative colitis (UC) have established that reduction in clinical symptoms and endoscopic activity each independently predict improved health-related quality of life (HRQL). However, the combined impact of these factors on HRQL has not been examined, nor whether histologic activity predicts HRQL. The current analysis examines individual and combined associations of these 3 types of disease activity with HRQL. **METHODS:** Post hoc, exploratory analyses were conducted on data from patients with active mild-to-moderate UC in an open-label trial who received 8 weeks of treatment with 4.8 g/day of multimatrix mesalamine once daily. Outcomes assessed at baseline and final visits included clinical and endoscopic activity (UC Disease Activity Index [UC-DAI]); histologic activity index (modified Geboes' scoring); disease-specific HRQL (Short Inflammatory Bowel Disease Questionnaire [SIBDQ]); and generic HRQL (SF-12v2® Health Survey [SF-12v2]). The individual impact of each type of disease activity on HRQL was examined by comparing changes in SIBDQ and SF-12v2 scores between subgroups classified by disease activity status (eg, achieving clinical remission), while their combined impact was tested using multivariable regression. Hochberg adjusted P values controlled for Type I error. **RESULTS:** Improvements in SIBDQ and SF-12v2 domains were significantly larger for patients with clinically meaningful improvements in clinical and endoscopic activity (all $P<0.001$), patients with lower histologic activity index scores (all $P<0.05$), and patients in clinical and endoscopic remission compared to endoscopic remission only (all $P<0.05$). Findings from regression models indicated that decreased clinical and endoscopic activity, though not histologic activity, uniquely predicted improvement in SIBDQ and SF-12v2 domains. **CONCLUSIONS:** Clinical, endoscopic, and histologic activity have separable, and in some cases additive impacts on UC patients' HRQL. Treatments impacting multiple types of disease activity should result in greater improvements in patients' functioning and well-being than treatments that target clinical, endoscopic, or histologic activity alone.

ASSESSMENT OF AWARENESS ABOUT HEPATITIS B AMONG HEALTHY POPULATION OF PUNJAB, PAKISTAN

Amir S[1], Masood I[1], Akhtar N[2], Nazir A[1], Naz M[1], Arooj S[1], Ayoub I[1]
[1]The Islamia University Of Bahawalpur, Bahawalpur, Pakistan, [2]The Islamia University of Bahawalpur, Bahawalpur, Pakistan

OBJECTIVES: The study was aimed to assess awareness about hepatitis B among residents of Punjab, Pakistan. **METHODS:** A cross sectional survey was conducted involving 616 respondents from 15th December 2015 to 15th March 2016. Respondents above 18 years of age and those domiciled in Punjab were only the target audience. Data was collected by self-distribution of pre-tested and validated questionnaire at public places like shopping malls, parks, household etc. Data was analyzed through SPSS version 20.0 by applying appropriate statistics. Initially cronbach's alpha was applied to check reliability and validity of study instrument. **RESULTS:** The mean age of the respondents was estimated to be 33.55 ± 10.341. Less than half of participants were employed (43. 2%), half (50.2%) were married, a very small proportion (5.0%) had post-graduate educational level and majority belonged to urban settings (74.2%). Both sexes equally participated in the study. Awareness was assessed by asking questions regarding general introduction to hepatitis B like signs and symptoms, infection nature, its modes of spread/transmission, treatment/prevention and disease information source. Qualification, marital status and occupation significantly influenced respondent's knowledge regarding hepatitis B ($p<0.05$). However, no statistically significant association was noticed regarding gender, age & residency of the study participants. Overall awareness score of respondents was estimated to be 22.28 ± 4.63. **CONCLUSIONS:** Based on findings it was concluded that majority of the participants 89.8% were aware of hepatitis B.

PGI42

FACTORS ASSOCIATED WITH TIME-TO-TREATMENT IN THE NEW DIRECT-ACTING ANTIVIRAL ERA FOR HEPATITIS C PATIENTS IN AN INTEGRATED HEALTH CARE SYSTEM

Karmarkar T[1], Padula WV[1], Watson ES[2], Gaskin DJ[1], Rodriguez CV[2]
[1]Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, USA, [2]Kaiser Permanente, Rockville, MD, USA

OBJECTIVES: New treatments for Hepatitis C offer higher rates of cure with fewer side effects, yet therapy costs are high. While new direct-acting antiviral agents (DAAs) have become the standard of care, providers and payers feel pressured to prioritize treatment due to high drug costs. We aim to examine the association of patient demographic, clinical and provider characteristics associated with DAAs. treatment. **METHODS:** Using electronic health record data from Kaiser Permanente Mid-Atlantic States (KPMAS), we constructed a Cox hazards model to examine the association between different patient factors on the "risk" of treatment over the study period. Our study sample included 3,017 patients with a confirmed diagnosis of Hepatitis C from the KPMAS Hepatitis C registry, as per pre-specified clinical criteria. The study period began on November 1, 2013 with the release of the initial second generation DAAs and concluded on May 31, 2016. **RESULTS:** In a Hepatitis C panel of 3017, 995 patients (33%) initiated DAA therapy over the course of the study period. Most patients were between the ages of 61-80 (55%), Black (67%) and male (62%). About 24% of patients were censored due to death or disenrollment from the health plan prior to the end of follow-up. Log-rank tests at baseline showed differences in probability of treatment by age category, prior treatment experience and race category. A multivariable cox hazards model showed older age, between 40-80 years, so be significantly associated with increased probability of treatment. Differences in fibrosis scores did not significantly change the likelihood of treatment in our sample. **CONCLUSIONS:** While our analysis shows that age impacts time-to-treatment with a DAAs, we need to better understand the reasons for this patterns in treatment. Further research with a longer follow-up period that covers the more recently approved pan-genotypic DAAs may provide more insight into treatment decisions.

PGI43

QUALITY OF CARE IN PATIENTS WITH CIRRHOSIS AND ASCITES, HEPATIC ENCEPHALOPATHY OR SPONTANEOUS BACTERIAL PERITONITIS: A RETROSPECTIVE ANALYSIS OF ELECTRONIC MEDICAL RECORDS

Dashputre AA, Kamal KM, Nemecek BD, Covvey JR
Duquesne University Mylan School of Pharmacy, Pittsburgh, PA, USA

OBJECTIVES: To assess evidence-based quality metrics in patients with cirrhosis and its complications. **METHODS:** Adults with cirrhosis (ICD-9-CM 571.2 and 571.5) and complications post-diagnosis (ascites [789.59], HE [572.2] and SBP [567.23]) from 2009-2014 were identified from EMR data from an academic health system. Quality metrics for analysis were developed, including: (1) availability of MELD-Na, (2) diuretic therapy for ascites, (3) secondary prophylaxis for SBP, (4) appropriate treatment for HE, (5) SBP primary prophylaxis for qualifying patients, and (6) avoidance of non-recommended medications. Logistic regression was used to assess patient and physician-related factors that predicted achievement of parameters (2) and (4). Data analysis was conducted using SAS 9.4. **RESULTS:** A total of 4,116 patients with cirrhosis were identified: 986 (24.0%) with ascites, 665 (16.2%) with HE and 148 (3.6%) with SBP. A total of 67.54% of patients had a calculable MELD-Na. Receipt of therapy was 57.62% (diuretics) for ascites, 54.29% (secondary prophylaxis) and 60.61% (primary prophylaxis) for SBP and 49.83% for HE. A total of 68.16%, 71.45%, 72.38% of patients with ascites, HE and SBP respectively, were avoiding non-recommended medications. Regression for (2) demonstrated overweight patients (OR 0.665; 95% CI: 0.463-0.957) and non-specialists/non-primary care practitioners (OR 0.402; 95% CI: 0.208-0.775) were less likely to receive and provide quality care, respectively. Results for (4) showed that obese patients (OR 0.458; 95% CI: 0.289-0.725) were less likely to receive quality care. **CONCLUSIONS:** Quality of care was suboptimal and significant deviation in practice from evidence-based guidelines was observed.

NEUROLOGICAL DISORDERS – Clinical Outcomes Studies

PND1

PREVALENCE OF GASTROINTESTINAL EVENTS IN PATIENTS WITH ALZHEIMER'S DISEASE IN JAPAN

Crawford B, Tomari A
IMS Japan KK, Tokyo, Japan

OBJECTIVES: The incidence rate of dementia in Japan for people aged 65 and greater is 15%, with Alzheimer's disease (AD) being the most frequent type of dementia (65.8%). There is no epidemiological data available on the underlying rate of gastrointestinal (GI) events within a Japanese AD population. Therefore, we explored the rate of GI events amongst AD patients compared to matched elderly patients. **METHODS:** This was a retrospective analysis of electronic hospital-based database (Medical Data Vision) utilizing data from 1 August 2012 through 31 July 2015. Inclusion/exclusion criteria included: at least 2 claims for AD (ICD-10: G30.x) at least 1 month apart during the identification period (August 2013 – July 2014); $\geq$55 years old; 1 year look-back; 1 year follow-up. Non-AD elderly patients were propensity score (PS)-matched to AD patients. The PS included age, gender, region, and adjusted Charlson Comorbidity Index (removal of dementia and cerebrovascular diseases). GI events requiring hospitalization were considered severe. Cumulative incidence and 95% confidence intervals were calculated for the total number of GI events and for each event. Groups were compared with a Cox proportional hazard model. **RESULTS:** 14,091 patients were included in both the PS-matched AD and non-AD samples. The average age was 80.8 ± 6.7 and 60.3% female in both groups. PS-matched AD patients had significantly higher cumulative incidence of GI events compared to non-AD patients: all GI events: 48.73 vs 35.91 ($p<0.0001$), constipation: 45.90 vs 32.73 ($p<0.0001$), GI bleeds: 2.13 vs 1.60 ($p=0.0010$); acute gastric ulcer: 0.35 vs 0.18 ($p=0.0038$); acute peptic ulcer: 0.21 vs 0.11 ($p=0.0347$). The same GI events plus inflammatory bowel disease were significantly higher in AD in the severe GI sub-analysis. **CONCLUSIONS:** Patients with AD have significantly more GI events than PS-matched elderly patients. This study provides a baseline rate of GI events within an AD population in Japan.

PATTERNS AND PREDICTORS OF DEPRESSION TREATMENT AMONG ADULTS WITH MULTIPLE SCLEROSIS AND DEPRESSION IN AMBULATORY CARE SETTINGS IN THE UNITED STATES

Bhattacharjee S[1], Goldstone L[1], Ip Q[2], Warholak T[1]
[1]The University of Arizona, Tucson, AZ, USA, [2]University of Arizona, Tucson, AZ, USA

OBJECTIVES: The objectives of this study were to identify patterns and predictors of depression treatment in ambulatory settings in the United States (US) among adults with Multiple Sclerosis (MS) and depression. **METHODS:** A cross-sectional study was

conducted by pooling several years (2005-2011) of data from National Ambulatory Medical Care Survey and the outpatient department of the National Hospital Ambulatory Medical Care Survey. The final study sample was identified from ambulatory visits among adults (age ≥ 18 years) with MS and depression. Ambulatory visits with MS were identified by using ICD-9-CM of 340.xx, while visits with depression were identified by ICD-9-CM codes of 296.2-296.36, 300.4 or 311, or if the answer to the question "Regardless of the diagnoses written…..does the patient now have: depression?" was "yes." Dependent variable of this study was pharmacological treatment for depression with or without psychotherapy. Predictors of depression treatment were ascertained by conducting multivariate logistic regression. Complex survey designs of the datasets were adjusted to obtain nation level estimates. **RESULTS:** According to the study findings, between 2005-2011 approximately 2.1 million visits involved a diagnosis of MS and depression. Depression treatment was observed in 57.25% of the study sample. Selective serotonin reuptake inhibitors were the most prescribed antidepressant class, and fluoxetine was the most prescribed individual antidepressant in the study sample. Individuals who were 40 years or older were 81% less likely (Odds Ratio=0.189, 95% CI 0.036-0.997) to receive depression treatment compared those who were in the age group of 18-39 years. With the increase in each chronic condition, the likelihood of receiving depression treatment decreased by 44% (Odds Ratio=0.554, 95% CI 0.335-0.917). **CONCLUSIONS:** Approximately six out of ten ambulatory visits involving MS and depression recorded some form of depression treatment. Future longitudinal studies should examine the clinical outcomes associated with depression treatment in this vulnerable population.

PND3

PATTERNS AND PREDICTORS OF DEPRESSION TREATMENT AMONG OLDER ADULTS WITH PARKINSON'S DISEASE AND DEPRESSION IN AMBULATORY CARE SETTINGS IN THE UNITED STATES

Bhattacharjee S[1], Alrabiah Z[1], Goldstone L[1], Sherman SJ[2]
[1]*The University of Arizona, Tucson, AZ, USA,* [2]*The University of Arizona, College of Medicine, Tucson, AZ, USA*

OBJECTIVES: The objectives of this study were to assess the patterns and predictors of depression treatment among older adults with Parkinson's disease (PD) and depression seeking care in ambulatory settings in the United States (US). **METHODS:** We adopted a cross-sectional study design by pooling multiple-year data (2005-2011) from the National Ambulatory Medical Care Survey (NAMCS) and the outpatient department of the National Hospital Ambulatory Medical Care Survey (NHAMCS). The final study sample consisted of visits by older adults (age ≥ 65 years) with PD and depression. PD was identified by using ICD-9-CM code of 332.xx. Depression diagnosis was identified if answer to the question "Regardless of the diagnoses written…..does the patient now have: depression?" was "yes". Depression treatment, which was the dependent variable for this study, was defined as antidepressant use with or without psychotherapy. To identify the predictors of depression treatment, multivariate logistic regression analysis was conducted adjusting for predisposing, enabling, and need factors. Complex survey design of NAMCS-NHAMCS were adjusted in all analyses to obtain nationally representative estimates. **RESULTS:** According to NAMCS-NHAMCS 2005-2011, approximately 1.7 million visits recorded a concurrent PD and depression diagnosis. Depression treatment was recorded in 57.63% of the study sample visits, mainly driven by antidepressant use alone. Men were 64% less likely (Odds Ratio=0.359, 95% CI 0.139-0.932) than women to receive depression treatment. Individuals with PD and depression were 74% more likely (Odds ratio=1.743, 95% CI 1.376-2.209) and 44% less likely (Odds ratio=0.559, 95% CI 0.396-0.790) to receive depression treatment with the increase in each number of medication used and chronic condition respectively. **CONCLUSIONS:** Approximately six out of ten older adults with PD and depression received some form of depression treatment. Future real-world long-term studies should investigate health outcomes associated with depression treatment in this population.

PND4

PREVALENCE OF BEHAVIORAL DISTURBANCES AND ASSOCIATED BURDEN IN PATIENTS WITH DEMENTIA IN US CLAIMS DATA: IS THERE UNDER-REPORTING?

Aigbogun MS[1], Stellhorn RA[1], Hartry A[2], Hammer-Helmich L[3], Baker R[1], Fillit HM[4]
[1]*Otsuka Pharmaceutical Development & Commercialization, Inc., Princeton, NJ, USA,* [2]*Lundbeck Pharmaceuticals Services, LLC, Deerfield, IL, USA,* [3]*Lundbeck A/S, Valby, Denmark,* [4]*Alzheimer's Drug Discovery Foundation, New York, NY, USA*

OBJECTIVES: Behavioral disturbances (BD) such as agitation in patients with dementia/Alzheimer's Disease dementia are challenging to families and adversely impact direct patient care, caregiver burden, and community resources. US administrative health claims are widely available and cover a broad range of patients with detailed/comprehensive data. Yet there are few published studies evaluating BD burden. Study objective was to examine clinical characteristics of BD in patients with dementia using a large representative Medicare Supplemental sample. **METHODS:** Patients diagnosed with dementia (including dementia of the Alzheimer's type) were selected from 6.3 million Medicare beneficiaries in the Truven MarketScan Medicare Supplemental and Coordination of Benefits 2012-2015 database. BD cases were identified using ICD9 diagnosis codes 294.11 or 294.21. Patients were ≥65 years old, with continuous medical and pharmacy benefits for ≥6 months pre- and post-index date (baseline). Descriptive analyses described prevalence rates and baseline comorbidities/medications. **RESULTS:** 92,054 patients with dementia were identified, of whom 17,351 (19%) had BD. Mean age was approximately 83 years. BD patients had higher Charlson Comorbidity Index scores than non BD cases (1.83 vs 1.66 $P<0.0001$). During baseline, the more common comorbidities for BD vs non-BD patients were mood disorders (21.5% vs 13.2%), psychotic disorders (20.8% vs 9.6%), and urinary tract infections (20.1% versus 15.4%), respectively. More common baseline medications for BD vs non-BD included anti-dementia drugs (43.8% vs 34.8%), antidepressants (43.4% vs 33.2%), antipsychotics (25.9% vs 8.3%), and antiepileptics (28.8% vs 20.8%), respectively. **CONCLUSIONS:** Study identifies the clinical characteristics of BD in patients with dementia using one of the largest comprehensive patient sample available. While BD is a common occurrence, the rate obtained in this study is low, potentially indicating either underreporting or lack of symptom recognition and treatment. Additional research is warranted to understand the diagnostic pathway to BD.

PND5

CLINICAL AND HUMANISTIC BURDEN AND UNMET NEEDS IN DUCHENNE MUSCULAR DYSTROPHY

Narayanan S[1], Gala S[2], Shao D[1]
[1]*Market Access Solutions LLC, Raritan, NJ, USA,* [2]*Market Access Solutions, LLC, Raritan, NJ, USA*

OBJECTIVES: Therapeutic landscape of Duchenne muscular dystrophy (DMD), a rare genetic disorder which causes severe and progressive muscle weakness, is rapidly changing. Our objective was to conduct a comprehensive review of global epidemiology, patient burden and unmet needs associated with DMD. **METHODS:** We conducted a targeted literature review of studies published from 2010 to 2016. Articles were retrieved for full review if the abstracts: reported prevalence/incidence or patient burden (clinical and humanistic); derived from a peer-reviewed journal; and reported in English-language. **RESULTS:** The prevalence of DMD per 100,000 males was highest in Sweden (16.8) and US (16.0) which varied with age, and the incidence was highest in Canada (27.78) and Denmark (18.80), however most estimates were over 15 years old. Common complications related to DMD included progressive cardiomyopathy, respiratory dysfunction, and orthopedic complications which affected survival. Standard of care (mostly, corticosteroids) prolonged survival but was associated with adverse events and toxicity. The quality of life (QoL) of patients with DMD was lower as compared to healthy population and QoL reduction was associated with disease progression. With a tolerable drug profile and superior efficacy, newer targeted therapies such as ataluren (approved ex-U.S, for patients with nonsense mutation DMD) and eteplirsen (approved in U.S, for DMD patients amenable to skipping Exon 51) have been recently shown to alleviate patient burden. **CONCLUSIONS:** This review highlights a significant clinical and humanistic burden among DMD patients due to lack of ambulation at an early age, short survival and lowered QoL. Epidemiological data may need updating to help accurately estimate DMD population size. With advent of new therapies targeted towards select patient subgroups in DMD, it is important to adequately understand the evolving patient characteristics, current treatment patterns and their impact on patient outcomes in the real world settings.

PND6

FACTORS ASSOCIATED WITH MISDIAGNOSIS AND UNDER-DIAGNOSIS OF ALZHEIMER'S DISEASE: A SYSTEMATIC REVIEW

Kim D[1], El-Gendi S[1], Ziadeh M[1], Djatche L[2], Pickering MK[1], Le T[1], Perfetto EM[3]
[1]*University of Maryland, School of Pharmacy, Baltimore, MD, USA,* [2]*Thomas Jefferson University, Philadelphia, PA, USA,* [3]*University of Maryland School of Pharmacy, Baltimore, MD, USA*

OBJECTIVES: Early screening and diagnosis of Alzheimer's disease (AD) and dementia can lead to better life planning and care. However, difficulty in diagnosis still exists and contributes to patients being misdiagnosed or under-diagnosed, resulting in a diagnosis late in the disease course. The objective of this study is to conduct a systematic review of the literature to explore the potential causes and barriers that lead to under-diagnosis and/or a misdiagnosis of AD and dementia. **METHODS:** PubMed database was searched to identify studies published from July 2008 to December 2016. The searching criteria included studies about AD and dementia completed on humans, English language, and published between 2008 and 2016. Two reviewers screened the title, abstract and full-text articles against the inclusion criteria, with two additional reviewers examining their results. Publications were excluded if they did not meet those criteria or were duplicate articles. **RESULTS:** A total of 358 articles were obtained from the literature search. Ninety-five articles were removed as duplicates. After screening, 43 articles were included and 220 original articles were excluded. Results from the articles indicate various barriers to the early diagnosis and misdiagnosis of AD and dementia including provider, caregiver, patient, health-system and diagnostic challenges. Delay or misdiagnosis could result in a poor quality of life for the patient and caregiver, contribute to financial and personal risks, and lead to the progression of the disease. **CONCLUSIONS:** Early diagnosis or detection of AD and dementia potentially reduces the social and economic burden of patients and caregivers. Additionally, it is important to diagnose patients with AD and dementia appropriately in a timely manner to ensure that treatment is initiated. With early detection of AD and dementia, risks associated with more severe cognitive impairment could be avoided. Community resources can be utilized to increase the understanding of early AD diagnosis.

PND7

IMPACT OF NON-ADHERENCE ON SEIZURE CONTROL, HEALTH-OUTCOMES AND COSTS BY ANTIEPILEPTIC DRUG CLASS AMONG PATIENTS WITH EPILEPSY

Lee LK[1], Velez F[2]
[1]*Kantar Health, San Mateo, CA, USA,* [2]*Sunovion Pharmaceuticals Inc, Marlborough, MA, USA*

OBJECTIVES: To compare health outcomes and associated costs among non-adherent patients with epilepsy using different classes of AEDs. **METHODS:** Data from the 2014-2015 US National Health and Wellness Survey, a nationally representative, self-administered, internet-based survey, were analyzed. Non-adherence was assessed by the 8-item Morisky Medication Adherence Scale (non-adherence indicated by scores>0, with 0=perfect adherence). Patients were grouped by AED class: sodium channel blocker (SCB), gamma-aminobutyric acid analog (GABA), synaptic vesicle protein 2A (SV2A), or multiple mechanism (MM). Demographic and health characteristics evaluated included age, gender, and seizure severity. Outcomes evaluated included seizure frequency, health-related quality of life (HRQoL, short-form-36 (SF-36) version 2), work productivity and activity impairment (6-item WPAI), health resource utilization (HRU), and estimated mean annual direct and indirect costs. Adjusting for patient characteristics, generalized linear models were used to compare differences in outcomes by AED group. **RESULTS:** Of 709 eligible patients, 236 (33%) were adherent and 473 (67%) were non-adherent. Adherence did not differ by AED class. Among non-adherent patients (mean age=42; 53% female), 245 (52%)

received a SCB, 25 (5%) GABA, 99 (21%) SV2A, and 104 (22%) MM. After adjusting for covariates, GABA patients had more seizures in the past 30 days vs MM, SCB, or SV2A, (19.5 vs. 2.17, 2.62, 0.53; each $p<0.001$). Patients on SCB or SV2A vs. MM had higher mental component HRQoL scores (45.89, 45.57 vs. 40.02, both $p<0.05$), higher health utilities (0.69, 0.68 vs. 0.63, both $p<0.05$), less overall work impairment (11.80%, 7.09% vs. 60.68%, both $p<0.05$), and lower total indirect costs ($1,256, $345 vs. $20,783, both $p<0.05$). No differences in HRU and direct costs were observed. **CONCLUSIONS:** In this nationally-representative survey, non-adherent patients with epilepsy treated with SCB and SV2A AEDs had fewer seizures, higher mental well-being and health utilities, decreased work impairment, and lower indirect costs versus other AED classes.

PND8

CURRENT TREATMENT PRACTICES AND THEIR EFFICACY AND SAFETY IN REFRACTORY OR SUPER-REFRACTORY STATUS EPILEPTICUS: A SYSTEMATIC REVIEW

Sharan N[1], Srivastava K[1], Akehurst R[2], Erder H[3], Strzelczyk A[4], Bonthapally V[5]
[1]*BresMed Health Solutions, Panjim, India,* [2]*Bresmed Health Solutions, Sheffield, UK,* [3]*M. H. Erder Health Economics, Livingston, NJ, USA,* [4]*Goethe University, Frankfurt am Main, Germany,* [5]*Sage Therapeutics, Inc., Cambridge, MA, USA*

OBJECTIVES: To assess the efficacy and safety of treatments for refractory or super-refractory status epilepticus (RSE/SRSE). **METHODS:** The following databases were searched: Embase, Medline, Medline in-process, PsycINFO, Cochrane using keywords "'status epilepticus", "epilepsy", "seizure", "random", "cohort", "observational". Randomized controlled trials (RCTs), non-RCTs, and observational studies were included. **RESULTS:** Database searches (August 2015) retrieved 6751 citations. Of these, 912 full-texts were screened for eligibility, after which 156 were considered as eligible. After further screening, nine RCTs, 10 non-RCTs and 120 observational studies were extracted. Super-Refractory Status Epilepticus. **CONCLUSIONS:** Findings suggest that there is no consensus for the management and definitions of RSE conditions. Agents such as valproate, propofol, midazolam and diazepam achieved good seizure control for RSE patients during continuous IV therapy but successful weaning from general anaesthetics has not been well studied. Well-designed prospective trials are needed to establish the efficacy and tolerability of RSE and SRSE treatments.

PND9

A MIXED TREATMENT COMPARISON OF DROXIDOPA AND MIDODRINE FOR THE TREATMENT OF NEUROGENIC ORTHOSTATIC HYPOTENSION

Han Y[1], Joe W[1], Chen JJ[2]
[1]*Cello Health, Yardley, PA, USA,* [2]*Marshall B. Ketchum University, Fullerton, CA, USA*

OBJECTIVES: No head-to-head comparisons of droxidopa and midodrine for neurogenic orthostatic hypotension (nOH) have been conducted. nOH is due to underlying neurologic disorders and is characterized by ≥20 mm Hg decrease in systolic blood pressure (sBP) or ≥10 mm Hg decrease in diastolic BP within 3 minutes of standing. This research was conducted to provide a systematic indirect comparison of droxidopa and midodrine. **METHODS:** A mixed treatment comparison (MTC) was conducted using a Bayesian hierarchical model allowing for indirect comparison of the interventions. Randomized controlled trials (RCTs) for analysis inclusion were identified using a systematic literature review. RCTs were assessed for comparability based on patient population and outcome measures. Improvement in standing sBP was the efficacy outcome measured for this analysis. Supine hypertension risk was assessed as a commonly reported measure of safety. **RESULTS:** The network of 6 RCTs were included; 12 treatment arms across studies facilitated the indirect comparison of midodrine and droxidopa. There was reasonable agreement between number of unconstrained data points, residual deviance and pair-wise results, suggesting a coherent network. The fixed-effect 95% credibility intervals for sBP improvement (mm Hg) from baseline relative to placebo were (11.35, 22.95) for midodrine and (1.61, 8.90) for droxidopa, respectively (positive numbers indicate improvement over placebo). MTC estimates of 95% credibility levels for supine hypertension risk ratio (relative to placebo) were (1.2, 20) for midodrine and (0.72, 2.7) for droxidopa. Due to limitations of the clinical data, potential confounding factors (eg, gender and formulation differences) were not accounted for in examining treatment effects. **CONCLUSIONS:** Droxidopa and midodrine were both more effective versus placebo in increasing sBP, with a larger effect observed with midodrine treatment. However, midodrine was also associated with significantly greater risk of supine hypertension compared with placebo, while no statistically significant increased risk was observed with droxidopa.

PND10

RETROSPECTIVE ANALYSIS OF TWO CLINICAL STAGING SYSTEMS FOR AMYOTROPHIC LATERAL SCLEROSIS (ALS) USING DATA FROM A PHASE III TRIAL OF EDARAVONE

Bornheimer R[1], Dukes EM[1], Agnese W[2], Merrill C[2], Oster G[3]
[1]*Policy Analysis Inc. (PAI), Brookline, MA, USA,* [2]*MT Pharma America, Inc., Jersey City, NJ, USA,* [3]*Policy Analysis Inc. (PAI) and Managing Co-Director, MINERVA Health Economics Network, Brookline, MA, USA*

OBJECTIVES: To evaluate the utility of the King's ALS Clinical Staging System (King's) and the Milano-Torino Staging System (MITOS) in capturing disease progression in a Phase III trial (Protocol MCI186-J19), in which edaravone was found to delay functional decline over 24 weeks, as assessed by the Revised ALS Functional Rating Scale (ALSFRS-R). **METHODS:** In MCI186-J19, patients with ALS were randomized to receive edaravone 60 mg/d (n=69) or placebo (n=68) for six 4-week cycles, after which all could receive 6 more cycles of open-label edaravone. Using patient-level data from this trial, we retrospectively mapped ALSFRS-R item scores at baseline and all follow-up assessments to King's and MITOS using published algorithms. We examined the percentage of subjects who experienced any decline in King's and MITOS, respectively, by weeks 24 and 48; we also examined the percentage of subjects who experienced a ≥2-stage decline in MITOS. **RESULTS:** Eighty percent of subjects in MCI186-J19 were King's Stage 1 or 2 at baseline; all were MITOS Stage 0. By week 24, 42.0% (95% confidence interval [CI]: 30.4%, 53.6%) of patients randomized to receive edaravone had experienced a decline in King's stage vs 55.9% (44.1%, 67.6%) of those randomized to receive placebo; corresponding figures for ≥1- and ≥2-stage declines in MITOS were 46.4% (34.8%, 58.0%) vs 47.1% (35.3%, 58.8%), and 2.9% (0.0%, 7.2%) vs 5.9% (1.5%, 11.8%), respectively. By week 48, 72.5% (62.3%, 82.6%) of edaravone-to-edaravone patients, and 79.4% (69.1%, 88.2%) of placebo-to-edaravone patients, had experienced a decline in King's stage; corresponding figures for ≥1-stage and ≥2-stage declines in MITOS were 66.7% (55.1%, 76.8%) vs 73.5% (63.2%, 83.8%), and 10.1% (4.3%, 17.4%) vs 23.5% (13.2%, 33.8%), respectively. **CONCLUSIONS:** Our retrospective study suggests that both King's and MITOS possibly may be useful in capturing differences in disease progression in clinical trials of new therapeutic agents in ALS.

PND11

FEASIBILITY OF A COMPARATIVE META-ANALYSIS OF VMAT2 INHIBITORS FOR THE TREATMENT OF TARDIVE DYSKINESIA

Caroff SM[1], Aggarwal S[2], Yonan C[3]
[1]*Perelman School of Medicine, University of Pennsylvania, Philadelphia, PA, USA,* [2]*NOVEL Health Strategies, Chevy Chase, MD, USA,* [3]*Neurocrine Biosciences, Inc., San Diego, CA, USA*

OBJECTIVES: Tardive dyskinesia (TD) is a persistent and often disabling movement disorder associated with antipsychotic therapy for which there is no approved treatment. Tetrabenazine, a vesicular monoamine transporter 2 (VMAT2) inhibitor, has been studied for the treatment of TD and is listed in TD treatment guidelines. Two novel VMAT2 inhibitors have shown promising efficacy in recent clinical trials. The objective of this analysis was to assess the feasibility of conducting a meta-analysis comparing tetrabenazine versus the VMAT2 inhibitors in development. **METHODS:** A systematic literature search of clinical trials for use of selective VMAT2 inhibitors in TD was undertaken in the databases Pubmed, Embase and OVID (1980-August 2016). Data were collected for the study design, duration, size, sites, comparators, outcomes, efficacy and safety. Feasibility assessment for meta-analysis was conducted based on the potential for developing an evidence network for all selective VMAT2 inhibitors. **RESULTS:** Out of 479 references, 11 studies were relevant in 893 patients with movement disorders, including TD, for three VMAT2 inhibitors valbenazine, deutetrabenazine and tetrabenazine. Two TD randomized controlled trials (RCTs) were identified for valbenazine (N=325) and one for deutetrabenazine (N=117). No RCTs were identified for tetrabenazine. All studies for tetrabenazine (n=8) were case series or open-label trials, with a median sample size of 20 TD patients. 7 of 8 studies defined efficacy by a subjective assessment of "improvement". One (single-arm) study used the AIMS. Valbenazine's KINECT2 and KINECT3, and deutetrabenazine's ARM-TD were multi-site, randomized, placebo-controlled studies. Efficacy was evaluated by centralized, blinded raters using the standardized assessment (AIMS). Safety and tolerability were evaluated at every study visit. **CONCLUSIONS:** Due to a lack of controlled and blinded studies with validated primary endpoints, published evidence supporting the efficacy and safety of tetrabenazine as a treatment for TD cannot be compared to novel VMAT2 inhibitors in a meta-analysis.

PND12

REAL-WORLD EVIDENCE FOR DISEASE-MODIFYING DRUGS IN MULTIPLE SCLEROSIS: TRENDS IN THE LITERATURE

Edwards NC[1], Beckerman R[2], Phillips AL[3]
[1]*Health Services Consulting Corporation, Boxborough, MA, USA,* [2]*Maple Health Group, LLC, New York, NY, USA,* [3]*EMD Serono, Inc., Rockland, MA, USA*

OBJECTIVES: To summarize trends in published literature regarding real-world evidence (RWE) for disease-modifying drugs (DMDs) in patients with multiple sclerosis (MS). **METHODS:** A systematic search of peer-reviewed studies published from 2010 to 2016 using the PubMed database was conducted. Studies evaluating RWE (prospective [cohort studies, registries, case studies/series, surveys, or randomized naturalistic trials] and retrospective [administrative claims, electronic health record, and chart reviews] studies) were included. Search terms used were: multiple sclerosis AND (disease modifying OR interferon OR peginterferon OR glatiramer OR fingolimod OR teriflunomide OR dimethyl fumarate OR natalizumab OR mitoxantrone OR alemtuzumab OR daclizumab) AND (cohort OR observational OR retrospective OR database). The search was restricted to articles published in English. Publications that did not report primary data were excluded. **RESULTS:** A total of 882 articles were identified using the search strategy; 313 were excluded (69 not evaluating MS, 70 not evaluating DMDs, 45 reviews/editorials, 37 pre-clinical/clinical studies, 35 study design/methodological studies, 33 meta-analyses, and 24 models). Two-thirds (68.4%) of the studies were prospective and one-third (31.6%) were retrospective. DMD types included were: self-injectables only (36.4%); orals only (6.7%); infusion therapies only (26.4%); self-injectables and orals (1.8%); self-injectables and infusion therapies (7.4%); orals and infusion therapies (2.8%); or self-injectables, orals, and infusion therapies (18.6%). Most studies were comparative (69.1% vs 30.9% noncomparative). Outcomes evaluated included relapses (44.6%), disease/disability progression (39.7%), safety/tolerability (32.0%), biomarkers (24.8%), brain activity (21.1%), adherence (19.7%), patient-reported outcomes (17.0%), resource use (6.9%), and cost (4.6%). From 2010 to 2016, the annual number of studies increased from 47 to 130. The proportion from Europe increased from 51.1% to 60.8%, whereas the proportion from the US decreased from 38.3% to 21.5%. **CONCLUSIONS:** The prominence and types of RWE studies examining DMDs in MS is growing; additional research is needed to determine the quality of studies and the impact on decision making.

PND14

DRUG-SPECIFIC DISCONTINUATION RATES FOR AVAILABLE MULTIPLE SCLEROSIS TREATMENTS

Brouwer E, Carlson JJ, Zimmermann M
University of Washington, Seattle, WA, USA

OBJECTIVES: To estimate drug-specific annual discontinuation rates for available disease modifying treatments of relapse remitting multiple sclerosis

(RRMS). **METHODS:** We considered the following disease modifying treatments for RRMS: teriflunomide, dimethyl fumarate, fingolimod, peginterferon B1-a, interferon B-1a (Rebif®, Avonex®, and Betaseron®), daclizumab, glatiramer acetate, natalizumab, ocrelizumab, and alemtuzumab. The discontinuation rates for each drug were derived from 26 clinical studies included in the Institute for Clinical and Economic Review-sponsored base-case network meta-analysis of multiple sclerosis; 2 studies were excluded because they did not include reasons for discontinuation. For each study, the total number of study participants, the total number of participants who discontinued, and the number who discontinued due to non-protocol related reasons were extracted. Reasons for discontinuation that were excluded from final discontinuation rates included death, refusal to sign re-consent form, withdrawing consent, protocol violation, administrative problems, or deviation from protocol. All other reasons for discontinuation were included. The percent of those discontinuing for qualified reasons out of the total number of study participants was then annualized. For each drug, an average of the annualized discontinuation percentages was taken, weighted by total study participants in each study. Results consider both proportions and their equivalent rates. **RESULTS:** Annual treatment discontinuation ranged from 1.9% to 15.5% of patients, with an average annual discontinuation of 7%. Teriflunomide (7mg, Aubagio®) and Dimethyl fumarate (Tecfidera®) had the highest discontinuation rates of available treatments with 15.5% and 13.3% annual discontinuation, respectively. Natalizumab (Tysabri®), ocrelizumab (Ocrevus®), interferon beta-1a (250 mcg, Betaseron®), and alemtuzumab (Lemtrada®) had annual discontinuation proportions below 5%. Most common reasons for treatment discontinuation included adverse events, disease progression, and loss to follow up. **CONCLUSIONS:** Disease-modifying treatments for relapse-remitting multiple sclerosis are associated with varying responses and subsequent discontinuation; providers and patients should consider likelihood of discontinuation when choosing treatment.

PND15

THE BURDEN OF ILLNESS ASSOCIATED WITH SUPER REFRACTORY STATUS EPILEPTICUS (SRSE)

Rycroft C[1], Sabar U[1], Bonthapally V[2], Hunt I[3], Erder H[4], Meng Y[1], Akehurst R[1], Strzelczyk A[5]

[1]*Bresmed Health Solutions, Sheffield, UK,* [2]*Sage Therapeutics, Inc., Cambridge, MA, USA,* [3]*Sage Therapuetics, Inc., Cambridge, MA, USA,* [4]*M. H. Erder Health Economics, Livingston, NJ, USA,* [5]*Goethe University, Frankfurt am Main, Germany*

OBJECTIVES: SRSE is a life-threatening form of status epilepticus (SE) that continues or recurs despite multiple therapeutic interventions (first-, second-, and third-line agents). We set out to review information on the epidemiology, health-related quality of life (HRQoL) and economic burden associated with refractory SE (RSE) and SRSE. **METHODS:** A structured, comprehensive literature review was conducted to identify articles from literature databases, guideline databases, regulatory and health technology assessment agency websites and conference proceedings. Data were extracted from eligible articles (reporting on RSE or SRSE and providing data on at least one topic of interest). Summaries of studies meeting predefined criteria are presented. **RESULTS:** One hundred and sixty articles met the inclusion criteria. Projections or estimates of epidemiology varied by country; incidence of SRSE was 13/100,000 cases/year in the US (1 article) and 3/100,000 cases/year in Germany (1 article). Publications on humanistic burden of SRSE (8 articles) reported that patients with SRSE had a lower HRQoL compared with RSE patients. However, patients with RSE (30 articles) also experienced functional impairment and required considerable care after discharge. Caregiver burden of RSE and SRSE was sparsely reported (SRSE: n=0; RSE: n=2); however, surveys of parent views indicated that parents found it stressful when their child had a RSE episode; however, despite this, their main priority during an RSE episode was to stop their child seizing as quickly as possible. Although economic data were limited (7 articles), the cost of SRSE is considerable; in one study, total annual direct costs of cases identified using the study algorithm as SRSE, accounted for €122.8 million in Germany (2013). **CONCLUSIONS:** To our knowledge this is the first comprehensive structured literature review on the humanistic and economic burden associated with RSE and SRSE. Our review indicates that the evidence base is limited but the burden of SRSE and RSE is clearly substantial.

PND16

INCIDENCE AND PREDICTORS OF ANTIPSYCHOTICS USE AMONG PATIENTS WITH PARKINSON'S DISEASE

Chekani F, Bali V, Aparasu RR

University of Houston, Houston, TX, USA

OBJECTIVES: Most antipsychotics are considered potentially inappropriate in patients with Parkinson's disease (PD). Limited research exists regarding factors contributing to the use of antipsychotics in patients with PD. This study examined the incidence and predictors of antipsychotic use among patients with newly diagnosed PD. **METHODS:** This cohort study used a large administrative database from 2000 to 2015 the Medical Outcomes Research for Effectiveness and Economics Registry (MORE2 Registry®). The study sample included adult patients with PD (ICD-9-CM 332.0). Patients were followed for 3 years and Cox regression was used to examine factors associated with initiation of antipsychotics after PD diagnosis. Several demographics and clinical characteristics were included in the Cox model based on previous literature and availability in data. **RESULTS:** The study population included 1,470 patients with Parkinson's disease. The mean age of the sample was 72.06 years (SD = 9.86). The incidence of antipsychotics use was 19.25% over 3-years follow up and quetiapine was the most frequently used antipsychotic agent (44.88%) in this study. The likelihood of using antipsychotics was significantly higher for PD patients with a history of antipsychotics use (Hazard Ratio, HR=2.08, P<0.01), dementia (HR=2.02, P<0.01), depression (HR=1.91, P<0.01), and schizophrenia (HR=1.49, P=0.02). Antipsychotics were less likely to be prescribed for PD patients using levodopa (HR=0.59, P<0.01), dopamine agonists (HR=0.69, P=0.02), catechol-O-methyl transferase inhibitors (HR=0.61, P=0.04) or other antiparkinson agents (HR=0.733, P=0.04). **CONCLUSIONS:** Antipsychotics are commonly used to control behavioral symptoms of patients with PD; however, most of these are considered potentially inappropriate in PD. Understanding the factors contributing to the use of antipsychotics can be helpful in optimizing use of these medications and improving pharmaceutical care for patients with PD.

PND17

ALLERGIES RATHER THAN ANTIBIOTICS USE ARE ASSOCIATED WITH MULTIPLE SCLEROSIS

Ren J[1], Ni H[2], Kim M[1], Cooley KL[3], Asche CV[1]

[1]*University of Illinois College of Medicine at Peoria, Peoria, IL, USA,* [2]*Illinois State University, Normal, IL, USA,* [3]*OSF Healthcare System, Peoria, IL, USA*

OBJECTIVES: The risk factors and etiology of multiple sclerosis (MS) remains unclear and controversial. Previous studies have reported contradictory associations between antibiotics use and MS, which leads more to the ongoing dispute. We hypothesized that antibiotics use might be a mediator of the association between allergies and MS. Thus, our study aimed to examine their intrinsic relationships among antibiotics use, allergy disease and MS. **METHODS:** A 1:3 matched case-control study was performed using the National Ambulatory Medical Care Survey database from 2006 to 2013 in the USA. MS cases were identified based on the ICD-9 code "340" in any diagnosis position. MS cases were matched to their controls based on year, age (difference≤3 years), gender, race, payer type and region utilizing SAS 9.4. Allergy diseases and antibiotics prescriptions were extracted by ICD-9 code and drug classification code, respectively. A generalized structural equation model was built in STATA 13.1 based on our hypothesis. **RESULTS:** The weighted prevalence of MS was 133.7 per 100,000 visits. Total 829 MS patients and 2441 controls were matched. When including allergy diseases in the model, use of penicillin or other antibiotics were no longer significantly negatively associated with MS. Patients with respiratory tract allergies were more likely to use penicillin (Odds ratio [OR]=8.44, p<0.001) and other antibiotics (OR=3.93, p<0.001), but the association was not found in patients with skin allergies. Notably, both respiratory tract allergies (OR=0.26, p<0.001) and skin allergies (OR=0.38, P=0.017) were inversely associated with the risk of MS. **CONCLUSIONS:** Antibiotics use might play a mediator role between the association between allergies and MS, which has not been reported in previous studies. History of allergy diseases might be considered as a protective factor of MS, suggesting that the development of immune responses against stimulatory environmental factors could inhibit responses to auto-antigens.

PND18

MORTALITY IN ALZHEIMER'S DISEASE: A SYSTEMATIC LITERATURE REVIEW

Sawant RV[1], Potashman M[2]

[1]*University of Houston, Houston, TX, USA,* [2]*Biogen, Cambridge, MA, USA*

OBJECTIVES: Mortality plays an important role in the economic evaluation of new therapies for Alzheimer's disease (AD). A systematic literature review was conducted to consolidate data on the estimates and key variables influencing economic modeling of mortality/survival in AD. **METHODS:** Relevant English-language studies were identified using a systematic literature search of Pubmed databases. Included studies (full-text) were required to report estimates for mortality/survival in AD stratified on at least one of three previously identified key variables: age, gender and AD severity. Exclusion criteria were animal studies, basic science/molecular studies, non-AD specific, lack of sound methodology, and follow-up time ≤ 2 years. **RESULTS:** A total of 12 studies were included in the final review, with 6 studies deriving estimates from newly-identified patients and 6 from presumably-prevalent patients. AD was classified using standard NINCDS-ADRDA criteria. Hazard ratios and relative risk estimates varied across the studies due to variability in the reference groups (AD vs non-AD; within-group comparisons of age/gender/AD-severity) and control variables. However, some commonalities were observed; the HR for 5-point increment in MMSE was reported by 3 studies (1 incident, 2 prevalent) and ranged from 1.11 to 1.66. Estimates for median survival [ST] were very similar among studies with incident patients, and decreased with increasing age [range = 6-7.5 years (age<75) and 3.5-4.9 years (age>85)]. The ST of AD patients was 32%-75% that of age- and gender- matched controls, with largest differences observed in patients <85. Overall, older age, male gender and greater disease severity were associated with shorter survival and increased risk of mortality in AD. **CONCLUSIONS:** Insights can be obtained from a systematic review of AD mortality data that demonstrate the increased risk of death from AD, however heterogeneity in reporting of findings impedes comprehensive meta-analysis. Future research on obtaining pooled estimates for use in economic models is warranted.

NEUROLOGICAL DISORDERS – Cost Studies

ALLOCATING PROVIDER RESOURCES TO ACCURATELY DIAGNOSE AND TREAT RESTLESS LEGS SYNDROME: A COST-EFFECTIVENESS ANALYSIS

Padula WV[1], Phelps CE[2], Onyekwere U[3], Moran D[3], Earley C[4]

[1]*Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, USA,* [2]*University of Rochester, Gualala, CA, USA,* [3]*Johns Hopkins Bloomberg School of Public Health, BALTIMORE, MD, USA,* [4]*Johns Hopkins Medicine, Baltimore, MD, USA*

OBJECTIVES: Restless legs syndrome (RLS) is a neurological disorder that is frequently underdiagnosed and misdiagnosed. Patients exhibiting RLS symptoms are often initially misdiagnosed with peripheral neuropathy, anxiety, sleeping disorder, or deep venous thrombosis, resulting in delays in proper treatment. Our objective was to analyze the cost-effectiveness of training primary care physicians in early and accurate diagnosis of RLS. **METHODS:** We used a Markov model to compare two strategies: one where primary care providers receive training to

diagnose RLS (informed care) and one where primary care providers do not receive training (standard care). This analysis was conducted from the U.S. societal perspective over 1, 5, and 50 years. Costs were adjusted to 2016 US dollars. Effectiveness was measured in units of quality-adjusted-life-years (QALYs). Costs and QALYs were discounted by 3%. Cost, utilities, and probabilities for the model were obtained through a comprehensive review of literature. An incremental cost-effectiveness ratio (ICER) was calculated to interpret our findings at a willingness-to-pay threshold of $100,000/QALY. Univariate and multivariate analyses were conducted, as was a probabilistic sensitivity analysis, to test model uncertainty. The Expected Value of Perfect Information was also calculated. **RESULTS:** In our lifetime model, providing training to primary care providers to correctly diagnose RLS was found to be cost-effective at willingness to pay (WTP) of $100,000 with an ICER of $4,593/QALY. The incremental cost for the informed care strategy was $2,021 per patient and the incremental effectiveness was 0.44 QALYs per patient. The model was sensitive to the utility for treated and untreated RLS. The probabilistic sensitivity analysis revealed that at the WTP threshold of $100,000, informed care had a 65.5% chance of being cost-effective. **CONCLUSIONS:** A program to train primary care providers to better diagnose RLS appears to be a cost-effective strategy for improving outcomes for patients suffering from RLS.

PND21

DOES THE COMMERCIAL AVAILABILITY OF CLOBAZAM AFFECT HEALTHCARE RESOURCE UTILIZATION AND COSTS AMONG PATIENTS WITH LENNOX-GASTAUT SYNDROME?

Francois C[1], Stern JM[2], Ogbonnaya A[3], Lokhandwala T[3], Duhig A[4], Shen V[1], Tan R[3], Kymes S[1]

[1]*Lundbeck, LLC, Deerfield, IL, USA,* [2]*University of California, Los Angeles, Los Angeles, CA, USA,* [3]*Xcenda, LLC, Scientific Consulting, Palm Harbor, FL, USA,* [4]*Xcenda, LLC, Palm Harbor, FL, USA*

OBJECTIVES: To compare healthcare resource utilization (HCRU) and costs on a per-patient-per-month (PPPM) basis among patients with probable Lennox-Gastaut syndrome (LGS) before and after the commercial availability of clobazam. **METHODS:** In this retrospective population study, de-identified data from MarketScan® Commercial and Medicare Supplemental databases (November 1, 2008 through November 2, 2014) were used to identify patients with probable LGS (≥2 medical claims for generalized convulsive or non-convulsive epilepsy and ≥1 medical claim for developmental disorder or cognitive impairment). The resulting cohort was stratified into two groups based on the commercial availability of clobazam: pre-clobazam (November 1, 2008–November 1, 2011) and post-clobazam (November 2, 2011–November 2, 2014). All-cause and seizure-related HCRU and costs for the pre-clobazam availability group were compared to those of the post-clobazam availability group. **RESULTS:** A total of 15,979 and 16,281 patients with probable LGS were identified prior to and following the commercial availability of clobazam, respectively. The post-clobazam availability group was slightly older than the pre-clobazam availability group (mean [SD]: 31.4 [24.7] vs 30.7 [25.1]; P=0.010); however, the gender distribution was similar. Comorbidities assessed were mostly similar between the groups with a few exceptions. There were significantly fewer seizure-related emergency department (ED; P=0.025), physician office (P<0.001), neurologist (P<0.001), primary care (P=0.002), and laboratory (P=0.045) visits (PPPM) among the post-clobazam availability group versus the pre-clobazam availability group. Seizure-related total (P<0.001), medical (P<0.001), physician office (P<0.001), neurologist (P=0.009), and laboratory (P=0.020) PPPM costs significantly decreased among the post-clobazam availability group versus the pre-clobazam availability group. No significant difference was observed when seizure-related prescription costs were compared between groups. A similar trend was observed with all-cause HCRU and costs. **CONCLUSIONS:** Patients with probable LGS experienced a reduction in all-cause and seizure-related HCRU and costs following the commercial availability of clobazam. Funding: Lundbeck

PND22

HEALTHCARE COSTS AMONG PATIENTS WITH LENNOX-GASTAUT SYNDROME TREATED WITH CLOBAZAM

Pina-Garza JE[1], Montouris GD[2], Vekeman F[3], Cheng WY[4], Tuttle E[5], Shen Y[4], Duh MS[4], Chatamra K[6], Kymes SM[6]

[1]*The Children's Hospital at TriStar Centennial Medical Center, Nashville, TN, USA,* [2]*Boston University School of Medicine, Boston, MA, USA,* [3]*Groupe d'analyse, Ltée, Montréal, QC, Canada,* [4]*Analysis Group, Inc., Boston, MA, USA,* [5]*Analysis Group, Inc., Menlo Park, CA, USA,* [6]*Lundbeck LLC, Deerfield, IL, USA*

OBJECTIVES: This retrospective analysis of healthcare claims data was conducted to examine healthcare costs in patients with probable Lennox-Gastaut syndrome (LGS) treated with clobazam (CLB). **METHODS:** Patients with likely LGS were identified from epilepsy patients (≥2 claims for epilepsy [ICD-9-CM 345.xx] or unspecified epilepsy [ICD-9-CM 780.39]) in 6 state Medicaid databases using a random forest machine-learning algorithm. CLB users were defined as having ≥2 prescription claims for CLB and ≥1 year of continuous enrollment before CLB initiation (index date). Monthly healthcare costs were estimated for pre-CLB (1 year before index date) and post-CLB (to end of data availability) periods. Generalized estimating equations were used to characterize and predict time trends before and after CLB initiation. To estimate the impact of CLB use on healthcare costs, the slope of monthly costs before CLB initiation was extrapolated beyond the index date and compared to post-CLB costs. The difference was quantified by calculating areas under the curve (AUCs). **RESULTS:** A total of 1,301 likely LGS patients were identified. Mean (SD) duration of observation post-CLB initiation was 1.60 (0.86) years. When compared to extrapolated costs without CLB during the post-CLB period, CLB treatment was associated with significant reductions in total all-cause, total epilepsy-related, and inpatient medical costs (P<0.05), and a nonsignificant increase in home care costs (P=0.45). The difference in AUCs was equivalent to a reduction of $1,538.89 (3.80%) in all-cause healthcare costs in the year after CLB initiation, and reductions of $2,236.34 (11.99%) and $3,112.29 (26.66%) for total epilepsy-related and inpatient costs, respectively. The cost increase for home care was $1,839.74 (11.62%). **CONCLUSIONS:** Results from this study indicate that CLB initiation in LGS patients is associated with reduced healthcare costs, mainly driven by lower inpatient costs. Funded by Lundbeck

PND23

ECONOMIC IMPLICATIONS OF REPLACING INTERFERON BETA-1A WITH OCRELIZUMAB IN RELAPSING MULTIPLE SCLEROSIS

Thomas N, Ma E, Yu EB

Genentech, Inc., South San Francisco, CA, USA

OBJECTIVES: Multiple sclerosis (MS) is a chronic, inflammatory disease of the central nervous system and a leading cause of disability in young adults. Ocrelizumab (OCR), a humanized monoclonal antibody that selectively targets CD20+B cells, demonstrated superior efficacy compared with subcutaneous interferon beta-1a (IFN β-1a) in reducing the number of relapses and delaying disease progression in patients with relapsing forms of MS (RMS) in two identical Phase III, randomized controlled clinical trials (OPERA I and OPERA II). We assessed the economic implications of relapses avoided with OCR compared with IFN β-1a from a US payer perspective. **METHODS:** Using the OPERA I and OPERA II efficacy data, the economic implications of relapses avoided with OCR 600 mg every 24 weeks compared with subcutaneous IFN β-1a 44 μg three times weekly were quantified in terms of total two-year relapse costs and total cost per patient per year. Only direct costs were evaluated in 2016 US dollars. The total costs evaluated included the cost of relapse and annual treatment-related costs. **RESULTS:** In OPERA I and OPERA II, 140 fewer protocol-defined relapses were observed with OCR compared with IFN β-1a over 2 years, and the annualized relapse rate at 2 years was lower with OCR vs IFN β-1a (0.156 vs 0.291, respectively). The relapses avoided with OCR over 2 years are associated with an estimated cost offset of $816,340 in relapse-related medical costs and with an average annual total cost offset of $18,745 per patient. **CONCLUSIONS:** The superior clinical efficacy of OCR compared with IFN β-1a in patients with RMS in the OPERA studies is associated with cost offsets based on relapse costs over 2 years and total costs per patient per year. Funded by Genentech, Inc.

PND24

DIRECT COSTS OF CYSTIC FIBROSIS IN THE UNITED STATES: EVIDENCE FROM 2010-2014 MEDICAL EXPENDITURE PANEL SURVEY

Kim M, Ren J, Chittivelu S, Asche CV

University of Illinois College of Medicine at Peoria, Peoria, IL, USA

OBJECTIVES: The cystic fibrosis (CF) is a genetic disorder requiring medical care for whole lifespan. A previous study reported that an incremental medical care expenditure of CF was $45,927 (2006 US dollar) per person per year based on private insurance claims database. However, the national cost burden of CF remains unknown. This study aimed to examine the nationally representative direct cost burden of CF at individual and national levels. **METHODS:** We conducted pooled cross-sectional analyses using 2010-2014 Medical Expenditure Panel Survey dataset. CF patients were identified with the ICD-9 code "277" from Medical Condition file. We employed multivariable two-part models consisting of logit and generalized linear model with log link and gamma distribution. The total expenditure was an outcome variable, summing up expenditures of office-based visit, outpatient visit, emergency department visit, inpatient visit and medication. Covariates included age, gender, race, marital status, education, family poverty level, insurance type, region and year. Adjusted incremental direct costs of CF were obtained compared to patients without CF. All costs were converted to 2014 US dollar using Medical Care components of Consumer Price Index. **RESULTS:** The unweighted (weighted) sample sizes for CF and non-CF patients were 163 (423,202) and 163,430 (313,057,747), respectively. The weighted annual prevalence of CF was 1.35 per 1,000 persons. The incremental medical expenditure of CF was $11,283 (p=0.003) per person per year. The major contributor of incremental medical expenditure was medication expenditure ($2,783, p=0.034) followed by inpatient expenditure ($2,702, p=0.123) and office visits ($1,153, p=0.003). Total national medical expenditure was $955 million per year. **CONCLUSIONS:** The direct cost burden of CF was considerable although it was lower than the case of privately insured population. Further research on indirect costs is necessary for CF patients.

PND25

INCREMENTAL ECONOMIC BURDEN OF CARDIOMETABOLIC DISORDERS AMONG PATIENTS WITH EPILEPSY

Ajmera MR, Goyal RK, Davis KL

RTI Health Solutions, Research Triangle Park, NC, USA

OBJECTIVES: Extensive evidence exists showing high prevalence and costs of psychiatric comorbidities in patients with epilepsy, but burden of non-psychiatric comorbidities in these patients has not been widely explored. Recent estimates indicate an elevated prevalence of cardiometabolic disorders (CMDs) among patients with epilepsy. This study examines the prevalence and incremental economic burden of CMDs in a US epilepsy cohort. **METHODS:** This study utilized a cross-sectional, retrospective study design using data from alternate multiple years (2008/2010/2012/2014) of the Medical Expenditure Panel Survey. Adults with epilepsy were identified using the ICD-9-CM code for epilepsy (345.xx). CMDs included diabetes, endocrine disorders, heart disease, and hypertension. Annual healthcare expenditures for hospitalizations, emergency room and outpatient visits, prescription drugs, dental care, and other services were assessed. T-tests were used to examine unadjusted differences in average annual healthcare expenditures between epilepsy patients with and without CMDs. Ordinary least squares (OLS) regression on log-transformed healthcare expenditures, adjusted for demographic, socioeconomic, and clinical characteristics, were conducted to estimate the magnitude of excess healthcare expenditures associated with CMDs.

All analyses were weighted to control for the complex sample design of MEPS. **RESULTS:** Among adults with epilepsy (unweighted n=252; weighted n=2.8 million), 37.8% had comorbid CMDs. Patients with comorbid epilepsy and CMDs had approximately three times higher total annual expenditures than patients without CMDs ($15,359 vs $5,314 [P<0.001]). Annual expenditures for prescription drugs and outpatient services were major contributors for the increased healthcare expenditures among patients with epilepsy and CMDs. OLS regression indicated that patients with comorbid CMDs had 45% (β=0.372;exp[β]=1.45;P<0.001) higher expenditures than patients without CMDs. **CONCLUSIONS:** The current study highlights the high prevalence of CMDs and increased healthcare expenditures due to CMDs in patients with epilepsy. The potential burden of comorbid CMDs should be considered by providers in the comanagement of chronic conditions in patients with epilepsy.

PND26

COST CONSEQUENCE ANALYSIS OF SC PEGINTERFERON BETA-1A EVERY 2 WEEKS VERSUS SC INTERFERON BETA-1ATIW IN PATIENTS WITH RRMS IN FIVE EUROPEAN COUNTRIES

Watson C[1], Gitlin M[2], Snyder S[3]
[1]Biogen, Cambridge, MA, USA, [2]BluePath Solutions, Los Angeles, CA, USA, [3]BluePath Solutions, Santa Monica, CA, USA

OBJECTIVES: To evaluate the economic and clinical impacts of treatment with subcutaneous peginterferon beta-1a (SC PEG-IFN) vs. SC interferon beta-1a (SC IFN beta-1a) for relapsing-remitting multiple sclerosis (RRMS) in five European countries (EU5): France, Germany, Italy, Spain, and UK. **METHODS:** A cost-consequence model, from the national payer perspective, was developed to compare country-specific costs of treating patients with SC PEG-IFN vs. SC IFN beta-1a. The model evaluates clinical and economic consequences of switching all patients who are currently on SC IFN beta-1a to SC PEG-IFN. A Markov model over two years with three month cycles was computed. Costs of relapse and disability status are from a cross-sectional cost of illness study (Kobelt et al. 2016). The annualized relapse rate and confirmed disability progression hazard ratios for SC PEG-IFN vs. SC IFN beta-1a were estimated using the results from Tolley et al. 2015 and Coyle et al. 2016. The RRMS populations treated with SC IFN beta-1a are from actual 2016 utilization. **RESULTS:** The number of RRMS patients treated with SC IFN beta-1a ranged from 2,810 in France to 11,699 in Germany. The use of SC PEG-IFN in place of SC IFN beta-1a reduced the number of relapses, and cost of DMT, relapse, and disability status in each country. The sum of these cost savings ranged from €9,514,404 in France to €61,955,057 in Germany, for a total savings of €178,871,314 over two years (64.2% due to drug, 27.1% to relapse, and 8.7% to disability status cost savings) across the EU5. Total savings per patient ranged from €3,460 in France to €10,865 in Spain. **CONCLUSIONS:** These results suggest that use of SC PEG-IFN compared with SC IFN beta-1a in the treatment of RRMS is a cost-saving strategy in the EU5. Additional research incorporating adherence and side effects are necessary to analyze treatment options.

PND27

COST CONSEQUENCE ANALYSIS OF SC PEGINTERFERON BETA-1A EVERY 2 WEEKS VERSUS SC INTERFERON BETA-1ATIW IN PATIENTS WITH RRMS IN THE UNITED STATES

Watson C[1], Gitlin M[2], Snyder S[3]
[1]Biogen, Cambridge, MA, USA, [2]BluePath Solutions, Los Angeles, CA, USA, [3]BluePath Solutions, Santa Monica, CA, USA

OBJECTIVES: To evaluate the economic and clinical impacts of treatment with subcutaneous peginterferon beta-1a (SC PEG-IFN) vs. SC interferon beta-1a (SC IFN beta-1a) for relapsing multiple sclerosis (RMS) in the United States. **METHODS:** A cost-consequence model, adopting a national perspective, was developed to compare costs of SC PEG-IFN vs. SC IFN beta-1a. The model evaluates clinical and economic consequences of switching all patients who are currently on SC IFN beta-1a to SC PEG-IFN using costs and baseline clinical characteristics specific to the US. A Markov model over two years with cycle times of three months was computed. Costs of relapse and disability status are from a cost of illness study (Kobelt et al. 2006). The hazard ratios for clinical outcomes of SC PEG-IFN vs. SC IFN beta-1a treatment were estimated using the results from Tolley et al. 2015 and Coyle et al. 2016. The RMS population treated with SC IFN beta-1a is from actual 2016 utilization. **RESULTS:** The number of RMS patients treated with SC IFN-1a was 19,717. The use of SC PEG-IFN in place of SC IFN beta-1a reduced the number of relapses by 10,244 and added 2,129 relapse-free years among the cohort. SC PEG-IFN also slowed disease progression (192 additional patients had an Expanded Disability Status Scale < 6.0 compared to SC IFN beta-1a), and reduced drug costs, relapse costs, and disability status costs. The sum of these cost savings for the cohort was $217,982,252 over two years (86.4% due to drug costs, 12.1% to relapse costs, and 14.5% to disability status cost savings). Total savings per patient were $11,056. **CONCLUSIONS:** The results of this model suggest that use of SC PEG-IFN compared with SC IFN beta-1a in the treatment of RMS in the US is a cost-saving strategy. Additional research incorporating adherence and side effects are necessary.

PND28

EXCESS COSTS ASSOCIATED WITH CENTRAL SLEEP APNEA IN THE ELDERLY

Sussman M, McBee P, Menzin J
Boston Health Economics, Waltham, MA, USA

OBJECTIVES: Central sleep apnea (CSA) occurs when the brain fails to signal the diaphragm to contract during sleep, resulting in an involuntary cessation of breathing. There are limited recent data on the economic and clinical burden of CSA among the elderly. This study evaluated the costs of this disease using data from the Medicare program. **METHODS:** Patients newly diagnosed with CSA between January 1, 2011 and December 31, 2013 ("cases") were identified using the Medicare 5% Standard Analytical Files. Non-CSA controls were identified in the same time period and matched 1:1 to cases. All patients were required to have continuous enrollment 12 months before index and at least 30 days post-index diagnosis. Resource utilization and medical costs were evaluated from index diagnosis to end of continuous enrollment. Matching (exact) variables included: age group, sex, race, geographic region, Charlson comorbidity index group excluding congestive heart failure, index quarter, baseline presence of congestive heart failure and baseline presence of obesity. **RESULTS:** Of approximately 3.2 million patients, 1,981 cases were identified. The final analysis included 730 matched patients in both cohorts; 77.7% were male and mean age was 75 years. In the baseline period, 6.6% of patients were obese. Median follow-up duration was 32.4 months for cases and 30.8 months for controls. Compared to controls, patients with CSA had higher post-index hospitalization utilization (57.5% vs. 49.3%; p=0.002), higher number of visits across all settings (inpatient: 1.66 vs 1.21, p<0.0001; ED: 1.28 vs. 0.73, p<0.0001; Office: 51.95 vs. 19.23, p<0.0001; Outpatient: 19.94 vs. 8.55, p<0.0001), and higher medical costs ($46,112 USD vs. $28,650 USD, p<0.0001). **CONCLUSIONS:** Resource utilization and medical costs for elderly patients with CSA are statistically significantly higher than matched patients without CSA. These results point to the need for interventions to better manage this population.

PND29

THE ECONOMIC BURDEN OF AGITATION IN ALZHEIMER'S DISEASE: A SYSTEMATIC LITERATURE REVIEW

Anatchkova M[1], Brooks A[1], Swett L[1], Harty A[2], Duffy R[3], Baker R[4], Hammer-Helmich L[5], Sanon Aigbogun M[6]
[1]Evidera, Inc., Bethesda, MD, USA, [2]Lundbeck, Deerfield, IL, USA, [3]Otsuka America Pharmaceutical, Inc., Princeton, NJ, USA, [4]Otsuka Pharmaceutical Development & Commercialization, Inc., Princeton, NJ, USA, [5]Lundbeck A/S, Valby, Denmark, [6]Otsuka Pharmaceutical Development & Commercialization, Inc, Princeton, NJ, USA

OBJECTIVES: To evaluate the economic burden of agitation in patients with Alzheimer's disease (AD). **METHODS:** A global systematic literature review was conducted for studies of clinical, humanistic, and economic burden of agitation in AD published in 2006-2016. References of identified papers and related literature reviews were examined. Studies meeting predetermined inclusion criteria for economic burden were summarized. **RESULTS:** Four studies from three countries (two UK, US, The Netherlands) met the inclusion criteria. Studies evaluated different economic outcomes including use of mental health services, health and social care costs, and cost of admission. In the Netherlands, agitation was associated with increased referrals to mental health services and increased economic burden. In the UK, excess cost associated with agitation was established to be £4091 a year per patient, accounting for 12% of their health and social care costs. The cost of admission for patients with behavioral symptoms was higher, but not statistically significant. In the US, a cost-benefit study of three second-generation antipsychotics and placebo reported the mean health service costs (range $1,004-$1,222) and adjusted total average monthly costs (range $1,023-$1,215) were not significantly different across groups. Two relevant literature reviews were examined, neither including papers from the current review. One included studies of economic burden of AD without focus on agitation. The second reported limited availability of studies evaluating economic burden of agitation in AD and used data collected in a systematic review of non-pharmacological interventions for agitation to model economic outcomes. Results suggested incremental increases in health care costs associated with increases in agitation symptoms. **CONCLUSIONS:** Our review has identified a gap in the existing data documenting the incremental economic burden of agitation in AD. Existing evidence suggests an increase in economic burden associated with agitation, however, additional studies are needed.

PND30

HEALTH INSURANCE COST OF HEAD TRAUMA IN HUNGARY: A COST OF ILLNESS STUDY

Oberfrank F[1], Donka-Verebes É[2], Boncz I[3]
[1]Institute of Experimental Medicine, Budapest, Hungary, [2]Integra Consulting Zrt., Budapest, Hungary, [3]University of Pécs, Pécs, Hungary

OBJECTIVES: The aim of our study is to calculate the annual health insurance treatment cost of head trauma in Hungary. **METHODS:** The data derive from the financial database of the Hungarian National Health Insurance Fund Administration (NHIFA), the only health care financing agency in Hungary. We analyzed the health insurance treatment cost and the number of patients for the year 2010. The following cost categories were included into the study: out-patient care, in-patient care, CT-MRI, PET, home care, transportation, general practitioner, drugs and medical devices. Head trauma was identified with the following codes of the International Classification of Diseases 10threvision: S04-S09, S14, S18-S19, S24, S34, T36-T44, T51, T90, T96. **RESULTS:** The Hungarian National Health Insurance Fund Administration spent 3.743 billion Hungarian Forint (HUF) (17.982 million USD) for the treatment of patients with head trauma. The annual average expenditure per patient was 25556 HUF (122.8USD) while the average expenditure per one inhabitant was 374 HUF (1.8 USD). Major cost drivers were acute inpatient care (84.4 % of total health insurance costs), outpatient care (8.8%) and primary care (2.6 %). The number of patients with head trauma was 146.3 per 10000 populations. We found the highest patient number in outpatient care (146465 patients) general practitioners (43243 patients) and acute inpatient care (27861 patients). **CONCLUSIONS:** Head trauma represents a significant burden for the health insurance system. Reimbursement of inpatient and outpatient care are the major cost drivers for head trauma in Hungary.

PND31

COST-EFFECTIVENESS ANALYSIS OF ALEMTUZUMAB FOR THE TREATMENT OF MULTIPLE SCLEROSIS IN BULGARIA, 2016

Djambazov S, Vekov T
Medical University Pleven, Pleven, Bulgaria

OBJECTIVES: The aim of the study is to offer pharmacotherapeutic guidelines for the treatment of relapsing-remitting multiple sclerosis (RRMS) based both on clinical data on therapeutic efficacy and economic data on comparative cost-effectiveness of potential therapeutic alternatives. **METHODS:** A systematic review of the published data on the health technology assessment of ALE for the treatment of RRMS conducted in other countries was carried out. The following databases have been used: MEDLINE, EMBASE, Web of Science, and Cochrane Library, literature from 2012 to 2016. The analysis includes assessments which are a full economic analysis of the cost/effectiveness (CEA) or cost/benefit (CUA) analysis. The benefits are expressed as final health results expressed as quality adjusted life years (QALY). The data on health benefits (Δ QALY) have been directly transferred for the needs of the economic assessment in Bulgaria. The data on drug therapy costs are based on the local reference prices in Bulgaria accessible in the Positive Drug List (PDL) as of August 2016. **RESULTS:** The outcomes of the health technology assessment of ALE for the treatment of patients with RRMS in Bulgaria are in accordance with the results from the published analogous economic analysis in other countries. ALE is a cost-effective therapy in comparison with interferon (IFN) beta-1a – ICER 7822 BGN/QALY, and in comparison with IFN beta-1b – ICER 8698 BGN/QALY. ALE dominates glatiramer acetate, fingolimod, and natalizumab. **CONCLUSIONS:** Data analysis of therapeutic efficacy, safety and pharmacoeconomic analysis leads to the conclusion that alemtuzumab can be recommended as both first and second therapeutic choice for the treatment of patients with active RRMS disease.

PND32

THE COST-EFFECTIVENESS OF CLOZAPINE VS. QUETIAPINE IN THE TREATMENT OF PARKINSON'S DISEASE PSYCHOSIS

Chekani F[1], Sansgiry SS[2]
[1]*University of Houston, Houston, TX, USA,* [2]*College of Pharmacy, University of Houston, Houston, TX, USA*

OBJECTIVES: Parkinson's disease psychosis (PDP) imposes a high economic burden on patients and societal resources. The prevalence of psychosis was estimated to be 25%–60 % in the lifetime course of Parkinson's disease. Clozapine and quetiapine are atypical antipsychotic agents indicated for the treatment of PDP. The aim of this study was to estimate the cost-effectiveness of clozapine and quetiapine in patients with PDP. **METHODS:** This study applied decision tree approach to perform cost-effectiveness analysis, from a third party perspective. The study obtained clinical data from published clinical trials on clozapine and quetiapine in the treatment of PDP. The analysis included all adverse events reported in eligible clinical trials and categorized the subjective complains as mild adverse events. For cost data such as hospitalization, we referred to publically available information; and the Red Book was used for drugs related costs. This study used Clinical Global Impression (CGI) ratings as the measure of effectiveness. The CGI is a brief assessment of the patient's overall clinical improvement prior to and after initiating a treatment. We assumed that the CGI change was zero for patients who were excluded from clinical trials due to non-responsiveness. **RESULTS:** Over the 3-month study period, the main adverse events in clozapine group were asymptomatic leukopenia (1.84%) and leukopenia with sepsis (0.10%). The use of quetiapine was associated with confusional state (2.25%). Mild adverse events occurred in both clozapine (16.85%) and quetiapine (20.32%) groups. The Incremental Cost-Effectiveness Ratios (ICER) were calculated at $763/55 for clozapine and $936/42 for quetiapine. In one way sensitivity analysis, the ICER for quetiapine was consistently negative. **CONCLUSIONS:** In our study, quetiapine had higher costs and lower expected value for effectiveness than clozapine. Future studies should be performed to evaluate the cost-effectiveness of antipsychotics in long-term follow-up of patients with PDP.

PND33

COST-UTILITY OF EARLY VERSUS DELAYED TREATMENT WITH INTERFERON BETA-1B IN CLINICALLY ISOLATED SYNDROME (CIS) FROM A UNITED STATES (US) PAYER PERSPECTIVE

Strand LN, Zimmermann MR, Carlson JJ, Hansen RN
University of Washington, Seattle, WA, USA

OBJECTIVES: To evaluate the cost-effectiveness of early versus delayed treatment with subcutaneous interferon beta-1b in clinically isolated syndrome (CIS), a first neurologic event suggestive of multiple sclerosis (MS) that precedes the majority of MS cases. **METHODS:** We used a three-state (CIS, MS, death) Markov model, annual cycles, a US payer perspective, and a 50 year time horizon to compare early treatment with interferon beta-1b to delayed treatment upon progression to clinically definite MS (CDMS). Clinical data included transition probabilities from CIS to CDMS based on the BENEFIT trial which followed patients for up to 12 years. Data on expected costs and utilities after progression to CDMS were based on a recently published network meta-analysis and cost-effectiveness model of MS. In our model costs included drug treatment and utilization by Kurtzke Expanded Disability Status Scale (EDSS). Patients entered the model at age 30 when they had experienced a CIS suggestive of MS and had $\geq$2 clinically silent lesions on magnetic resonance imaging (MRI). We estimated costs in 2016 USD, projected life-years, and quality adjusted life years (QALYs). The primary outcome was the incremental cost-effectiveness ratio (ICER). **RESULTS:** Early treatment was more expensive ($678K compared to $604K for late treatment) but associated with a greater number of QALYs (8.83 compared to 8.63 for late treatment), with an ICER of $382K per QALY. Mortality in MS and cost of treatment were the most influential model parameters, and preliminary results from a probabilistic sensitivity analysis were consistent with the main analysis. **CONCLUSIONS:** Early treatment of CIS may not be cost-effective from the perspective of payers in the US health system, which contrasts with economic models in other countries. Importantly, all models in this area are limited by sparse CIS-specific cost and utility data.

PND34

COST-UTILITY ANALYSIS OF ALEMTUZUMAB VERSUS SUBCUTANEOUS INTERFERON BETA-1A FOR THE TREATMENT OF RELAPSING-REMITTING MULTIPLE SCLEROSIS: US PAYER PERSPECTIVE

Smith A, Hashemi L, Wandstrat T
Sanofi, Cambridge, MA, USA

OBJECTIVES: To compare the cost-effectiveness of alemtuzumab versus subcutaneous interferon beta-1a in patients with relapsing-remitting multiple sclerosis (RRMS), and an inadequate response to prior treatment, in the United States from a payer perspective. **METHODS:** Utilizing a 20-year time horizon, a cost-utility analysis was conducted comparing annual intravenous (IV) infusions of alemtuzumab 12 mg (administered as 2 annual courses of 5 daily infusions at treatment initiation and 3 daily infusions at year 1) to subcutaneous interferon beta-1a 44 ug 3 times weekly. A cohort-based Markov model was developed based on the previously published School of Health and Related Research model (Chilcott 2003). Transition probabilities were based on direct clinical trial evidence of disability worsening derived from the CARE-MS II study (Coles et al 2012). **RESULTS:** The results indicate that alemtuzumab was found to be cost-effective versus SC IFNB-1a. The use of alemtuzumab was associated with slower EDSS worsening and reduced relapse burden compared with SC IFNB-1a. The quality-adjusted life-years obtained with alemtuzumab and SC IFNB-1a were 7.02 and 5.76, respectively, and total costs per patient were USD 453,031 and USD 716,627, respectively. In the base case, alemtuzumab was dominant versus SC IFNB-1a. **CONCLUSIONS:** Alemtuzumab is both cost-saving and more effective when compared with SC IFNB-1a in RRMS patients with an inadequate response to prior treatment, from a US payer perspective. **REFERENCES**: Chilcott J, et al. BMJ 2003;326:522; Coles AJ, TwymanCL, Arnold DL, et al. Lancet 2012;380:1829-39.

PND35

COST-UTILITY OF DISEASE MODIFYING THERAPIES FOR RELAPSING-REMITTING MULTIPLE SCLEROSIS

Zimmermann M[1], Brouwer E[1], Tice JA[2], Seidner M[3], Loos A[3], Liu S[3], Chapman RH[3], Kumar V[3], Carlson JJ[1]
[1]*University of Washington, Seattle, WA, USA,* [2]*UCSF School of Medicine, San Francisco, CA, USA,* [3]*Institute for Clinical and Economic Review, Boston, MA, USA*

OBJECTIVES: To assess the cost-effectiveness of disease modifying therapies (DMTs) alemtuzumab, daclizumab, dimethyl fumarate, fingolimod, glatiramer acetate (Glatopa®, Copaxone® 20mg), interferon beta-1a (30mcg, 22mcg, 44mcg), interferon beta-1b (Betaseron®, Extavia®), natalizumab, peginterferon beta-1a, teriflunomide (7mg, 14mg) in relapsing-remitting multiple sclerosis (RRMS) in the US. **METHODS:** We used a lifetime Markov model from a US payer perspective with health states based on Kurtzke Expanded Disability Status Scale (EDSS) in RRMS and secondary-progressive MS. RRMS patients with mean age 29 entered the model with EDSS 0-6. Relative risks of EDSS progression and rate ratios for relapses for each DMT compared to supportive care were based on a network meta-analysis of clinical trials. Safety and discontinuation data were summarized from trials. Published data was used for cost by EDSS, cost per relapse, and utilities. Discounted wholesale acquisition costs were used for DMT costs. Outcomes were projected life-years, quality-adjusted life-years (QALYS), relapses, cost per QALY (ICER), and cost per relapse-avoided. **RESULTS:** Projected life-years and QALYS ranged from 21.9 and 7.8 for teriflunomide 7mg to 23.1 and 12.6 for alemtuzumab, relapses ranged from 15.6 for interferon beta-1a (Avonex®) to 10.8 for alemtuzumab, and total costs ranged from $572,000 for alemtuzumab to $1,480,100 for daclizumab. Alemtuzumab dominated all other DMTs for both ICER and cost per relapse-avoided. In the absence of alemtuzumab, glatiramer acetate (Glatopa®), interferon beta-1a (Extavia®), peginterferon beta-1a, natalizumab, and daclizumab increased QALYs compared to supportive care, with resulting ICERs of $194,300, $148,300, $11,939,400, $284,200, and $309,600, respectively; and glatiramer acetate (Glatopa®), dimethyl fumarate, fingolimod, and natalizumab decreased relapses compared to supportive care, with resulting costs per relapse-avoided of $261,200, $3,269,000, $120,600, and $119,300, respectively. **CONCLUSIONS:** Alemtuzumab provided the best health outcomes and lowest costs for patients with RRMS.

PND36

COST-UTILITY ANALYSIS OF PEGYLATED INTERFERON BETA-1A VERSUS INTERFERONS BETA-1A AND BETA-1B IN PATIENTS WITH RELAPSING-REMITTING MULTIPLE SCLEROSIS IN COLOMBIA

Ordoñez JE
Universidad del Rosario, Bogotá, D.C., Colombia

OBJECTIVES: To determine cost-utility of pegylated interferon beta-1a (PegINFβ-1a) versus interferons beta-1a (INFβ-1a) and beta-1b (INFβ-1b) in patients with Relapsing-Remitting Multiple Sclerosis (RRMS) in Colombia. **METHODS:** The base case patient has a RRMS severity $<$2.5 according to Expanded Disability Status Scale, the perspective of analysis was from Colombian health system. Time horizon was 20 years; the annual discount rate was 5% for benefits and costs. Outcomes: proportion of patients without relapsing during 24 months, survival rate at 20 years, Quality-Adjusted Life Years (QALYs). Direct costs were calculated for the year 2016. A Markov decision model was constructed in a hypothetical cohort of 1000 patients, considering ten RRMS' states. The model represents the probabilities of moving from state to state, leaving the treatment and

dying. **RESULTS:** Clinical efficacies are: PegINFβ-1a, 39%; INFβ-1a, 23.9%; INFβ-1b, 13.7%. Most common complications include depression (53%), spasticity (49%) and fatigue (70%). Total discounted costs to 20 years are: no treatment, US$ 47,015; PegINFβ-1a, US$ 173,708; INFβ-1a, US$ 210,365; INFβ-1b, US$ 165,267. Discounted QALYs to 20 years in 1000 patients are: no treatment, 7,435; PegINFβ-1a, 9,293; INFβ-1a, 8,601; INFβ-1b, 8,104. ICER versus no treatment are: PegINFβ-1a, US$ 68,175; INFβ-1a, US$ 140,040; INFβ-1b, US$ 176,674. Survival rates to 20 years are: no treatment, 68.3%; PegINFβ-1a, 92.0%; INFβ-1a, 86.9%; INFβ-1b, 76.6%. To willingness to pay higher than US$ 80,000, PegINFβ-1a has a probability higher than 85% to be the chosen treatment, for lower values, the highest probability is no treatment strategy. In the univariate sensitivity analysis, PegINFβ-1a is dominant over INFβ-1a in all scenarios of costs, and PegINFβ-1a is dominant over INFβ-1b on scenario at the minimum cost of PegINFβ-1a. **CONCLUSIONS:** PegINFβ-1a is the most cost-effective strategy in patients with RMSS, both in terms of improved survival and long term QALYs as well as in terms of lowest ICER.

PND37

DIMETHYL FUMARATE VERSUS FINGOLIMOD AND TERIFLUNOMIDE FOR THE TREATMENT OF RELAPSING-REMITTING MULTIPLE SCLEROSIS IN COLOMBIA: A COST-UTILITY ANALYSIS

Ordoñez JE
Universidad del Rosario, Bogotá, D.C., Colombia

OBJECTIVES: To determine cost-utility of dimethyl fumarate versus fingolimod, teriflunomide and no treatment in patients with Relapsing-Remitting Multiple Sclerosis (RRMS) in Colombia (South America). **METHODS:** The base case patient has a RRMS severity < 2.5 according to Expanded Disability Status Scale, the perspective of analysis was from Colombian health system. Time horizon was 20 years; the annual discount rate was 5% for benefits and costs. Outcomes: proportion of patients without relapsing during 24 months, survival rate at 20 years, Quality-Adjusted Life Years (QALYs). Direct costs were calculated for the year 2017. A Markov decision model was constructed in a hypothetical cohort of 1000 patients, considering ten disease' states. The model represents the probabilities of moving from state to state, leaving the treatment and dying. **RESULTS:** Clinical efficacies are: dimethyl-fumarate, 36%; fingolimod, 28%; teriflunomide, 12%. Most common complications include depression (53%), spasticity (49%) and fatigue (70%). Total discounted costs to 20 years are: no treatment, US$ 46,113; dimethyl-fumarate, US$ 372,421; fingolimod, US$ 341,324; teriflunomide, US$ 227,901. Discounted QALYs to 20 years in 1000 patients are: no treatment, 7,435; dimethyl-fumarate, 9,161; fingolimod, 8,792; teriflunomide, 8,016. ICER versus no treatment are: dimethyl-fumarate, US$ 189,040; fingolimod, US$ 217,426; teriflunemide, US$ 312,647. Survival rates to 20 years are: no treatment, 68.3%; dimethyl-fumarate, 90.2%; fingolimod, 86.4%; teriflunemide, 76.5%. To willingness to pay higher than US$ 195,000, dimethyl-fumarate has the highest probability to be the chosen treatment, for lower values, the highest probability is no treatment strategy. In the univariate sensitivity analysis, the dimethyl-fumarate case base ICER is lower than US$ 130,000 versus fingolimod and teriflunomide, according to the value reported in the willingness to pay curves. **CONCLUSIONS:** Dimethyl fumarate is the most cost-effective strategy in patients with RMSS, both in terms of improved survival and long term QALYs as well as in terms of lowest ICER.

PND38

EVIDENCE MAP OF COST-UTILITY MODELS IN MULTIPLE SCLEROSIS PUBLISHED SINCE 1960

Martin A
Crystallise Ltd., East Tilbury, UK

OBJECTIVES: To create an evidence map of studies reporting cost-utility models for multiple sclerosis, and the geographical jurisdictions for which these studies were conducted. **METHODS:** We searched the heoro.com database (www.heoro.com) for cost-utility modelllling studies in multiple sclerosis (MS) that were published between 1960 and 28th December 2016. We analysed the abstracts identified by the search to determine the different types of interventions modelled across the range of geographical locations, by date and type of MS. We presented the findings as an evidence map. **RESULTS:** We found a total of 42 abstracts. Of these, 14 were on relapsing-remitting MS, six were on progressive MS and 22 were on any type of MS or did not specify. Fifteen abstracts modelled the use of interferon beta-1b, 11 interferon beta-1a and seven were on any type of interferon-beta. Fourteen abstracts modelled the cost-utility of glatiramer acetate, four natalizumab and three each fingolimod, mitoxantrone and cannabinoids. Fourteen abstracts were set in the United Kingdom, 10 in the United States, four in Sweden, three in Spain, two in Germany and seven were international literature reviews or set in multiple countries. Twenty-one of the models used a societal perspective and nine a healthcare payer perspective, with 10 abstracts not specifying this. Of the 42 abstracts, 23 were published between 2010 and 2016 and none were published before 1997. **CONCLUSIONS:** The majority of cost-utility models published for treatments of multiple sclerosis assessed interferon beta formulations or compared these treatments against newer products, and were generally relevant to the UK or US jurisdiction. The substantial impact of the disease on social and occupational functioning was reflected in the high proportion of models that were conducted from a societal perspective.

PND39

ECONOMIC BURDEN ASSOCIATED WITH THE MANAGEMENT OF EPILEPSY

Baribeau V[1], Lachaine J[2]
[1]*PeriPharm Inc., Montreal, QC, Canada,* [2]*Université de Montréal, Montreal, QC, Canada*

OBJECTIVES: The propose of this study was to describe the characteristics of epileptic patients and to estimate the health care resources utilization and cost related to the management of epilepsy. **METHODS:** Patients with at least two diagnosis of epilepsy between January 2011 and December 2013 were selected from the Quebec public drug plan database (RAMQ). Only newly diagnosed epileptic patients were included, i.e. patients with no diagnosis of epilepsy in the two-year period preceding. Non-refractory epileptic patients were patients who used one or two different anti-epileptic drug (AED) and refractory patients were patients who used at least three different AED in a two-year period. A control group of patients without epilepsy matched for age group and gender was selected from a random sample in a 1:10 ratio. **RESULTS:** A total of 6,230 epileptic patients and a control group of 62,300 matched patients without epilepsy were included in this study. The average age of epileptic patients was 48.1 years (SD=24.4) and 51.0% were men. Epileptic patients had a significantly higher proportion of comorbidities such as depression, anxiety, transient ischemic attack, cerebrovascular diseases and intellectual disabilities than the matched control group without epilepsy. Epileptic patients had significantly more health care cost per year (10,290 CAN$; SD=18,904) than the matched control group (3,516 CAN$; SD=8,437). The primary drivers for the difference of cost were the inpatient visit and medication. The refractory epileptic patients had 1.7 times more health care resources cost per year (n=571; 17,336 CAN$; SD=23,340) than the non-refractory patients (n=4,109; 10,263 CAN$; SD=17,860) and 2.2 times more than the epileptic patients without treatment (n=1,550; 7,764 CAN$; SD=19,129). **CONCLUSIONS:** The management of epilepsy is associated with a significant economic burden. Compared to non-refractory epileptic patients, refractory patients have a much higher health care resources utilisation and cost.

PND40

AN ANALYTICAL FRAMEWORK TO PROJECT THE POTENTIAL MEDICARE COST BENEFIT OF INTEPIRDINE (RVT101) IN MILD-MODERATE ALZHEIMER'S DISEASE

Zhu CW[1], Asare E[2], Ramaswamy S[2], Lombardo I[2], Stern Y[3]
[1]*Icahn School of Medicine at Mount Sinai, Bronx, NY, USA,* [2]*Axovant Sciences, Inc., New York, NY, USA,* [3]*Columbia University, New York, NY, USA*

OBJECTIVES: The Dependence Scale (DS) captures a combination of the cognitive, functional, and psychiatric changes that occur in Alzheimer's disease (AD) and is strongly correlated with cost of patient care. As reported previously, combination therapy with donepezil and 35 mg intepirdine (RVT-101), an oral 5HT6 antagonist in development for the treatment of mild-moderate AD, was projected based on a conversion algorithm to reduce progression in Dependence Level (DL) compared to donepezil monotherapy using data from a placebo-controlled study. Here we examine potential Medicare cost differences associated with this reduced DL progression. **METHODS:** The Alzheimer's Disease Cooperative Study – Activities of Daily Living Scale (ADCS-ADL) was measured in a 48-week study of intepirdine vs placebo on top of stable donepezil in subjects with mild-moderate AD (n=684). The ADCS-ADL was converted to DL using a published algorithm. Total costs projected to be paid by Medicare by DL were estimated from the Predictors 2 study using Medicare claims data and assigned to this study. Cost changes from baseline were compared between treatment groups. **RESULTS:** Estimated costs projected to be paid by Medicare were higher at more severe DLs, ranging from $4,755 for DL=0/1 to $23,311 for DL=4/5. The Medicare costs associated with the donepezil monotherapy group were projected to increase by $595 over all visits, while the Medicare costs associated with the 35 mg intepirdine plus donepezil combination therapy group were projected to decrease by $283. The magnitude of annualized Medicare cost benefit associated with intepirdine treatment was projected to range from $443 to $1,203 based on baseline DL. **CONCLUSIONS:** In this analytical framework, combination therapy with 35 mg intepirdine and donepezil was associated with projected annualized Medicare cost benefits between $443 and $1,203 compared to donepezil monotherapy. Intepirdine is currently being evaluated in a global Phase 3 study in mild-moderate AD with data expected in 2017.

PND41

COMPARISON OF INSTITUTIONAL PLACEMENT BETWEEN ALZHEIMER'S DISEASE (AD) PATIENTS IN MEDICAID AND TWO AD REGISTRIES

Tafazzoli A, Kansal A
Evidera, Bethesda, MD, USA

OBJECTIVES: A significant fraction of all patients with AD receiving institutional care are covered through the Medicaid program. We sought to compare the institutional placement predicted using published equations based on DADE and CERAD studies with that in a study of the Medicaid population. **METHODS:** We simulated disease progression and the need for institutional care over 10 years in patients with AD using the AD Archimedes Condition-Event simulator (AD ACE). The AD ACE is constructed using predictive equations for change in disease biomarkers and clinical scales derived primarily from analyses of AD Neuroimaging Initiative (ADNI) data. Rates of institutional care placement were simulated based on published equations from DADE study, with a second equation based on CERAD study tested as a scenario. Patients with mild AD (mean MMSE 23) were simulated, and a more severe subset of patients (mean MMSE 21) tested as a scenario. These analyses were compared against published probabilities of institutionalization for AD patients from New Jersey Medicaid claims data. **RESULTS:** The simulated populations showed lower rates of institutional care after 3 years (10%) than the rate in Medicaid patients (23%). Over the long-term, however, the rates of institutional care in the simulated population (56%) rose to similar levels to that in the Medicaid population (52%). Simulating patients with more advanced AD had institutionalization rates similar to the base case: 10% at 3 years and 60% at 10 years. In the alternate equation scenario, rates were also similar to the base case at 3 years (10%), but even higher at 10 years (75%). **CONCLUSIONS:** Published equations for rates of institutional care may be suitable for describing the long-term need of patients with AD in a Medicaid

population, but may not adequately capture the early need, potentially underestimating the economic burden of AD in this program.

PND42

MARKET ACCESS CONSIDERATIONS IN PHARMACEUTICAL IN-LICENSING VALUATIONS

Ohanjanyan A, Mukku S, Edathodu A, Samuel J, Leung SK, Digiacomo F, Olid Golzalez A
Access Infinity, London, UK

OBJECTIVES: Valuation of assets in licensing deals is based on the asset's 'approvability', with the estimated value of the asset increasing as the likelihood of regulatory approval grows with each successful clinical development stage. This study aimed to assess the 'reimbursability' and price potential in the EU5 of a CNS asset that faces generic competition. **METHODS:** In-depth interviews with 10 former senior national and regional level payers from EU5 were conducted, along with analysis of historic EU5 at-launch prices of CNS drugs using IMS data. **RESULTS:** The asset's successful Phase III trial was 6-weeks long and conducted against placebo as the comparator. Assuming EMA approval, European payers unanimously agreed that this data would not be sufficient for negotiating premium prices in the EU5 markets. Payers requested 6 month-long direct and/or indirect comparative studies against standard of care (SoC) therapies in the EU, all of which are generic. To avoid generic price referencing, superiority in efficacy and/or safety vs SoC would have to be demonstrated. Analogue analysis of CNS drugs launched in genericised EU5 markets showed that comparative studies demonstrating non-inferiority in efficacy and superiority in safety vs generic comparators might lead to 3-4 times price premium over a generic price, while superiority in both efficacy and safety to >5 times price premium. We estimated that with the existing data the asset would be reimbursed at €1-€1.6 per day in EU5 (vs estimated $65 per day in the US). With additional data the asset could be reimbursed at €2.5-€5 per day. **CONCLUSIONS:** Estimating the EU5 reimbursement and price potential is a crucial consideration in asset valuation process that can significantly alter the asset's NPV. Market access analysis should be carried out early in the development process to insure that the clinical development plan addresses the 'reimbusrability' issues.

NEUROLOGICAL DISORDERS – Patient-Reported Outcomes & Patient Preference Studies

PND43

QUANTIFYING THE BENEFITS OF INJECTION-RELATED PAIN REDUCTION ON PATIENT OUTCOMES

Davis M[1], Johnson SJ[1], Espinosa R[1], Skup M[2]
[1]*Medicus Economics, LLC, Milton, MA, USA,* [2]*AbbVie Inc., North Chicago, IL, USA*

OBJECTIVES: Evaluate patient outcomes for a new formulation of the multiple sclerosis (MS) drug glatiramer acetate (GA) associated with reduced injection-related pain. **METHODS:** This retrospective, closed-cohort study included adults from the Truven MarketScan Commercial database with: ≥2 claims with MS diagnoses, ≥6 months of continuous GA treatment before approval of the new formulation, and ≥6 months of data after the index date (earliest claim for new formulation [switchers] or GA claim closest to index date of match [non-switchers]). Non-switchers were propensity-score matched 1:1 to switchers using baseline demographics, comorbidities, resource use, and costs. Adherence (measured by proportion of days covered) and direct costs were compared for switchers and non-switchers 6 months following the index date. Difference-in-differences analysis compared outcomes 6 months before and after the index date. Wilcoxon signed-rank and McNemar's tests for matched pairs compared continuous and categorical measures, respectively. Outcomes were also assessed using multivariate regression analyses. **RESULTS:** Within 6 months of approval, approximately 42% of patients switched to the new GA formulation (switchers, n=1,362; non-switchers, n=2,093). After matching, there were no significant differences in demographics, comorbidities, or baseline costs. Following approval of the new formulation, switchers had significantly better adherence than non-switchers (90% vs 80%; p<0.0001) and total costs for switchers were $221 less than non-switchers (p=0.01), driven by reduced medical costs of $1,882 (p=0.17). Difference-in-differences analysis demonstrated improved adherence (+2 vs -8 percentage points; p<0.0001) and $508 lower increase in total costs relative to baseline for switchers versus non-switchers (p=0.005). In multivariate analyses, switchers were predicted to have a 13% increase in adherence (90% vs 80%; p<0.0001) and 22% reduction in medical costs ($8,798 vs $11,255; p=0.002). **CONCLUSIONS:** The new formulation of GA with reduced injection-related pain improved adherence and reduced medical costs. Reformulation of other therapies that reduce injection-related pain may provide similar benefits.

PND44

ADHERENCE WITH PROPHYLACTIC MIGRAINE MEDICATIONS AMONG PATIENTS WITH AND WITHOUT PRIOR PROPHYLACTIC MEDICATION USE

Bonafede MM[1], Sapra S[2], Tepper SJ[3], Cappell KA[4], Desai P[2]
[1]*Truven Health Analytics, an IBM Company, Cambridge, MA, USA,* [2]*Amgen Inc, Thousand Oaks, CA, USA,* [3]*Dartmouth, Lebanon, NH, USA,* [4]*Truven Health Analytics, an IBM Company, Ann Arbor, MI, USA*

OBJECTIVES: To describe adherence and persistence with prophylactic migraine medications (PMM) among all users as well as among subgroups with (Experienced) and without (Naïve) prior PMM use. **METHODS:** This retrospective cohort study identified adult migraine patients (ICD-9 346.XX and/or migraine-specific medications) in the Truven Health MarketScan Commercial Database January 2010-June 2014. The first new PMM prescribed in the study period was the index event; patients were stratified based on whether they had pre-index use of a different PMM (PMM Experienced) or were PMM Naïve. Patients without 12 months of enrollment pre- and post-index or with a diagnosis of HIV or malignancy were excluded. The primary study outcomes were adherence and persistence with the index PMM during the 12-month follow-up. Discontinuation was defined as a gap of ≥60 days in supply of the index PMM. **RESULTS:** 76,236 migraine patients met the inclusion criteria; 60.8% were PMM Experienced. PMM Experienced patients were older (mean age 45.0 [SD=12.3] versus 43.0 [SD=12.3]), more likely female (85.1% versus 83.3%), and had higher baseline Deyo Charlson Comorbidity Scores (0.38 [SD=0.70] versus 0.24 [SD=0.59]) than Naïve patients. Across all PMM users, mean proportion of days covered (PDC) was 0.43 (SD=0.34) and 24.0% had PDC≥0.80; PMM Experienced patients had higher PDC than Naïve patients (0.44 [SD=0.34] versus 0.40 [SD=0.33]) and were more likely to have PDC≥0.80 (25.3% versus 21.7%). Among all PMM users, 71.4% discontinued, time to discontinuation was 162.0 days (SD=142.2); PMM Experienced patients were less likely than Naïve patients to discontinue (69.5% versus 73.5%) and had a longer time to discontinuation (169.3 days [SD=143.4] versus 153.9 [SD=140.7]) (all p<0.001). **CONCLUSIONS:** Overall adherence to migraine prophylactic medication is low; PMM Experienced patients had slightly higher adherence and persistence compared to Naïve patients. Approximately one-in-four patients had PDC≥0.80 and over two-thirds discontinued their index PMM in the year after it was initiated.

PND45

PATIENT CHARACTERISTICS AND TREATMENT ADHERENCE AMONG PATIENTS TREATED WITH DELAYED-RELEASE DIMETHYL FUMARATE FOR RELAPSING REMITTING MULTIPLE SCLEROSIS IN ISRAEL

Desai U[1], Huang M[2], Kirson NY[1], King S[1], Hellstern M[1], Schonfeld S[1], Birnbaum HG[1], Lee A[2]
[1]*Analysis Group, Inc., Boston, MA, USA,* [2]*Biogen, Cambridge, MA, USA*

OBJECTIVES: Few studies have relied on real-world data to describe the characteristics and treatment patterns of patients using oral disease-modifying treatments (DMTs) for relapsing remitting multiple sclerosis (RRMS) outside the US. This study reports the demographics, MS symptom burden, and treatment adherence among patients initiating treatment with a leading oral DMT – delayed-release dimethyl fumarate (DMF, also known as gastro-resistant DMF) – in Israel. **METHODS:** Patients aged ≥18 years diagnosed with MS and with ≥1 prescription for DMF were selected from de-identified electronic medical records data from a health fund in Israel (1/2013-1/2016). Patients were required to have continuous enrollment with the health fund for ≥12 months before (baseline) and ≥6 months after (follow-up) the first observed prescription (index) date. Patient characteristics during baseline and adherence during the follow-up period, as measured by medication possession ratio (MPR), were described. **RESULTS:** Of the 177 patients meeting the selection criteria (mean age: 40 years; ~30% male), 114 (64%) had previously used injectable DMTs for RRMS (primarily interferon beta). The average duration from MS diagnosis to index date was 69 months (median: 45 months). Nearly half of the patients had indications of neuropathic or musculoskeletal pain in the year before index, 26% bladder or bowel problems, 16% vision issues, 15% cognitive or psychiatric disorders, and 15% depression. The mean MPR during the 6-month follow-up period was 0.81 (median: 0.91); over two-thirds (69%) of the patients were considered adherent (MPR >0.8). **CONCLUSIONS:** Patients initiating DMF in Israel had considerable symptom burden, and many used injectable DMTs prior to treatment initiation, possibly reflecting the relatively recent approval of the medication in Israel. Most patients were adherent to treatment during the 6-month follow-up period. Further research is needed to understand long-term adherence among Israeli patients.

PND46

RETROSPECTIVE, CLAIMS-BASED ANALYSIS DEMONSTRATES LIMITED PERSISTENCE AND ADHERENCE, AND LOW DAILY DOSES OF AMANTADINE IMMEDIATE RELEASE (AMT-IR) IN PATIENTS WITH PARKINSON'S DISEASE (PD)

Navarro RP[1], Pahwa R[2], Tanner CM[3], Hauser RA[4], Isaacson SH[5], Patni R[6]
[1]*University of Florida, Gainesville, FL, USA,* [2]*University of Kansas Medical Center, Kansas City, KS, USA,* [3]*UCSF School of Medicine, San Francisco, CA, USA,* [4]*University of South Florida, Tampa, FL, USA,* [5]*Parkinson's Disease and Movement Disorders Center of Boca Raton, Boca Raton, FL, USA,* [6]*Adamas Pharmaceuticals, Emeryville, CA, USA*

OBJECTIVES: Five decades after introduction, levodopa remains the treatment of choice for PD. Chronic levodopa treatment with progressing PD contributes to levodopa-induced dyskinesia (LID), defined as involuntary, non-rhythmic, purposeless, unpredictable movements during waking hours occurring in approximately 30% of patients. LID can compromise optimal levodopa treatment. No FDA-approved drug for LID exists. AMT-IR was originally approved for influenza and later indicated in parkinsonism. It has also been evaluated in small studies for the treatment of dyskinesia. Conflicting guidelines for the use of AMT-IR in dyskinesia exist. While higher doses of AMT-IR have been shown to produce greater reductions in dyskinesia, they are associated with increased frequency of central nervous system adverse events. Real-world use, persistence, and adherence for AMT-IR has not been extensively analyzed or reported. **METHODS:** A retrospective claims-based analysis was conducted utilizing Symphony Health data to evaluate current AMT-IR utilization patterns in PD patients persistent on levodopa for at least 4 years (indicating presence of LID (Suh, 2012). Persistence was defined as continuous therapy without refill gaps > 90 days. Adherence was defined as ≤ 5 days between expected and actual refill dates. **RESULTS:** Among 22,000 patients persistent on levodopa for 4 years, approximately 1,500 (6.8%) had taken AMT-IR. At 1 year, 39% were persistent and 7% were adherent. The average starting dose was approximately 200 mg/day amantadine HCl (equivalent to 162 mg amantadine). Only 15% of patients started at 300mg/day amantadine HCl (equivalent to 243 mg amantadine) or greater. At one year, among those initiated on ≥300mg/day (243 mg amantadine), 38% were persistent while only 4% were

adherent. **CONCLUSIONS:** This claims analysis demonstrates limited persistence and adherence at daily doses of 200-300 mg AMT-IR in PD patients. Higher dosage forms and improved delivery systems for amantadine in the treatment of LID may increase efficacy, persistence, and adherence.

PND47

LEVERAGING DISEASE MANAGEMENT & TECHNOLOGY TO HELP MULTIPLE SCLEROSIS PATIENTS ADHERE TO TREATMENT PLAN

Stevens CA, Varghese B, Kazmi M, Tochterman G
CareMed Specialty Pharmacy, Lake Success, NY, USA

OBJECTIVES: Determine if patients who enroll in a CareMed Specialty Pharmacy led disease management program for the treatment of Multiple Sclerosis (MS) with SC/IM therapy are more adherent than patients who are not enrolled in such a support program. Recent MS study results show that aderence of patients on SC/IM therapy is 70.8%; these patients were not supported by any disease management programs. Further, MS patients who took their medication consistently were found to have 66% fewer emergency room (ER) visits and 23% lower medical costs than those MS patients who did not. Average MS-related medical costs for patients in the lowest medication adherence range were $23,253, while those in the highest adherence range averaged $17,814, resulting in an average savings over $5,400. **METHODS:** Enroll 1,647 patients in a disease management program and track their adherence to SC/IM therapy over the course of 12 months. Develop a robust disease management program with input from physicians and patients. Contruct a pharmacy based MS patient facing interactive portal. Integrate analytic and programmatic approaches to support patient adherence. Adherence metrics of this study were: 1) Number of missed doses in four weeks; 2) Reason dose was missed; 3) Perceived side effects; 4) Ease of administration; 5) Medication satisfaction. **RESULTS:** 97.4% of all SC/IM therapy doses for participating in CareMed's disease management program were administered based on physician treatment plans compared to 70.8% of all SC/IM therapy doeses for patients not participating in a disease management program. **CONCLUSIONS:** Pharmacy led MS focused disease management programs can support better adherence resulting in fewer ER visits and a reduction in overall medical costs. Further study regarding disease management programs and their impact on outcomes and costs is recommended.

PND48

COMPARISION OF HEALTH UTILITY MEASURES FOR AMYOTROPHIC LATERAL SCLEROSIS IN THE GENERAL KOREAN POPULATION: STANDARD GAMBLE AND EURO QOL-5D

Kim J, Lee S, Lee S, Lim SJ, Suh D
Chung-Ang University, Seoul, South Korea

OBJECTIVES: To elicit health utilities for health states of amyotrophic lateral sclerosis (ALS) in the general population of South Korea using standard gamble (SG) and Euro-quality of life five dimensions questionnaire (EQ-5D) as well as to identify the factors which cause differences in the two utility measures. **METHODS:** Four ALS health state descriptions according to disease severity were developed: mild, moderate, severe, and terminal state. Utilities of these states were measured via SG and EQ-5D from 202 respondents, who were selected using a stratified quota sampling method to represent the general Korean population. Utility values for each health state were compared using paired t-tests, and the relationships between the two utility measures and levels of disease-severity and sociodemographic factors were tested using generalized estimating equations. **RESULTS:** When disease severity increased, both SG and EQ-5D showed systematic decreases. The utility values between SG and EQ-5D for each state, excluding the mild state, were significantly different: utility value for mild 0.880±0.101 vs. 0.877±0.053 ($p=0.716$); moderate, 0.787±0.154 vs. 0.722±0.092 ($p<0.000$); severe, 0.629±0.186 vs. 0.446±0.186 ($p<0.000$); terminal 0.346±0.206 vs. 0.014±0.144 ($p<0.000$). The differences in utility values between SG and EQ-5D in health states progressively increased as patients' health states became more deteriorated. The differences in utility for moderate, severe, and terminal state were 1.06, 1.20, and 1.36 times greater, respectively, compared to that of mild state. The differences in utility were 7% higher in women than men ($p=0.02$). **CONCLUSIONS:** The study found that utility values of SG were significantly higher than those of EQ-5D. In addition, the difference between SG and EQ-5D gradually increased as patients' health became severe, implying that general population was risk averse. It is recommended that a future study be performed to find the causes of the differences between utility derived from SG and EQ-5D in the Korean population.

PND49

EFFECTS ON COMPENSATING VARIATION OF NUMBER AND KIND OF COMPETING SUBSTITUTES IN DISCRETE-CHOICE EXPERIMENTS

Gonzalez JM[1], Johnson FR[1], MacDonald KV[2], Marshall D[2]
[1]*Duke Clinical Research Institute, Durham, NC, USA,* [2]*University of Calgary, Calgary, AB, Canada*

OBJECTIVES: Evaluate the impact on preference estimates of changing the substitutability of treatment alternatives in DCE questions. **METHODS:** Adult members of an online panel, completed a web-enabled DCE survey (N=811). Respondents were asked to imagine they had a gene variant associated with risks of health problems. Two constructed interventions to reduce the risk of health problems were described in addition to watchful waiting: preventative surgery and medication. Using a three-alternative labeled experimental design, respondents were allowed to either choose between surgery and watchful waiting (n=193) (Group 1), medication and watchful waiting (n=217) (Group 2), and surgery or medication in addition of watchful waiting (n=401) (Group 3). A random-parameters logit (RPL) model was used to estimate separate preferences for respondents in each of the three groups. Compensating variation (CV) for the average surgery and medication were calculated for each group to measure the expected benefit of adding each intervention to the list of alternatives to prevent future health problems. **RESULTS:** Surgery and medication CV values were similar when estimated with and without a second type of intervention in the choice questions. We found that CV varied with the likelihood and severity of future health problems. For example, among respondents who considered only the possibility of choosing medications in the choice questions, CV ranged between $32 and $103, based on the risk level and the severity of the health problem. In general, having only one type of intervention in the choice questions was associated with greater CV for the least valuable intervention. Only with high risk of mild health problems was surgery more desirable than medications. **CONCLUSIONS:** The study results provide some assurance that DCE models can be robust to incomplete specifications of relevant substitutes in choice questions, even in cases where clinically-relevant alternatives are imperfect substitutes.

PND50

DEVELOPING AN INSTRUMENT TO MEASURE CAREGIVER PRIORITIES FOR POTENTIAL TREATMENT FOR PRADER-WILLI SYNDROME: A COMMUNITY-CENTERED APPROACH

Tsai J[1], Thayer WM[1], Strong T[2], Kayadjanian N[3], Bridges JF[1]
[1]*Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, USA,* [2]*The Foundation for Prader-Willi Research, Walnut, CA, USA,* [3]*International Consortium to Advance Clinical Trials for Prader-Willi Syndrome, Walnut, CA, USA*

OBJECTIVES: Prader-Willi syndrome (PWS) is a neurodevelopmental disorder resulting from abnormalities of genes on chromosome 15. No cure for PWS exists. Emerging treatments target hyperphagia and behavioral outbursts, the importance of which is not well documented. We developed and tested a novel stated-preference instrument to measure caregiver preferences for emerging PWS treatments. **METHODS:** We used a community-engagement approach to engage diverse stakeholders in developing and piloting the instrument. Partnering with the Prader-Willi Syndrome Clinical Trials Consortium, we assembled a community advisory board and engaged the board through interviews and meetings. The engagement influenced the design, length, wording of the survey, and the protocol for the debrief interviews. A novel best-worst scaling instrument (case 1) was designed with 13 choice tasks; caregivers were asked to determine the most and least important of the four treatment outcomes listed in each task. A score was generated where prioritized outcomes are more positively ranked. We recruited caregivers at an annual conference for the pilot of the survey and debrief interviews. Caregivers provided feedback in debrief interviews once they previewed or completed the survey. **RESULTS:** 54 caregivers completed the pilot survey (RR=50%). The majority of the PWS patients were diagnosed through genetic testing (98%). The respondents value treatments addressing hyperphagia (score = 0.77, SD: 0.44) and food-related behavior (score = 0.43, SD: 0.57). 14 caregivers completed the interviews. Interview analysis indicated clarity in the survey wording and heterogeneity in the community. **CONCLUSIONS:** We demonstrated the feasibility of conducting preference research using a community-centered approach in a broad-spectrum disease where heterogeneity is prevalent. Advocacy organizations such as Parent Project Muscular Dystrophy have been generating preference evidence to advise the Food and Drug Administration (FDA) in the patient-focused drug development. This study can inform the FDA and provides a model of engaging stakeholders for endpoint prioritization.

PND51

THE VALUE OF DIAGNOSTIC TESTING FOR PARENTS OF CHILDREN WITH RARE GENETIC DISEASES

Marshall DA[1], MacDonald KV[1], Bernier FP[1], Innes AM[1], Hartley T[2], McInnes B[1], Deal K[3], Gillespie M[4], Care4Rare Canada Consortium[5], Mackenzie A[6], Boycott KM[6]
[1]*University of Calgary, Calgary, AB, Canada,* [2]*Children's Hospital of Eastern Ontario Research Institute, University of Ottawa, Ottawa, AB, Canada,* [3]*McMaster University, Hamilton, ON, Canada,* [4]*Children's Hospital of Eastern Ontario Research Institute, Ottawa, ON, Canada,* [5]*Care4Rare Canada Consortium, Ottawa, ON, Canada,* [6]*Children's Hospital of Eastern Ontario Research Institute, University of Ottawa, Ottawa, ON, Canada*

OBJECTIVES: Patients with rare genetic diseases traditionally experience a prolonged and expensive diagnostic odyssey culminating in a delayed diagnosis or, too frequently, no diagnosis at all. Whole-exome sequencing (WES) can now rapidly identify mutation(s) responsible for rare, single-gene diseases, and potentially reduce the diagnostic odyssey. Before WES is adopted into clinical practice, a clear estimation of the value of a WES-based diagnosis for families is critical. **METHODS:** Based on our literature review and qualitative research (focus groups, interviews with parents of children with rare genetic diseases), we developed a discrete choice experiment (DCE) survey which has been administered online to parents of children with rare genetic diseases. The DCE included 14 choice tasks with 6 attributes and 3 alternatives considering orthogonality, D-efficiency and level balance. Preferences were analyzed using conditional logit and hierarchical Bayes. **RESULTS:** Preliminary results include n=214 respondents: mean age 41 years (range: 22-65 years), female (90%), have university degrees (42%), married (72%), employed full-time (46%), identify as white (89%), and high income ($80,000 CAD or more, 58%). Overall, 88% reported their child had genetic testing, and 64% reported their child had a diagnosis. Of those who reported no diagnosis, the mean duration spent seeking a diagnosis is 5.7 years (range: 1-25 years). The most valued attributes were time to obtain an answer from the diagnostic test (diagnosis or not), chance of obtaining a diagnosis and cost. The positive or negative impact of the results and the type of diagnostic testing were significant but not as strongly valued, with WES preferred to other testing. Parents were willing to pay approximately $5000 CAD on average for diagnostic testing. **CONCLUSIONS:** Parents of children with rare genetic diseases place a high value on obtaining information, regardless if it is a diagnosis or not. Additionally, WES is valued over other diagnostic tests.

PND52

COMPARATIVE ASSESSMENT OF HEALTH RELATED QUALITY OF LIFE AMONG THALASSEMIA PATIENTS WITH HEALTHY CHILDREN, A CROSS-SECTIONAL STUDY

Masood I, Ali S, Abid U, Shahid S, Arshad S, Saba A, Zafar R
The Islamia University of Bahawalpur, Bahawalpur, Pakistan

OBJECTIVES: The aim of this study was to assess the health-related quality of life (HRQoL) of thalassemia patients by comparing it with HRQoL of healthy persons and to evaluate the factors associated with HRQoL among thalassemia patients and level of depression of their caregivers. **METHODS:** This cross-sectional study was conducted in Thalassemia Center, Bahawal Victoria Hospital, Bahawalpur from February 2016 to March 2016 among 150 patients ranging from 2 to 18 years in age. Patient's HRQoL was measured using PedsQL (Pediatric Quality of Life) 4.0 generic scale and the depression level in their caregivers was assessed using PHQ-9 (Patient Health Questionnaie-9). HRQoL of healthy control group was also measured using same questionnaires. **RESULTS:** The mean score of psychosocial functioning was higher in control group (95.51 74.40) as compared to patients (38.5724.29). The school functioning score (26.8426.08) was lowest of psychosocial measures in thalassemia patients, followed by emotional functioning (30.2330.18) and social functioning (60.1029.87) score. The mean physical health score was found to be 49.2023.92 in patients whereas control group showed the mean score of 89.0611.91. Majority (28%) of the caregivers showed severe depression while 20.7% showed moderately severe depression and (18%) showed mild depression. **CONCLUSIONS:** In conclusion, thalassemia has substantial negative effect on HRQoL of children and their caregivers. Continuous psychological support from health authorities, improvement in policies made by government and school officials and more understanding from society can be helpful in enhancing quality of life of these patients and their caregivers.

PND53

CHOICE OF TREATMENTS AND WILLINGNESS TO PAY TO INSURE FOR MULTIPLE SCLEROSIS DISEASE MODIFYING THERAPIES

Sandberg EA[1], Cohen JT[2], Wakeford C[3], Lin P[1]
[1]Center for the Evaluation of Value and Risk in Health, Institute for Clinical Research and Health Policy Studies,Tufts Medical Center, Boston, MA, USA, [2]Tufts Medical Center, Boston, MA, USA, [3]Biogen Idec Inc., Cambridge, MA, USA

OBJECTIVES: Prior to the approval of the first disease modifying therapy (DMT) in the mid 1990's there were limited options for treatment for Multiple Sclerosis (MS). DMTs have transformed MS by delaying its progression and reducing relapses. However, these therapies can be expensive and may have side effects. This study aimed to: 1) Characterize the preference of neurologists and the general public between the pre-DMT time period (pre-1995) andcurrent landscape, and; 2) Assess the public's willingness to pay (WTP) for insurance to cover DMTs. **METHODS:** We conducted a national online survey. Part 1 asked neurologists and respondents from the general population to choose between pre-DMTs and current DMT regimens. In Part 2, general population respondents participated in a bidding game to determine WTP for health insurance to cover DMT costs should they develop MS. **RESULTS:** Most respondents (76% of neurologists and 65% of the general population)preferred DMTs over pre-DMT era treatments. On average, the general population had a WTP of $22per family member per month (PMPM) ($16 median) for MS DMT insurance. Respondents who chose pre-DMT era treatments had a numerically lower WTP($19 mean,$14 median PMPM), compared with those who preferred DMTs ($23 mean, $17 median PMPM). **CONCLUSIONS:** Although most respondents prefer DMTs to non-DMTs, some general population respondents and neurologists prefer pre-DMT therapies. The neurologist result is surprising given the strong physician group recommendations for use of DMTs at the earliest point possible. Ex-ante WTP for MS DMT insurance coverage is 4-5 times the current PMPM cost of MS DMTs, which was $4.43 in 2015.

NEUROLOGICAL DISORDERS – Health Care Use & Policy Studies

PND54

DIFFERENCES IN TIMING OF MEMANTINE INITIATION IN MILD-MODERATE AND MODERATE-SEVERE ALZHEIMER'S PATIENTS IN USA VS. JAPAN

Hu G[1], Koganov M[2], Shinozaki R[3], Harigaya K[3]
[1]InTask Inc., Morristown, NJ, USA, [2]KMK Consulting Inc., Morristown, NJ, USA, [3]SSRI Co., Ltd., Tokyo, Japan

OBJECTIVES: 1) To design and test a patient simulation platform representative of mild-moderate and moderate-severe Alzheimer's patients in the USA and Japan 2) To compare prescribing behavior between Japanese and US physicians in the treatment of Alzheimer's disease. **METHODS:** The study was comprised of two stages. First, we developed a bilingual simulation platform with 16 profiles representing a range of mild-moderate and moderate-severe patients. Various ADL measure, and patient inputs were mapped to the virtual patients' MMSE and GDS scores. After pre-testing the simulation's realism and usability, the full study was launched in September 2016. A total of 209 psychiatrists/neurologists/PCPs were surveyed (104 in Japan; 105 in the US). **RESULTS:** In general, US physicians initiated a regimen including memantine earlier than did Japanese physicians. Japanese physicians prescribed significantly less often at milder levels of severity, and their usage of memantine matched their American peers only at severe levels of impairment (MMSE score of <10). Physicians in the US also demonstrated differences in prescribing across gender, while this effect was not observed in Japan. In a post-simulation survey, physicians indicated that the simulation was realistic and that their treatment decisions within the survey reflected real-life practice. **CONCLUSIONS:** Problems with the quality and availability of prescription data necessitate the consideration of other research methods, particularly in challenging populations (rare diseases, small subpopulations). This study demonstrated the promise of using simulation to observe prescribing behavior across different markets. Limitations of this research include significant time costs for the development of comprehensive, realistic patient profiles and currently, the inability to identify information accessed by the physician beyond categories of information viewed. Next steps include the comparison of collected data to prescribing databases and the exploration of other applications- simulating environmental changes (insurance coverage, etc.), forecasting, and message testing.

PND55

CLINICAL, DEMOGRAPHIC, TREATMENT AND COST CHARACTERISTICS OF DEMENTIA WITH LEWY BODIES FROM A LARGE US ADMINISTRATIVE CLAIMS DATABASE

Leverenz J[1], Vinton G[2], Ramaswamy S[3]
[1]Cleveland Clinic, Cleveland, OH, USA, [2]C1 Consulting, Wellesley Hills, MA, USA, [3]Axovant Sciences, Inc., New York, NY, USA

OBJECTIVES: Several analyses on treatment dynamics in Alzheimer's disease (AD) using claims data have been published, but there is little similar data available in Dementia with Lewy Bodies (DLB). This study seeks to characterize DLB treatment dynamics using data from a claims database. **METHODS:** Truven MarketScan, a US claims database with over 100 million patients, was used for this study. Two samples were identified for analysis: "cross-sectional" (Jul 2014–Jun 2015) and "longitudinal" (Jan 2010–Jun 2015). Both cohorts used similar inclusion criteria, though patients in the longitudinal cohort were tracked from their first dementia diagnosis (Dx) whereas patients in the cross-sectional cohort were identified based on a combination of ICD-9 diagnostic, confirmatory diagnostic and/or treatment (Rx) claims. **RESULTS:** For the cross-sectional analysis, 26,315 AD and 473 DLB patients were identified. The mean ages were 83 (AD) and 81 (DLB) years. AD patients were more frequently female (63% v. 52%). For the longitudinal analysis, 16,107 AD and 771 DLB patients were identified. The mean age for both AD and DLB was 81 years. AD patients were more often female than DLB patients (63% v. 53%). Despite more specialist involvement, the DLB patients were less likely to be taking dementia Rx than AD patients (69% v. 77%) and those on Rx were more likely to be on monotherapy. DLB patients had higher use of psychotropic Rx. Setting of care was similar, but the DLB group had higher annualized costs, driven by hospitalization. **CONCLUSIONS:** The gender and psychotropic use characteristics of the DLB patients identified in this analysis are consistent with the diagnosis of DLB. The results suggest that DLB patients have more annualized cost and are on more psychotropic medications than AD patients, but surprisingly are less frequently on dementia Rx.

PND56

THE USE OF ANTIEPILEPTIC DRUGS FOR CHILDHOOD EPILEPSY IN HOSPITAL SETTINGS

Pan I, Lam S
Baylor College of Medicine/Texas Children's Hospital, Houston, TX, USA

OBJECTIVES: To investigate the use of antiepileptic drugs (AEDs) for pediatric epilepsy in children's hospitals. **METHODS:** We identified the study cohort from children discharged between 10/1/2013 and 9/30/2014 in the Pediatric Health Information System (PHIS) database. Inpatient epilepsy encounters in 30 National Association of Epilepsy Center Level III or Level IV designated centers and 7 other children's hospitals were included. Inclusions were patients aged 0-17 years with ICD-9-CM diagnosis of epilepsy (345.XX). Exclusions were missing gender and charges. Simple and multivariable general-linear model with the Gamma family and log-link function were used to determine factors associated with increased AED charges for childhood epilepsy. A Multi-level model with a random-effect for each hospital was used. Analyses used SAS®9.4 and STATA 14.0 software. **RESULTS:** 15261 inpatient epilepsy visits were included, 30.31% with intractable epilepsy. 77.7% were under age 12. Payers included public (47.8%) and private insurers (49.1%). 13.5% patients had no AED use. 32.7% (4496 cases) were on monotherapy; among them, most commonly used AEDs were levetiracetam (LEV), oxcarbazepine (OXC), and valproic-acid-and–derivatives (VPA). Over 26% used multidrug regimens (3 to 9 AEDs) during hospitalizations. LEV shared 31% of total inpatient adjusted-AED charges ($3,632,793USD); Clobazam and Lacosamide consisted of 24% of total adjusted-AED charges. Median inpatient adjusted-AED charge was $284USD per inpatient, (interquartile-range (IQR) $631; mean $911). Factors associated increased AED charges (p-value < 0.05) include male gender (5% more charges than female), older age, Black/Hispanic (12%/10% more than White), South region (113% more than Northeast), intractable epilepsy (78% more than non-intractable), and presence of complex-chronic conditions (CCC) (59% more than those without CCC). **CONCLUSIONS:** Gender, age, race, geographic practice variation, CCC, and intractable epilepsy status were significantly associated with increased adjusted-AED charges. Further study is warranted to incorporate long-term clinical outcomes into analysis models and to understand drivers of AED charges.

PND57

EXPENDITURE OF INPATIENTS WITH PARKINSON'S DISEASE IN DIFFERENT MEDICAL INSTITUTIONS IN SHANGHAI

Kang Q[1], He J[1], Yang Y[1], Hu SL[2]
[1]Shanghai Medical Information Center (Shanghai Health Development Research Center), Shanghai, China, [2]Shanghai Health Development Research Center, Shanghai, China

OBJECTIVES: There have been few studies on the expenditure of patients with Parkinson's disease (PD) in China. The aim of this study was to investigate direct cost of inpatients with PD in various medical institutions in Shanghai. **METHODS:** This study was conducted using data from the Shanghai Discharged Patients Medical Record Information Platform. The records of 2926 patients with

PD who have been discharged from all professional medical institutions in 2015 were examined. **RESULTS:** The hospitalized patients with PD were from third-grade hospitals(893), second-grade hospitals(1020), private hospitals(368), community health centers(272) and nursing homes(373). The average expenditure of all cases was RMB 27083. The average cost of patients in above-mentioned institutions were respectively RMB 37275,25782,21681,14712 and 20587. Medical consumables cost largest (45.25%) in the third-grade hospitals, while only cost less than 1.50% in other institutions. The largest part accounting for the expenses in the nursing homes, second-grade hospitals and community health centers were comprehensive medical services (including general medical services and nursing services, et al), which respectively accounted for 54.55%, 48.97% and 40.53%. The fee of drugs, not including Traditional Chinese Medicine(TCM), was more than 19.5% in each institution. The ratio of TCM expenditure in the community health centers was largest (13.29%), while the ratios in others were less than 6%. In private hospitals, the largest part of the expenditure was treatment (21.00%). **CONCLUSIONS:** PD causes significant expense for the health care system. The disparities of medical expenditure of PD in different institutions exists, illustrating the challenges for reducing the economic burden of this section of the society. This argues for more research to evaluate the rationality of some expenditure among patients in various institutions.

PND58

ALZHEIMERS DISEASE AND RELATED DEMENTIAS AND OUT-OF-POCKET HEALTHCARE SPENDING AND BURDEN

Dwibedi N[1], Findley P[2], Wiener RC[3], Shen C[4], Sambamoorthi U[1]
[1]West Virginia University, School of Pharmacy, Morgantown, WV, USA, [2]Rutgers University, New Brunswick, NJ, USA, [3]West Virginia University, Morgantown, WV, USA, [4]The University of Texas MD Anderson Cancer Center, Houston, TX, USA

OBJECTIVES: The objective of our study is to estimate the excess burden of annual total direct out-of-pocket spending and out-of-pocket spending on different types of healthcare services among elderly Medicare beneficiaries with Alzheimer's Disease and Related Dementias (ADRD) by comparing them to Medicare beneficiaries without ADRD. **METHODS:** We used data from 2012 Medicare Current Beneficiary Survey. The study sample comprised older adults (age>65 years), living in the community, with positive total healthcare expenditures, and enrolled in Medicare throughout the calendar year (462 with ADRD, and 7,160 without ADRD). We estimated the total out-of-pocket spending on healthcare and out-of-pocket spending by service type: inpatient, outpatient, home health, prescription drugs, and others. We measured out-of-pocket spending burden by calculating the percentage of income spent on healthcare and defined high out-of-pocket spending burden as having this percentage above 10%. Multivariable analyses included ordinary least squares regressions and logistic regressions that adjusted for predisposing, enabling, need, personal healthcare practices and external environment characteristics. **RESULTS:** The average annual per-capita out-of-pocket healthcare spending was greater among individuals with ADRD compared to those without ADRD ($3,285 vs. $1,895); home health and prescription drugs accounted for 52% of total out-of-pocket spending among individuals with ADRD and 34% among individuals without ADRD. Higher out-of-pocket spending burden by those with ADRD persisted even after adjustment for other factors (Beta=3.38, p=0.003). Elderly individuals with ADRD were more likely to have high out-of-pocket spending burden (AOR =1.49; 95% CI=1.13, 1.97) compared to those without ADRD. Our results showed that ADRD is associated with excess out-of-pocket healthcare spending, primarily driven by prescription drugs and home healthcare use. **CONCLUSIONS:** Medicare beneficiaries with ADRD have higher out-of-pocket expenditures as compared with Medicare beneficiaries without ADRD. The financial burden as a percent of income is higher with Medicare beneficiaries with ADRD as compared with Medicare beneficiaries without ADRD.

PND59

ALZHEIMER'S DISEASE IN CHINA: A DECISION MAKING TOOL FOR RESOURCE ALLOCATION

Gurnani M[1], de Pouvourville G[2], Caputo J[3]
[1]Essec Business School, Singapore, Singapore, [2]ESSEC Business School, Cergy-Pontoise, France, [3]ESSEC Asia Pacific, Singapore, Singapore

OBJECTIVES: to model the future disease burden and economic impact scenarios of Dementia and Alzheimer's disease (AD) in China so as to provide a tool for health resource allocation. **METHODS:** Literature search was conducted on PubMed using pre-specified keywords. Research articles (n=50) on prevalence and cost of AD dementia in China were identified based on pre-specified criteria. Prevalence data was used against projected Chinese population in 2030 to forecast number of AD dementia cases. This data was then inputted into MS Excel based model to predict the economic cost of dementia in 2030. Finally, multiple scenarios based on prevalence and cost estimates were generated. **RESULTS:** Our model predicts by 2030 the number of people with dementia in China would grow to 7.8 Mn; a growth of over 50% compared to 2015 (5.1 Mn). This is equivalent to 20 new AD cases diagnosed hourly. Most of this growth is expected in urban China with number of AD patients growing by over 105%; female AD cases increasing more than males (108% vs 101%). The number of AD patients in rural China would only increase by 13%. China AD economic burden in base case scenario (using China prevalence rates) is expected between USD 22Bn – 93Bn (average 62Bn) in 2030. On the other hand, in Scenario 1 (using 2015 US prevalence rates) the economic burden is expected to rise to USD 178Bn (average). In Scenario 2, economic burden further increases to USD 266 Bn when aggressive Chinese AD cost estimates are utilized. **CONCLUSIONS:** Changing demographics, urban/rural shift and increased diagnosis rates are expected to lead to an epidemic of AD dementia in China in the near future. Significant investments are required immediately to reduce the huge economic impact. This research provides a framework for future healthcare resource allocation for AD, Dementia and Mental Health investments in China.

PND60

A RETROSPECTIVE COMPARISON DESCRIBING DEMOGRAPHIC, FUNCTIONAL, AND CLINICAL DIFFERENCES OF U.S. NURSING HOME RESIDENTS WITH PARKINSON'S DISEASE WITH AND WITHOUT PSYCHOSIS

Allen C[1], Zarowitz BJ[2], O'Shea T[3], Fredericks D[4]
[1]CVS Health, San Antonio, TX, USA, [2]CVS Health, Livonia, MI, USA, [3]CVS Health, Englewood, OH, USA, [4]ACADIA Pharmaceuticals Inc., San Diego, CA, USA

OBJECTIVES: Describe demographic, functional, and clinical differences between nursing home residents (NHR) with Parkinson's disease (PD) and PD with psychosis (PDP). **METHODS:** A retrospective analysis was conducted using linked and de-identified Minimum Data Set (MDS) assessments and prescription claims of NHR from 10/1/2010-9/30/2012. Differences between PD (MDS item I5300, ICD9 332.0 or 332.1) and PDP (PD plus documentation of psychosis, hallucinations, or delusions) were evaluated by Chi-Square analysis. Longitudinal comparison of age- and gender-matched PD and PDP cohorts from baseline (first full MDS) to completion (last full MDS, ≥12 months apart) was by McNemar's test. **RESULTS:** Of 300,371 NHR, 6,551 PD and 1,303 PDP residents met criteria and were evaluated. More PDP residents were male (52% vs. 49%, p=0.048), had depression (67.4% vs. 50.6%; p<0.001), anxiety disorder (46.3% vs. 26.2%; p<0.001), stroke (22.4% vs. 20.0%, p=0.048), bipolar disorder (12.1% vs. 5.8%, p<0.001), and urinary tract infections (34.5% vs. 30.9%; p=0.01). More PDP residents had moderate/severe cognitive impairment (85.3% vs. 72.1%; p<0.001), frequent-always bowel or urinary incontinence (71.4% vs. 62.1% and 69.3% vs. 58.7%; p<0.001), overall behavioral symptoms (21.2% vs. 7.0%; p<0.001), rejected evaluation of care (31.2% vs. 12.8%; p<0.001), required extensive assistance/total dependence (EA/TD) (78.7% vs. 74.4%; p<0.001), and had major injuries from falls (4.8% vs. 2.6%; p=0.01). PDP residents were prescribed more antipsychotics (69.8% vs. 22.8%; p<0.001), anxiolytics/sedative-hypnotics (55.3% vs. 40.7%; p<0.001), and antidepressants (68.7% vs. 55.8%; p<0.001). Longitudinal comparison of matched cohorts (n=473 per group) showed PDP residents had greater functional deterioration requiring EA/TD (20.3% vs. 11.4%; p<0.001), and increased major injury from falls (11.4% vs. -7.1%; p=0.042). **CONCLUSIONS:** NHR with PDP had more EA/TD, major injury from falls, incontinence and antipsychotic prescriptions. A higher prevalence of these four Centers for Medicare and Medicaid Services quality measures may result in higher resource utilization.

PND61

SELF-REPORTED INSOMNIA AND SLEEP CHARACTERIZATION IN THE UNITED STATES

Morlock A, Freiling N
Acumen Health Research Institute, Ann Arbor, MI, USA

OBJECTIVES: To evaluate sleep characteristics (difficulty initiating sleep [DIS], difficulty maintaining sleep [DMS], non-restorative sleep [NRS] and time slept on weekdays) in patients with self-reported insomnia. **METHODS:** Using data from a nationally representative research survey fielded in 2016, sleep characteristics, quality of life, emergency department visits and productivity loss were assessed in participants with insomnia. Standardized sleep questionnaires were used to characterize sleep complaints. Descriptive and multivariable models with US population-based weighting was used to obtain adjusted odds ratios (ORs) and 95% confidence intervals (CIs) across patient groups. **RESULTS:** Insomnia was reported in 26.8% of the US adult population. The most frequent sleep complaints reported for those with insomnia were NRS alone (30.6%), DIS, DMS and NRS (27.8%) and DMS and NRS (10.9%). Comparing patients with DIS alone or DMS alone (4.6%) and NRS alone (30.6%) weekday hours slept were 7.5, and 6.6, respectively. Days with reduced productivity in the past week were higher for those with NRS alone compared to those reporting DIS alone or DMS alone (3.43 vs. 0.42; p<0.001). Emergency department visits over the last 6 months were higher for those with DIS alone or DMS alone compared to those with NRS alone (0.91 vs. 0.38; p<0.001). Scores on the Restorative Sleep Questionnaire (v2) were lower (worse) for those with NRS alone compared to those with DIS alone or DMS alone (50.23 vs. 53.41; p<0.001). **CONCLUSIONS:** Insomnia is common complaint expressed in several ways. How patients characterize insomnia symptoms is related to health related quality of life, productivity and resource utilization.

PND62

REVIEW OF THE EPIDEMIOLOGY AND TREATMENT LANDSCAPE IN PEDIATRIC MULTIPLE SCLEROSIS IN THE UNITED STATES

Krupp LB[1], Vieira MC[2], Boulos FC[2], Toledano H[2], Peneva D[3], Pourrahmat M[4], Druyts E[4]
[1]NYU Langone Medical Center, New York, NY, USA, [2]Novartis Pharmaceuticals, East Hanover, NJ, USA, [3]Precision Health Economics, Los Angeles, CA, USA, [4]Precision Health Economics, Vancouver, BC, Canada

OBJECTIVES: Pediatric multiple sclerosis (MS) is a challenging condition to quantify and treat due to the evolving changes in diagnosis criteria, introduced in 2007 and revised in 2012, the limited evidence on the epidemiology of the disease and the efficacy and safety of therapies, and the lack of long-term data. No treatments have been approved for pediatric MS. This study aims to identify the epidemiological data and treatment landscape for children with MS in the US. **METHODS:** Two systematic searches were performed in MEDLINE (1946-2016) and EMBASE (1974-2016) to identify studies examining the epidemiology of pediatric MS, and any treatment guidelines or consensus statements for pediatric patients with MS in the US. Hand searches of MS societies and organizations were conducted to identify further evidence. International or regional guidelines were also considered. **RESULTS:** Of 623 references identified in the first search, 12 focused on the prevalence, incidence, or demographics of pediatric MS, 54 focused on natural history, and two considered

both. The mean age at diagnosis with MS was 15 years, and as high as two-thirds of patients were female. The prevalence of pediatric MS ranged from 0.39 to 9.70 per 100,000 children, with incidence between 0.03 and 2.3 per 100,000 children-years. Of 81 references identified in the second search, only three focused on recommendations for pharmacological treatments for children. The efficacy and safety of disease-modifying therapies suggested by consensus statements have only been reported in observational studies or small retrospective case reports and series. **CONCLUSIONS:** There is variation in the reported prevalence and incidence of pediatric MS in the US. Clinical evidence from randomized controlled trials is needed to support treatment guidelines for the pediatric MS population.

PND63

A COMPARISON OF ANTIEPILEPTIC DRUGS APPROVED BY THE US FOOD AND DRUG ADMINISTRATION AND HEALTH CANADA

Alsharaimy F[1], Chong D[1], Seoane-Vazquez E[2], Rodriguez-Monguio R[3], Eguale T[1]
[1]MCPHS University, Boston, MA, USA, [2]Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA, [3]University of Massachusetts Amherst, Amherst, MA, USA

OBJECTIVES: Antiepileptic drugs (AEDs) sales have been increasing globally. The US Food and Drug Administration (FDA) and Health Canada (HC) are two regulatory agencies that use different approval processes and regulatory actions to approve new drugs. The aim of this study was to conduct a comparative analysis of antiepileptic drugs (AEDs) approved in the peirod 1953- 2016 by these two regulatory agencies. **METHODS:** In the study period, all AEDs approved by the FDA and HC were collected from the Drugs@FDA database, the Health Canada Drug Product database, and the Health Canada Notice of Compliance (NOC) database. For each AED, the following data were extracted: approval date, indications, contra-indications, dosage forms, routes of administration, strengths, boxed warnings, market status and review status. Differences in these characteristics were assessed qualitatively and quantitatively. **RESULTS:** Of the 46 drugs on the WHO ATC list, 13 AEDs were never submitted to or approved by the FDA and HC; 33 AEDs were approved by either the FDA or HC. Only 19 AEDss were approved by both regulatory agencies. The mean number of AEDs' indications approved by the FDA (1.95±0.97) was higher than the HC's (1.63±0.83), though the difference was not statistically significant. The FDA approved more indications in 7 AEDs (36.8%) while HC approved more indications for only one drug. The average number of contra-indications approved by HC (2.89±2.77) was higher than the average number of contraindications approved by the FDA (1.53±1.54). Other differences were identified in drug approval dates, restrictions, limitations, boxed warning, dosage forms, and strengths. **CONCLUSIONS:** There are significant differences in AEDs characteristics approved by the FDA and HC. More research may be needed to compare the clinical evidence that lead to these discrepancies between the two regulatory agencies.

PND64

GENERIC COST-EFFECTIVENESS ANALYSIS MODELS AS A PRECISION MEDICINE DECISIONMAKING TOOL: A CASE EXAMPLE

Hao J[1], Snyder SR[2]
[1]Geisinger Health System, Danville, PA, USA, [2]Geisinger Department of Epidemiology and Health Services Research, Forty Fort, MA, USA

OBJECTIVES: Economic evaluation is integral to informed healthcare decisionmaking in the rapidly growing and changing field of precision medicine, however this research is time consuming and expensive involving highly-skilled researchers. Generic models are proposed as a novel approach to address this critical evidence shortage to allow users to input local values. The purpose of this study is to develop and test a generic pharmacogenomic cost-effectiveness model. **METHODS:** A generic model was developed based on a published country-specific model to evaluate routine HLA-B*15:02 screening for new adult epilepsy patients to prevent carbamazepine-induced Stevens Johnson Syndrome and Toxic Epidermal Necrolysis (SJS/TEN) versus two strategies without screening. A country-specific model was comprehensively reviewed and modified based on evidence reviews and multi-disciplinary international team consensus to incorporate generalizable assumptions and parameter values. Input parameters requiring user-provided values were identified to reflect local conditions and reality-based sensitivity analysis. The generic model was transparently documented, tested and cross validated by comparing its incremental cost-effectiveness ratio (ICER) results using country-specific input values to results of country-specific models from Thailand, Malaysia and Singapore for the same input values. **RESULTS:** The base-case and probabilistic sensitivity analyses' results for the generic and country-specific models for all 3 countries were consistent in terms of whether HLA-B*15:02 screening was cost-effective at the country-specific cost-effectiveness threshold value. Differences between the generic and country-specific model results were largely due to differences in model structure and assumptions. **CONCLUSIONS:** A generic pharmacogenomic cost-effectiveness model is feasible and can offer an efficient and timely value-based decisionmaking tool. Developing generic models to perform cost-effectiveness analyses can provide useful evidence for decisionmaking reliably, more quickly and without staff extensively trained in decision modeling, as well as facilitate understanding about what conditions can meet cost-effectiveness thresholds.

PND65

DEMOGRAPHICS, CLINICAL CHARACTERISTICS, AND TREATMENT PATTERNS OF HUNTINGTON DISEASE PATIENTS TAKING TETRABENAZINE FOR CHOREA: FINDINGS FROM THREE DIFFERENT DATA SOURCES

Anderson K[1], Iyer R[2], Schilling T[2], Abler V[2], Sung V[3]
[1]Georgetown University, Washington, DC, USA, [2]Teva Pharmaceutical Industries, Frazer, PA, USA, [3]University of Alabama, Birmingham, AL, USA

OBJECTIVES: Huntington disease (HD) is a multifaceted neurodegenerative disorder characterized by involuntary movements, specifically chorea. Tetrabenazine (TBZ), the only FDA-approved treatment in HD, has been shown to be efficacious for chorea control; although, tolerability concerns exist. This analysis aims to examine and compare demographics, clinical characteristics, and treatment patterns of HD patients with chorea who are prescribed TBZ from three different databases. **METHODS:** Data were gathered from descriptive retrospective analyses of two large administrative claims databases, Optum and Truven, and one electronic medical record (EMR) database, IBM Explorys. Patients were identified from Optum or Truven if they had a claim of HD chorea (ICD 333.4) with continuous medical and prescription coverage pre- and post- index date (date of first TBZ claim) or from Explorys using EMRs of patients diagnosed with HD with ≥1 TBZ prescription and complete dosing information. Discontinuation was defined as having ≥90-day therapy gap in both claims analyses and either switching or stopping TBZ in the follow-up period in Explorys. **RESULTS:** 2,077 and 2,047 patients with HD-chorea were identified from Truven and IBM, respectively, and approximately 1,200 patients from Optum. Less than 15% of patients identified from all three databases had any initiation of TBZ. Of those taking TBZ, there were no gender differences. TBZ discontinuation rates were 35% and 46% in the Optum and Truven databases, respectively. In the Explorys analyses, 68% discontinued/switched from TBZ during study period. An increase in depression diagnosis after TBZ initiation was observed in all three analyses. **CONCLUSIONS:** Results were consistent in showing a low rate of treatment initiation and high rate of TBZ discontinuation in patients with HD-chorea, indicating an unmet need for an efficacious and tolerable treatment in these patients. Further research is needed to understand the reasons for low treatment initiation rates and high discontinuation rates with TBZ in the HD population.

PND66

TREATMENT PATTERNS IN TUBEROUS SCLEROSIS COMPLEX (TSC) PATIENTS WITH RENAL ANGIOMYOLIPOMA AND SUBEPENDYMAL GIANT CELL ASTROCYTOMA (SEGA)

Song X[1], Said Q[2], Tran OV[3], Prestifilippo J[2], Bissler J[4], Krueger DA[5]
[1]Truven Health Analytics, Shrewsbury, MA, USA, [2]Novartis Pharmaceutical Corporation, East Hanover, NJ, USA, [3]Truven Health Analytics, Cambridge, MA, USA, [4]The University of Tennessee Health Science Center, Memphis, TN, USA, [5]Cincinnati Children's Hospital Medical Center, Cincinnati, OH, USA

OBJECTIVES: TSC is a rare multi-organ disease, often with neurologic and renal complications. This study examined commercial and Medicaid insurance treatment patterns (everolimus, sirolimus, and surgeries) in TSC patients with renal angiomyolipoma or SEGA in the US. **METHODS:** Patients with ≥1 diagnosis of TSC and with renal angiomyolipoma or SEGA were extracted from the MarketScan® Commercial (1/1/2009-8/31/2016) and Medicaid (1/1/2009-6/30/2015) databases. Patients were followed from index date (earliest TSC, renal angiomyolipoma or SEGA diagnosis) until inpatient death or end of data. The proportion of patients treated, types of initial treatment and subsequent treatments were examined during the variable follow-up. **RESULTS:** The final sample included 1,497 TSC patients (n=896 renal angiomyolipoma only, n=411 SEGA only, and n=190 with both). Compared with commercial patients (n=984), Medicaid patients (n=513) had the same mean age (22 years), a higher proportion of males (50.3% vs. 42.9%), and a longer follow-up period (48 vs. 38 months). Treatment rates were similar between commercial and Medicaid (58.0% vs. 61.7%, p=0.182), but it took significantly more days for Medicaid patients to initiate treatment (377 vs. 516 days, p<0.001). In the commercial cohort, among the 46.4% patients starting treatment with surgery, 33.7% had repeat surgeries and 16.2% switched to drug treatment; among the 11.6% patients starting treatment with a drug, only 4.4% had subsequent surgeries. In the Medicaid cohort, among 48.0% who started treatment with surgery, 57.8% had repeat surgeries and 10.2% switched to drug treatment; among the 14.4% patients starting treatment with a drug, 16.2% had subsequent surgeries. Analysis was also conducted separately for patients with renal angiomyolipoma only, SEGA only, and both renal angiomyolipoma and SEGA. **CONCLUSIONS:** This analysis finds that only 58.0-61.7% of TSC patients with renal angiomyolipoma or SEGA received treatments and Medicaid patients had a longer time to initiate treatment than Commercial patients.

RESPIRATORY-RELATED DISORDERS – Clinical Outcomes Studies

PRS1

ASSESSING THE HOSPITAL READMISSION AND MORTALITY RATES AMONG ELDERLY PATIENTS WITH CHRONIC OBSTRUCTIVE PULMONARY DISEASE

Du J[1], Xie L[1], Keshishian A[1], Zhang Q[1], Yuce H[2], Baser O[3]
[1]STATinMED Research, Ann Arbor, MI, USA, [2]New York City College of Technology-CUNY and STATinMED Research, New York, NY, USA, [3]Columbia University and STATinMED Research, New York, NY, USA

OBJECTIVES: To evaluate the 30- and 60-day readmission and mortality rates of patients diagnosed with chronic obstructive pulmonary disease (COPD) in the US Medicare population. **METHODS:** Patients aged ≥65 years on the admission date with an inpatient stay and a primary discharge diagnosis for COPD (International Classification of Diseases 9th Revision Clinical Modification diagnosis codes: 490.xx, 491.xx, or 496.xx) were identified using Medicare data from 01JAN2010 through 31OCT2013. The discharge date was designated as the index date. Patients were required to have continuous medical and pharmacy benefits for 1 year before the admission date and 2 months after the discharge date. Patients who died within 2 months post-discharge date were also included. Demographic and clinical characteristics were examined for the 12-month pre-discharge period. The 30- and 60-day readmission and mortality rates after discharge were computed. Descriptive analysis was performed, and mean and standard deviation were provided for continuous variables as well as numbers and percentages for categorical variables. **RESULTS:** A total of 279,768 patients were identified after

applying the selection criteria. The mean age of Medicare patients with COPD was 77.8 years (standard deviation [SD]=7.7). Female (61.2%) and white (90.0%) patients were the largest demographic groups included in the study. The average Charlson comorbidity index score was 2.9 (SD=2.7). Comorbid conditions: 59.6% of patients were smokers; 45.7% had moderate or severe renal disease, 40.5% had congestive heart failure, 39.2% had diabetes, and 37.5% had any malignancy. The 30-day hospital readmission rate was 20.3%, and the mean time-to-30-day-readmission was 12.5 days. The 60-day hospital readmission rate was 29.0%, and the mean time-to-60-day-readmission was 22.4 days. The 30- and 60-day mortality rates were high: 6.5% and 9.7%, respectively. **CONCLUSIONS:** US Medicare patients diagnosed with COPD had significant hospital readmission and mortality rates in the 30 or 60 days following hospital discharge.

PRS2

COMPARATIVE ANALYSIS OF NEBULIZED ARFORMOTEROL VS INHALED LONG-ACTING BETA-AGONISTS FOR COPD: RESCUE MEDICATION USE AND MEDICAL OUTCOMES

Ganapathy V[1], Vasey J[2]
[1]Sunovion Pharmaceuticals Inc., Marlborough, MA, USA, [2]Practice Fusion, San Francisco, CA, USA

OBJECTIVES: Arformoterol (ARF) is a nebulized long-acting beta2-agonist for maintenance use in chronic obstructive pulmonary disease (COPD) patients. Real-world studies comparing outcomes of ARF with those of inhaled long-acting beta2-agonists (LABA) in community-based COPD patients are lacking. This study compares rescue medication use (RMU) and medical outcomes among COPD patients treated with ARF vs LABA. **METHODS:** De-identified electronic health records (EHR) of patients in the Practice Fusion EHR database between 2010 and 2016 were analyzed. Patients aged >18 years with a COPD diagnosis (ICD-9 CM: 490-492, 494-496; or ICD-10: J40-J44, J47) were included. Patients initiating ARF (index) with no prior LABA use restriction were propensity matched to LABA patients without prior ARF use. The index date for the LABA cohort was randomly assigned to correspond with the ARF index date. The proportion of patients with RMU (ie, short-acting beta agonists [SABA], short-acting muscarinic antagonists [SAMA], or combination [SABA/SAMA]), number of exacerbations, and office visits was compared 6-months pre- and post-index date. Generalized linear models were estimated as appropriate for outcome type. A p value of 0.05 was used to test statistical significance. **RESULTS:** The proportion of patients (n=3646 in each) with any RMU decreased in the post-index period for ARF and increased for LABA cohorts (odds ratios [ARF vs LABA]: 0.94, p=0.427 for SABA or SAMA and 0.68, p=0.0016 for SABA/SAMA usage). An increase in number of exacerbations and office visits was observed in the post-index period for both cohorts; increases in office visits were higher for the LABA than the ARF cohort (incidence rate ratios [ARF vs LABA]: 0.87, p=0.15 for exacerbations and 0.92, p=0.012 for office visits). **CONCLUSIONS:** ARF treatment is associated with lower SABA/SAMA use and office visits compared with inhaled LABA treatment in community-based COPD patients and may represent a potential alternative treatment choice for inhaled LABAs.

PRS3

RESULTS OBTAINED IN PATIENTS TREATED WITH OMALIZUMAB IN COSTA RICA'S SOCIAL SECURITY (CAJA COSTARRICENSE DE SEGURO SOCIAL)

Castro Cordero JA, Ching Fung SM, Marin Piva H
Caja Costarricense de Seguro Social, San Jose, Costa Rica

OBJECTIVES: Omalizumab is an humanized antibody IgE, used in Caja Costarricense de Seguro Social (CCSS) for the treatment of persistent severe allergic asthma with inadequate control with the available medicines, including inhaled corticoids. This study is aimed to assess the results obtained in patients treated with omalizumab in CCSS between 2012 and 2014. **METHODS:** Observational, retrospective study, based on the omalizumab prescriptions in the CCSS. Clinical records were reviewed to collect information on hospital admissions, emergency room (ER) visits, amount of exacerbations, day and night symptoms, forced expiratory volume (FEV) and required drugs for control. The clinical condition in the 6 months prior to treatment was considered baseline condition, and clinical response was established as the clinical condition after 6 months of treatment. **RESULTS:** We accessed information for 33 patients. Female predominated over male in a 4.5:1 ratio. Average age was 42.1 years (IC95% 35.9; 48.3). All patients were diagnosed with severe persistent asthma. The risk for hospitalization decreased 75.3% (p<0.001) with treatment. Considering the number needed to treat (NNT=2) it's required to treat 2 patients to prevent 1 hospitalization. Risk for ER visit decreased 58% (p<0.001), it's needed to treat 2 patients to prevent 1 visit to ER (NNT=2). Risk for clinical exacerbation decreased 57.6% (p<0.001), NNT=2. Risk for having day symptoms twice a week decreased 67% (p<0.001), NNT=2. Risk for having night symptoms twice a week decreased 89%. Mean FEV1 after starting treatment increased 23% (p=0.031). Risk of requiring 3 or more inhalations of rescue treatment with albuterol decreased 68% (p=0.0012). The chronic use of systemic corticosteroids decreased 64% with treatment (p<0.001). Inhaled corticoids requirement remains unchanged, regardless of the agent used. **CONCLUSIONS:** Giving treatment with omalizumab to patients with uncontrolled severe asthma in Costa Rica's Social Security, significantly improves their clinical condition after 6 months.

PRS4

RIOCIGUAT IN THE PHARMACOLOGICAL TREATMENT OF PULMONARY ARTERIAL HYPERTENSION: A SYSTEMATIC REVIEW

Faria GG[1], Mosegui GB[2], Vianna CM[3], Tavares CV[4], Cordeiro BC[1]
[1]Universidade Federal Fluminense, Niteroi, Brazil, [2]Universidade Federal Fluminense, Niterói, Brazil, [3]Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Brazil, [4]Brazilian Air Force, Rio de Janeiro, Brazil

OBJECTIVES: To perform a systematic review (SR) of the efficacy of pharmacological treatment of Pulmonary Arterial Hypertension comparing Riociguat with other available medications or with placebo. **METHODS:** Following the steps described in the PRISMA guideline, a search for randomized controlled clinical trials was conducted in which Riociguat was used alone or in combination with other therapies, in databases MEDLINE, LILACS, Web of Science, Science Direct, Cochrane Library Wiley and in the gray literature (Google Scholar, Capes Bank of Theses and Clinical Trials). EndNote and Mendeley were used as reference managers. Outcomes analyzed were: death, 6-minutes walking distance (6MWD), WHO functional class (improvement, stabilization or worsening), hemodynamic variables (pulmonary vascular resistance, cardiac index, pulmonary-artery pressure), clinical worsening, hospitalization and quality of life. **RESULTS:** 467 articles were obtained, remaining 379 after the duplicated articles withdrawal. After exclusion by title and abstract by two independent reviewers, 47 studies remained. Through the gray literature, 6 studies were obtained, counting 53 studies for full article reading, and the eligibility criteria were verified. Five studies were selected to compose the SR. Compared with placebo, Riociguat showed improvements in 6MWD, pulmonary vascular resistance, WHO functional class and time to clinical worsening, also maintained after one year of use. Subgroup analysis was performed comparing of treatment-naive patients and patients on background PAH-targeted therapy. **CONCLUSIONS:** This work may be used as a management and decision support tool, based on the same rationality that involves a Health Technology Assessment, contributing to quality the decisions to be taken in relation to the incorporation of new technology.

PRS5

ASTHMA TREATMENT PATTERN LONGITUDINAL ANALYSIS

Kim C[1], Campbell JD[1], Strand M[2], Dilokthornsakul P[3]
[1]University of Colorado Anschutz Medical Campus, Denver, CO, USA, [2]University of Colorado Anschutz Medical Campus, Aurora, CO, USA, [3]Naresuan University, Phitsanulok, Thailand

OBJECTIVES: Asthma management guidelines suggest a stepwise therapeutic management strategy for asthma patients. This study aims to characterize the association between treatment step trajectories and patient characteristics. Additionally, the association between asthma health outcomes with treatment step trajectories is assessed. **METHODS:** A retrospective cohort study between Jan. 2006 through Dec. 2013 using a random sample from IMS PharMetrics Plus claims database of asthma patients in the United States aged between 6 and 64 at index. The primary outcomes of interest are treatment step (ordinal: guideline-based steps 0 (mild) to 5 (severe)) and asthma exacerbation events categorized as dichotomous and nominal (asthma-related hospitalizations, emergency room visits, and oral steroid bursts). Data was modeled using a generalized linear mixed model (GzLMM) framework for both outcomes of interests. A priori selection of covariates of interest were age, gender, Charlson Comorbidity Index (CCI), region and insurance type. **RESULTS:** There was a statistically significant association between treatment steps and time since index date, baseline age, gender, and CCI (p<0.05) under a proportional odds model. The generalized logit model indicates that treatment step 2 subjects have an overall lower odds of asthma hospitalization event compared to those on treatment steps 1,3,4 and 5 (i.e. 0.064 vs. 0.106, 0.095, 0.110, and 0.222 times lower odds of hospitalization compared to no event, respectively). Females compared to males had a higher asthma exacerbation event (1, 2, 3, and 4) odds (1.914, 1.133, 1.297, and 1.253) compared to no event. Patients with 1 unit increase in CCI value have a higher odds of event 1, 3, and 4 compared to no event. **CONCLUSIONS:** The longitudinal analysis of asthma treatment steps identified many significant associations between treatment steps and patient characteristics such as baseline age, CCI, and gender. Additionally, patients with higher CCI values and females (compared to males) had higher odds of exacerbation events.

PRS6

OPTIMIZING SURVIVAL AND COST-UTILITY IN THE TREATMENT OF BRONCHIOLITIS OBLITERANS SYNDROME: A CALIBRATED AGENT-BASED MODELING APPLICATION

Jones CA[1], Zia A[2], Weimersheimer P[3], Mesa OA[4], Vos R[5]
[1]ForMyOdds LLC, Burlington, VT, USA, [2]University of Vermont, Burlington, VT, USA, [3]University of Vermont College of Medicine, Burlington, VT, USA, [4]Therakos, Inc., a Mallinckrodt Corporation, Wokingham, Berkshire, UK, [5]KULeuven, Leuven, The Netherlands

OBJECTIVES: Standard regression models for calculating cost-utility analysis often overlook outliers. In this study, our goal was to build a calibrated Agent Based Model (ABM) that could align treatments with complex and heterogeneous patient characteristics, and compare cost-utility in a more granular fashion between extracorporeal photopheresis (ECP) offered to patients at earlier versus later stages of BOS severity. **METHODS:** We calibrated an ABM that simulates survival and cost-utility. We focused on earlier access to ECP across defined scenarios and underlying disease severity. Patient characteristics such as age, gender, timing of ECP, changes from baseline in forced expiratory volume (FEV) per second, outliers at different levels of allograph rejection, and grade of BOS severity were assigned to each individual in the ABM. We then compared individual cost-utility estimates for patients receiving ECP at different stages of BOS in a manner that highlights the outlier effects, and scaled up the calibrated ABM to the U.S. transplant population using the United Network for Organ Sharing (UNOS) dataset. **RESULTS:** Our preliminary calibrated findings suggest that ECP cost-utility estimates are markedly lower when offered at earlier as compared to later stages of BOS. As such, we were able to model the value of early-intervention while illustrating outlier effects. Our findings highlight how patient-specific characteristics must be considered for maximizing survival and quality of life while minimizing cost. **CONCLUSIONS:** Using patient-level data, ABMs can illustrate survival and cost-utility in a manner that calibrates the right treatment for the right patient at the right time, such as the application of ECP to patients in various stages of BOS. In this precision medicine framework, such calibrated ABMs can be scaled and presented in a graphical way to inform policy at the population level.

PRS7

COMPLIANCE WITH A QUALITY MEASURE AND INCORPORATION OF AN EVIDENCE-BASED PRACTICE IN PATIENTS WITH CHRONIC OBSTRUCTIVE PULMONARY DISEASE

Thiessen K, Kathe NJ, Hammond D
University of Arkansas for Medical Sciences, Little Rock, AR, USA

OBJECTIVES: Chronic obstructive pulmonary disease (COPD) affects more than 15 million Americans and is the third leading cause of mortality in the United States. The aims of this study were to describe rate of compliance with the quality measure that patients with COPD receive an inhaled corticosteroid and inhaled bronchodilator and to assess the effect of the evidence-based practice, extended course systemic macrolide therapy, on COPD exacerbation rate. **METHODS:** Patients ≥18 years-of-age with a hospitalization or emergency department (ED) visit for a COPD exacerbation were identified in IMS Lifelink Plus (2006-2015). The earliest COPD exacerbation date was the index-date. Patients had continuous enrollment for 6 months before and after index-date. Patients with ≥1 prescription for inhaled corticosteroid and bronchodilator within 30 days from index-date were defined as standard therapy. Patients with ≥30 day supply of macrolide within 90 days of index-date were defined as macrolide therapy. COPD exacerbation recurrence was defined as hospitalization or ED visit in the six month post-index period. Logistic regression analysis was performed using age, sex, geographic region, and comorbidities to assess the effect of exposure to macrolide on COPD exacerbation recurrence. **RESULTS:** Of 56,055 patients who met inclusion criteria, 4,512 (8.05%) received an inhaled corticosteroid and bronchodilator, 202 (0.36%) received systemic macrolide therapy, and 41 (0.07%) received both interventions. Within six months of index-date exacerbation, 7,987 (14.25%) patients experienced another exacerbation. In unadjusted analysis, receipt of macrolide therapy was associated with lower odds of experiencing another COPD exacerbation (odds ratio 0.473, 95% confidence interval 0.319-0.701); however, after adjusting for covariates, this association no longer existed (odds ratio 0.880, 95% confidence interval 0.415-1.867). **CONCLUSIONS:** There is a low rate of compliance with the quality measure that patients with COPD receive an inhaled corticosteroid and an inhaled bronchodilator and no effect on exacerbation rate with use of systemic macrolide therapy.

PRS8

PREVALENCE AND CHARACTERISTICS OF E-CIGARETTE USERS AMONG COPD PATIENT POPULATION IN THE UNITED STATES

Shah A, Paliwal Y, Holdford D
Virginia Commonwealth University, Richmond, VA, USA

OBJECTIVES: To estimate the prevalence and study e-cigarette (e-cig) user characteristics among Chronic Obstructive Pulmonary Disease (COPD) patient population in the United States. **METHODS:** The National Health Interview Survey (NHIS) 2014 data were used to generate weighted prevalence estimates among the US adult civilian noninstitutionalized population with age ≥ 18 years (Weighted N = 239,688,457). COPD individuals were those who responded yes to the question "Have you ever been told by a doctor or other health professional that you had chronic obstructive pulmonary disease, also called COPD?". Current e-cig users were the one using e-cig devices for either every day or some day while ever e-cig users were those who had ever used e-cigs even once. E-cig user characteristics among COPD subjects evaluated were age, sex, race, census region, marital status, current working status, type of employment, number of current jobs, smoking status, BMI, current use of combustible or smokeless tobacco products, and quit attempts over the past year. Chi-squared tests were used to compare the data. All our analysis employed NHIS sampling weights to generate data representative of the entire US population. **RESULTS:** Weighted prevalence estimates for current and ever e-cig users among COPD subjects were 8.64% (Weighted N = 642,848) and 24.37% (Weighted N = 1,793,828) respectively. Among current e-cig users with COPD, proportion of use were found to be higher ($P < 0.05$) for ages 45 to 64 years age (56.96%), divorced (30.75%), residents in the south region (53.88%), unemployed (87.50%), dual users of other tobacco products (68.48%), and individuals who have tried quitting tobacco use at least once in past 12 months (62.20%). **CONCLUSIONS:** Awareness and use of e-cigs have not just increased in general population, but its uptake has also increased in the COPD disease population. Usage was higher among current smokers and those who wanted to quit tobacco.

PRS9

CHARACTERISTICS ASSOCIATED WITH AWARENESS AND USE OF ELECTRONIC NICOTINE DELIVERY SYSTEM (ENDS) AMONG STUDENTS ENROLLED IN HEALTH SCIENCE PROGRAMS

Hoong GY[1], Dujaili JA[1], Blebil AQ[2], Ahmed SI[1]
[1]International Medical University Malaysia, Bukit Jalil, Malaysia, [2]UCSI University, Cheras, Malaysia

OBJECTIVES: The present study aims to assess the demographic characteristics associated with the awareness and use of electronic-cigarettes (e-cigarettes) among students enrolled in health science programs. **METHODS:** A web-based survey was conducted between July 1st and August 31st, 2016 among active undergraduate students of International Medical University (IMU) in Kuala Lumpur, Malaysia. The survey contained 31 items about sociodemographic characteristics, e-cigarette awareness, perceptions and use, as well as conventional cigarette smoking, health-risk and sensation seeking behaviours (SSB). Binary logistic regression was performed to identify factors associated with e-cigarette use. **RESULTS:** A total of 404 students were enrolled in the study. The vast majority of our cohort were aware of an e-cigarettes (94.78% versus 5.22%). Out of 404, 53 (14%) students reported ever use of an e-cigarette during the past 30 days. E-cigarette use was significantly associated with nationality, gender, race, mother's and father's education. After controlling for the effects of confounders using binary logistic regression, e-cigarette users were more likely to be male, Malay, and being a child of less educated father. Moreover, SSB total score (aOR = 1.20, $P < 0.001$), conventional cigarette use (aOR = 7.79, P = 0.002), hookah use (aOR = 8.51, $P < 0.001$), and cigarette smoking for parents (aOR = 0.20, P = 0.026) were significantly contributing to the ever use of e-cigarette. **CONCLUSIONS:** The prevalence of e-cigarette use was moderately high among students enrolled in health science program compared to the general population in Malaysia. Hence, it would be of great importance for health sciences students to explore their inner position toward e-cigarette smoking. Whether they smoke because they ignore the risk or because they deny or even seek it or do they accept the risk but procrastinate the attempt to quit.

RESPIRATORY-RELATED DISORDERS – Cost Studies

PRS10

ADDING RESLIZUMAB TO U.S. MANAGED CARE FORMULARY FOR TREATMENT OF SEVERE EOSINOPHILIC ASTHMA RESULTED IN NET TOTAL COST SAVINGS

Huang H[1], Gani R[2], Sun SX[3], Ariely R[3]
[1]QuintilesIMS, Cambridge, MA, USA, [2]QuintilesIMS, Berkshire, UK, [3]Teva Pharmaceuticals, Malvern, PA, USA

OBJECTIVES: Reslizumab, a humanized interleukin-5 monoclonal antibody, is a new treatment to reduce the risk of clinical asthma exacerbations (CAE) in patients with severe eosinophilic asthma. A budget impact model was developed to assess the economic impact of adding reslizumab to existing severe eosinophilic asthma treatment from the perspective of a United States (US) managed care organization (MCO). **METHODS:** A hypothetical MCO with 1,000,000 members was used in the model. The model structure was based around the current clinical pathway of patients eligible for treatment with reslizumab. Prevalence of severe eosinophilic asthma was estimated using age-specific prevalence data from the Centers for Disease Control and Prevention, US census demographic data and published literature. CAE rate, relative risk reduction of CAE associated with reslizumab, CAE costs, and drug and drug administration costs were taken from published literature. The model accommodates a 5-year time horizon. Sensitivity analyses were performed using the upper and lower limits of 95% confidence intervals for the CAE rate and relative risk reduction of CAEs. **RESULTS:** When reslizumab was included as a treatment option to a 1,000,000-member health plan, the base-case model resulted in an overall cost savings of $862 in year 1, $7,150 in year 2, $12,911 in year 3, $19,155 in year 4, and $25,937 in year 5. Total cost savings were due to lower drug costs of reslizumab compared to omalizumab and mepolizumab and medical cost offsets from reduction of CAE. Sensitivity analyses showed that the result was most sensitive to the relative risk reduction of exacerbations associated with reslizumab. **CONCLUSIONS:** Addition of reslizumab to severe eosinophilic asthma treatment resulted in net overall cost savings to a MCO. This implies that reslizumab is a desirable treatment option among hard-to-treat patients whose cost of treatment is already high.

PRS11

COST-EFFECTIVENESS AND BUDGET IMPACT ANALYSIS OF UMEC/VI FOR THE TREATMENT OF COPD PATIENTS IN COLOMBIA

Gamboa Garay OA[1], Medina Torres YA[1], Gamboa Garay CA[1], Bastidas Goyes AR[2], Dieleman S[3]
[1]Instituto para la Evaluación de la Calidad y Atención en Salud-IECAS, Bogotá, Colombia, [2]Sabana University, Bogotá, Colombia, [3]GlaxoSmithKline, Bogotá, Colombia

OBJECTIVES: To evaluate the cost-effectiveness and budget impact of UMEC/VI compared with Tiotropio (TIO), Indacaterol/glicopirronio (QVA149), Indacaterol/Tiotropio (IND+TIO) and Fluticasona/Salmeterol (FCS) as maintenance bronchodilator treatment in patients aged ≥40 with moderate to severe COPD from the Colombian National Health System (NHS) perspective. Umeclidinium/vilanterol (UMEC/VI) is a fixed dose combination of a long-acting muscarinic receptor antagonist (LAMA) and a long-acting beta 2 receptor antagonist (LABA). **METHODS:** An analytical cost-effectiveness model (CEM) of COPD disease progression and a budget impact model (BIM) were developed from the GALAXY model. Data sources were literature reviews and governmental databases; efficacy data was derived from an indirect treatment comparison using a frequentist approach conducted by Huisman et al. The CEM used risk equations per attribute (lung function, exacerbations, symptoms, exercise capacity). Outcomes included mortality, quality of life, and resource utilization. A 20-year time horizon was used and costs and benefits were discounted at 5%. The BIM explored the inclusion of UMEC/VI in the NHS benefit plan, using a 3-year time horizon, including adverse event costs and costs of COPD-related events. **RESULTS:** TIO, IND+TIO and QVA149 were more costly and less effective than UMEC/VI and FCS. Costs per additional QALY gained/person treated with UMEC/VI compared to FCS was estimated to be COP$1,325,903 and $17,770,045 for 0.5 years and 20 years of treatment, respectively; indicating that UMEC/VI is cost-effective using the threshold of three times GDP/capita. Furthermore, the inclusion of UMEC/VI will allow the NHS to save COP$16,838,928,466 in the first year (5% UMEC/VI participation rate) to COP$19,325,269,697 in the third year (15% participation rate). **CONCLUSIONS:** UMEC/VI is less costly and more effective in this analysis, resulting in possible budget savings when included in the NHS benefit plan for patients aged ≥40 with moderate to severe COPD from the Colombian NHS perspective. Results are maintained in the sensitivity analysis.

PRS12

ECONOMICAL IMPACT OF TREATMENT WITH OMALIZUMAB IN COSTA RICAN SOCIAL SECURITY

Castro Cordero JA, Marin Piva H, Ching Fung SM
Caja Costarricense de Seguro Social, San Jose, Costa Rica

OBJECTIVES: To assess the budget impact generated by the use of Omalizumab in Caja Costarricense de Seguro Social (CCSS) and to estimate the cost effectiveness

of the intervention in Costa Rica's Social Security. **METHODS:** Based on the effectiveness study previously conducted, that demonstrated that giving treatment with omalizumab to patients with uncontrolled severe asthma in Costa Rica's Social Security, significantly improves their clinical condition after 6 months, we collected information on the amount of units of Omalizumab bought and administered to patients. Then, we constructed a model (decision tree) to evaluate the cost of clinical management of a patient with sever asthma with and without Omalizumab, using effectiveness data in clinical practice documented in CCSS. Cost data for medicines was obtained from the price paid registered in CCSS database; hospitalization cost and Emergency Room (ER) attention costs were obtained from the CCSS institutional tariff model. **RESULTS:** Between January 2012 and December 2014, a total of 33 patients received omalizumab, with a total consumption of 1.571 units and an inversion of US$870.224,03. Last registered unit (vial with 150mg) price in December 2015 was US$553,93. In the base case scenario modeled, that considered a 4-day hospitalization time and 7-hour ER attention, the cost of treatment per patient without Omalizumab was US$14.526,4 and with Omalizumab it was US$13.779,5, saving US$747 using Omalizumab, with a cost-effectiveness ratio of US$633 per hospitalization avoided (cost saving technology). In the most pessimistic scenario in the sensitivity analysis conducted, that considered no hospitalizations avoided neither ER attentions avoided, there was an incremental cost of US$13.271,4, that represents about 1.31 times Costa Rica's GDI per capita (US$10.100 in 2015). **CONCLUSIONS:** Considering effectiveness in clinical practice, omalizumab is a cost-saving technology when prescribed to patients with uncontrolled sever allergic asthma in Costa Rican Social Security.

PRS13

IMPACT OF IMPROVED STOVE ON COST OF ILLNESSES THAT ARE RELATED TO HOUSEHOLD AIR POLLUTION IN PAKISTAN

Malik A, Fatmi Z, Jamali T
Aga Khan University, Karachi, Pakistan

OBJECTIVES: Use of biomass fuel for household cooking is one of the major sources of household air pollution. In low and middle income countries an improved stove has been introduced to control air pollution and reduce burden and economic burden of respiratory and other related illnesses. The objective of this paper is to estimate the cost of respiratory and other related illnesses in household that used traditional stove versus improved stove. **METHODS:** We collected data from 605 household (217 treated, 388 control) in Sindh and Punjab provinces in September 2014.We estimate cost of medical care for treatment of respiratory illnesses and eye illnesses in the women who use traditional stove (control) and improved stove (treated) group. Medical care costs include consultation charges, purchase of medicines, and laboratory/radiology charges. **RESULTS:** Yearly median medical care cost of treating respiratory illnesses and eye illnesses significantly lower in treated group (PKR 2000 and PKR 898.5 respectively) than in control groups (PKR 2027.5 and PKR 1000). In regression analysis the medical care cost of respiratory illnesses and eye illnesses were higher in the control group (PKR 446.66 (SE 5708) and PKR 965.91 (SE 2943.78) respectively) than in the treatment group. **CONCLUSIONS:** Improved stove are better in terms of fuel efficiency and in reducing the burden and economic burden of related illnesses. However we recommend further research in this area with larger sample and appropriate follow up to capture difference over time and across treated and control groups.

PRS14

DIRECT AND INDIRECT COSTS OF COPD FROM PATIENT PERSPECTIVE: 1-YEAR FOLLOW UP

Martínez Briseño D, Fernandez Plata Md, García-Sancho C, Cano-Jiménez D, Ramírez A, Sansores R, Pérez Padilla R
National Institute of Respiratory Disease, Mexico, Mexico

OBJECTIVES: To estimate and compare direct and indirect cost of COPD along one-year follow-up stratifying by GOLD criteria from patient perspective. **METHODS:** We conducted a prospective study during August 2013-July 2014 in a public tertiary referral hospital. We enrolled sequentially COPD patients from wards, outpatient and COPD clinics. We applied a questionnaire each visit or hospitalization during the study period to obtain sociodemographic characteristics, working days lost and out-of-pocket expenses. Patients were classified into three non-mutually exclusive groups: outpatient, inpatient and outpatient + hospitalization due to an exacerbation. In the first questionnaire we asked information for the year prior to enrollment. In the subsequent questionnaires we asked for the information between the previous consultation and the current one. In this study, we analyzed the information of follow-ups. Costs were transformed in 2014 US Dollars. **RESULTS:** We recruited 611 patients at base line; only 72% (442) had at least one follow-up. Frequencies in each group were: outpatients, 437; inpatients, 42; outpatient + hospitalization, 37. In the outpatient group, median annual direct costs ranged from $562 to $2,902 and were statistically different ($P < 0.001$). We observed increased cost by GOLD in the inpatient and outpatient + hospitalization groups but differences were no statistically significant. Medical cost represented a higher proportion of direct cost in the three groups of patients (53-99%). For GOLD II and IV, we found significant differences ($P < 0.05$) in direct medical cost when compare outpatient vs outpatient + hospitalization groups. Spending on drugs represented the largest amount of medical costs. The proportion on drug expenses varied 93-99% for outpatient group, 53-92% for inpatient group and 28-56% for outpatient + hospitalization group. **CONCLUSIONS:** Even when patients with COPD receive a subsidy for their medical care, they incur large out-of-pocket expenses. The biggest expense is in medicines.

PRS15

COST-EFFECTIVENESS ANALYSES OF UMECLIDINIUM BROMIDE 62.5 MCG VERSUS GLYCOPYRRONIUM 44 MCG AND UMECLIDINIUM BROMIDE 62.5 MCG VERSUS TIOTROPIUM 18 MCG IN PATIENTS WITH CHRONIC OBSTRUCTIVE PULMONARY DISEASE IN THE UK

Shah D[1], Driessen M[2], Risebrough N[3], Baker TM[4], Naya I[5], Lloyd EJ[5], Briggs A[6], Ismaila A[7]
[1]*ICON Plc, New York, NY, USA,* [2]*GlaxoSmithKline, London, UK,* [3]*ICON plc, Toronto, ON, Canada,* [4]*ICON Health Economics & Epidemiology, New York City, NY, USA,* [5]*GlaxoSmithKline, Brentford, UK,* [6]*Memorial Sloan-Kettering Cancer Center, New York, NY, USA,* [7]*GSK, Research Triangle Park, NC, USA*

OBJECTIVES: Cost effectiveness of once-daily umeclidinium bromide (UMEC) 62.5 mcg was compared with once-daily glycopyrronium (GLY) 44 mcg and once-daily tiotropium (TIO) 18 mcg in patients with chronic obstructive pulmonary disease (COPD) from a UK National Health Service (NHS) perspective. **METHODS:** A linked-equation model was implemented to estimate COPD progression, associated health-service costs, exacerbation rates, survival and quality-adjusted life years (QALYs). Statistical risk equations for endpoints and resource use were derived from the ECLIPSE and TORCH studies, respectively (Briggs A, et al. Med Decis Making 2016). Treatment effects (mean [standard error]) at 12 weeks on forced expiratory volume in 1 second and St George's Respiratory Questionnaire score were obtained from two UMEC head-to-head studies: +33 mL (14.3) and -0.64 units (0.8) versus GLY (Rheault T, et al. ERJ Open Res 2016), and +53 mL (14.3) and -0.46 units (0.8) versus TIO (Feldman G, et al. Int J Chron Obstruct Pulmon Dis 2016). Treatment costs reflect UK list prices (2016) and NHS unit costs; UMEC and GLY prices being equal and less than TIO. A 5-year horizon, discounted costs and effects at 3.5% were used. **RESULTS:** Over a 5-year time-horizon, patients receiving UMEC were predicted to experience fewer annual exacerbations (-0.05), and gain life years (+0.01) and QALYs (+0.03) versus GLY. Incremental costs were £14/patient due to longer predicted survival, leading to an incremental cost-effectiveness ratio of £440/QALY. UMEC resulted in annual exacerbation reductions (-0.08) and life years gained (+0.02) versus TIO after 5 years. An incremental QALY gain (+0.03) was found against cost savings of -£355/patient. Sensitivity analyses showed that variation in the main parameters did not alter the results. **CONCLUSIONS:** Assuming the same price, UMEC may be considered a cost-effective treatment versus GLY. UMEC was dominant (less costly and more effective) over treatment with TIO. Funding: GlaxoSmithKline (study HO-14-8059).

PRS16

DIRECT AND INDIRECT COSTS OF SEVERE UNCONTROLLED ASTHMA IN THE BRAZILIAN PUBLIC PERSPECTIVE

Campos DF[1], Rosim RP[1], Ballalai Ferraz AF[1], Camillo AL[2], Oliveira TM[2], Penha MF[2], Matsuo AL[2]
[1]*QuintilesIMS, São Paulo, Brazil,* [2]*AstraZeneca, Cotia, Brazil*

OBJECTIVES: The study aims to assess the direct costs of uncontrolled severe asthma from the Brazilian public payer perspective and its indirect costs from a societal perspective. **METHODS:** We used Brazilian public claim databases (DataSUS) in order to identify patients with severe uncontrolled asthma and assess their direct costs. Through a record linkage methodology, we identified patients with records in both hospital and ambulatory databases. Patients were screened according to the following criteria: long-acting beta agonist associated with high dose inhaled corticosteroids and at least two hospitalizations within a six-month period. Resource utilization was calculated and resource costs were obtained from the official Brazilian procedure table (SIGTAP). Resource utilization that could not be identified through database analysis were obtained through literature review. Total population treated by the Brazilian healthcare system was estimated based on DataSUS databases, Saúde Não Tem Preço reports (another government program for pharmaceutical assistance) and literature reporting proportion of severe uncontrolled patients within asthma population. Indirect costs were calculated using the human capital approach: data on work absenteeism was found at scientific literature and premature deaths were obtained through the Brazilian mortality information system. Per capita gross domestic product was reported by the Brazilian official statistics and demographics agency (IBGE). **RESULTS:** We screened 577 unique patients with an average daily consumption of 2,121 micrograms of budesonide and 57 micrograms of formoterol, and the hospitalization rate was 2.65 per patient-year. The calculated total direct costs incurred by the total severe uncontrolled population in Brazil was BRL 24.8 million, of which, 78% are due to hospitalizations and 17% due to drug dispensation. The calculated indirect costs were BRL 416.2 million, of which 96% are due to premature deaths. **CONCLUSIONS:** Despite relatively low direct costs, severe uncontrolled asthma is a disabling and life-threatening disease, responsible for substantial indirect costs.

PRS17

HOSPITAL COST FOR CHRONIC OBSTRUCTIVE PULMONARY DISEASE (COPD) FOR THE BRAZILIAN PUBLIC HEALTH SYSTEM, 2000 – 2015

Pinto CR, Lemos AC, Costa LA, Carneiro IM, Yamamura LL, Netto EM, Alcântara AT
Federal University of Bahia, Salvador, Brazil

OBJECTIVES: To estimate trends in the hospitalization cost for chronic obstructive pulmonary disease (COPD) within the Brazilian Public Health System from 2000 to 2015. **METHODS:** The number of hospitalizations, total yearly cost due to COPD and mean cost per hospitalization and number of days per event were abstracted from National Health System Data (DATASUS) for the period of 2000 to 2015. Costs represent federal reimbursement values for hospitalizations (includes medical procedures, exams, medications and taxes) and were reported in Brazilian Reals (1.00BRL≈0.28USD Average 2016). **RESULTS:** In Brazil, there were 2,743,061 hospitalizations due to COPD during the studied period, making a total cost of 1,530,118,424.82BRL. The average annual cost in Brazil was 102,007,894.99BRL, in

average 557,81BRL per event, with the mean length of stay of 5,87 days. The cost per hospitalization increased 100,3% during the studied period (426,49BRL to 854,42BRL). The mean annual length of stay increased by 0,5 day in 15 years. Total costs for hospitalizations for COPD among regions in Brazil increased in the North (+25,1%), Northeast (+20,8%) and Southeast (+22,2%) and decreased in the South (-31,6%) and Mid-west (-15,9%) regions. **CONCLUSIONS:** The cost of hospitalization for COPD has an important economic impact on the health-care system in Brazil. There is a trend to increase in the North, Northeast and Southeast regions, reflecting difficulties of the health system to provide adequate management of COPD. Initiatives to reduce health resource utilization and improve health status in patients with COPD should be considered in short and medium-term.

PRS18

DETERMINATION OF DIRECT COSTS OF THE PULMONARY ARTERIAL HYPERTENSION TREATMENT IN COLOMBIA

Upegui A[1], Robles A[1], Bejarano A[2]
[1]Universidad Externado, Bogota, Colombia, [2]Unicoc, Bogota, Colombia

OBJECTIVES: To develop a costing exercise that allows comparing the direct costs in each functional class (FC) I to IV, of Pulmonary Arterial Hypertension (PAH) from perspective of the third-party-payer. **METHODS:** PAH is a disease with a very low prevalence in Colombia, high rate mortality and deterioration in HRQoL, make it to be considered an orphan disease. The treatment cost of a patient with PAH varies considerably according to the disease progression, mainly influenced by the hospital and pharmacological costs that it requires. Treatment cost for patient during a year of staging in each FC of the disease were estimated, according to WHO classification, pharmacological costs for each stage were included taking into account the clinical recommendations observed in the SEPAR-ALAT2 guide. A literature review was carried out to compare information in treatment scheme necessary for the patient, including the procedures, this information was validated with experts. Costs of the resources and inputs were taken from SOAT 2001 +30 tariff, and from market drugs. **RESULTS:** Results are presented as the consolidated of direct costs that could be required by a patient over a year of treatment, these costs include outpatient, hospital management, medication support, and medical consultations required, the exercise allows to evidence a high cost in FC IV, this being US $ 7,189 per month, while in FC-II and III costs are US $ 2,950 and US $ 2,918 per month respectively, a patient in FC-I would represent a cost of US $ 294 per month. **CONCLUSIONS:** The results of the exercise demonstrate the need to concentrate the focus of patient care, to avoid its progression, since a patient progressing to FC IV represents a high considerable cost to health system. In addition to this, the progressing patient represents a higher occupation of hospital resources, which also implies a considerable deterioration in HRQoL.

PRS19

ECONOMIC IMPACT OF EXACERBATIONS DUE TO CHRONIC OBSTRUCTIVE PULMONARY DISEASE (COPD) PATIENTS IN THE PERSPECTIVE OF BRAZILIAN PRIVATE HEALTHCARE SYSTEM

Matsuo AL[1], Paloni Ed[2], Camillo AL[1], Penha MF[1]
[1]AstraZeneca, Cotia, Brazil, [2]Orizon, Barueri, Brazil

OBJECTIVES: To evaluate the economic burden exacerbations due to COPD in the Brazilian private healthcare system. **METHODS:** The Orizon database is an administrative database containing over 18 million lives of the Private System. Eligibility criteria were patients with ≥40 years with the ICD-10 codes: J41, J410, J411, J418, J42, J43, J431, J432, J438, J438, J439, J44, J440, J441, J448, J449 from 2010 to 2015. A total of 1755 patients were identified and costs related to hospitalizations or outpatient treatment were analyzed using an exchange rate of 1 USD = 3.23 BRL. **RESULTS:** From 2010 to 2015 we observed an increasing cost per event (inpatient and outpatient), ranging from USD 4,228,10 in 2010 to USD 9,398.72 in 2015. Raising costs may be explained, at least in part, because of Brazilian annual currency inflation. The direct medical costs of hospitalized patients were much higher than outpatient treatment. The mean outpatient exacerbation treatment cost was USD 102.61 while the inpatient treatment, the mean cost was USD 9,659.05 per event. The mean yearly direct medical cost per COPD patient was USD 5,891.04 in 2010 (n = 239); USD 6,079.62 in 2011 (n = 302); USD 8,119.59 in 2012 (n = 414); USD 8,637.42 in 2013 (n = 459); USD 11,536.36 in 2014 (n = 475) and USD 13,181.13 in 2015 (n = 574). The rate of events per patient were similar among the years, ranging from 1.39 to 1.50 event/year. **CONCLUSIONS:** The treatment cost of COPD exacerbations are raising each year in the Brazilian private system. Due to high annual costs per patient, especially COPD severe cases that may require more often hospitalizations, maintaining the disease under control may save resources for health plans.

PRS20

ASSESSING THE ECONOMIC BURDEN AND 30-DAY READMISSION RATES AMONG PATIENTS WITH PNEUMONIA IN THE US VETERANS HEALTH ADMINISTRATION POPULATION

Borra S[1], Cao Y[1], Wang L[1], Baser O[2]
[1]STATinMED Research, Plano, TX, USA, [2]Columbia University and STATinMED Research, New York, NY, USA

OBJECTIVES: To assess health care costs, 30-day readmission rates, and predictors of 30-day readmission among patients with pneumonia in the US Veterans Health Administration (VHA) population (01OCT2010-30SEP2015). **METHODS:** Patients included the VHA population for diagnosed with pneumonia (International Classification of Disease, 9th Revision, Clinical Modification codes 480-486) were identified the identification period (01OCT2011-30SEPT2014). The initial diagnosis date was designated as the index date. Patients without a pneumonia diagnosis, but with the same age, race, and gender as study pneumonia patients were identified for comparison. For control patients, the index date was randomly selected to minimize bias. Adult patients were required to have continuous medical and pharmacy benefits for 1 year pre- and post-index date. Health care costs and 30-day readmission rates during the 1-year follow-up period were compared among 1:1 matched patients with and without pneumonia. Logistic regression was used to examine the predictors of 30-day readmission. **RESULTS:** After matching, there were 165,849 patients in each group. Compared to patients without pneumonia, those with pneumonia incurred higher inpatient ($32,134 vs $800; $p<0.0001$), outpatient ($8,032 vs $1,963; $p<0.0001$), and total costs ($40,167 vs $2,764; $p<0.0001$) as well as a higher 30-day readmission rate (33.4% vs 0.5%; $p<0.0001$). The likelihood of 30-day readmission was lower among patients aged 18-64 years versus ≥65 years (odds ratio [OR]: 0.4-0.9; $p<0.0001$) and higher among male (OR: 1.2; $p<0.0001$), black (OR: 1.4; $p<0.0001$), and white patients (OR: 1.3; $p<0.0001$) compared to those of other races and those with higher Charlson comorbidity index (CCI) scores (OR: 1.1; $p<0.0001$). **CONCLUSIONS:** Patients with pneumonia had significantly higher 30-day readmission rates and economic burden than those without pneumonia. Age, gender, race, and CCI score were significant predictors of 30-day readmission.

PRS21

MEDICAL, ABSENTEEISM, AND MORTALITY COST OF ASTHMA IN THE UNITED STATES

Nurmagambetov T, Kuwahara R, Garbe P
Centers for Disease Control, Atlanta, GA, USA

OBJECTIVES: The cost of asthma is an important measure of the impact of the disease on society. Presenting the burden of the disease in monetary terms provides critical information to decision makers for better allocation of health-care resources. In this paper we provided estimates of the prevalence, medical costs, and costs of absenteeism (missed school and workdays) and mortality attributable to asthma using the most recent data available. **METHODS:** The primary source of data for this study was the 2008-2013 household component of the Medical Expenditure Panel Survey (MEPS). We used a two-part regression model to estimate annual per person medical expenditure and negative binomial models to estimate asthma-related absenteeism. We applied a human capital approach to measure the value of absenteeism and mortality. We used personal weights from MEPS to estimate national prevalence and costs of asthma. **RESULTS:** Prevalence of asthma in the United States ranged from 4.81% in 2008 to 5.16 in 2011. Over the 2008-2013 period, the incremental medical cost of asthma was $3,081 (2015 US dollars) per person per year, with $1,552 attributable to prescription medication, $682 to office-based providers visits, $161 to hospital-based outpatient visits, $553 to hospitalizations, and $117 to emergency rooms visits. Asthma was responsible for additional 1.78 work and 2.32 school days lost annually which represents more than 8.6 million work and more than 5.1 million school days lost nationally due to asthma, for a total loss of $2.9 billion. The total cost of asthma was $62.6 billion, of which $57.9 billion was for medical expenditures and $4.7 billion was attributed to absenteeism and mortality. **CONCLUSIONS:** The cost of asthma represents a significant economic burden in the United States. Our study results highlight the urgent need to improve and enhance strategies to prevent and control asthma, and thereby reduce its economic burden.

PRS22

PREVALENCE AND TREATMENT COST OF NON-COMMUNICABLE DISEASES RELATED TO SMOKING IN INDONESIA

Kristina SA
Universitas Gadjah Mada, Yogyakarta, Indonesia

OBJECTIVES: This study aimed to estimates the current incidence and treatment cost of non-communicable diseases attributed to tobacco among Indonesian population in 2015. **METHODS:** An epidemiological study was performed. Using national universal coverage database in 2015 we calculated the incidence and treatment cost of 19 diseases. Proportion of smoking attribution toward diseases and treatment cost due to smoking were calculated using smoking attributable fraction (SAF) formula, using the prevalence of smoking and relative risk of each disease. **RESULTS:** The study revealed that the incidence of smoking related diseases accounted for 991,331 about 21.6% of total incidence of chronic diseases in Indonesia. The highest rank of diseases prevalence was hypertension, chronic obstructive pulmonary diseases (COPD) and ischemic heart disease. The treatment cost of smoking in Indonesia was conservatively estimated to be at least US$ 2,177 million, approximately 2.5% of the 2015 gross domestic product. A majority of the cost was largely concentrated in the male population (US$2,164 million). Treatment costs of hypertension, COPD, and ischemic heart disease had the highest cost burden. **CONCLUSIONS:** This study finding provides scientific evidence about economic burden of smoking, particularly the healthcare expenditure covered by government. Tobacco control efforts need to be prioritized in to prevent higher losses of the nation. This study's evidence is important for informing national public health policy to advocate the health promotion and prevention program.

PRS23

CALCULATION OF YEARS OF LIFE LOST (YLL) CAUSED BY TUBERCULOSIS

Damdinbazar O[1], Nachin B[1], Dorjsuren T[2], Yundendorj G[2]
[1]Ach Medical University, Ulaanbaatar, Mongolia, [2]Mongolian National University of Medical Sciences, Ulaanbaatar, Mongolia

OBJECTIVES: In Mongolia, tuberculosis is the sixth cause of death among all death causes, and first reason of death which caused by infectious diseases. Any research and calculation on YLL caused by tuberculosis were not

conducted. Objective of the study was to estimate YLL caused by tuberculosis among Mongolian. **METHODS:** In this analysis we were used data of population illness and death rate of 2015. The YLL calculation method was the same method as which WHO uses for YLL calculation. The analysis of social and economic lost accumulated from GDP per person. In 2015, the average life expectancy of population in Mongolia was 70 years, and GDP in that year equal to $3,943.00. **RESULTS:** In 2015, about 240 people have died due to pulmonary and extra-pulmonary tuberculosis and 177 of them were male and 63 of them female. Consequently, the YLL calculated as 6085 and 3 person per 100'000 population dies due to pulmonary and extra-pulmonary tuberculosis. Based on GDP per capita, economic cost equals to $23,993,155.00. **CONCLUSIONS:** In 2015, preventable YLL caused by tuberculosis was equal to 6085. Furthermore, YLL high in 25-49 age group mostly among the males. Regrettably, this middle age group composes the main national human resource and it is causing greatloss in our country.

PRS24

THE USE OF BEHAVIORAL ECONOMICS AND SOCIAL PSYCHOLOGY TO IMPROVE TREATMENT OF ACUTE RESPIRATORY INFECTIONS (BEARI): A COST-EFFECTIVENESS ANALYSIS

Gong CL[1], Zangwill KM[2], Hay JW[1], Meeker D[1], Doctor J[1]
[1]University of Southern California, Los Angeles, CA, USA, [2]Harbor-UCLA Medical Center, Torrance, CA, USA

OBJECTIVES: Based on previous research showing that three behavioral economics interventions can minimize inappropriate use of antimicrobials for upper respiratory infection (URI), we sought to determine the cost-effectiveness of these interventions: (1) Suggested Alternatives (SA), which utilizes computerized clinical decision support to suggest non-antibiotic treatment choices in lieu of antibiotics; (2) Accountable Justification (JA), which mandates free-text justification into the patient's electronic health record when antibiotics are prescribed; and (3) Peer Comparison (PC), which sends a periodic email to prescribers about his/her rate of inappropriate antibiotic prescribing relative to peers. **METHODS:** We used a 30-year Markov model from the US societal perspective to simulate the utilization of antibiotics, cost of care, and health outcomes among a cohort of 45-year-old adults presenting to a healthcare provider with URI and its potential complications. Transition probabilities between disease states, costs, and utility values were derived from the literature and available surveillance data. Discounted total costs, quality-adjusted life years, and incremental cost-effectiveness ratios of each intervention relative to no intervention were calculated, and sensitivity of these estimates assessed through a series of one-way sensitivity analyses. **RESULTS:** Relative to the status quo, each intervention is cost-effective, as ICERs indicate the dominance of each intervention over current practice (lower costs but higher QALYs). In the base case, total costs for each intervention were $2,155, $1,183, $1,121, and $1,040, and total QALYs were 28.64, 28.79, 28.81, and 28.82 for the control, SA, JA, and PC groups respectively. Dominance was driven by decreased costs for each intervention primarily due to significant decreases in healthcare utilization for antibiotic-associated ADRs. Results remained robust in one-way sensitivity analyses. Notably, the rate of bacterial resistance development did not have a substantial impact on the results. **CONCLUSIONS:** Behavioral economics interventions can be cost-effective strategies for reducing inappropriate antibiotic prescriptions by reducing healthcare resource utilization.

PRS25

COST-EFFECTIVENESS OF ROFLUMILAST AS ADD-ON TO TRIPLE INHALED THERAPY VERSUS TRIPLE INHALED THERAPY IN PATIENTS WITH SEVERE AND VERY SEVERE CHRONIC OBSTRUCTIVE PULMONARY DISEASE ASSOCIATED WITH CHRONIC BRONCHITIS IN THE UK

Kiff C[1], Ruiz S[2], Varol N[3], Gibson D[4], Davies A[1], Purkayastha D[5]
[1]ICON plc, Abingdon, UK, [2]AstraZeneca, Barcelona, Spain, [3]AstraZeneca, Cambridge, UK, [4]AstraZeneca, Luton, UK, [5]Phastar, Manchester, UK

OBJECTIVES: To assess the cost-effectiveness of roflumilast (ROF) added to triple inhaled therapy (ICS+LABA+LAMA) versus ICS+LABA+LAMA alone in UK patients with severe chronic obstructive pulmonary disease (COPD), chronic bronchitis and ≥2 moderate or severe COPD exacerbations in the past year. Data used were from the phase 3b/4 clinical trial REACT's (NCT01329029) valid cases set, as a proportion of REACT patients did not meet the licence criteria for ROF. **METHODS:** An Excel-based cohort state transition (Markov) model estimated total costs and outcomes over 40 years from a UK National Health Service and Personal Social Services perspective. The model has three GOLD-based states: severe COPD, very severe COPD, and death. All patients enter in the severe state and there is an irreversible transition from severe to very severe COPD. Background rates of moderate and severe exacerbations were estimated with negative binomial regressions adjusting for disease severity and treatment in the trial sub-population treated with triple therapy. Published health-related quality of life weights were applied to health states and exacerbations to generate quality-adjusted life years (QALYs). List prices for drugs were used. **RESULTS:** ROF reduced the annual rate of exacerbations (moderate or severe) compared with ICS+LABA+LAMA alone (rate ratio [RR]: 0.80, p=0.0117). There was a greater reduction in rates of severe (RR: 0.66; p=0.003) than moderate (RR: 0.89; p=0.247) exacerbations. ROF treatment resulted in the avoidance of >1 severe and 0.6 moderate exacerbations per patient. Approximate incremental gains for ROF were 0.17 QALYs at £2996 per patient (probabilistic cost per QALY: £17,855/QALY), with a 70% probability of being cost-effective at a £20,000/QALY threshold. ROF remained cost-effective under several different sensitivity analyses, and also had favorable cost-effectiveness when evaluated in patients with very severe COPD. **CONCLUSIONS:** ROF as add-on to ICS+LABA+LAMA is cost-effective for patients with severe COPD and frequent exacerbations.

PRS26

COST-EFFECTIVENESS ANALYSIS OF PORACTANT ALPHA (200MG/KG DAILY) COMPARED TO BERACTANT (100MG/KG DAILY), IN PREMATURE INFANTS WITH RESPIRATORY DISTRESS SYNDROME, FROM THE MEXICAN INSTITUTE OF SOCIAL SECURITY (IMSS) PERSPECTIVE

Murra Anton ZA[1], Paladio-Hernandez JA[2], Murra Anton S[3], Baptista C[1]
[1]Brown University, Providence, RI, USA, [2]Independent Researcher, Estado de México, Mexico, [3]Instituto Nacional de Ciencias Médicas y Nutrición Salvador Zubirán, Mexico City, Mexico

OBJECTIVES: This study sought to determine the cost-effectiveness of Poractant Alpha (200mg/KG daily) in comparison to Beractant (100mg/KG daily) in the treatment of Respiratory Distress Syndrome (RDS) in premature infants from the Mexican Institute of Social Security (IMSS) perspective. **METHODS:** A systematic review of the literature was performed to identify relevant phase-III Random Controlled Trials (RCTs) and meta-analyses on the target population. Fourteen published articles were identified and a fixed-effects meta-analysis was performed using WINBUGS. A decision tree model was designed to assess the success in terms of mortality rates associated with the treatments. The costs included were cost of the drug, Intensive-Care Unit (ICU) days and adverse events. All the costs were estimated based on Diagnosis-Related Groups and Unit Costs published yearly by IMSS, except for the cost of Poractant Alpha which was obtained from other Mexican Public Health Institutions. The time horizon was 30 days, so no time discount was needed. The health outcome was the mortality rate. The perspective of the analysis was IMSS' Perspective. A probabilistic sensitivity analysis (PSA) through Montecarlo simulations was performed. **RESULTS:** Poractant Alpha was an alternative that reduced the number of ICU days compared to Beractant in almost 3 days per patient. Also, it reduced the main adverse event associated with the treatment, the Bronchopulmonary Dysplasia, from 41.5% to 21.30%. As a result, the total cost of treatment (CoT, in USD) was $65,385 and $73,500, for Poractant Alpha and Beractant, respectively. Moreover, the mortality rate was 9.0% for Poractant Alpha and 16.7% for Beractant. These results were robust under uncertainty, in more than 85% of the cases. **CONCLUSIONS:** Poractant Alpha is a dominant strategy over Beractant for the treatment of the RDS in premature infants from the IMSS Perspective. These results were robust under uncertainty.

PRS28

DETERMINANTS OF TOBACCO CONSUMPTION IN POPULATION OVER 50 YEARS OLD AFFILIATED TO A COLOMBIAN GOVERNMENT SUBSIDIZED HEALTH INSURER

Marrugo Arnedo C[1], Florez Tanus A[2], Gomez de la Rosa F[3], DueñasCastell C[1], Lopez Pájaro K[4], Mazenett Granados E[4], Mora Jayutt G[1], Alvis Guzman N[5]
[1]Universidad de Cartagena. Centro de investigación e innovación en salud-CIISA, Cartagena de Indias, Colombia, [2]Universidad de Cartagena. Centro de Investigación y Docencia. Hospital Infantil Napoleón Franco Pareja. Centro de Investigación e Innovación en salud, Cartagena de Indias, Colombia, [3]ALZAK Foundation, Cartagena, Colombia, [4]Centro de investigación e Innovación en Salud - CiiSA, Cartagena de Indias, Colombia, [5]ALZAK Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia

OBJECTIVES: To estimate the determinants of tobacco consumption in population over 50 years old affiliated to a Colombian government subsidized health insurer. **METHODS:** A cross-sectional study based on a sample of 191,541 affiliates characterized in the individualized health risk database from a Colombian government subsidized health insurer that has approximately two million affiliates distributed in 12 departments and more than 180 municipalities. A logistic regression model was developed whose dependent variable takes value 1 if the member consumes tobacco (at least one daily in the last 30 days at the time of the survey). An adjusted analysis by age and sex was made. **RESULTS:** The smoking prevalence in people over 50 years old in 2015 was 15.1% CI (14.97% - 16.22%), in men was 21.90%, whereas in women was 9.91%. The mean of age was 61.2. In respect of determinants, education OR 0.94 CI (0.93 – 0.94), being busy OR 0.91 CI (0.89 – 0.92), good eating habits OR 0.96 CI (0.94 – 0.98) and a physical activity OR 0.98 CI (0.97 – 0.99) are protective roles in determining the consumption of tobacco. On the other hand, age OR 1.06 CI (1.06 – 1.07), alcohol consumption OR 13.82 CI (13.62 – 14.01) and living in urban areas OR 1.15 CI (1.13 – 1.17) increase the probability of consuming tobacco. Men are more likely to use tobacco than women (0.45 pp), as the income level increases, the consumption probability decreases (-0.02 pp). **CONCLUSIONS:** The smoking prevalence in the population over 50 years old is high. The present study generates evidence to review the tobacco control policy, finally, it is necessary to implement prevention programs in the insurer.

PRS29

INDIRECT COSTS ASSOCIATED WITH COPD IN BULGARIA

Tachkov K[1], Kamusheva M[1], Andreevska K[2], Grekova D[2], Mitov K[1]
[1]Medical University-Sofia, Faculty of Pharmacy, Sofia, Bulgaria, [2]Medical University - Plovdiv, Plovdiv, Bulgaria

OBJECTIVES: To calculate the indirect costs of Chronic Obstructive Pulmonary Disease (COPD) in Bulgaria generated from the lost productivity due to absence from work (absenteeism), due to premature retirement, and due to reduced productivity. **METHODS:** An observational study was conducted among 426 COPD patients in five main regions of Bulgaria. Information about days out of work, premature retirement and decreased productivity was collected through interview during regular patients' visits. The indirect costs were calculated using human capital approach. Average daily wage was considered in calculations of the absenteeism, minimal pension for the earlier retirement, and average wage for reduced productivity corrected with incapacity coefficient. Non-parametric method Kruskal-Wallis was applied to compare the medians of the indirect costs

for different patients group according to COPD severity. **RESULTS:** 147 (34.5%) out of all 426 enrolled COPD patients were employees and more than half of them (57%) reported absence from work. The average number of missed working hours per patient per year was 192 (24 days). The average reduced productivity was approximately 65,5% and the earlier retirement was reported by 56 patients. Indirect costs per patient generated due to reduced productivity were much higher than the indirect costs generated due to absenteeism – 3750.64 euro (SD=854.11) vs 521.45 euro (SD=380.15) per patient, respectively. The highest indirect costs per patient were associated with premature retirement – 25 353 euro (SD=19 935.50). The indirect costs are higher in the patients groups with more severe disease which is statistically significant ($p<0.05$). **CONCLUSIONS:** COPD has significant indirect costs. With the progression of the disease the indirect costs increased and mostly that for the lost productivity.

PRS30

TAX LOSSES AND GAINS ATTRIBUTED TO SMOKING CESSATION APPLYING A TAIWAN PUBLIC ECONOMIC PERSPECTIVE

Connolly M[1], Kotsopoulos N[2], Yang M[3]
[1]University of Groningen, Groningen, The Netherlands, [2]Global Market Access Solutions, Mooresville, NC, USA, [3]National Taiwan University, Taipei, Taiwan

OBJECTIVES: Conventional economic analyses excludes important economic gains attributed to smoking cessation therapy. In addition to smoking-attributable mortality and morbidity from quitting smoking, there is an established relationship between smoking and reduced productivity and wage effects. In this prototype analysis we assess how public investments in smoking cessation that changes smoking prevalence can influence future government tax revenue and social transfer costs in Taiwan. **METHODS:** A modified generational accounting framework was developed to assess relationships between smoking attributed morbidity and mortality and public economic consequences including lifetime tax revenue gains/losses and government social transfers and health spending. Based on the current prevalence of smoking in Taiwan, a cohort model was developed for smokers, former-smokers and non-smokers. The model simulated the lifetime discounted fiscal transfers for different age cohorts in five year age bands, and the benefit-cost ratio (BCR) of smoking cessation investments. Comparable models were built for males and females based on 2016 Taiwanese dollars (NTD). **RESULTS:** For different age cohorts of male smokers, those who quit smoking had an average increase in lifetime earnings of NTD127,150 ranging from NTD202,000 for those aged 25-30, and NTD28,500 for those aged 61-65. The average present value of additional lifetime tax was NTD24,350, with difference of NTD32,775 in lifetime health costs between smokers and former smokers. The average lifetime earnings loss and average tax gains in females was NTD108,680, and NTD20,810, respectively. The BCR ratio based on treatment costs ranged from 1.13 – 1.36 for male smokers. Similar BCR ratios were identified for female smokers. **CONCLUSIONS:** We demonstrate that lifetime tax revenue gains are greater from investments in smoking cessation compared with the tobacco tax revenue loss in those aged 25 – 65 in males and females. Lifetime tax revenue gains were greater in younger aged persons indicating that early intervention offers more fiscal benefits.

RESPIRATORY-RELATED DISORDERS – Patient-Reported Outcomes & Patient Preference Studies

TARGETED LITERATURE REVIEW OF ADHERENCE TO THERAPIES IN CYSTIC FIBROSIS (CF)

Narayanan S[1], Mainz JG[2], Gala S[3], Tabori H[2], Grossoehme D[4]
[1]Market Access Solutions LLC, Raritan, NJ, USA, [2]Jena University Hospital, Jena, Germany, [3]Market Access Solutions, LLC, Raritan, NJ, USA, [4]Cincinnati Children's Hospital Medical Center, Cincinnati, OH, USA

OBJECTIVES: To assess adherence to different CF therapies, association of adherence with outcomes, and factors influencing adherence. **METHODS:** A targeted literature review of studies published from 2010 to 2016. An article was retrieved for full review if the abstract met each of the following criteria: referred to adherence of any of the CF therapies, namely, inhaled treatments, oral treatments, airway clearance therapy (ACT) and other mode of treatments; published in a peer-reviewed journal and in English-language. **RESULTS:** A total of 19 studies qualified for inclusion. Overall long-term ($\geq$ 12 months) adherence to ivacaftor is high but it is low for other CF treatments such as antibiotics, dornase alfa, hypertonic saline, pancreatic enzymes (PE), airway clearance therapy (ACT) and vitamins. Patients are more adherent to inhaled therapies as compared to oral therapies such as PE and vitamins, and among inhaled treatments, more patients are adherent to tobramycin inhalations at 12 months than dornase alfa or hypertonic saline. Adherence to ACT via flutter device is lower as compared to other methods, and all other inhaled/oral treatments. Adherence varied by treatment, mode of treatment administration, age, season, time and method of adherence measurement. Higher rates of exacerbations, longer length of inpatient stays as well as increase in some healthcare costs were observed among patient groups with sub-optimal adherence. Treatment-related issues (adverse effects, longer/inconvenient & frequency of administration, polypharmacy), poor patient-provider communication, lack of disease- and treatment-related knowledge and unwillingness to take medication in public were key barriers to adherence. **CONCLUSIONS:** Adherence to CF treatments was sub-optimal, varied widely and were found to influence clinical and economic burden of the disease. Identifying ways to overcome the barriers to sub-optimal adherence can positively affect outcomes associated with CF. Healthcare providers and policy makers should devise patient-centered and caregiver-enabled interventions to improve adherence.

PRS32

IMPACT ANALYSIS FOR THE LAW ON 'PROTECTION OF NON-SMOKERS, SMOKING AND DISTRIBUTION OF TOBACCO PRODUCTS' AMONG HEALTHCARE PROFESSIONAL EMPLOYEES FROM THE HEART INSTITUTE OF THE UNIVERSITY OF PÉCS

Bibó AZ[1], Varga V[1], Juhász K[2], Sebestyén A[1], Endrei D[1], Horváth L[1], Boncz I[1], Molics B[1]
[1]University of Pécs, Pécs, Hungary, [2]Baranya County Government Office, Pécs, Hungary

OBJECTIVES: Smoking is one of the leading risk factors in the development of several diseases worldwide. The aim of the study was to analyse the effect of the Law amendment among healthcare professional employees from the Heart Institute of the University of Pécc, and also to measure how it affected smoking behaviour. **METHODS:** The research was based on a cross-sectional study with quantitative methods. At baseline, N=161 employees were enrolled from the Heart Institute, University of Pécs. Of these, N=125 (72.67%) could be involved into the analysis. The subjects were asked to fill in a self-made questionnaire. The questions were centred around five topics: socio-demographic characteristics, smoking behaviour, environmental tobacco smoke exposure, awareness of negative effects for health and attitude related to control policy. The analyses were made with MS Office Excel 2007/2010 and SPSS software. The analyses include t-tests, chi square tests, linear regression, and ANOVA. **RESULTS:** The main hypothesis that non-smokers give higher ratings for the effectiveness of the Law modification as opposed to smokers was proved with significant difference (P=0,0002368; P<0,05). A marked difference was also found with respect to the rating of passive smoking among smoker, and non-smoker healthcare professionals (P=0.01514, P<0.05). Tobacco use among smoker employees has not changed. While some of the subjects reduced the amount of cigarettes they smoked daily, others continued to go through the same amount. To summarise, no change has been recorded (P=1; P<0.05). **CONCLUSIONS:** Smoking continues to be the main public health issue in our country, requiring continuous action in the future. Another Law amendment is going to be introduced by the government to control the packaging of the cigarette boxes. Further more extensive research should be conducted with a focus to measure the efficiency of the newer Law modifications.

PRS33

INHALER CONFIDENCE AND SATISFACTION AMONG CHRONIC OBSTRUCTIVE PULMONARY DISEASE (COPD) PATIENTS WITH COMORBIDITIES – A COMPARISON OF HAND-HELD VERSUS NEBULIZED MAINTENANCE BRONCHODILATORS

Ganapathy V[1], Rajagopalan K[1], Roughley A[2], Small M[3]
[1]Sunovion Pharmaceuticals Inc., Marlborough, MA, USA, [2]Adelphi Real World, Cheshire, UK, [3]Adelphi Real World, Bollington, UK

OBJECTIVES: Hand-held (HH-LA) or nebulizer (Neb-LA) devices are traditionally used to deliver long-acting bronchodilators for maintenance treatment of COPD. However, a significant proportion of COPD patients with cardiovascular and neurological (CV&N) comorbidities may have low confidence in operating hand-held inhaler devices as instructed. This study compared patient-reported confidence and satisfaction with device use and their association with other PROs among COPD patients with $\geq$ 1 CV&N comorbidities treated with HH-LA or Neb-LA. **METHODS:** Data from 2015 Adelphi US Respiratory Disease Specific Programme, a nationally representative survey of physicians and their COPD patients were analyzed. Since HH-LA use is overrepresented in the COPD population, Neb-LA patients were oversampled (n=204) to augment the sample size. CV&N comorbidities included Alzheimer's, dementia, Parkinson's, cerebrovascular disease, congestive heart failure and coronary artery disease. PROs included - (i) confidence and satisfaction with inhaler device, ii) Morisky medication adherence scale (MMAS) and iii) COPD assessment test (CAT). Categorical and continuous outcomes variables were tested using chi-square and independent sample t-tests, respectively at $P<0.05$. **RESULTS:** Of 909 COPD patients, 28.7% had $\geq$1CV&N comorbidities (160/705 on HH-LA; 101/204 on Neb-LA). Baseline characteristics were comparable between patients treated with HH-LA or Neb-LA (n=261). A significantly higher proportion of Neb-LA than HH-LA patients in this sub-group reported being 'very' or 'completely' confident (73.7% vs. 55.2% p=0.034) and 'very' or 'extremely' satisfied (86.8% vs. 66.1%; p=0.01) with using their device. Greater confidence with use of Neb-LA in this sub-group were associated with better adherence, as reported on the MMAS (rho=0.30, p=0.02) but not CAT (0.04, p=0.75) scores. **CONCLUSIONS:** In this survey of COPD patients with cardiovascular or neurological comorbidities, use of Neb-LA was associated with greater patient reported confidence and satisfaction with device use as compared to treatment with HH-LA. Greater confidence was also associated with better adherence for Neb-LA patients.

PRS34

SALFORD LUNG STUDY IN CHRONIC OBSTRUCTIVE PULMONARY DISEASE (SLS COPD): FOLLOW-UP INTERVIEWS ON PATIENT-CENTRED OUTCOMES

Svedsater H[1], Doward L[2], Whalley D[2], Crawford R[2], Leather D[1], Lay-Flurrie J[3], Bosanquet N[4]
[1]GSK, Brentford, UK, [2]RTI Health Solutions, Didsbury, UK, [3]GSK, Uxbridge, UK, [4]Imperial College London, London, UK

OBJECTIVES: To explore experiences of participants in SLS COPD (an open-label study comparing fluticasone furoate/vilanterol versus usual care in COPD).1 **METHODS:** Subsamples of patients completing SLS COPD were interviewed. Standard interviews (telephone/face-to-face) included closed-ended study-specific questions on: background/lifestyle, COPD symptoms/daily-life impact, environmental/temporal trigger factors, self-management/disease awareness, control, exacerbation experience/management, quality of life (QoL; specific dimensions/overall). Extended interviews (face-to-face) included the closed-ended plus additional open-ended questions. Quantitative data were analysed descriptively; qualitative data were

analysed by qualitative description approach. **RESULTS:** 400 patients were interviewed (standard, n=360/extended, n=40). Mean age (SLS COPD entry/follow-up interview=65.2/66.2 years) and gender (53.3% male) were reasonably representative of patients completing SLS COPD; 37% were current smokers. Breathlessness was the most frequently reported COPD symptom (88.5%) and the most improved/worsened (26.8%/20.9%) during SLS COPD; qualitative analysis revealed breathlessness most impacted: walking, climbing stairs, housework, self-care. Quantitative analysis revealed COPD most impacted functioning, physical activities, relationships/psychological state; qualitative analysis reinforced the broader impact of these on QoL. Strategies to prevent COPD worsening included: exercise, medication adherence, smoking reduction/cessation. 59.5% (n=238/400) described having 'quite a lot'/'very much' control over COPD; a high-risk group reported having no control (n=36[9.0%]). 66.5% (n=266/400) reported experiencing an exacerbation; severity of last exacerbation was considered (n=264/266): mild (n=21[7.9%]), moderate (n=74[27.8%]), severe (n=127[47.7%]), very severe (n=42[15.8%]); 60.5% managed this at home (resting/antibiotics and/or oral corticosteroids). Mean/total overall QoL score: 6.5/10; reported QoL changes during SLS COPD were: improvement (35.3%), no change (43.3%), deterioration (21.3%). No specific/serious adverse events were reported in interviews. **CONCLUSIONS:** Quantitative and qualitative data confirm breathlessness as the key COPD symptom, impacting most on mobility, daily activities and self-care; however, patients focused more on life-impacts of COPD than symptoms alone. This first, detailed evidence of COPD experiences over an extended period adds valuable information to the SLS COPD findings. **FUNDING:** GSK (117375). 1NEJM(2016) 375:1253.

PRS35

PREFERENCE FOR TASTE OF NICORETTE GUM COMPARED TO STORE BRAND NRT GUM

Saunders FG[1], Chase A[1], Gordon W[2]
[1]*GlaxoSmithKline Consumer Healthcare, Warren, NJ, USA,* [2]*Weinman Schnee Morais, Inc., New York, NY, USA*

OBJECTIVES: Patient adherence to nicotine replacement therapy (NRT) can affect long-term successful smoking cessation. Preference in regard to certain sensory attributes such as taste could lead to increased adherence. The goal of this study was to evaluate whether the taste of Nicorette® Gum is preferred over leading store brand NRT gum. **METHODS:** This three-cell, randomized, double-blind taste test was conducted among 945 adult smokers at 23 shopping malls throughout the US. Participants were randomized to one of three test cells in which they tasted two pieces of comparably flavored NRT gum (1 piece of Nicorette and 1 piece of leading store brand). Each cell represented a flavor – mint (n=319), fruit (n=314), or cinnamon (n=312). Participants were required to chew the gum for 1 minute, and "park" the gum for 1 minute before disposing. After waiting 10 minutes and cleansing their palate, participants tasted the second piece of gum in the same manner. Upon completion, subjects were asked a comparative question related to flavor preference and two questions related to whether the gum tasted refreshing and invigorating. **RESULTS:** Overall, participants significantly preferred the taste of Nicorette gum to the store brand gum, 69% to 31% ($p<.0001$). Smokers preferred the taste of Nicorette gum across all flavors, mint, 79% to 21% ($p<.0001$), fruit, 68% to 32% ($p<.0001$), and cinnamon, 58% to 42% ($p=.003$). Of all respondents, 83% and 65% claim Nicorette had a refreshing and invigorating taste, respectively, compared with their responses of 53% and 47% for the leading store brand gum, respectively. **CONCLUSIONS:** Significantly more smokers prefer the taste of Nicorette gum to the taste of the leading store brand NRT gum. The taste of nicotine gum can be an obstacle to patient adherence, and completion of recommended duration of therapy. Favorable product sensory attributes can potentially improve compliance, treatment outcomes, and quit success.

PRS36

DEPRESSION TREATMENT AND HEALTH-RELATED QUALITY OF LIFE AMONG ADULTS WITH ASTHMA

Milky G, Thomas III J
Purdue University, West Lafayette, IN, USA

OBJECTIVES: Depressive symptoms are common in asthma patients and depression is associated with reduction in Health-Related Quality of life (HRQoL). We examined association between use of anti-depressants and change in HRQoL among asthma patients. **METHODS:** A retrospective longitudinal study was conducted using 2010 to 2014 Medical Expenditure Panel Survey (MEPS) data. Sample inclusion criteria were being 18 years old or older, diagnosed with asthma based on ICD code 493, and screening positive for depression based on a score of 3 or higher on the Patient Health Questionnaire (PHQ-2). MEPS Round 2 data served as baseline measures, and Round 4 data served as follow up. Separate multivariate linear regression models estimated association between anti-depressant use and change in PCS and MCS scores. The response variable was change in the PCS score in one model and change in the MCS score in the other. The predictor variable in each model was anti-depressant use, which was coded as treated or not-treated. Each model included the covariates, socio-economic status, co-morbidity, baseline MCS or PCS score, baseline PHQ-2 score, and duration of anti-depressant use. **RESULTS:** A total of 492 individuals met sample inclusion criteria. Of those, 94 (23%) used anti-depressant. A majority of the sample was female (64.2%). The mean age was 47 years (std. dev. =15.9). The baseline and follow-up MCS scores were lower among adults who were treated than those who were not treated ($p=0.017$). The sample mean PCS and MCS scores were 36.5 (SE=0.74) and 32.6 (SE=0.49) respectively at baseline. Individuals who used anti-depressants had positive change in the PCS score (beta= 3.27, $p < .0001$) and negative change in the MCS scores (beta = -5.99, $p < .0001$). **CONCLUSIONS:** Anti-depressant use was associated with improved the PCS scores. However, the change in the MCS score showed negative association with anti-depressant use.

THE PATIENTS' COST OF THE MONTELUKAST THERAPY

Répásy B[1], Csákvári T[2], Vajda R[1], Kovács G[3], Horváth L[1], Endrei D[1], Boncz I[1]
[1]*University of Pécs, Pécs, Hungary,* [2]*University of Pécs, Zalaegerszeg, Hungary,* [3]*Széchenyi István University, Győr, Hungary*

OBJECTIVES: The aim of our study is to analyze the public price of the montelukast sodium therapy in Hungary within the generic competition. **METHODS:** Data derived from the nationwide pharmaceutical database of Hungarian National Health Insurance Fund Administration. We analízes the annual turnover and price of the medicaments containing the active substance montelukast sodium from 2007 to 2015. Accordingly our indicators were: consumer price, DCT (Daily cost of Therapy), co-payment, quasi co-payment, DOT (Days of Treatment). **RESULTS:** Before the appearance of generic medicaments (October, 2011), the public price of the brand-name Singulair 10 mg tablets was 7 USD (on lifted category legal title). Due to the blind bid methods of the Hungarian National Health Insurance Fund Administration the public price of Singulair decreased to 1.5 USD in January, 2013. The public price of the generic drugs started from about 2 USD (October, 2011) and decreased to about 0.7 USD (April, 2013). Due to the increasing DOT the total amount of the public price payed by the patients had increased until 2011, it reached the amount of 1 million USD, then due to the generic competition and blind bid methods it decreased to 490.000 USD. The total amount of public price of the brand-name Singulair moved to the generics during 3 years (2011-2014). The DCT of the originator Singulair 10 mg tablets decreased from 1.1 USD to 0.34 USD, the DCT of the generic product Montelukast TEVA decreased from 0.67 USD to 0.16 USD in the period under review. **CONCLUSIONS:** Due to the generic competition the patients' access to drugs containing montelukast sodium increased significantly.

PRS38

CORRELATES OF MARIJUANA USE WITHIN THE PAST YEAR AMONG ADULTS IN THE UNITED STATES

Adjei Boakye E[1], Osazuwa-Peters N[2], Li X[3], Tutlam N[3], Tobo BB[3], Burroughs TE[1], Buchanan PM[1]
[1]*Saint Louis University Center for Outcomes Research (SLUCOR), Saint Louis, MO, USA,* [2]*Saint Louis University Cancer Center, Saint Louis, MO, USA,* [3]*Saint Louis University, Saint Louis, MO, USA*

OBJECTIVES: To examine the correlates of marijuana use in the prior 12 months among US adults. **METHODS:** Data from 2013-2014 National Surveys on Drug Use and Health, a cross-sectional nationally representative survey, identified 64,901 adults aged 21 and above. Outcome variable was self-reported marijuana use in the past year or not. Independent variables included sociodemographic factors, cigarette smoking, and other illicit drug use. Weighted, multivariate logistic regression models were constructed to examine the association between independent variables and marijuana use. **RESULTS:** The prevalence of past-year marijuana use among respondents was approximately 12%. In the adjusted model, there was a dose response association between age and marital status and marijuana use. Respondents who were 35-49 years old (aOR = 1.37; 95% CI: 1.21 – 1.55) and 21–34 years old (aOR = 2.89; 95% CI: 2.57 – 3.26) were more likely to have used marijuana in the past year compared to those who were 50+ years as were widowed/divorced/separated (aOR = 1.27; 95% CI: 1.11 – 1.45) and never married (aOR = 2.14; 95% CI: 1.95 – 2.35) compared to married respondents. Past-year users were more likely to be male (aOR = 1.14; 95% CI: 1.04 – 1.24), and black (aOR = 1.32; 95% CI: 1.18 – 1.47) versus white. Past-year users, in addition to frequent marijuana use, also were more likely to smoke cigarettes within the past year and use other illicit drugs such as cocaine within the past year. **CONCLUSIONS:** Younger adults, men, blacks, unmarried individuals and other substance users were more likely to use marijuana. Comprehensive screening, treatment for use of multiple substances, and additional research and patient education on the possible harms of marijuana use are needed. Particularly in the age of increasing policy changes, at the state level, around the legalization of marijuana, these findings may have important public health implications.

PRS39

PREDICTORS OF NEBULIZED ARFORMOTEROL USE: A RETROSPECTIVE ANALYSIS AMONG MEDICARE BENEFICIARIES WITH CHRONIC OBSTRUCTIVE PULMONARY DISEASE

Gilmer TP[1], Ganapathy V[2], Xu Z[1], Celli BR[3], Sharma G[4], Cho-Reyes S[5], Navaie M[6]
[1]*University of California San Diego, La Jolla, CA, USA,* [2]*Sunovion Pharmaceuticals Inc., Marlborough, MA, USA,* [3]*Harvard University, Boston, MA, USA,* [4]*University of Texas Medical Branch, Galveston, TX, USA,* [5]*Advance Heath Solutions, LLC, San Diego, CA, USA,* [6]*Advance Health Solutions, LLC, New York, NY, USA*

OBJECTIVES: To evaluate predictors of nebulized long-acting beta2 agonist (LABA) Arformoterol (Brovana®) use among Medicare beneficiaries with chronic obstructive pulmonary disease (COPD). **METHODS:** This retrospective cohort study used Medicare administrative data from 2010-2014 to identify beneficiaries with ≥2 COPD outpatient visits 30 days apart or ≥1 COPD-related hospitalization(s) using ICD-9 codes (i.e., 491.xx, 492.xx, and 496). Inclusion criteria required beneficiaries to have ≥1 COPD medication claim(s) and continuous enrollment in Medicare parts A, B, and D. After excluding deaths, beneficiaries who initiated Brovana® (study group, n=11,886) were compared to those without Brovana® use (control group, n=450,178) to examine predictors of Brovana® use. Logistic regression analyses were employed to examine predictors of Brovana® use. Odds ratios, 95% confidence intervals, and p-values were computed. **RESULTS:** In this analysis, 91% were Caucasian (91%), 60% were female, and 36% were dual-eligibles. Mean age was similar among Brovana® users (72.2 ±10.1 years) and controls (72.3 ±10.2 years). Beneficiaries were more likely to receive Brovana® if they were using LAMAs (OR=1.1, 95% CI: 1.1, 1.2), inhaled SABAs (OR=1.1, 95% CI: 1.1, 1.2), systemic corticosteroids (OR=1.5, 95% CI: 1.4, 1.6), or

methylxanthines (OR=1.4, 95% CI: 1.3, 1.5). Brovana® users were more likely to have a COPD-related hospitalization (OR=1.3, 95% CI: 1.2, 1.4), an outpatient pulmonologist visit (OR=1.4, 95% CI: 1.3, 1.5), ≥1 exacerbation(s) (OR=1.3, 95% CI: 1.3, 1.4), or oxygen dependence (OR=2.0, 95% CI: 1.9, 2.1) in the year prior to initiating Brovana® (all p's<0.0001). **CONCLUSIONS:** In this analysis, Medicare beneficiaries who received Brovana® were more likely to be on additional COPD medications, have ≥1 exacerbation(s) and have a prior COPD-related hospitalization. These results suggest that Brovana® users maybe sicker and likely to have higher COPD severity than non-Brovana® users. More work is needed to identify subgroups of patients who may benefit most from Brovana® therapy.

PRS40

PRESCRIBING PRACTICES OF ANTIBIOTICS FOR THE TREATMENT OF RESPIRATORY TRACT INFECTIONS IN THE BAHAWAL VICTORIA HOSPITAL, BAHAWALPUR, PUNJAB, PAKISTAN

Rehan Sarwar M[1], Imran M[2], Akhtar R[3], Ibrar M[3], Ul Haq I[3], Shaukat A[3], Husnain Z[3], Ashraf N[3], Ullah HI[3], Yaqub S[3], Sahar M[3], Sakhi I[3], Yaqoob S[3]

[1]*The Islamia University of Bahawalpur, Bahawalpur, Pakistan,* [2]*Imperial College of Business Studies, Lahore, Pakistan,* [3]*Akhtar Saeed College of Pharmaceutical Sciences, Lahore, Pakistan*

OBJECTIVES: Estimate the prescribing practices for mild/moderate respiratory tract infections (RTIs) based on the principles established by the standard treatment guidelines. **METHODS:** Prescriptions and medication charts written during the period of November 2014 to March 2015 with the diagnosis of upper and lower RTIs were collected from ENT, Pulmonology, pediatrics 1 and pediatrics 2 wards of the Bahawal Victoria Hospital. A data collection form was designed for this study. All prescribed antibiotics and demographic information of the patients were extracted from the prescriptions. Each prescribed antibiotic was evaluated for rational prescribing based on the standard guidelines of Current Medical Diagnosis and Treatment, CDC and World Health Organization. All data was entered and analyzed by using SPSS 21.0. **RESULTS:** Among the 789 participants (56% males and 44% females), the most commonly prescribed antibiotic classes were; penicillins (47%), macrolide (35.3%), cephalosporins (33.9%) and fluoroquinolone (29.8%), respectively. The most commonly prescribed antibiotics were; erythromycin (48.7%), augmentin (36.9%) and ceftriaxone (27.7%), respectively. The overall level of inappropriate prescribing for all the patients based upon application of the standard treatment guidelines was 55.9%. The major reasons for the inappropriate prescribing were; wrong drug (29.3%), wrong dose (33.5%), wrong frequency (34.3%) and wrong duration (30.2%), respectively. **CONCLUSIONS:** The study has revealed high levels of inappropriate prescribing for the RTIs and in-addition has underlined the unavailability and inconsistency of the current treatment guidelines. The results have significant implications for the health status of patients being cured for mild/moderate RTIs and propose the need for appropriate interventions to be established and presented by authorities to address the matters raised.

PRS41

RACE AND ETHNICITY AMONG CHILDREN WITH ASTHMA IN THE UNITED STATES: ASSOCIATION WITH ASTHMA, ASTHMA CONTROL AND OUTCOMES

Sullivan PW[1], Ghushchyan V[2], Navaratnam P[3], Friedman H[3], Ortiz B[4], Kavati A[4], Lanier B[5]

[1]*Regis University, Denver, CO, USA,* [2]*American University of Armenia, Yerevan, Armenia,* [3]*DataMed Solutions LLC., New York, NY, USA,* [4]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA,* [5]*American College of Allergy Asthma and Immunology, Fort Worth, TX, USA*

OBJECTIVES: Previous studies show a high prevalence of asthma and poor control among certain subgroups of children. However, the relationship remains poorly understood. **METHODS:** This was a cross-sectional analysis of children with and without asthma (aged 6-17) in the nationally representative 2007-2013 Medical Expenditure Panel Survey. Outcomes included asthma prevalence; asthma-specific (AS) Emergency Department (ED) and inpatient (IP) visits and expenditures; and indicators of asthma control (self-reported exacerbations or use of ≥3 rescue inhaler canisters /3 months). Negative binomial regression analyses were used for ED and IP visits; Generalized Linear Models with log-link for healthcare expenditures; and logistic regression for asthma control indicators. Regressions controlled for comprehensive socio-demographics. **RESULTS:** Non-Hispanic White, Non-Hispanic Asian, Mexican and Hispanic-Central/South American children were less likely and Non-Hispanic Black, Non-Hispanic Multiple Race and Hispanic-Puerto Rican children more likely to have asthma. Among children with asthma, the following appeared to have increased ED/IP use and/or indicators of poor control: Non-Hispanic Black, Non-Hispanic Asian, Non-Hispanic Multiple Race, Hispanic-Mexican and Hispanic-Puerto Rican. For example, compared to Non-Hispanic Whites, Non-Hispanic Blacks incurred greater ED and IP visits (IRR=3.3, 34.8; p<0.05). Non-Hispanic Blacks and Non-Hispanic Asians with asthma had higher AS medical, ED and IP expenditures than Non-Hispanic Whites with asthma. The following children had greater odds of overusing rescue inhalers (compared to Non-Hispanic White): Non-Hispanic Black (2.4), Non-Hispanic Asian (7.5), Hispanic-Mexican (3.3) and Hispanic-Puerto Rican (3.2) (all p<0.05). **CONCLUSIONS:** Asthma and poor asthma control is prevalent among certain subgroups of children based on ethnicity and/or race in the U.S.

PRS42

A REAL WORLD PROFILE OF THE BASELINE CHARACTERISTICS OF ASTHMA PATIENTS NEWLY TREATED WITH OMALIZUMAB IN THE UNITED STATES

Ke X[1], Kavati A[2], Wertz D[1], Huang Q[1], Wang L[1], Willey VJ[1], Stephenson JJ[1], Ortiz B[2], Panettieri, Jr. RA[3], Corren J[4]

[1]*HealthCore Inc., Wilmington, DE, USA,* [2]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA,* [3]*Rutgers, The State University of New Jersey, New Brunswick, NJ, USA,* [4]*David Geffen School of Medicine at University of California, Los Angeles, Los Angeles, CA, USA*

OBJECTIVES: To assess demographics, clinical characteristics, and healthcare resource utilization (HCRU) and costs among asthma patients prior to omalizumab initiation in a real-world environment. **METHODS:** This retrospective observational cohort study utilized US claims data from the HealthCore Integrated Research Database between 01/01/2006 and 04/30/2016. The study population consisted of asthma patients newly treated with omalizumab (defined as ≥4 omalizumab claims within the first 6 months post-index period; index date=first omalizumab claim date), aged ≥6 years, and ≥12 months pre- and post-index healthcare insurance enrollment. Patient demographics, clinical characteristics, and HCRU and costs within the 12 month pre-index period (baseline) were presented using descriptive statistics. Costs were adjusted to 2016 US dollars. **RESULTS:** The study identified 768 asthma patients newly treated with omalizumab with a mean (SD) age of 45.7 (±15.90) years and 58.5% female. At baseline, 78.0% patients had ≥1 visit to an allergist/immunologist; 74.5% had allergic rhinitis; 83.2% had spirometry testing; and 81.5% had total immunoglobulin E (IgE) testing or blood/skin testing for allergen-specific IgEs. The most commonly prescribed asthma controller medications at baseline were inhaled corticosteroids (ICS)-long-acting beta agonists (LABA) combinations (including free or fixed dose combinations; 70.1%) and leukotriene modifiers (68.1%), with 73.3% of patients having ≥1 fill of medium/high dose ICS overall. In terms of HCRU, 66.8% patients had ≥1 asthma exacerbations (11.7%, 10.7%, and 58.2% inpatient, emergency room, and outpatient exacerbations [office visit and oral corticosteroid prescription], respectively; 34.4% patients with ≥2 exacerbations) at baseline. The baseline mean (SD) annual all-cause and asthma-related total healthcare costs were $21,489 ($27,727) and $9,638 ($17,546), respectively. **CONCLUSIONS:** Study results showed that the majority of asthma patients initiating omalizumab had asthma-related testing, were prescribed ICS-LABA combinations, had >1 asthma exacerbation, and significant all-cause and asthma-related costs within the 12 month pre-index period in a real-world clinical setting.

PRS43

CHARACTERISTICS OF HOSPITALIZED PATIENTS WITH COMMUNITY-ACQUIRED BACTERIAL PNEUMONIA (CABP) AT GREATEST RISK FOR PROLONGED HOSPITAL LENGTH OF STAY IN AN INTEGRATED DELIVERY NETWORK

Le HV[1], LaPensee K[2], Lodise TP[3], Martin C[1]

[1]*PAREXEL INTERNATIONAL, DURHAM, NC, USA,* [2]*Paratek Pharmaceuticals, King of Prussia, PA, USA,* [3]*Albany College of Pharmacy and Health Sciences, Albany, NY, USA*

OBJECTIVES: Hospitalization of patients with CABP places a major burden on the US healthcare system. There are increasing efforts to reduce length of hospital stay (LOS) among pneumonia patients. This study attempts to identify CABP patients at increased risk for prolonged LOS. **METHODS:** A retrospective study of hospitalized patients with CABP in the Geisinger IDN medical encounter 2010-2015 database was performed. Inclusion criteria: (1) age ≥ 18 years, (2) primary diagnosis for CABP, (3) >1-year enrollment before index CABP hospitalization, (4) received ceftriaxone + macrolide or a fluoroquinolone on hospitalization day 1 or 2 and continued for ≥ 2 days. The primary outcome was LOS ≥ 8 days. **RESULTS:** During the study period, 1,089 patients met study criteria. The mean (SD) age was 66.7 (16) years. The geometric mean (SD) and median LOS were 4.1 (1.8) and 4.0 days, respectively. Of the 1,089 patients, 171 (15.7%) had LOS ≥ 8 days. LOS ≥ 8 days was similar between the following groups: age ≥ 65 vs. < 65 years (14.4% vs. 16.4%), body mass index ≥ 30 vs. < 30 (12.6% vs. 17.4%), presence of COPD/bronchitis vs. absence of COPD/bronchitis (16.1% vs. 12.8%), CCI ≥ 2 vs. 0-1 (16.2% vs. 14.3%), and previous (non-CABP) hospitalization vs. no previous hospitalization (15.7% vs. 15.8%). Patients with a CURB-65 score ≥ 3 had a statistically significantly higher risk of prolonged LOS ≥ 8 days vs. those with CURB-65 score ≤ 2 (19% vs. 14%, p<0.0001). Patients with LOS ≥ 8 days had a modest elevated risk of 30-day readmissions/repeated ED visits. **CONCLUSIONS:** Patient populations with CABP thought to be at an increased risk for unfavorable health outcomes were not found to be at an increased risk for prolonged LOS. These findings highlight the need to better delineate patient populations at greatest risk for prolonged LOS.

PRS44

HOSPITAL ADMISSIONS PATTERNS IN ADULT PATIENTS WITH COMMUNITY ACQUIRED BACTERIAL PNEUMONIA (CABP): IDENTIFICATION OF POTENTIALLY AVOIDABLE HOSPITAL ADMISSIONS THROUGH A RETROSPECTIVE DATABASE ANALYSIS

LaPensee K[1], Lodise TP[2], Kobayashi M[3], Martin C[4], Le HV[4]

[1]*Paratek Pharmaceuticals, King of Prussia, PA, USA,* [2]*Albany College of Pharmacy and Health Sciences, Albany, NY, USA,* [3]*Parexel Access Consulting, Durham, NC, USA,* [4]*PAREXEL INTERNATIONAL, DURHAM, NC, USA*

OBJECTIVES: Studies demonstrate that Community Acquired Bacterial Pneumonia (CABP) patients without major comorbidities and limited disease severity can be successfully managed in the outpatient setting. This study described hospitalization patterns among adult patients with CABP relative to disease severity using U.S. hospital data. **METHODS:** A retrospective study of hospitalized patients with a primary diagnosis for CABP in the MedAssets hospital 2012-2015 data was performed. Inclusion criteria included age ≥ 18 years, hospitalized with primary diagnosis for CABP, received ceftriaxone + macrolide or a fluoroquinolone on day 1 or 2 of hospitalization. Hospitalized CABP patients with potentially avoidable hospital admissions were categorized using the calculated Charlson Comorbidity Index (CCI) score. **RESULTS:** Among 65,347 CABP patients receiving ceftriaxone and a macrolide or a fluoroquinolone on day 1 or 2, 23,764 (36%) were hospitalized and eligible for this analysis. 78% of patients with CCI ≥ 2 were hospitalized. Among patients with CCI ≤ 1, 33% (41,583) were hospitalized. The geometric mean hospital stay was 4.1 days for patients with CCI scores ≤ 1 vs. 4.3 days for

CCI scores ≥ 2. The 30-day in-hospital mortality rate per 1,000 was 3.4 for the hospitalized study patients: 3.7 (95% CI 2.9 - 4.6) for those with CCI ≤ 1, and 1.9 (95% CI 0.8 - 3.9) for those with CCI ≥ 2. **CONCLUSIONS:** More than one third of CABP patients in this study were hospitalized. Most hospitalized patients had CCI ≤ 1. Given costs associated with managing hospitalized CABP patients, these findings highlight the need for healthcare systems to adopt well-defined criteria for hospital admission based on presence of comorbidities. These results demonstrate the need to better delineate patient populations at risk for hospitalization and in-hospital mortality, and for identifying outpatient treatments that can effectively reduce hospital admissions.

PRS45

A STUDY OF PREVALENCE, BELIEFS AND ATTITUDE AMONG HEALTHCARE PROFESSIONALS TOWARDS SMOKING AND ITS CESSATION IN SOUTH PUNJAB, PAKISTAN

Masood I[1], Akbar J[2], Ali S[2], Seemab S[2], Nazir K[2]
[1]*The Islamia University Of Bahawalpur, Bahawalpur, Pakistan,* [2]*The Islamia University of Bahawalpur, Bahawalpur, Pakistan*

OBJECTIVES: This study aimed to investigate the Prevalence, Beliefs and Attitude of healthcare professionals towards Cigarette smoking and its cessation. **METHODS:** A cross-sectional study was carried out among health care professionals including general and family physicians, nurses and pharmacist in the southern Punjab, Pakistan. A self administered questionnaire was distributed among 200 healthcare professionals with response rate of 80%. Data was analyzed by using SPSS. Descriptive statistics was applied to evaluate the data and chi square test was used to check association between dependent and independent variables. **RESULTS:** Among total 160 respondents, 109 (68.12%) were physicians, 24(15%) were pharmacists and 27(16.8%) were nurses. Significantly greater proportion agreed that smoking was a harmful activity. Almost all of the participants considered smoking as an addictive behavior. Most non-smokers agreed that smoking cessation was the single biggest step in improving health while majority of the non-smoking professionals identified smoking as individual's life style choice. Most of the respondents had no negative beliefs and attitudes towards discussing smoking. More than half of the respondents declared that they are not appropriately trained to help patients in quitting smoking. 79% of all students believed that doctors should play a role model in smoking cessation by not smoking themselves. **CONCLUSIONS:** There is a need for an increased emphasis on inhibited smoking-related attitude development among health care professionals. Strategies should be made to encourage physicians, pharmacist and nurses to quit smoking as patients consider them as a role model and steps should be taken to train all the health care professionals regarding patient counseling for smoking cessation.

PRS46

THE INTENTION TO QUIT SMOKING AND IMPORTANCE EVALUATION ON SMOKING CESSATION APP FEATURES

Xu J, Cheng F
Tsinghua University, Beijing, China

OBJECTIVES: Given that 620 million Chinese own smartphones, smartphone applications (apps) for smoking cessation are increasingly used in China to help smokers quit. We aim to analyze the intention to quit smoking among Chinese smokers with smartphones and their evaluation on the importance of smoking cessation APP features. **METHODS:** Questionnaire survey was used to collect data among smokers own smartphones during 1 May 2016 and 31August 2016. Cumulative-odds logistic regression was used to analyze the influencing factors of intention to quit smoking. Descriptive analysis was employed to analyze demographic characteristics of smokers with smartphones and their evaluation on the importance of smoking cessation App features. **RESULTS:** The score of intention to quit smoking among 74% of smokers was≥5 with a total score of 10. Only 4.4% of smokers with smartphones downloaded smoking cessation App. Intention to quit smoking was influenced by factors of the living regions (OR=1.224, 95% CI:1.03-1.46) and trying to quit smoking before (OR=3.202, 95%CI:2.08-4.93). There was no statistical significance between Intention to quit smoking and the importance score of APP features (P>0.05). However, features including "clinical expert support", "will change with the follow-up needs" and "interests of smokers and allow share the process of smoking cessation with family members and friends" have higher importance score (2.78,2.73 and 2.82 respectively). **CONCLUSIONS:** The Intention to quit smoking is lower among smokers with smartphones in China. Moreover, the utilization rate of smoking cessation App is low considering the significant smoking population with smartphones. Therefore, the improvement and promotion of effectively mobile smoking cessation technology based on importance evaluation from smokers is critical to reduce the smoking and increase health.

ASSESSMENT OF HOSPITALIZATIONS DUE TO OVERDOSE AMONG MISSISSIPPI'S DIVISION OF MEDICAID (DOM) BENEFICIARIES WITH OPIOID PRESCRIPTIONS

Gangan N[1], Pace P[1], Banahan III B[1], Kirby T[2], Noble S[2]
[1]*Center for Pharmaceutical Marketing and Management, University of Mississippi, University, MS, USA,* [2]*Office of the Governor, Mississippi Division of Medicaid, Jackson, MS, USA*

OBJECTIVES: Treatment of chronic non-cancer pain with prescription opioids has increased nationally in recent years. The 2016 Centers for Disease Control guidelines for prescribing opioids for chronic pain stressed the increased risk associated with higher morphine equivalent daily doses (MEDD). Higher MEDD have been associated with increased risks of overdose and death. This study examined the relationship between MEDD levels and hospitalization due to overdose in the Mississippi Medicaid program. **METHODS:** A retrospective observational study was conducted using Mississippi's DOM claims data. Included were beneficiaries >18 years, continuously enrolled, and having opioid prescription claims between July 1, 2015 and June 30, 2016. Patients in long term care, in hospice care or with a cancer diagnosis were excluded. The MEDD of each opioid prescription was calculated using quantity dispensed, days supply and a conversion factor for the strength prescribed. Inpatient claims were used to identify hospitalization for overdose within 30 days of an opioid prescription. Logistic regression was conducted to determine the odds of hospitalization at MEDD levels of 50 mg and 90 mg levels compared to less than 50 MEDD. **RESULTS:** 38,262 beneficiaries were prescribed opioids during the study period and met the inclusion criteria. Of these, 19.8% had MEDD levels > 50 mg and 6.8% had daily MEDD levels > 90. A total of 108 hospitalizations due to overdose were identified. Compared to patients with daily MEDD levels less than 50mg , patients with MEDD levels > 50 mg were 2.5 times (95% CI: 1.677-4.081) as likely to have a hospitalization for an overdose event and patients with daily MEDD levels >90 mg were 2.6 times (95% CI: 1.680-3.721) as likely to have an overdose hospitalization. **CONCLUSIONS:** Although the percentage of beneficiaries having hospitalizations due to opioid overdose is small, the odds of an overdose is significantly increases with higher MEDD levels.

PSY2

DOES TREATMENT WITH PREGABALIN AND GABAPENTIN INCREASE THE RISK OF DEMENTIA, PNEUMONIA AND UNINTENTIONAL FALLS? A SYSTEMATIC LITERATURE REVIEW

Jaggi A, Fatoye F, Shi X, Odeyemi I
Manchester Metropolitan University, Manchester, UK

OBJECTIVES: Pregabalin and gabapentin are the mainstay oral treatment for peripheral neuropathic pain (PNP). Iatrogenic cognitive impairment is generally considered to be reversible once consumption of central nervous system (CNS) active medications such as pregabalin and gabapentin is stopped. There is evidence to suggest the use of CNS active drugs could be associated with long-term, more detrimental adverse events including dementia, pneumonia and unintentional falls. However, it is unknown if these long-term outcomes are associated with pregabalin and gabapentin. This systematic review examined whether there is a correlation between treatment with pregabalin and gabapentin and the onset of these adverse events. **METHODS:** A systematic review was conducted using MEDLINE and EMBASE. Keywords included combinations of pregabalin, gabapentin, pneumonia, dementia and falls. The inclusion criteria for studies were: 1) written/published in English; 2) human studies; 3) publication year to reflect marketing authorization year for pregabalin (2004-present) and gabapentin (1993-present). Articles were reviewed for inclusion by an independent reviewer and 5% were cross examined by a second independent reviewer. A narrative synthesis of results using thematic content analysis was conducted. **RESULTS:** A total of eight studies reporting a correlation of adverse events and pregabalin or gabapentin were included; pneumonia (2), dementia (1) and falls (5). Study designs included case report, randomised controlled trials (RCT), pilot-RCT, retrospective toxicity and sequence symmetry analysis. Renal dysfunction and drug-drug interactions as a cause for increased risk of adverse events were two major themes identified from thematic analysis. **CONCLUSIONS:** In view of low quality and extensive heterogeneity between studies, firm conclusions could not be reached. Longitudinal database or prospective studies may help to determine the correlation between pregabalin and gabapentin and the onset of dementia, pneumonia and unintentional falls, especially in subgroups with renal dysfunction.

PSY3

EXENATIDE IN OBESE OR OVERWEIGHT PATIENTS WITHOUT DIABETES: A SYSTEMATIC REVIEW AND META-ANALYSES OF RANDOMIZED CONTROLLED TRIALS

Su N, Xu T, Sun X
West China Hospital of Sichuan University, Chengdu, China

OBJECTIVES: Exenatide is increasingly used in obese or overweight patients with diabetes. However, its safety profile and effects on weight loss in nondiabetic obese or overweight population remain unclear. We aimed to evaluate efficacy and safety of exenatide in obese or overweight participants without diabetes. **METHODS:** We searched up to January 2016 in MEDLINE (Ovid SP),EMBASE (Ovid SP), Cochrane Central Register of Controlled Trials (CENTRAL), some Chinese databases and ClinicalTrials.gov for randomized controlled trials (RCTs) investigating exenatide in obese or overweight participants without diabetes. The primary outcomes included body weight and body mass index (BMI). We pooled data to calculate the mean differences (MDs) with their 95% confidence intervals (CIs). We assessed overall evidence quality of BMI reduction and weight los according to the Grading of Recommendations Assessment, Development and Evaluation (GRADE) approach. **RESULTS:** Six randomized controlled trials involving 362 patients were included in the meta- analysis. The follow-up duration ranged from12 to 24 weeks. Compared with control group, a larger body weight loss (MD:−4.47 kg; 95%CI: −6.67 to −2.27; P b 0.0001), regardless of dosage and population, was achieved by the obese or overweight patients in exenatide group. Exenatide also elicited a greater reduction in BMI (MD: −0.86 kg/m2; 95% CI: −1.39 to −0.33; P= 0.001) and waist circumferences (MD: −1.78 cm; 95% CI: −3.13 to −0.44; P =0.009) compared with the control. No significant benefits were showed in exenatide group in terms of blood pressure and lipid profiles. Gastrointestinal adverse events were mostly common during the treatment of exenatide. **CONCLUSIONS:** Exenatide could significantly reduce body weight in obese or overweight participants without diabetes, and might be a safe alternative GLP-1 receptor agonist for weight control in such patients. Larger randomized trials with longer follow-up duration are required to confirm the effectiveness and safety of exenatide.

PSY4

THE PREVALENCE OF IN-HOSPITAL FALLS IN U.S. SURGICAL ADULT PATIENTS ON PAIN MANAGEMENT IS LOWEST IN PATIENTS PRESCRIBED OPIOIDS COMPARED TO EITHER A FEMORAL NERVE BLOCK OR BUPIVACAINE LIPOSOME INJECTABLE SUSPENSION

Yang GA[1], Abraham J[2]
[1]The Medicines Company, Parsippany, NJ, USA, [2]The Medicines Company, Reading, MA, USA

OBJECTIVES: For obvious reasons hospitals want to avoid a patient falling while in hospital. For patients receiving opioids, falls are considered opioid-related adverse events but recent prevalence data is unknown. The purpose of this quantitative study was to benchmark the prevalence of in-hospital falls for surgical patients on pain management (both opioid and non-opioid) in the U.S. between 2012-2015. **METHODS:** The analysis was conducted using Premier's hospital database. The cohort included adults (18+ years) undergoing major/minor surgeries with post-operative pain management between Oct, 2012 and Sep, 2015. Three major types of pain management were investigated: femoral nerve blocks (FNB), bupivacaine liposome injectable suspension and opioids. Opioid use was further broken down to oral, parenteral and Intravenous Patient Controlled Analgesics (IV PCA) sub-groups. Falls occurring during hospitalization were identified by ICD9 E-codes and/or service charges. The yearly point prevalence of falls was measured for each type of pain management and sub-groups based on the ratio of falling patients to the total surgical population of each pain therapy. **RESULTS:** The overall prevalence of inpatient falls for pain management were very low, with the highest frequency on patients receiving a FNB had (0.34%), followed by bupivacaine liposome injectable suspension group (0.28%). Opioid patients were the least likely to experience falls (0.25%). Among opioids, patients on oral opioids were prone to more hospital falls (0.27%) than parenteral (0.25%), or IV PCA opioids (0.26%). The falling rates decreased over the three years: FNB (0.43% to 0.28%), bupivacaine liposome injectable suspension (0.33% to 0.24%) and opioids (0.27% to 0.22%). **CONCLUSIONS:** The prevalence of in-hospital falls is very low. This study revealed that opioid use alone to relieve pain may not contribute to falls more than a FNB or bupivacaine liposome injectable suspension. Further studies may investigate correlation, risks and consequences related.

PSY5

ASSOCIATION BETWEEN BODY MASS INDEX CATEGORIES, OSTEOARTHRITIS PREVALENCE, & TOTAL HEALTHCARE EXPENDITURES AMONG PATIENTS WHO ARE OVERWEIGHT OR OBESE

Johnston SS[1], Hsiao C[2], Yoo A[3], Daskiran M[4], Goldstein LJ[5]
[1]Johnson & Johnson Co., New Brunswick, NJ, USA, [2]Global Health Economics and Market Access, Ethicon Inc., Cincinnati, OH, USA, [3]Epidemiology & Health Informatics, Medical Devices, Johnson and Johnson Co., New Brunswick, NJ, USA, [4]Johnson & Johnson, New Brunswick, NJ, USA, [5]Johnson & Johnson, Markham, ON, Canada

OBJECTIVES: To examine the association between body mass index (BMI [kg/m2]) categories, osteoarthritis prevalence, and total healthcare expenditures among patients who are overweight or obese. **METHODS:** Retrospective, observational study using U.S. electronic medical records linked to administrative claims data (Optum Integrated database). Patients selected for study were aged 18-64 years, had a recorded BMI between 25.5-80 during 2014, and were continuously enrolled in health insurance for 6 months before and after the last BMI measurement (12-month evaluation period) in 2014. Patients were classified into BMI categories using the last recorded BMI in 2014: 25-29.9 (overweight); 30-34.9 (obese/class-I [OCI]); 35-39.9 (obese/class-II [OCII]); ≥40 (obese/class-III [OCIII]). Patients were classified as having osteoarthritis if they had ≥1 medical claim with an ICD-9-CM diagnosis code for osteoarthritis (715.xx) during the evaluation period; the remaining patients were classified into a 'reference group' without osteoarthritis. Multivariable generalized linear models, adjusting for age, sex, race/ethnicity, and geography, were used to generate adjusted estimates of osteoarthritis prevalence by BMI category and evaluation period total healthcare expenditures by BMI category/osteoarthritis through recycled prediction. **RESULTS:** A total of 155,837 patients were included for study (mean age=47 years; 50% female): 71,793 (46.1%) overweight; 45,391 (29.1%) OCI; 21,787 (14.0%) OCII; 16,866 (10.8%) OCIII. Adjusted osteoarthritis prevalence increased with each BMI category relative to the overweight category (all P<0.001): osteoarthritis prevalence in overweight=7.2%; OCI=9.1%; OCII=10.9%; OCIII=15.2%. Patients with osteoarthritis had higher expenditures than the reference group without osteoarthritis in each BMI category, and expenditures increased with BMI (all P<0.001): overweight, $17,844 for osteoarthritis vs. $8,830 for reference group; OCI, $19,200 osteoarthritis vs. $9,501 reference group; OCII, $21,157 osteoarthritis vs. $10,469 reference group; OCIII, $23,857 osteoarthritis vs. $11,805 reference group. **CONCLUSIONS:** Among patients who were overweight or obese, osteoarthritis prevalence and total healthcare expenditures increased substantially with increasing BMI category.

PSY6

BODY MASS INDEX, HBA1C CONTROL, AND HEALTHCARE EXPENDITURES AMONG PATIENTS WITH TYPE 2 DIABETES: AN ANALYSIS OF ADMINISTRATIVE CLAIMS LINKED TO ELECTRONIC MEDICAL RECORDS

Johnston SS[1], Hsiao C[2], Goldstein LJ[3], Daskiran M[4], Scamuffa R[5]
[1]Johnson & Johnson Co., New Brunswick, NJ, USA, [2]Global Health Economics and Market Access, Ethicon Inc., Cincinnati, OH, USA, [3]Johnson & Johnson, Markham, ON, Canada, [4]Johnson & Johnson, New Brunswick, NJ, USA, [5]Ethicon, Johnson & Johnson, Cincinnati, OH, USA

OBJECTIVES: To examine the association between body mass index (BMI) categories, poor hemoglobin A1c control (HbA1c≥7%), and healthcare expenditures among US patients with type 2 diabetes mellitus (T2DM) and BMI classified as overweight or greater (BMI ≥25). **METHODS:** Retrospective, observational study using U.S. electronic medical records linked to administrative claims data (Optum's Integrated Claims-Clinical data). Patients selected for study were aged≥18, had a recorded BMI between 25-80 during 2014, were continuously enrolled in health insurance for 6 months before and after the last BMI measurement (12-month evaluation period) in 2014, and had ≥1 medical claim T2DM diagnosis and ≥1 antihyperglycemic prescription claim within the evaluation period. Patients were classified into BMI categories using the last recorded BMI in 2014: 25-29.9 (overweight); 30-34.9 (obese/class-I [OCI]); 35-39.9 (obese/class-II [OCII]); ≥40 (obese/class-III [OCIII]). Multivariable regressions adjusting for patient demographics were used to examine the associations between poor HbA1c control, BMI category, and separate outcomes of total healthcare expenditures and pharmacy expenditures measured during the evaluation period. **RESULTS:** A total of 27,117 patients were included for study (mean age=64; 52% female): Compared to patients with HbA1c<7%, those with HbA1c≥7% had 8% higher total healthcare expenditures (Cost Ratio [CR]=1.08, P=0.002, adjusted=$22,477 vs. $20,837) and 23% higher pharmacy expenditures (CR=1.23, P<0.001, adjusted=$5,297 vs. $4,297). Compared with overweight patients: OCI patients did not have significantly higher total healthcare or pharmacy expenditures; OCII patients did not have significantly higher total healthcare expenditures but did have 17% higher pharmacy expenditures (CR=1.17, P<0.001, adjusted=$5,287 vs. $4,527); OCIII patients had 13% higher total healthcare expenditures (CR=1.13, P=0.001, adjusted=$24,206 vs. $21,433) and 30% higher pharmacy expenditures (CR=1.30, P<0.001, adjusted=$5,895 vs. $4,527). **CONCLUSIONS:** Among patients with T2DM who are overweight or obese, poor HbA1c control and high levels of obesity are associated with higher total healthcare expenditures and pharmacy expenditures.

PSY7

DEVELOPMENT OF RECOMMENDATION FOR GESTATIONAL WEIGHT GAIN IN THE CHINESE PREGNANT WOMEN: A LONGITUDINAL STUDY

Tan J[1], Liu X[2], Sun X[3]
[1]School of West China Public Health, Sichuan University, Chengdu, China, [2]West China Women's and Children's Hospital, Sichuan University, Chengdu, China, [3]West China Hospital, Sichuan University, Chengdu, China

OBJECTIVES: To develop a recommendation for gestational weight gain for the Chinese pregnant women; **METHODS:** We conducted a retrospective longitudinal study involving repeated measures of weight data at a referral medical center in China. Singleton deliveries without predefined adverse outcomes were eligible for inclusion. We used two-level linear spline model to predict weight gain by gestational age (week) according to pre-pregnancy BMI categories (Chinese population standard). We reported the recommended gestational weight gain and the rates of weight gain during pregnancy, and plotted the recommended gestational weight gain charts by week of gestation, stratified by pre-pregnancy BMI. The MLwiN 2.30 and SAS 9.4 were used for analysis; **RESULTS:** We collected data from 10,031 pregnant women with singleton and term pregnancy. After removing individuals with pre-defined adverse outcomes, 4,566 pregnant women with 50,589 repeated measurements of weight were finally included. For underweight (pre-pregnancy BMI<18.5 kg/m2), normal (18.5-23.9 kg/m2), overweight (24.0-27.9 kg/m2), and obese (≥28.0 kg/m2) pregnant women, the recommended gestational weight gains are 12.7-17.4 kg, 12.4-17.2 kg, 10.9-16.1 kg, and 9.3-14.6 kg; and the corresponding rates of weight gain are 2.40, 2.35, 2.14, and 1.95 kg/month between 14 and 36 weeks of gestation. The recommended weight gain is similar at 10th to 14th gestational week (about 0.5 kg/month) and in the last month (about 1-2 kg); **CONCLUSIONS:** The recommendation for the gestational weight gain is specifically applicable for the Chinese pregnant women, with important implications for the pregnancy weight management.

PSY8

A SYSTEMATIC LITERATURE REVIEW ON CARCINOID HEART DISEASE IN PATIENTS WITH CARCINOID SYNDROME

Ovcinnikova O[1], Marshall M[2], Bagnati F[3], Hoffmanns P[3], Taveau C[2], Nayroles G[3]
[1]Mapi, London, UK, [2]Mapi, Nanterre, France, [3]Ipsen Pharma SAS, Boulogne-Billancourt, France

OBJECTIVES: Carcinoid heart disease (CHD) is a life-threatening complication of carcinoid syndrome (CS). Our aim was to review published findings to assess epidemiology and outcomes in CS patients with CHD. **METHODS:** A systematic literature review was conducted in PubMed, Embase, Cochrane Library and ClinicalTrials.gov without date restrictions. From 380 de-duplicated records screened, 72 full-text articles were reviewed for eligibility and 39 publications were selected (EU n=21, US n=18). Data on study design, patient characteristics, CHD prevalence and outcomes were collected. **RESULTS:** No CHD-specific trials were found. Observed CHD patient sample sizes varied from 7 to 265 (median: US 65; EU 27), with study periods of 1–28 years (median: US 20y; EU 5y). Reported prevalence of CHD in CS varied from 16 to 28% but rose to 40-85% in CS patients referred for echocardiography because of suspected CHD. Urinary 5-hydroxyindoleacetic acid (u5-HIAA) levels were, on average, 2–4 fold higher in CHD patients compared to non-CHD CS. Peak 5-HIAA levels were linked to CHD progression (odds ratio, 1.08 for each increase of 25mg per 24h). CHD patients had higher mortality and morbidity vs non-CHD patients. In small intestine neuroendocrine tumours, reported 5-year overall survival was 37% for CHD patients and 71% for non-CHD patients. CHD outcomes have improved over time with greater use of somatostatin analogues, hepatic artery embolization, better perioperative management and surgery outcomes. Valvular surgery can achieve acceptable outcomes and better functional status, although perioperative mortality remains at 15-20% across studies. Tumour progression determines long-term survival after surgery. **CONCLUSIONS:** Reporting of CHD outcomes are inconsistent, and visibility is low. The understanding of epidemiology and trends remains limited due to disease rarity. Research faces limitations: lack of clinical studies, poor feasibility of randomised trials, lack of standardized criteria for quantifying CHD progression. National registries and international collaboration are needed.

PSY9

COMPARATIVE ASSESSMENT OF PREEMPTIVE POTENTIAL OF DEXMEDETOMIDINE VERSUS TRAMADOL IN PERIOPERATIVE SHIVERING UNDER SPINAL ANESTHESIA: A RANDOMIZED, CONTROLLED STUDY

Arora G, Chhaya A
S.B.K.S Medical Institute & Research Centre, Sumandeep Vidyapeeth University, VADODRA, GUJARAT, India

OBJECTIVES: There is equivocal evidence about preemptive potential of Dexmedetomidine and Tramadol for post spinal anesthesia shivering. We evaluated safety and efficacy of Dexmedetomidine compared to Tramadol in reducing incidence of post spinal shivering with effects on haemodynamics. **METHODS:** Sixty American Society of Anesthesiologist's grade- I & II patients of either sex, aged between 18 to 60 years, scheduled for elective surgeries under spinal anesthesia were divided into two equal sized groups (n=30). After neuro-axial blockade with 3.5 ml Bupivacaine 0.5% (Heavy), patients were administered with preemptive I.V. Dexmedetomidine (1 ug/kg) or I.V. Tramadol (1 mg/kg) in random order determined by chit-pull system. Haemodynamic parameters, grade of shivering as per Wrench scale were recorded from administration of test drug till 135 minutes past administration at regular intervals and sedation score as per Filos was observed at 90 minutes past drug administration. Any adverse events during the study were also recorded. Comparability of both groups in terms of demographics was assessed using ANOVA test. Difference in incidence of perioperative shivering (Grade $\geq$2) and haemodynamic profile of both groups was evaluated using Chi-square test and unpaired t-test respectively. **RESULTS:** Dexmedetomidine group demonstrated lesser incidence of perioperative shivering under spinal anesthesia (3.33%) than that in Tramadol group (20%) (p value=0.044). A sedation score of $\geq$2 was observed in more number of patients in group D(60%) as compared to that in group T(20%)(p value=0.001). Group T presented higher occurrence of nausea (16%) compared to that in Group D (nil) (p value=0.019). However, incidence of bradycardia and hypotension were higher in group D as compared to that of group T. **CONCLUSIONS:** Dexmedetomidine was found to have higher preemptive potential for perioperative shivering over tramadol with additional benefit of sedation without respiratory depression.

PSY10

CONSISTENCY OF CLINICAL RESPONSE TO RECOMBINANT HUMAN PARATHYROID HORMONE (1-84) (RHPTH[1-84]) AMONG PATIENTS WITH HYPOPARATHYROIDISM

Chen K[1], Li N[2], Gao W[2], Zhao J[2], Signorovitch J[2]
[1]Shire Human Genetic Therapies, Inc., Lexington, MA, USA, [2]Analysis Group, Inc., Boston, MA, USA

OBJECTIVES: Among patients with hypoparathyroidism, rhPTH(1-84) has demonstrated superior efficacy compared to placebo in achieving target serum calcium and reductions in calcium and active vitamin D supplementation. We assessed whether patient and disease characteristics might be associated with clinically-significant differences in clinical response to rhPTH(1-84). **METHODS:** Data were drawn from phase III trial (REPLACE: NCT00732615; EudraCT2008-005063-34) that randomized patients with hypoparathyroidism to receive rhPTH(1-84) (n=84) or placebo (n=40). Clinical response was defined as a composite of $\geq$50% reductions in calcium and active vitamin D supplementation and achieving target serum calcium at Week 24 compared to baseline. The potential for effect modification was assessed across multiple subgroup analyses and in a multivariable analysis that combined predictors for clinical response. Potential correlates of response included demographics, vitamin D dose, calcium dose, disease duration, weight, PTH, serum calcium, serum phosphate, and renal function. **RESULTS:** Baseline characteristics of the study population were diverse. The difference in clinical response rates with rhPTH(1-84) vs. placebo was 52% (55% vs. 3%) in the overall population. Across multiple subgroup analyses, response rate difference ranged from 40% to 100%. No evidence of effect modification was detected. Four predictors of response to rhPTH(1-84) were identified in a multivariable model: shorter duration of hypoparathyroidism, lower weight, normal total serum calcium, and lower prescribed calcium dose. When patients were divided into two groups with predicted rates of response higher vs. lower than median, response rate differences were 45% in the lower group and 62% in the higher group. **CONCLUSIONS:** Across multiple studied subpopulations, including subpopulations defined by multiple markers, differences in clinical response rates range from 40% to 100% with rhPTH(1-84) vs. placebo. These results highlight the consistency of high and clinically significant response rates to rhPTH(1-84) across a broad range of hypoparathyroidism patients.

PSY11

EVALUATING THE IMPACT OF A CLINICAL DECISION SUPPORT TOOL TO REDUCE CHRONIC OPIOID DOSE AND DECREASE RISK CLASSIFICATION IN HIGH RISK VETERANS IN THE VETERANS HEALTH ADMINISTRATION

Patel S[1], Carmichael J[1], Taylor J[1], Bounthavong M[2], Higgins D[1]
[1]VA Sierra Pacific Network (VISN 21), Reno, NV, USA, [2]VA PBM Academic Detailing Program Office, San Diego, CA, USA

OBJECTIVES: To determine the influence of a clinical decision support tool (CDST) in reducing morphine equivalent monthly dose (MEMD), Risk Index for Overdose or Serious Prescription Opioid-Induced Respiratory Depression (RIOSORD) score and class in veterans receiving chronic opioid therapy (COT). **METHODS:** This retrospective analysis evaluated the impact of a CDST, Chronic Opioid Therapy Clinical Reminder (COT-CR), on decreasing opioid prescribing. COT-CR correlates quality of life to current opioid regimen through a prompted pain assessment. COT veterans were identified through the VISN 21 data warehouse, an electronic health records database. Patients who received COT-CR (treatment) and did not receive COT-CR (control) were matched using propensity scoring. In the primary analysis, we used an interrupted time series design to evaluate changes in MEMD for the intervention and control groups before and after the index date, defined as the visit date with a pain specialist or primary care provider (12 months before and 6 months after). The secondary analyses used a retrospective cohort design to evaluate changes in RIOSORD score and class from the index date to the study end. **RESULTS:** After matching, 3,801 patients were included in the intervention and control groups, respectively. For the primary analysis, there was a greater MEMD reduction rate in the post-index period for the intervention group compared to the control group (-11.6 MEMD; 95% CI: -0.97 to -22.25, P=0.032). In the secondary analyses, the intervention group had a significantly greater rate of decrease in RIOSORD score compared to the control group (-8.8% vs. -5.8%, P=0.030). Comparative changes in risk class were insignificant. **CONCLUSIONS:** A trend towards decreased MEMD, RIOSORD score and class was observed for both groups in the post-index period. Comparative reduction in MEMD and RIOSORD score was statistically significant for the intervention group. Combined with other efforts, this CDST is beneficial in minimizing opioid use and risk.

PSY12

COMPARATIVE EFFICACY OF IBRUTINIB MONOTHERAPY VERSUS OBINUTUZUMAB PLUS CHLORAMBUCIL IN THE TREATMENT OF CHRONIC LYMPHOCYTIC LEUKAEMIA (CLL): A MATCHING ADJUSTED INDIRECT COMPARISON (MAIC)

Sanden SV[1], Diels J[1], Cote S[2], Baculea S[3]
[1]Janssen-Cilag Ltd, Beerse, Belgium, [2]Janssen-Cilag, High Wycombe, Bucks, UK, [3]Janssen-Cilag, Bucks, UK

OBJECTIVES: As there are no head-to-head trials of ibrutinib versus obinutuzumab plus chlorambucil (OBI+CHLOR) in patients with previously untreated CLL, a MAIC was performed to assess their relative effects on progression-free survival (PFS) and overall survival (OS) while adjusting for potential treatment effect modifiers. **METHODS:** Individual patient data from RESONATE-2 (ibrutinib versus CHLOR) and aggregate data from CLL11 (OBI+CHLOR versus CHLOR) were available. As per the MAIC technique, patients from RESONATE-2 not meeting the CLL11 inclusion criteria were excluded. The remaining RESONATE-2 patients were reweighted to match all relevant baseline characteristics reported for CLL11 (CIRS score, age, Binet stage, β2-microglobulin, del11q, ECOG status, creatinine clearance, sex and unmutated IGHV). Hazard ratios (ibrutinib vs CHLOR) for investigator assessed (INV) PFS, independent review committee (IRC) assessed PFS and OS were recalculated for the weighted population and subsequently used in a Bayesian Network Meta-Analysis to compare with OBI+CHLOR. The results were compared with those of a traditional indirect comparison (IC). **RESULTS:** The traditional IC HRs [95% credible interval (CrI), probability HR<1 (p(HR<1))] of ibrutinib versus OBI+CHLOR for PFS INV, PFS IRC and OS were 0.48 [CrI=0.22–1.02, p(HR<1)=97%], 0.85 [CrI=0.44–1.63, p(HR<1)=69%] and 0.40 [CrI=0.10–1.54, p(HR<1)=91%], respectively. Of the total trial population of 136/133 (ibrutinib/CHLOR) participants in RESONATE-2, 95 and 96, respectively satisfied the CLL11 inclusion criteria. After matching, all available baseline characteristics were balanced across trial populations. MAIC adjusted HRs were 0.12 [CrI=0.02–0.97, p(HR<1)=98%] (PFS INV), 0.24 [CrI=0.04–1.35, p(HR<1)=95%] (PFS IRC) and 0.21 [CrI=<0.01–8.89, p(HR<1)=79%] (OS). **CONCLUSIONS:** This analysis shows that while results of a traditional IC are in favour of ibrutinib, they still represent an underestimation of the true treatment benefit of ibrutinib on PFS and OS; namely, a 95% probability for PFS by IRC and 79% for OS of ibrutinib being better than OBI+CHLOR.

PSY13

COMPARATIVE EFFECTIVENESS OF TARGETED IMMUNOMODULATORS FOR THE TREATMENT OF MODERATE-TO-SEVERE PLAQUE PSORIASIS: A SYSTEMATIC REVIEW AND NETWORK META-ANALYSIS

Loos AM[1], Liu S[1], Segel C[1], Ollendorf D[1], Pearson SD[1], Linder JA[2]
[1]Institute for Clinical and Economic Review, Boston, MA, USA, [2]Northwestern University, Chicago, IL, USA

OBJECTIVES: To evaluate the comparative effectiveness of targeted immunomodulators for adults with moderate-to-severe plaque psoriasis. **METHODS:** We performed a systematic literature review of randomized controlled trials of targeted immunomodulators – TNF-a inhibitors (adalimumab, etanercept, infliximab), ustekinumab, IL-17A inhibitors (secukinumab, ixekizumab, brodalumab), and apremilast (the only oral agent) – that evaluated the comparative clinical benefits or harms relative to placebo or each another. We searched and included studies from MEDLINE, EMBASE, and Cochrane-indexed articles, as well as "grey literature" sources such as conference abstracts. The primary outcome in nearly all trials was a 75% improvement on the Psoriasis Area and Severity Index (PASI 75) during induction (10-16 weeks). To evaluate direct and indirect comparisons, we conducted a network meta-analysis (NMA) using a multinomial model within a Bayesian framework and adjusted for placebo response. **RESULTS:** We identified 36 RCTs, which included 8 direct comparisons. Across trials, the average participant was 43-46 years old and had psoriasis for 17-20 years; 22-30% had psoriatic arthritis and the baseline PASI score was 19-30. In placebo-controlled trials, patients on targeted immunomodulators had markedly higher rates of PASI 75 response (29% to 90%) than patients who received placebo (2% to 19%). In head-to-head trials, PASI 75 response rates were higher for ustekinumab (68-74%), secukinumab (77%), and ixekizumab (87-90%) versus etanercept (42-57%) and were higher for secukinumab (91%), brodalumab (85-86%), and ixekizumab (91%) versus ustekinumab (69-79%). In the NMA, the targeted immunomodulators ordered by an increasing relative risk of achieving PASI 75 during induction relative to placebo were apremilast (6.2), etanercept (9.6), adalimumab (13.0), ustekinumab (14.0), secukinumab (15.4), infliximab (16.2), brodalumab (17.3), and ixekizumab (17.9). **CONCLUSIONS:** In general, IL-17A inhibitors are more effective than ustekinumab, which are, in turn, generally more effective than etanercept, adalimumab, and apremilast.

PSY14

COST-UTILITY OF USTEKINUMAB IN THE TREATMENT OF MODERATE TO SEVERE PSORIASIS IN COLOMBIA

Aguirre A[1], Guerrero E[2], Hernandez N[3], Coronell S[3], Argote AC[4], Giraldo CV[5], Ojeda C[6]
[1]*Janssen Cilag SA, Bogota, Colombia,* [2]*Janssen Colombia, Bogota, Colombia,* [3]*Private Practice, Bogota, Colombia,* [4]*Hospital San José, Bogota, Colombia,* [5]*Universidad El Bosque, Bogota, Colombia,* [6]*Hospital La Samaritana, Bogota, Colombia*

OBJECTIVES: To evaluate the cost-utility of ustekinumab in moderate to severe psoriasis compared with the use of infliximab, adalimumab, etanercept and secukinumab. **METHODS:** A Markov model from a third-party payer's perspective was performed, using quality-adjusted life-years (QALYs) as the final outcome measure, which was modelled through Psoriasis Area Severity Index (PASI) 50, 75 and 90. The model timeframe was ten years with a 5% discount rate. The comparators were selected by conducting a modified Delphi panel of experts. Only direct medical costs were considered: cost of first biologic and treatment with a second biologic after failure or non-response to initial medication (failure was an absorbing state and its cost was an average of all other biologics besides the starting biologic). A probabilistic sensitivity analysis on prices and key variables of the model was also performed. **RESULTS:** The total discounted costs of treatment per patient for a 10-year period were (USD): ustekinumab $37,682; infliximab $49,434; adalimumab $44,363; etanercept 50 mg $49,017, etanercept 25mg $48 828; and secukinumab $52,456 (Exchange rate: 1 USD = COP $3,000). The model estimated QALYs associated with increases in utility based on the PASI response achieved by each comparator during each weekly cycle. The accumulated QALYs after the ten year period were: 6.11, 4.20, 5.69, 5.41, 5.30 and 5.61 with ustekinumab 45mg/90mg for patients with body weight over 100 kilos, infliximab 5mg/kg, adalimumab 40mg, etanercept 50mg, etanercept 25mg and secukinumab 300mg, respectively. Shorter time on treatment with first biologic implied lower QALYs. The cost utility analysis of ustekinumab compared to all alternatives resulted in more QALYs to patients at the lowest cost. **CONCLUSIONS:** The results show that the use of ustekinumab is the alternative that added more QALYs to patients at the lowest cost in the long term in comparison to the use of any anti-TNF or anti-IL 17.

PSY15

COMPARATIVE EFFECTIVENESS OF NERVE BLOCKS VERSUS PERIARTICULAR INJECTIONS IN TOTAL KNEE ARTHROPLASTY

Aljabri D[1], Sherman C[1], White L[1], Visscher S[2], Cole H[1], Wright K[1], Rucci M[1], Khan MM[3], Xirasagar S[3], Horner R[3], Naessens J[2]
[1]*Mayo Clinic, Jacksonville, FL, USA,* [2]*Mayo Clinic, Rochester, MN, USA,* [3]*University of South Carolina, Columbia, SC, USA*

OBJECTIVES: Total knee arthroplasty (TKA), one of the most painful surgical procedures, is projected to increase almost eight-fold, from 450,000 in 2005 to 3.48 million in 2030, attributable to population aging and obesity. Accordingly, advances in pain management techniques are highly relevant to orthopedic surgery. Two common pain management methods after TKA are nerve block (NB) and periarticular injection (PAI). This study explored whether either technique provided advantages in patient outcomes and satisfaction. **METHODS:** This is a retrospective study comparing adult patients who received NB (N=514) versus PAI (N=483) of ropivacaine, epinephrine, ketorolac, and morphine, for primary TKA at Mayo Clinic, Florida from 2013-2016. We compared patient outcomes including: pain scores, time after surgery to first ambulation, cumulative postoperative distance walked, postoperative length of stay, and discharge disposition. Patient satisfaction with pain control was also captured, along with resource utilization measures including emergency visits, readmissions, and revisions. **RESULTS:** Our results indicated that PAI was associated with lower pain during the 24 hours after surgery (mean score, on a 0to10 scale: NB=2.4 vs. PAI=1.7;$P<0.001$) compared to NB, but thereafter, until discharge, there was no difference (mean: NB=3.2 vs. PAI=3.1;P=0.370). PAI was associated with earlier knee ambulation (mean: NB=31.3 vs. PAI=22.3 hours;$P<0.001$), longer walking distance (mean: NB=21.4 vs. PAI=50.3 meters;$P<0.001$), shorter hospital stay (mean: NB=2.9 vs. PAI=2.3 days;$P<0.001$), more discharges to home (NB=48.3% vs. PAI=79.3%;$P<0.001$), and better patient satisfaction with pain control (mean score, on a 0to100 scale: NB= 88.4 vs. PAI= 92.7;P=0.006) compared to NB. Resource utilization measures (emergency visits, readmissions, and revisions) were similar between the two groups ($P>0.05$). **CONCLUSIONS:** With increasing demand for TKA and based on early evidence, providers and policymakers should consider PAI as an efficient pain management approach. This method has proven to provide better patient satisfaction with pain control, earlier and further mobilization, and quicker discharges, which accordingly impacts cost.

PSY16

A BAYESIAN NETWORK META-ANALYSIS (NMA) OF IBRUTINIB VS BENDAMUSTINE-RITUXIMAB FOR TREATMENT NAÏVE CHRONIC LYMPHOCYTIC LEUKAEMIA (TN-CLL) PATIENTS WITH CIRS ℞ 6 OR CLCR ≥ 60 ML/MIN

Sanden SV[1], Baculea S[2], Parra Gabilondo R[3], Gros B[3], Cote S[2]
[1]*Janssen-Cilag Ltd, Beerse, Belgium,* [2]*Janssen-Cilag, High Wycombe, Bucks, UK,* [3]*Janssen-Cilag, Madrid, Spain*

OBJECTIVES: Ibrutinib has demonstrated superiority in terms of efficacy and tolerability to chlorambucil (Chl) for TN-CLL patients who are elderly or unfit (RESONATE-2). Within this trial there is a subgroup of less fragile patients, defined as those having a Cumulative Illness Rating Scale (CIRS) score ≤6 or Creatinine clearance (ClCr)≥60 ml/min that could be potential candidates for bendamustine-rituximab (BR) therapy. As no head-to-head comparison exists for this relatively fit subgroup, an NMA was conducted to compare the efficacy of ibrutinib vs. BR in patients suitable for chemoimmunotherapy. **METHODS:** Out of sixteen randomized controlled trials (RCTs) in TN-CLL patients identified in a systematic literature review, four RCTs were conducted in patients/subgroups of patients who were relatively younger or more fit (CLL8, Hallek 2010; CLL10, Eichorst 2016; LRF CLL4, Catowsky 2007; RESONATE-2, the less fragile subgroup, data at a median follow-up of 28.6 months). They are connected in a network of evidence that could inform the indirect comparison of interest. A Bayesian NMA was conducted to compare hazard ratios (HR) of overall survival (OS) and progression-free survival (PFS) of ibrutinib vs. BR, FC, FCR and Chl. A fixed effect model was used due to the limited size and structure of the network. **RESULTS:** Ibrutinib had favorable HRs and the highest pairwise probability of being the best treatment (P) in terms of PFS and OS versus BR (HR=0.36/0.55, P=100%/87%), FC (HR=0.33/0.36, P=100%/99%), FCR (HR=0.59/0.53, P=95%/92%) and Chl (HR=0.14/0.40, P=100%/99%). Ibrutinib had the highest probability of being the best treatment in the network in terms of PFS (99%) and OS (94%). **CONCLUSIONS:** This analysis suggests that ibrutinib is a more effective treatment compared to BR in terms of survival outcomes PFS and OS in TN-CLL patients who are relatively younger or more fit, defined as having a CIRS≤6 or ClCr≥60 ml/min.

ROUX-IN-Y GASTRIC BYPASS IN TYPE 2 DIABETES PATIENTS WITH MILD OBESITY: A SYSTEMATIC REVIEW AND META-ANALYSIS

Luque A[1], Junqueira Junior SM[1], Cohen R[2]
[1]*Johnson & Johnson Medical Brazil, São Paulo, Brazil,* [2]*Hospital Alemão Oswaldo Cruz, Sao Paulo, Brazil*

OBJECTIVES: Type 2 Diabetes (T2D) control after Roux-in-Y gastric bypass (RYGB) is a well-established outcome for obese patients. Evidence suggest that the positive metabolic benefits are independent of baseline body mass index (BMI) and surgical interventions for patients with BMI below 35 kg/m2 and T2D without clinical control after optimal medical treatment are the best evidence based approach. The aim of this study was to evaluate the efficacy of RYGB for medically uncontrolled T2D in patients with mild obesity. **METHODS:** A systematic review and meta-analysis was conducted, following the respective PICOT search strategy (P: BMI<40kg/m2 with inclusion of BMI<35 kg/m2 and few Asiatic patients; I: RYGB; C: Clinical treatment; O: Total T2D control; partial T2D control; Glycated hemoglobin (HbA1c) variations; T: Minimum of 6 months of follow up; D: Randomized Clinical Trial (RCT)) and a minimum sample size of 20 patients per arm. Researched databases included MEDLINE, Embase and Cochrane CENTRAL, with full published papers up to June 2016. The qualities of the RCTs were evaluated by risk of bias criteria and the GRADE evaluation was done by each outcome. Meta-analysis was performed with fix or random methods according to data heterogeneity. RevMan 5.0 was employed for the analysis. **RESULTS:** 5 RCTs were included in the final analysis, with follow-up times ranging from 12 to 36 months and a great proportion of patients with BMI<35kg/m2. Total and partial T2D control were significantly higher within the surgical patients (RR: 20.58 [5.02; 84.35]), (RR: 20.71 [5.16; 83.12]), respectively, with a high level of recommendation. HbA1c dropped (-1.85 [-2.17; -1.53]) with a high level of recommendation. **CONCLUSIONS:** High level of evidence suggests that RYGB is the best treatment option for patients with mild obesity and uncontrolled T2D after optimal medical treatment.

PSY18

PHASE 2 OPEN-LABEL EXTENSION (OLE) STUDY OF PATISIRAN, AN INVESTIGATIONAL RNA INTERFERENCE (RNAI) THERAPEUTIC FOR THE TREATMENT OF HEREDITARY ATTR AMYLOIDOSIS WITH POLYNEUROPATHY

Adams D[1], Coelho T[2], Conceicao I[3], Waddington-Cruz M[4], Schmidt H[5], Buades J[6], Campistol JM[7], Pouget J[8], Berk JL[9], Polydefkis M[10], Ziyadeh N[11], Partisano AM[11], Chen J[11], Gollob J[11], Suhr OB[12]
[1]*National Reference Center for FAP (NNERF)/ APHP/ INSERM U 1195/ CHU Bicêtre, Le Kremlin-Bicêtre, France,* [2]*Unidade Clinica de Paramiloidose, Hospital de Santo Antonio, Porto, Portugal,* [3]*Centro Hospitalar Lisboa Norte-Hospital de Santa Maria, Lisboa, Portugal,* [4]*Hospital Universitário Clementino Fraga Filho, Rio de Janeiro, Brazil,* [5]*Universitätsklinikum Münster, Münster, Germany,* [6]*Hospital Son Llatzer, Palma de Mallorca, Spain,* [7]*University of Barcelona, Barcelona, Spain,* [8]*Hôpital de La Timone, Marseille, France,* [9]*Boston University, Boston, MA, USA,* [10]*Johns Hopkins University, Baltimore, MD, USA,* [11]*Alnylam Pharmaceuticals, Cambridge, MA, USA,* [12]*Umeå University, Umeå, Sweden*

OBJECTIVES: Hereditary ATTR (hATTR) amyloidosis is a rapidly progressive, life-threatening disease caused by a mutation in the transthyretin (TTR) gene, resulting in sensory, motor and autonomic neuropathies, and cardiac dysfunction. The aggressive disease course can lead to significant morbidity, disability, and mortality. The objective of this abstract is to describe the safety and efficacy of patisiran, an investigational RNAi therapeutic inhibiting hepatic TTR protein production, from its Phase 2 open-label extension (OLE, NCT01961921) study. **METHODS:** Patients with hATTR amyloidosis with polyneuropathy who previously received patisiran were eligible to continue dosing (0.3mg/kg IV) every 3 weeks for two years. In addition to long-term safety, the study assessed the difference in neuropathy impairment (mNIS+7) from baseline, and other relevant measures. mNIS+7 is a 304-point composite measure of neuropathy impairment including: neurologic exam of the limbs and cranial nerves; electrophysiologic measures of nerve fiber function; quantitative sensory testing (QST); and autonomic function. **RESULTS:** Twenty-seven patients enrolled, median age: 64 years and 74% patients with V30M mutation, the predominant mutation in this disease. Patisiran was generally well tolerated, 6 patients experienced SAEs unrelated to study drug; flushing (25.9%) and infusion-related reactions (18.5%) were the most common related AEs (all mild) and did not result in any discontinuations. Following > 24 months of patisiran, patients experienced sustained mean serum TTR lowering of ~80% (mean maximal knockdown: 93%). Preliminary 24-month data (n=24) suggests improvement in neuropathy with a mean 6.7-point decrease in mNIS+7 driven by a mean 7.7-point change in sensation (measured by QST). Overall, 17/24 patients (71%) were noted to have no change or an improvement in mNIS+7 at 24 months compared

to baseline. **CONCLUSIONS:** Preliminary 24-month data demonstrated long-term administration of patisiran was generally well-tolerated, and supports the therapeutic hypothesis that TTR knockdown can potentially halt or improve neuropathy progression in hATTR amyloidosis patients.

PSY19

COST-EFFECTIVENESS OF AZACITIDINE COMPARED WITH LOW-DOSES OF CHEMOTHERAPY (LDC) IN MYELODYSPLASTIC SYNDROME (MDS)

Candelaria-Hernández M[1], López Karpovitch X[2], Mijangos-Huesca FJ[3], Montaño-Figueroa E[4], Lemus-Carmona EA[5], Guzmán-Vázquez S[6], Díaz-Martínez JP[6], Soto-Molina H[6]
[1]*National Institute of Cancerology, Mexico City, Mexico,* [2]*National Institute of Medical Sciences and Nutrition Salvador Zubirán (INCMNSZ), Mexico City, Mexico,* [3]*PEMEX Hospital, Mexico City, Mexico,* [4]*General Hospital of Mexico, Mexico City, Mexico,* [5]*Celgene S. de R.L. de C.V., Mexico D.F., Mexico,* [6]*Health Solutions, Mexico City, Mexico*

OBJECTIVES: Assess, from a Mexican health care perspective, the cost-effectiveness of azacitidine compared with Low-Doses of Chemotherapy (LDC) plus best supportive care (BSC) for the treatment of adult patients with intermediate-2 and high-risk MDS, who are not eligible for haematopoietic stem cell transplantation. **METHODS:** We developed a cost-effectiveness survival analysis model of 3 stages: MDS, AML, and death. OS and costs are extrapolated beyond three-year time horizon. Discount rate of 5% was applied. To estimate the model cycle probability transition to mortality state, survival curves were constructed for each treatment arm using individual patient-level data from Study AZA-001. Unitary cost are from public price list, and profiles for the management of MDS and AML were collected separately using a structured questionnaire. Probabilistic sensitivity analyses (PSA) were conducted by simultaneously sampling from estimated probability distributions of model parameters. **RESULTS:** Overall survival was projected to increase by 72.26 weeks with azacitidine. Incremental expected total costs for azacitidine compared to LDC was MXN $68,045. However, the cost of the drug therapy was lower with azacitidine. The ICER for azacitidine compared to LDC was MXN$48,932 per LYG. PSA showed that azacitidine was a highly cost-effective option in 96.49% of the simulated cases in MXN$180,000/LYG willingness-to-pay. **CONCLUSIONS:** Compared with LDC, azacitidine represents a cost-effective treatment alternative in patients with MDS from a Mexican perspective.

PSY20

WHICH PAIN ETIOLOGIES ARE MOST LIKELY TO RESULT IN LONG TERM OPIOID USE? RESULTS FROM A LARGE NATIONALLY REPRESENTATIVE INCEPTION COHORT STUDY

Shah AB, Hayes CJ, Martin BC
University of Arkansas for Medical Sciences College of Pharmacy, Little Rock, AR, USA

OBJECTIVES: This study sought to explore the relationships between pain etiologies and the probability of long term opioid use among persons newly prescribed an opioid. **METHODS:** We identified cancer-free persons with new opioid use episodes who were greater than 13 years of age without a prior history of substance abuse from a nationally representative database of commercially insured population from 2006-2015. We categorized individuals into 11 mutually exclusive pain etiology categories based on their medical claims: Trauma and Surgery, Trauma, Surgery, Burn, Delivery, Dental Procedure, Chronic pain, Non-chronic pain, Inpatient stay, Emergency department visit. Chronic pain was assessed in prior six months and all others were assessed in the week prior to receiving an opioid. Patients were followed until opioid discontinuation (a gap of at least 180 days without opioid use), eligibility loss or study end (September 2015). Cox proportional Hazards models were used to model the time to opioid discontinuation controlling for potential confounders. **RESULTS:** We identified a total of 1,386,132 patients with median time to discontinuation of 5 days. Chronic pain diagnoses (25.58%) followed by non-chronic pain (24.87%) and trauma (9.89%) were the most frequent etiologies for an opioid. Persons with chronic pain had the highest probability of continued opioid use at one year (8.91%) and dental procedures had the lowest (0.92%). Relative to surgery patients, those with a chronic pain diagnosis had the lowest likelihood of discontinuation (HR=0.73; $p<0.001$) followed by patients who had an inpatient stay (HR=0.76; $p<0.001$) or surgery and trauma (HR=0.77; $p<0.001$). **CONCLUSIONS:** Patients treated with opioids for chronic non cancer pain are the most likely to use opioid over long periods. Persons with surgery, trauma, non-trauma ED use, and deliveries prior to an opioid are infrequently prescribed opioids for long durations suggesting that managing acute pain with opioids seldom develops into chronic opioid use.

PSY21

ASSOCIATION BETWEEN CHRONIC HEPATITIS B AND METABOLIC SYNDROME

Zhao X, Shah DR, Sambamoorthi U
West Virginia University, School of Pharmacy, Morgantown, WV, USA

OBJECTIVES: The association between chronic hepatitis B (CHB) infection and metabolic syndrome (MetS) remains inconclusive. This study examined the association between CHB infection and MetS among adults in the United States with recent data and adjustments for a comprehensive set of risk factors. **METHODS:** Adults aged 18 years or older who were clinically assessed for Hepatitis B and MetS from the National Health and Nutrition Examination Survey (NHANES) 2003-2004, 2005-2006, 2007-2008, 2009-2010, and 2011-2012 cycles were included in the study (n=29,906). MetS was defined according to the NCEP/ATP III guidelines. CHB was identified by the seropositivity of Hepatitis B surface antigen and core antibody in the absence of Hepatitis B surface antibody. Statistical analyses included chi-square tests and logistic regressions. **RESULTS:** A lower proportion of adults with CHB reported MetS as compared to adults without CHB (9.6% vs. 18.6%, p= 0.037). In adjusted analyses, adults with CHB were less likely to report MetS compared to those without CHB with an adjusted odds ratio (AOR) of 0.12 and 95% CI: (0.02-0.85). When analyzed by individual components of MetS, high waist circumference (AOR = 0.10, 95% CI: 0.03-0.41) and dyslipidemia (AOR = 0.42, 95% CI: 0.21-0.84) were less likely among those with CHB compared to no CHB. No association between CHB and other metabolic components were found. **CONCLUSIONS:** A significantly inverse association between CHB and MetS was found in the study. Future studies need to explore the underlying mechanisms of the observed associations.

PSY22

NUMBER OF TRANSTHYRETIN FAMILIAL AMYLOID POLYNEUROPATHY CASES IN BRAZIL

Alexandre RF, Squiassi HB, Santana CF
Pfizer, São Paulo, Brazil

OBJECTIVES: Transthyretin familial amyloid polyneuropathy (TTR-FAP) is a rare, highly disabling, life-threatening disease characterized by progressive sensorimotor and autonomic neuropathy that presents either as sporadic cases or as familial cases, then often in geographical clusters such as Northern Portugal, Sweden, or Japan. It is irreversible and fatal within 7 to 12 years of symptom onset in the absence of therapy. Acknowledging that the epidemiological data of TTR-FAP across Brazil is inadequately understood at present, the aim of our study was to estimate the number of disease symptomatic cases in this country. **METHODS:** Analysis of the number of TTR-FAP symptomatic cases in Brazil was performed based on a published epidemiological data of TTR-FAP in Portugal, according to Parman et al., 2016, considering that the Brazil has an important Portuguese influence due to colonization. Using the Portugal epidemiological data, the TTR-FAP prevalence in Brazil was calculated considering the number of resident population in Portugal in 2016 (TTR-FAP prevalence in Portugal = [N TTR-FAP diagnosed patients] / [N resident population]). To estimate the number of Portuguese immigrants in Brazil (luso-Brazilian population), a search of gray literature sources (secondary data) was made. The number of TTR-FAP symptomatic cases in the country was estimated by applying the TTR-FAP prevalence in Portugal to the number of luso-Brazilian population. **RESULTS:** TTR-FAP prevalence estimate in Portugal was 1.92 (2000 symptomatic cases diagnosed / 10,4 million resident population). According to found secondary data on gray literature sources, currently 25 million luso-Brazilians live in the country, resulting in approximately 4,800 symptomatic cases of TTR-FAP in Brazil. **CONCLUSIONS:** TTR-FAP is a rare disease and devastating. In Brazil, the number of TTR-FAP symptomatic cases was close to the number of the disease symptomatic cases observed in endemic regions, which could be associated with a burden impact to the Brazilian Public Health.

PSY23

CONCOMITANT USE OF OPIOID AND BENZODIAZEPINES AND THE RISK OF OPIOID OVERDOSE REQUIRING HOSPITALIZATIONS: A RETROSPECTIVE COHORT STUDY

Dave C, Alrwisan A, Zhu Y, Winterstein A, Hartzema A
University of Florida, Gainesville, FL, USA

OBJECTIVES: Although opioids and benzodiazepines are now the leading cause of prescription drug poisoning and overdose deaths in the United States, their concomitant use is increasing on a yearly basis. The objective of the study was to compare the risk of an opioid overdose requiring hospitalization in patients concomitantly using opioids and benzodiazepines to patients using opioids only. **METHODS:** We identified a cohort of opioid initiators with a non-cancer pain diagnosis in a commercial claims database from 2008-14. Exposure was classified into periods of concomitant and opioid only use. For each concomitant user, we matched four control periods of opioids-only use on time since opioid initiation using an incidence density sampling approach. We estimated a propensity score on the matched sample using 86 baseline characteristics including patterns of prior opioid use. The outcome was defined as hospitalization with principal diagnosis of an opioid overdose. Using a Cox proportional hazard model with stabilized inverse probability of treatment weighting (IPTW), we calculated the hazard ratio (HR) of an opioid overdose associated with concomitant use compared to opioid only use, modelled as a time-varying covariate. **RESULTS:** We created a matched cohort of 1,114,456 opioid initiators (mean [SD] age 48[11], 64% female). The unadjusted hazard ratio (HR) for an opioid overdose was 3.08 (95% CI, 2.28-4.16). After IPTW adjustment, the HR decreased to 2.36 (95% CI, 1.86-3.03), corresponding to an absolute excess risk of 12.83 (95% CI 8.18, 19.16) overdose hospitalizations per 10,000 patient years. **CONCLUSIONS:** Compared to opioid use alone, concomitant use of opioids and benzodiazepines was associated with a significantly higher risk of opioid overdose requiring hospitalization; however the absolute risk difference was small. Further research should evaluate the mechanism of this association.

PSY24

DO PAYERS VALUE RARITY? AN ANALYSIS OF THE RELATIONSHIP BETWEEN DISEASE RARITY AND ORPHAN DRUG PRICES IN EUROPE

Medic C[1], Korchagina D[2], Young KE[3], Toumi M[4], Postma M[5], Wille M[1], Hemels M[1]
[1]*Raptor Pharmaceuticals Europe B.V., Utrecht, The Netherlands,* [2]*University of Paris-Sud, Paris, France,* [3]*Creativ-Ceutical, Paris, France,* [4]*Aix-Marseille University, Marseille, France,* [5]*University of Groningen, Groningen, The Netherlands*

OBJECTIVES: This study assessed the relationship between the prevalence of rare diseases (rarity) and the annual treatment cost of orphan drugs (price) in Europe. **METHODS:** A four step process was implemented scoping France, Germany, Italy, Norway, Spain, Sweden, UK: 1. Extraction of approved orphan drugs and disease prevalence from the European Medicines Agency website; 2. Extraction of ex-factory price from IHS POLI and country price databases; 3. Calculation of annual treatment cost per patient per drug; 4. Analysis of annual treatment costs versus disease prevalence using simple regression analysis **RESULTS:** A total of 120 orphan drugs were analysed for indications with a prevalence ranging from 0.001 to 5 patients per 10,000 with a mean of 1.24 per 10,000 and a median of 1 per 10,000. Results show a statistically significant inverse correlation between annual treatment cost and disease prevalence in all countries,

with the treatment being more expensive the rarer the disease (France: r=-0.370, p=0.002; Germany: r=-0.365, p=0.002; Italy: r=-0.340, p=0.002; Spain: r=-0.316, p=0.041; UK: r=-0.358, p=0.0004; Sweden: r=-0.414, p=0.014; Norway: r=-0.367, p=0.002). When analysis was focused on the rarest diseases (prevalence between 0-1 per 10,000), a stronger correlation exists in all countries (France: r=-0.525, Germany: r=-0.482, Italy: r=-0.497, Spain: r=-0.531, UK: r=-0.436, Sweden: r=-0.455, Norway: r=-0.466; all $p<0.05$ except Sweden p=0.077). **CONCLUSIONS:** In all the countries in scope, this study shows an inverse correlation between annual treatment cost and disease prevalence with high statistical significance. Although pricing is a complex process where different attributes are assessed, this study supports the idea that payers in all the countries value rarity of disease in pricing decisions.

PSY25

UTILIZING AUTOMATED CLINICAL DECISION SUPPORT SYSTEMS TO REDUCE MORBIDITY, MORTALITY, AND COSTS DUE TO PRESCRIPTION OPIOID OVERDOSE – A RETROSPECTIVE STUDY

Sasinowski M[1], Joyce AR[1], Murrelle EL[1], Thompson SM[2], Zedler BK[1]
[1]*Venebio Group, LLC, Richmond, VA, USA,* [2]*University of Richmond, Richmond, VA, USA*

OBJECTIVES: To estimate the risk of, and characterize risk factors associated with, serious opioid-induced respiratory depression (OIRD) among medical users of prescription opioids in two diverse patient populations and to evaluate the impact of providing automated, personalized, risk-mitigating clinical decision support on patient health outcomes and costs. **METHODS:** This retrospective characterization of risk for serious prescription OIRD in national Veterans Health Affairs (VHA) and commercially insured populations (CIP) involved administrative claims data from 1.9 million VHA and over 18 million CIP patients who were dispensed a prescription opioid. Baseline factors associated with an event of serious OIRD among 7,234 cases and 28,932 controls in CIP were identified using multivariable logistic regression. **RESULTS:** The strongest associations with serious OIRD in CIP were diagnosed substance use disorder (OR=10.20, 95% CI 9.06-11.40) and depression (OR=3.12, 95% CI, 2.84-3.42). Other strongly associated factors included other mental health disorders; impaired liver, renal, and pulmonary function; prescribed fentanyl, methadone and morphine; higher daily opioid doses; and concurrent psychoactive medications. The majority of risk factors were concordant in both populations, despite CIP being substantially younger; including more females and less chronic disease; and having greater prescribing prevalence of higher daily opioid doses. A statistically significant, monotonically increasing relationship between risk and adjusted average total monthly health care costs was observed in VHA ($1,226 versus $2,081, P=0.010, for lowest- and highest-risk patients, respectively). **CONCLUSIONS:** Risk for serious prescription OIRD among subgroups of patients with private or public health insurance is high, despite differences in demographics, clinical conditions, health care delivery systems, and clinical practices. The identification of patients at high risk for overdose through automated characterization of risk factor profiles and provision of personalized risk-mitigating measures has substantial potential to reduce the morbidity, mortality, and health care costs due to serious prescription OIRD.

THE COURSE OF PREGNANCY AND DELIVERY OUTCOMES IN PATIENTS WITH OVERWEIGHT AFTER IN VITRO FERTILIZATION

Zhumatova M[1], Parmankulova T[1], Myrzabek B[1], Seitaliyeva A[1], Satbayeva E[1], Batagoeva Z[1], Nurmanbetova T[2]
[1]*Asfendiyarov Kazakh National Medical University, Almaty, Kazakhstan,* [2]*Kazakh-Russian Medical University, Almaty, Kazakhstan*

OBJECTIVES: To evaluate the character of pregnancy's course and delivery outcomes in patients with overweight and pregnancy induced by the program (IVF and embryo transfer) and in patients with overweight and self-pregnancy. **METHODS:** The study involved 126 patients with pregnancy (age 28 to 40 years). The first group included 67 patients with pregnancy induced by IVF and ET, and the second group included 59 patients with self-pregnancy. Statistical processing of the results obtained in the study was produced using the statistical program SPSS 21.0 (SPSS Inc., USA). For estimation of differences of quantitative indexes between groups we used Student's criterion. The differences were considered significant at $p<0.05$. **RESULTS:** In the first group 21.3% of patients were overweight while 15.1% of patients belong to class I and II obesity, according to body mass index (BMI). In the second group 9.7% of patients were overweight and 7.6% were obese. The delivery outcomes by caesarean section were observed more frequently in the patients of the first group (to 32%) compared with the second group. Among women with overweight and obese, in the first group glucose intolerance or gestational diabetes was revealed in 12.7% cases, and in the second group these diseases were revealed in 8.2% cases. In both groups, obesity and overweight were associated with age (older than 35 years, $p<0.05$), hyperglycaemia and hypertension ($p<0.001$) and macrosomia of the fetus ($p>0,05$). Macrosomia of the fetus were detected in 82.3% of patients in the first group and in the 42.6% of the cases in the second group. **CONCLUSIONS:** The patients with pregnancy induced by the IVF and ET program in comparing with women with self-pregnancy more often had overweight, which was associated with hypertension and hyperglycemia, macrosomia of the fetus.

PSY27

OPTIMIZING SURVIVAL AND COST-UTILITY IN THE TREATMENT OF ACUTE AND CHRONIC GRAFT VERSUS HOST DISEASE: A CALIBRATED SYSTEM DYNAMICS MODELING APPLICATION

Zia A[1], Jones CA[2], Mesa OA[3], Weimersheimer P[4]
[1]*University of Vermont, Burlington, VT, USA,* [2]*ForMyOdds LLC, Burlington, VT, USA,* [3]*Therakos, Inc., a Mallinckrodt Corporation, Wokingham, Berkshire, UK,* [4]*University of Vermont College of Medicine, Burlington, VT, USA*

OBJECTIVES: Outliers in graft vs host disease (GvHD) can sometimes present disproportionally extreme costs and quality of life measures, which may be ignored by regression-based estimates of cost-utility. Agent Based Models (ABMs) can capture these outlier effects, which can then be applied to patients whose characteristics match similarly. In this study, our goal was to build a calibrated ABM that could align treatments with heterogeneous patient characteristics, and compare cost-utility in a more granular fashion between extracorporeal photopheresis (ECP) offered to acute vs chronic GvHD patients. **METHODS:** Using a 20-week clinical trial panel dataset comprising 26 patients, we calibrated an ABM that simulates cost-utility for acute vs chronic GvHD patients before and after ECP. Patient characteristics such as organ involvement (skin, GI, liver, lungs, gut) and severity (II, III, IV for acute; moderate or severe for chronic) were assigned to each individual in the ABM. We scaled up the calibrated ABM to population-based estimates provided by the United Network for Organ Sharing (UNOS). **RESULTS:** Our preliminary ABM findings suggest that ECP cost-utility estimates are markedly lower in the case of chronic as compared with acute GvHD. We were able to illustrate outlier effects in both conditions. These outlier effects would not be captured in traditional regression and cost-utility analyses. Our findings highlight how patient-specific characteristics such as age, gender, and organ involvement matched to severity must be considered for maximizing survival and quality of life while minimizing cost. Simulations aross the wider UNOS population confirm this effect of outliers on survivability and quality of life. **CONCLUSIONS:** Using patient-level data, ABMs can illustrate survival and cost-utility in a manner that calibrates the right treatment for the right patient at the right time, such as the application of ECP to chronic vs acute GvHD. Such calibrated ABMs may also be scalable to population-based data.

PSY28

RISK OF ACUTE LIVER INJURY ASSOCIATED WITH THE USE OF ORLISTAT: SELF-CONTROLLED CASE SERIES STUDIES USING THE MARKETSCAN® COMMERCIAL CLAIMS DATABASE

Xia Y, Guo JJ, Kelton CM, Heaton PC, Cavanaugh T, Wu T
University of Cincinnati, Cincinnati, OH, USA

OBJECTIVES: The objective of this study is to assess the association between the use of orlistat and the risk of acute liver injury. **METHODS:** A self-controlled case series (SCCS) study was conducted by using Truven MarketScan® Commercial Claims data (2003-2004). Patients prescribed at least one prescription of orlistat and experienced an acute liver injury during the study period were included. Conditional Poisson regression model was used to calculate the incidence rate ratios comparing the risk of acute liver injury during periods of orlistat exposure with periods of no exposure. **RESULTS:** A total of 159 patients were included in this SCCS study. With the SCCS study design to remove the effect of differences among patients, we did not detect the association between the orlistat exposure and the risk of acute liver injury. Compared to the absence of orlistat exposure period, there was no statistically significant increased risk of acute liver injury during the first 30 days treatment of orlistat (incidence rate ratio (IRR), 1.07; 95% confidence interval (CI), 0.52-2.20). The similar results were found for other time periods: 90 days before the first orlistat prescription (IRR, 1.12; 95% CI, 0.72-1.75), 31-61 days of orlistat treatment (IRR, 0.49; 95% CI, 0.12-1.99), 61-90 days of orlistat treatment (IRR, 0.54; 95% CI, 0.13-2.21), post-exposure interval (IRR, 0.88; 95% CI, 0.38-2.03), and more than 90 days orlistat use (IRR, 0.77; 95% CI, 0.38-1.56). **CONCLUSIONS:** The significant association between the orlistat exposure and the risk of acute liver injury was not detected, even though it may be due to small sample size with the low statistical power in this SCCS study. With the safety concern of acute liver injury events in patients prescribed orlistat, caution is advised for physicians in the use of orlistat. Future research is needed to guide clinical decision making.

PSY29

EVIDENCE-BASED BAYESIAN MODELING TO PREDICT SURVIVAL IN PATIENTS WITH SPORADIC INCLUSION BODY MYOSITIS (SIBM)

Capkun G[1], Schmidt J[2], Ghosh S[3], Sharma H[3], De Vera A[1], Demin I[1], Risson V[1], Amzal B[4], Wiecek W[5], Obadia T[4]
[1]*Novartis Pharma AG, Basel, Switzerland,* [2]*Department of Neurology, University Medical Center Göttingen, Göttingen, Germany,* [3]*Novartis, Hyderabad, India,* [4]*LASER ANALYTICA, London, UK,* [5]*LASER Analytica, London, UK*

OBJECTIVES: sIBM is a rare muscle disease characterized by dysphagia, atrophy and weakness of proximal and distal muscles, typically manifesting in ≥ 50s. Limited data has been published on the disease and how mortality is associated with disease progression and severity. Our objective was to predict mortality in sIBM patients based on six disease-related outcomes that may influence patient's life span. In addition, our aim is to select the model providing best prediction of mortality against existing literature. **METHODS:** Literature review provided data on association between outcomes related to manifestation of sIBM and mortality in elderly people and patients with neurodegenerative diseases. Demographic and disease-related outcomes data from sIBM patients were collected at annual meetings of the Myositis Association. Gender- and age-adjusted survival curves from WHO served as reference survival rate. Simulation of mortality in 2000 virtual cohorts was performed using a Weibull parametric model with combinations of up to six disease-related outcomes potentially accounting for additional mortality risk in sIBM patients: 6-minute walking distance (6MWD), BMI, dysphagia, falling, aspiration pneumonia, being wheelchair-bound. Results were compared with the mortality rates observed in two published sIBM cohorts, adjusted for demographics. **RESULTS:** The simulation could exactly replicate the observed 12-year mortality rate of 72% from the multi-country study published by Cox et al., when using dysphagia and 6-minute-walking-distance as predictors. For the second publication of the sIBM cohort in France by Benveniste et al., the observed 2-year mortality rate (18%) was comparable to the % baseline mortality without any predictors. **CONCLUSIONS:** Our results suggest that long-term survival in sIBM patients can be predicted with age, gender, 6MWD and dysphagia as predictors, though with a possible country effect. Further validation of our

findings is required through natural history studies in sIBM , especially regarding the impact of the disease on the short-term survival.

PSY30

EVALUATION OF SURVIVAL OUTCOMES OF POST-FRONTLINE ANTI-MYELOMA TREATMENTS IN MULTIPLE MYELOMA PATIENTS BASED ON DATA FROM SEER-MEDICARE DATABASE

Nooka A[1], Voorhees P[2], Kumar S[3], Mehra M[4], Lam A[4], Slavcev M[4], Ukropec J[5], Dasgupta A[6]
[1]Winship Cancer Institute, Emory University, Atlanta, GA, USA, [2]Levine Cancer Institute, Carolinas HealthCare System, Charlotte, NC, USA, [3]Mayo Clinic, Rochester, MN, USA, [4]Janssen Global Services, LLC, Raritan, NJ, USA, [5]Janssen Global Services, LLC, Spring House, PA, USA, [6]SmartAnalyst Inc., New York, NY, USA

OBJECTIVES: The regimens of lenalidomide with dexamethasone (Rd) and bortezomib with dexamethasone (Vd) are cornerstone therapies for treatment of multiple myeloma (MM), both in the frontline and subsequent lines of treatment (LOT). This study aims to characterize patients treated with these regimens for relapsed disease in a non-referral setting, and to evaluate survival outcomes with these treatments. **METHODS:** Patients with index MM diagnosis on or after January 1, 2007, and with an anti-MM treatment documented, were identified in the SEER-Medicare database. Business rules were applied to identify their LOTs. Post-frontline treatment cases that contained Rd and Vd were separately considered for analysis. Patient characterization was done of the included LOT cohorts, and survival analysis carried out. Cox regression analysis was carried out to evaluate the impact of various covariates. **RESULTS:** Of the 18,778 patients with an appropriate index MM diagnosis date, 2,725 patients had ≥1 relevant LOT and were included in the analysis, and yielded 12,363 LOTs. Of these, cases of ≥2 LOT (LOT2+) for Rd and Vd were 579 and 447, respectively. For Rd cases in LOT2+, median age was 74.2, median number of prior LOTs was 1, 65% received prior PI, 63% received prior IMiD, and 33% previously received both a PI and IMiD; the corresponding numbers for Vd cases in LOT2+ were 74.0, 1, 63%, 83%, and 47%. The median overall survival of the 2 cohorts was 32.1 and 20.7 months, median progression-free survival 13.2 and 8.3 months, and their mortality rate 0.0144 and 0.0286 per patient-month of pre-progression follow-up. **CONCLUSIONS:** Analysis of these standards of care regimens suggest worse outcomes (given the more elderly population) versus published estimates in recent clinical trials, but are consistent with outcomes based on real-world data. These results highlight the need for more efficacious treatments for relapsed/refractory MM patients.

SYSTEMIC DISORDERS/CONDITIONS – Cost Studies

PSY31

BUDGET IMPACT ANALYSIS OF 5% LIDOCAINE MEDICATED PLASTER COMPARED WITH DRY NEEDLING AND INFILTRATION OF TRIGGER POINT FOR THE TREATMENT OF MYOFASCIAL PAIN SYNDROME OF THE UPPER TRAPEZIUS UNDER THE PERSPECTIVE OF BRAZILIAN PRIVATE HEALTHCARE SYSTEM

Kashiura D[1], Piedade AD[1], Engel T[1], Rodrigues CR[2]
[1]Evidências - Kantar Health, São Paulo, Brazil, [2]Grunenthal do Brasil Farmacêutica Ltda, São Paulo, Brazil

OBJECTIVES: Studies show that 5% lidocaine medicated plaster (LMP) has similar efficacy in the treatment of myofascial pain syndrome (MPS) of the upper trapezius in comparison with dry needling and infiltration of trigger point, and is better accepted by patients, besides being a non invasive therapy. We aimed to simulate the financial impact of the LPM introduction in the treatment of MPS in Brazilian private healthcare system, compared with these two therapies. **METHODS:** Eligible population was calculated for 3 sizes of Health Maintenance Organizations (HMOs): big (>100,000 lives), medium (20,000-100,000 lives), and small (<20,000 lives). Data from National Regulatory Agency for Private Health Insurance and Plans were used to obtain the mean number of patients for each size of HMO and extrapolated according to growth rates to estimate future years. Prevalence rates of disabling pain, MPS and percentage of MPS with trigger points were applied to estimate the target population. Direct medical costs and resource use of intervention and comparators were estimated annually, using exchange rate of 2016. Time horizon had 5 years and 2 market share scenarios were created, one with complete uptake of 5% LMP at the first year, and another with progressive uptake, starting with 40% at the first year and increasing 15% annually. **RESULTS:** Compared with dry needling, complete uptake of 5% LMP in the first year presented cost savings of 224,785 BRL, 23,461 BRL, and 3,715 BRL after 5 years in big, medium and small HMOs, respectively. Compared with infiltration of trigger point, there were savings of 236,860 BRL, 24,721 BRL, and 3,914 BRL for big, medium and small HMOs, respectively. Scenario of progressive uptake also saved resources for all comparators and HMOs. **CONCLUSIONS:** The uptake of 5% medicated LMP for MPS treatment in the Brazilian private healthcare system has great cost saving potential.

PSY32

BUDGET IMPACT ANALYSIS OF ELIGLUSTAT FOR TREATMENT OF GAUCHER DISEASE TYPE 1 IN THE UNITED STATES

Nalysnyk L[1], Sugarman R[2], Ward AJ[2]
[1]Sanofi Genzyme, Cambridge, MA, USA, [2]Evidera, Waltham, MA, USA

BACKGROUND: Current therapeutic options for Gaucher disease type 1 (GD1) include intravenous enzyme replacement therapy (ERT) with imiglucerase, velaglucerase alfa, or taliglucerase alfa or oral substrate reduction therapy (SRT) with eliglustat or miglustat. Transfer of patients from ERT to SRT may present an opportunity for cost savings. **OBJECTIVES:** This study evaluated the budget impact associated with increased utilization of eliglustat for the treatment of adults with GD1. **METHODS:** A budget impact model reflecting the US payer perspective calculated the change in pharmaceutical and administration costs resulting from increasing eliglustat market share from 12% (current) to 44% (hypothetical). Eliglustat market share was drawn equally from existing shares of imiglucerase (40%) and velaglucerase alfa (40%) and assumed to be static over the analysis period. Unit costs were obtained from Redbook (WAC), 2016. ERT WAC costs were adjusted to account for site of care-based markup and the proportion of patients receiving infusions in each site of care based on a typical large regional health plan. Administration costs were obtained from analysis of claims (DataMart Multiplan). All costs expressed in 2016 USD. **RESULTS:** In a plan with 5 million members and 25 treated patients with GD1, increased utilization of eliglustat, shifting market share evenly from all sites of care, resulted in total 3-year savings of $4.58M (13.6%) to the plan. The corresponding per member per month (PMPM) savings were $0.025. When all patients receiving ERT infusions in the hospital outpatient setting were shifted to eliglustat, 3-year savings increased to $7.75M (23.0%) and PMPM savings increased to $0.043. Results were sensitive to proportion of patients receiving infusions at each site of care. **CONCLUSIONS:** Based on these analyses, increased utilization of eliglustat resulted in meaningful cost savings to a payer's overall budget. Cost savings are highest among patients switching from ERT administered in a hospital outpatient setting.

PSY33

POTENTIAL SAVINGS FROM BIOSIMILARS IN CANADA

Warwick G, Lungu E
Patented Medicine Prices Review Board, Ottawa, ON, Canada

OBJECTIVES: A number of biologic drugs, representing 12% of Canadian pharmaceutical sales in 2015, recently began to face, or soon will face, competition from lower-cost biosimilars. This study assesses the potential cost savings based on various assumptions of market uptake and pricing. **METHODS:** The drugs considered in the study are Avastin, Enbrel, Eprex, Gonal-F, Herceptin, Humira, Lantus, Neupogen, Remicade, Rituxan, Tysabri, and Xolair. Data from the IMS AG MIDAS™ Database, was used to forecast the Canadian utilization for each drug for three years following the expected biosimilar entry. A number of sensitivity analyses were conducted to evaluate the cost implications of different scenarios of biosimilar pricing and uptake based on Canadian and international observations. The analysis is conducted based on a number of OECD countries . The results are reported for the national market, as well as for public and private drug plans. **RESULTS:** At a drug level, the savings from biosimilar entry vary depending on the size of the market as well as assumptions of price level and potential market penetration, both of which depend on the policies governing the reimbursement of biosimilars. The findings suggest that the greatest savings could be realized by modeling similar market conditions to those prevailing in Norway and Finland. **CONCLUSIONS:** As biosimilars and originator products are not interchangeable, the market penetration and pricing of biosimilars depends on regulations and reimbursement policies. Understanding the potential savings under different scenarios of uptake and pricing provides valuable insight into the cost impact of various policy levers.

PSY34

BUDGET IMPACT ANALYSIS OF 5% LIDOCAINE MEDICATED PLASTER COMPARED WITH PREGABALIN OR GABAPENTIN MONOTHERAPY FOR THE TREATMENT OF DIABETIC POLYNEUROPATHY UNDER THE PERSPECTIVE OF BRAZILIAN PRIVATE HEALTHCARE SYSTEM

Piedade AD[1], Kashiura D[1], Engel T[1], Rodrigues CR[2]
[1]Evidências - Kantar Health, São Paulo, Brazil, [2]Grunenthal do Brasil Farmacêutica Ltda, São Paulo, Brazil

OBJECTIVES: To estimate the financial impact of introduction of 5% lidocaine medicated plaster (LMP) monotherapy compared with pregabalin or gabapentin monotherapy, in the Brazilian private healthcare system for the treatment of diabetic polyneuropathy (DPN). **METHODS:** Eligible population was calculated for 3 sizes of Health Maintenance Organizations (HMOs): big (>100,000 lives), medium (20,000-100,000 lives), and small (<20,000 lives). Data from National Regulatory Agency for Private Health Insurance and Plans (ANS) was used to obtain the number of patients and extrapolated according to growth rates. Prevalence rates of diabetes and polyneuropathy and percentages of patients in use of antiepileptic drugs were applied to reach the final target population. Direct medical costs and resource use related to disease and adverse events management were estimated annually and based on a Markov model previously developed for cost-effectiveness analysis. Costs of drugs not used in hospitals or ambulatories weren't included once they aren't covered. Time horizon had 5 years and 2 market share scenarios were created, one with complete uptake of 5% LMP at the first year, and another with progressive uptake, starting with 40% at the first year and increasing 15% annually until reaching 100%. **RESULTS:** Compared with pregabalin, complete uptake of the plaster in one year demonstrated cost saving of 64,457 BRL, 6,727 BRL and 1,065 BRL for big, medium and small HMOs, respectively. Compared with gabapentin, cost saving increased to 1,096,971 BRL, 114,491 BRL, and 18,129 BRL for big, medium and small HMOs, respectively. Scenario of progressive uptake also showed cost saving results for all comparators and HMO sizes. **CONCLUSIONS:** The uptake of 5% LMP in Brazilian private healthcare system for DPN treatment can save costs compared with pregabalin and gabapentin. Its use associated with pregabalin also presented this potential for patients non-responders to pregabalin. Savings are attributed to lower adverse event rates.

PSY35

A BUDGET IMPACT ANALYSIS OF PARENTAL IRON TREATMENTS FOR IRON DEFICIENCY ANEMIA IN THE UK: REDUCED RESOURCE UTILIZATION WITH IRON ISOMALTOSIDE (MONOFER)

Pollock RF[1], Muduma G[2]
[1]Ossian Health Economics and Communications GmbH, Basel, Switzerland, [2]Pharmacosmos A/S, Holbaek, Denmark

OBJECTIVES: The reported prevalence of iron deficiency anemia (IDA) varies widely but estimates suggest that 3% of men and 8% of women have IDA in the UK. Parenteral iron is indicated for patients intolerant or unresponsive to oral

iron, or requiring rapid iron replenishment. This study evaluated differences in the cost of treating these patients with iron isomaltoside (Monofer; IIM) relative to other intravenous iron formulations. **METHODS:** A budget impact model was developed to evaluate the cost of using IIM relative to ferric carboxymaltose (Ferinject; FCM), low molecular weight iron dextran (Cosmofer; LMWID) and iron sucrose (Venofer; IS) in patients with IDA. To establish iron need, iron deficits were modeled using a simplified dosing table. The base case analysis was conducted over 1 year in patients with IDA with mean bodyweight of 82.4 kg (standard deviation [SD] 22.5 kg) and hemoglobin levels of 9.99 g/dL (SD 1.03 g/dL) based on an analysis of patient characteristics in IDA trials. Costs were modeled using UK healthcare resource groups. **RESULTS:** Using IIM required 1.34 infusions to correct the mean iron deficit, compared with 1.34, 1.77, and 7.74 with LMWID, FCM, and IS, respectively. Patients using IIM required multiple infusions in 34.6% of cases, compared with 34.6%, 77.2% and 99.8% of patients with LMWID, FCM and IS, respectively. Total costs were estimated to be GBP 451 per patient with IIM or LMWID, relative to GBP 594 with FCM (saving GBP 143 or 24.0% per patient) or GBP 2,600 with IS (saving GBP 2,148 or 82.6% per patient). **CONCLUSIONS:** Using IIM in place of FCM or IS resulted in a marked reduction in the number of infusions required to correct iron deficits in patients with IDA. The reduction in infusions was accompanied by substantial reductions in cost relative to FCM and IS over 1 year.

PSY36

FINANCIAL IMPACT OF THE INCORPORATION OF GOLIMUMAB AS AN ALTERNATIVE OF ANTI-TNF AGENT IN MAIN PUBLIC INSTITUTIONS IN MEXICO

Guirant-Corpi L[1], Fritz K[1], Aguirre A[1], Santos E[2]
[1]Janssen Mexico, Mexico City, Mexico, [2]Janssen, São Paulo, Brazil

OBJECTIVES: Biologic agents are mainly used for the treatment of rheumatic diseases; particularly rheumatoid arthritis is considered one of the priority problems of public health in Mexico. This analysis aims to compare Mexican public expenditure on tumor necrosis factor inhibitors (anti-TNF) in two main health-care providers for salaried workers and to estimate the budget impact of the incorporation of golimumab as an alternative anti-TNF therapy. **METHODS:** A descriptive analysis was developed based on published data of prescribing information for each anti-TNF agent (dosage per patient for rheumatoid arthritis) and on national tenders to obtain the acquisition price for each therapy. The two institutions evaluated were the Mexican Social Security Institute (IMSS) and the Institute of Social Security and Services of State Workers (ISSSTE) covering ~50% and ~11% of Mexican population, respectively. The data obtained about the purchases of anti-TNF agents during the period 2014-2016 was used to calculate the annual number of patients in treatment. Based on these calculations, an extrapolation was performed to estimate the number of patients in treatment during 2017-2019 periods. Finally, a budget impact model was developed to analyze the impact of the penetration of golimumab in both institutions. Costs are expressed in 2016USD ($1USD=$20MXN). **RESULTS:** In both institutions the anti-TNF with the highest expenditure was adalimumab, followed by etanercept (25mg and 50mg) and infliximab to the last. According to total population covered, average number of patients in anti-TNF agents' treatment is 0.4% and 1.1% for IMSS and ISSSTE, respectively. With the incorporation of golimumab in 10% of patients at IMSS the total savings for 2017-2019 period would be $2.5 million and for ISSSTE $2.0 million. **CONCLUSIONS:** The incorporation of golimumab at IMSS and ISSSTE formularies represents potential savings that could lead to an increase in the number of patients who benefit from these anti-TNF therapies.

PSY37

BUDGET IMPACT OF LORCASERIN FOR THE TREATMENT OF OBESITY IN A MANAGED CARE ORGANIZATION

Knoth RL, Nikonova E, Wang Z
Eisai Inc., Woodcliff Lake, NJ, USA

OBJECTIVES: Lorcaserin is a 5-HT2Creceptor agonist indicated for chronic weight management in patients with overweight and obesity in addition to diet and exercise. Using an analytic cost model, this study examined the consequences of lorcaserin utilization in a managed care organization from a payer perspective. **METHODS:** The model generated outputs for a hypothetical one-million member health plan based on the results from BLOOM, BLOOM-DM and BLOSSOM, three Phase III clinical trials of lorcaserin 10mg BID. The population consisted of adult patients who were overweight (BMI=27-29 kg/m2 with >1 obesity-related comorbidities) or obese (BMI > 30 kg/m2) with or without type 2 diabetes. Other model inputs included the proportion of patients who utilize anti-obesity medications, response to treatment, time on treatment, cost of medication, market share of lorcaserin, and potential cost savings to the health plan for weight loss. Model outputs included total costs and per-member per-month (PMPM) costs over a 3 year timeline. **RESULTS:** Among adults eligible for treatment with an anti-obesity medication (N= 350,273), the model predicted only 448 would initiate treatment on lorcaserin each year of the 3-year timeline. Among those, 43.4% without T2D and 30.4% with T2D would be expected to continue treatment for a full year. Using a wholesale acquisition price of lorcaserin of $241.07 for a one month supply, total net cost to the health plan at one-year, including costs offsets, would be $301,632 or 3 cents PMPM. By year 3, PMPM costs would be 6 cents. **CONCLUSIONS:** Although there is a large population eligible for anti-obesity medications, the results from this model suggest that only a small proportion of these patients will actually initiate and continue lorcaserin treatment. This resulted in relatively minimal cumulative total net costs to the health plan, less than 10 cents PMPM over a 3 year period.

PSY38

ECONOMIC EVALUATION OF DARATUMUMAB FOR THE TREATMENT OF PATIENTS WITH DOUBLE REFRACTORY MULTIPLE MYELOMA IN MEXICO

Salazar A, Aguirre A, Herrera M
[1]Janssen, Mexico City, Mexico

In Mexico the Histopathological Registry of Malignant Neoplasms in 2002, reported 593 new cases of MM. Additionally the prognosis of patients with multiple myeloma is highly variable, with a median survival of 2-3 years. Daratumumab was recently approved as monotherapy for the treatment of Double Refractory Multiple Myeloma (DRMM) being the only drug approved in this indication to date in Mexico. **OBJECTIVES:** To develop an economic analysis to estimate the budgetary impact of including Daratumumab in the public sector as a treatment for patients with DRMM. **METHODS:** Currently in Mexico there's no other drug approved for the treatment of DRMM patients therefore a budget impact analysis of the use of Daratumumab in different public institutions was carried out. Regarding the current alternative treatment, two therapeutic regimens were considered: thalidomide+dexamethasone representing 43% of targeted patients; and melphalan+-prednisone for the rest of patients. The time horizon was 5 years and the costs were obtained from institutional sources. Finally a deterministic sensitivity analysis was performed to test uncertainty of main variables. **RESULTS:** The estimate of DRMM patients in Mexico was 55 per year; hence the addition of daratumumab has a financial impact for the National Health System for the first year of 0.000629% of the budget, similar to budget impact in IMSS of 0.000408%, 0.000205% in ISSSTE, 0.002475% in Seguro Popular, 0.000043% in SEDENA, 0.000039% in SEMAR and 0.000006% in PEMEX. **CONCLUSIONS:** There are currently no other therapeutic options approved for the treatment of DRMM patients, in addition to the few patients who are candidates for it the addition of daratumumab to public institutions in Mexico does not generate a high budgetary impact, while providing a targeted option of treatment for them.

PSY39

ECONOMIC EVALUATION OF BENDAMUSTINE IN PATIENTS WITH RELAPSED INDOLENT NON-HODGKIN'S LYMPHOMA IN MEXICO

Salazar A, Aguirre A, Herrera M
[1]Janssen, Mexico City, Mexico

Non-Hodgkin lymphoma (NHL) is a type of hematologic cancer that originates in lymphocytes T or B. Most patients with indolent NHL (iNHL) present advanced stages at the time of diagnosis and in those with early relapse (<12-24months), the disease may be resistant to drugs that have been used previously. In 2008, the estimated incidence rate of iNHL in Mexico was 3.9 and 2.9 per 100,000 per year for men and women, respectively. **OBJECTIVES:** To evaluate the cost-effectiveness and budgetary impact of bendamustine-rituximab (BR) for the treatment of iNHL that has progressed during or within six months of treatment with rituximab or a regimen containing rituximab in Mexico. **METHODS:** A cost-effectiveness analysis was performed through a Markov model to compare BR vs fludarabine-rituximab (FR) from the public healthcare perspective (main Public Institutions such as IMSS and Seguro Popular i.a.). The time horizon is lifetime, estimated at 35years, based on overall survival data from base study (NCT01456351). The costs were obtained from institutional sources and an exchange rate of $20MXN/USD was applied. Outcomes were measured as quality-adjusted life years (QALYs), life years (LYs) and Progression-free life years gained (PFLYs). Sensitivity analyses were performed to test the robustness of the model and base case results. **RESULTS:** BR regimen is a cost-effective treatment for iNHL patients. Baseline analysis estimates that BR generates lower costs and additional efficacy of 0.936 QALYs, 1.087 LYs and 1.412 PFLYs, compared to FR. Robustness of results were confirmed by deterministic and probabilistic sensitivity analysis. Furthermore the addition of BR as a treatment option has a budget impact of 0.0000739% for IMSS, 0.0000372% for ISSSTE, 0.0000011% for PEMEX and 0.0004490% for Seguro Popular. **CONCLUSIONS:** Bendamustine-rituximab regimen is a therapeutic option for patients with iNHL, which generates greater efficiency and lower costs than FR, generating a low budgetary impact to the public institutions in Mexico.

PSY40

ANALYSIS OF COSTS MINIMIZATION OF HAEMATE-P® USE IN THE TREATMENT OF VON WILLEBRAND'S DISEASE IN COLOMBIA

Robles A[1], Bejarano A[2], Upegui A[1], Tamayo C[3]
[1]Universidad Externado, Bogota, Colombia, [2]Unicoc, Bogota, Colombia, [3]U Nacional, Bogota, Colombia

OBJECTIVES: To develop the economic evaluation of Haemate-p® use in the treatment of Von Willebrand's disease (EVW) as Gold Standard therapy versus use of coagulation factor treatments combined with different amounts of presentation from the perspective of the third-party payer. **METHODS:** It was developed the economic evaluation of Haemate-p® use against other coagulation factor treatments combined in different presentation amounts (assuming no superiority or inferiority in terms of safety and tolerance), through a cost minimization analysis in a cohort of patients, simulated at different weights in Kilograms (kg) and under the assumption of cohorts in prophylaxis and per event. The economic evaluation took into account the presentation of Haemate-p® of 1200 IU Von Willebrand Factor (vWF) + 500 IU FVIII and it was compared with presentations of Comparator 1: 375 IU vWF + 500 FVIII and Comparator 2: 1000 vWF + 0 FVIII, wherein the amounts of factor do not define the effectiveness of the therapy; analyzing cost differences in patients from 15 kg of weight to 110 kg of weight. **RESULTS:** The results are presented as the expenditure summation in use of the number of vials necessary to cover the calculated dose for each patient in a single application, in prophylaxis and per event. The use of Gold Standard therapy for VWD represents a saving of 32.81% to 74.67% in a single application of

medication, this variation depends on the combined amounts of factor used in alternative therapies. **CONCLUSIONS:** The results suggest that, in the use of coagulation factors for VWD treatment, it is necessary to recognize the effects of the different doses in the different presentations of each treatment, on the costs assumed in its application. In this sense, and as a final result, Haemate-p® is presented as the thrifty technology in the treatment of this pathology.

PSY41

MEASURING THE ECONOMIC IMPACT OF SSB TAXES IN BRAZIL: AN INPUT-OUTPUT ANALYSIS

Cardoso L[1], Balbinotto Neto G[2]
[1]Universidade Federal de Goias, Goiânia, Brazil, [2]Universidade Federal do Rio Grande do Sul, Porto Alegre, Rio Grande do Sul, Brazil

OBJECTIVES: This study aims to estimate the effects of the SSB tax with special focus on macroeconomic and sectoral variables, considering the productive relations and the distributional issues associated with this policy. **METHODS:** To achieve this goal, we used the Leontief price model derived from the input-output matrix for Brazil, 2009. **RESULTS:** The results show that the sugary drinks sector is weak intersectoral relations and will not appear as a key sector for the Brazilian economy. Considering these connections, simulating a tax increase of 10% on the production of sugary drinks causes a contraction of 2.84% in the gross value of production, while the economy as a whole reduced by 0.017%. Concerning to employment, the economy loses 10,020 jobs, among which 38.45% occur in the sector itself, and the remaining in sectors directly related to the SSB or sectors related to food and drinks in general. The highest deciles of income distribution are those that lose more with taxation. With the tax increase, it is estimated an increase in government revenue at R$ 597 million. Finally, this policy would have an effect on general prices in the economy, raising the price index at 0.017%. **CONCLUSIONS:** The main conclusion of this study is that a tax increase applied to the soft drinks industry generates negative impacts on the economy, but it reaches the expected effect: reduction of household consumption for this product. Considering an additional tax of 10%, it was identified a little reduction in aggregate output given that 1) the sector has few intersectoral relations, 2) it is intended to meet final demand and 3) it has small share in the total economy. However, the increase in tax would significantly reduce the consumption of sugary drinks in the short term. These results reflect the short-term effect of rising prices on the economy.

PSY42

RELATIONSHIP BETWEEN SITE OF CARE AND INFUSIBLE BIOLOGIC MEDICATION AND ADMINISTRATION COSTS

Tkacz J[1], Ellis L[2], Meyer R[2], Kubacki M[2], Muser E[3], Brady B[1]
[1]Health Analytics, Columbia, MD, USA, [2]Janssen Scientific Affairs, LLC, Horsham, PA, USA, [3]Janssen Scientific Affairs, LLC, Titusville, NJ, USA

OBJECTIVES: To compare medication and administration costs of infused biologics for treatment of chronic inflammatory disease (Rheumatoid Arthritis (RA), Crohn's Disease (CD), or Ulcerative Colitis (UC) when administered at different sites of care. **METHODS:** Patients with RA, CD, or UC receiving an indicated infusible biologic (abatacept, infliximab, natalizumab, rituximab, or tocilizumab) were identified in Truven Commercial Claims and Encounters database (1/1/2009 to 12/31/2013) and followed for ≥12 months. Biologic medication and administration costs for each infusion were summarized by place of infusion: Hospital inpatient (HI); Hospital Out-Patient Department (HOPD); Physician Office (PO) or Home-based Infusion (HB); Other (O). Within each disease and site of care, administration and drug costs were compared via Kruskal-Wallis tests. **RESULTS:** Infusions from 8,307 RA, 3,530 CD and 2,148 UC patients were studied. The majority of infusions for RA occurred in PO (84%); 13% in HOPD, and 2% in HB. For CD/UC patients, 55%/59% of infusions were administered in PO, 40%/35% in HOPD; 4% /4% in HB; and <2%/≤1% were HI/O. In RA, mean drug/administration costs were similar between PO and HB; mean HB drug costs ($3,056) were slightly higher than PO ($2,739) and mean HB administration costs ($201) were slightly lower than PO ($324; N.S.). Similar trends were observed in CD/UC infusions. Highest drug/administration costs were observed in the HI and HOPD settings. **CONCLUSIONS:** Drug and administration costs differed by site of care. Total infusion costs were lowest and were similar in PO and HB although drug costs tended to be higher in HB than PO. While HI and HOPD had highest drug plus administration costs, a lower proportion of infusions were provided in these sites, particularly for RA patients. Additional studies are needed to understand patient outcomes and quality of care metrics associated with different infusion sites of care.

PSY43

IMPROVED POSTOPERATIVE CLINICAL AND DISCHARGE OUTCOMES FOR LIPOSOMAL BUPIVACAINE COMPARED TO BUPIVACAINE

Asche CV[1], Maurer BT[2], Ren J[1], Kim M[1], Gordon K[3], Kirkness CS[1]
[1]University of Illinois College of Medicine at Peoria, Peoria, IL, USA, [2]Great Plains Orthopedics, Peoria, IL, USA, [3]UnityPoint Health-Proctor, Peoria, IL, USA

OBJECTIVES: While more than 300,000 total hip arthroplasties (THA) are performed annually in the United States, there is no gold standard for an effective post-operative THA pain strategy. The objective of this retrospective cohort study was to compare clinical, and discharge outcomes for patients utilizing an extended-release liposomal bupivacaine (LB) to a control cohort utilizing bupivacaine. **METHODS:** The LB cohort included 64 consecutive THA patients from one surgeon at a single institution between August 2013 and July 2015 and 66 consecutive THA procedures performed by the same surgeon between June 2011 and July 2013 were selected as the control cohort. Clinical (pain [VAS], distance walked, opioid use, falls) and discharge (discharge destination, length of stay[LOS], readmission rates) outcomes were compared on post-operation day (POD) 0, 1 and 2 using univariate and multivariate analyses. **RESULTS:** The LB cohort showed significantly lower AUC VAS pain scores on POD 0, 1 and 2. Significantly fewer LB patients used rescue opioids on POD1 and POD2. LOS decreased significantly from 2.7 to 2.0 days and 30% more LB patients were discharged at POD1. After adjusting for covariates, LB patients were more likely to walk farther than controls after surgery. LB cohort had significantly fewer 30-day readmissions than the control cohort. For patients with available financial data, adjusted mean hospital charge costs were lower in the LB patients. Categorically, the LB cohort had lower costs than the control cohort for room, medical and surgical supplies, diagnostic test (including labs and operation), and physical therapy. There were no differences in falls or discharge location. **CONCLUSIONS:** This retrospective cohort study comparing LB to bupivacaine demonstrated improved perioperative pain management, less opioid use, decreased length of stay, lower costs, earlier discharge and increased physical function.

PSY44

A COMPARATIVE STUDY OF ORPHAN DRUG PRICES IN EUROPE

Young KE[1], Soussi I[2], Hemels M[3], Toumi M[4]
[1]Creativ-Ceutical, Paris, France, [2]Creativ-Ceutical, Tunis, Tunisia, [3]Raptor Pharmaceuticals Europe B.V., Utrecht, The Netherlands, [4]Aix-Marseille University, Marseille, France

OBJECTIVES: Orphan drugs have been a highlight of discussions due to its higher price than non-orphan drugs. Moreover, there is currently no European consensus on value assessment which has led to differences in price and access among countries. This study aimed to assess price differences among countries by comparing the annual treatment cost per patient of similarly available orphan drugs in France, Germany, Italy, Norway, Spain, Sweden, and the UK. **METHODS:** Orphan drugs granted market authorisation up to June 13, 2016 were extracted from the European Medicines Agency (EMA) website. The annual treatment costs per drug were calculated using ex-factory prices from IHS POLI and country price databases. The treatment cost in the comparator country was compared to the UK and ratios were analysed. Subanalyses were done on cost quartiles (most to least expensive orphan drugs in the UK) and disease areas. **RESULTS:** 120 orphan drugs were included in the analysis. Compared to the UK, the average annual costs were more expensive in France (averaged ratio 1.13), Germany (1.11), Italy (1.08), Spain (1.07), and were cheaper in Sweden (0.99) and Norway (0.88). The average ratios offered a restrictive view as the ratios were greatly heterogeneous and ranged from 0.26 to 1.92. The ratios were also heterogeneous in the different disease areas in all countries. When we divided the UK orphan drugs into 4 cost quartiles, the averaged ratios varied minimally in all countries except France which shows that the cost differences were similar for the most expensive and least expensive orphan drugs in the UK. **CONCLUSIONS:** Individual orphan drug prices can vary widely across European countries, although on average these differences are relatively minor. This study suggests that in Europe, we may not be able predict which country may have higher or lower prices for orphan drugs.

PSY45

HEALTHCARE COST COMPARISON ANALYSIS FOR MORBIDLY OBESE PATIENTS UNDERGOING BARIATRIC SURGERY WITH THOSE MANAGED BY CONVENTIONAL TREATMENT IN INDIA

Lakdawala M[1], Bhasker AG[1], Mapari J[2], Kohli A[2], Maheshwari V[3], Bhandari H[3]
[1]Center for Obesity and Digestive Surgery, Mumbai, India, [2]Johnson & Johnson Pvt Ltd, Mumbai, India, [3]SmartAnalyst India (Pvt.) Ltd., Gurgaon, India

OBJECTIVES: Bariatric surgery (BS), an effective treatment for morbid obesity, is proven to reduce comorbidities. However, in absence of health economics studies in India, surgeons and patients/payers are uncertain about the long term economic implications of BS. This study aimed to evaluate and compare the cumulative healthcare cost incurred by morbidly obese patients opting for BS with those incurred by patients opting for conventional treatment over a 10-year period in India. **METHODS:** A cost comparison model was developed using a combination of a decision tree and a Markov model. Three types of surgeries common in India – laparoscopic mini gastric bypass, laparoscopic Roux-en-Y gastric bypass and laparoscopic sleeve gastrectomy, were considered in the BS arm. Transition probabilities and BS related outcomes data were sourced from published literature. The analysis considered direct medical costs including the cost of bariatric surgery and associated complications, cost of drugs, physician visits and hospitalization for managing co-morbidities, and cost of obesity management measures. All costs were discounted at 3%. The results were expressed in terms of difference in total per-patient healthcare costs incurred by patients in the two arms. **RESULTS:** For a hypothetical population with a mean age of 40 years and a mean BMI of 43 kg/m2, the total per-patient cost for BS arm was ₹670,014 compared to ₹1,015,300 for the conventional arm over a period of 10 years. The per-patient co-morbidity management cost in BS arm reduced by 70% over 10 years. The current analysis estimated that initial investment in BS will be recouped within ~5.5 years post-surgery due to cost saving in co-morbidity management. **CONCLUSIONS:** The current analysis shows that although bariatric surgery requires an initial investment, it will result in lower healthcare expenses compared to conventional treatment, in a five year time period after surgery.

PSY46

ECONOMIC IMPACT OF TREATING SEVERE HEMOPHILIA A PATIENTS WITH PLASMA-DERIVED FACTOR-VIII/VWF VERSUS RECOMBINANT FACTOR-VIII IN THE UNITED STATES

O'Day K[1], Runken MC[2], Meyer KL[1], Spears JB[2]
[1]Xcenda, LLC, Palm Harbor, FL, USA, [2]Grifols, Inc., Research Triangle Park, NC, USA

OBJECTIVES: The development of alloantibodies to factor-VIII (FVIII) therapy (inhibitors) can result in increased complications and economic burden. The Survey of Inhibitors in Plasma-Products Exposed Toddlers (SIPPET) study found higher inhibitor rates in previously-untreated patients (PUPs) treated with conventional recombinant FVIII (rFVIII) than those treated with plasma-derived FVIII

with von Willebrand factor (pdFVIII/VWF). The objective of this study was to quantify the economic impact of treating PUPs with pdVIII/VWF versus rFVIII. **METHODS:** A 3-year time horizon Excel-based cost-analysis was developed from the perspective of a US healthcare payer. In the analysis, 1-year old PUPs initiated prophylactic or on-demand treatment with rFVIII or pdFVIII/VWF. Rates of high-titer inhibitor development were obtained from the SIPPET study (28.4% with rFVIII and 18.6% with pdFVIII/VWF). PUPs developing inhibitors received immune tolerance induction (ITI) and bypassing agents. After one year, patients successfully tolerized with ITI returned to FVIII treatment, while patients unsuccessfully tolerized received bypassing agent prophylaxis. Treatment regimens, ITI outcomes, and rates of serious bleeds were based on the literature and expert clinical opinion. All cost inputs in the analysis were identical between the two arms, except for the costs of the two antihemophilic agents which were based on WAC (Red Book). Treatment costs for rFVIII and pdFVIII/VWF patients were calculated monthly based on patient weight and total costs and then estimated on a per-patient and US population basis. **RESULTS:** Total per-patient treatment costs over 3 years were $824,336 for rFVIII and $540,939 for pdFVIII/VWF patients, resulting in an average annual savings of $94,465 per patient for pdFVIII/VWF. Based on the current US population, an estimated 247 PUPs would be diagnosed annually, resulting in a cost savings of nearly $70 million over 3 years. **CONCLUSIONS:** Treatment of severe hemophilia A in PUPs with pdFVIII/VWF has the potential to result in significant cost-savings compared to treatment with rFVIII.

PSY47

THE APPLICATION OF RECOMBINANT HUMAN THROMBOPOIETIN FOR THE EMERGENCY TREATMENT OF PRIMARY IMMUNE THROMBOCYTOPENIA

Li L[1], Yang F[2], Xuan J[3]
[1]Fudan University, Shanghai, China, [2]Shanghai Centennial Scientific Ltd, Shanghai, China, [3]Sun Yat-Sen University, Guangzhou, China

OBJECTIVES: Recombinant Human Thrombopoietin (rhTPO) was recommended to emergency treatment in primary immune thrombocytopenia (ITP) patients in China. The application of rhTPO could potentially reduce the usage of platelet transfusion and intravenous immunoglobulin for emergency treatment of ITP patients. The study purpose is to evaluate the hypothesis in clinical practice. **METHODS:** An expert questionnaire was designed to collect relevant clinical information of emergency treatment in ITP patients. 53 hematologists completed the questionnaire who were selected from Beijing, Shanghai, Guangzhou, Jinan, Chengdu and Wuhan in China. The treatment cost of with and without rhTPO for emergency treatment in ITP patients was compared. **RESULTS:** The survey results indicate that , the rate of platelet transfusion is 50% and 85% for with rhTPO and without rhTPO respectively. The intravenous immunoglobulin in the emergency treatment of ITP patients was 30% and 50% for with rhTPO and without rhTPO respectively. And the average amount of platelet and intravenous immunoglobulin used for an ITP patient was 1.5 unit (200 ml/unit) and 5 days (400 mg/kg per day) for both groups. The treatment cost of one unit platelet transfusion conducted in other previously study was RMB 5,114. The daily treatment cost of intravenous immunoglobulin was RMB 5,000. Thus, in with rhTPO arm, the cost of platelet transfusion and intravenous immunoglobulin was RMB 3,835.5 and RMB 7,500. In without arm, the cost was RMB 6,520.35 and RMB 12,500 respectively. With rhTPO price is RMB 1,102, 7 days per an ITP patient emergency treatment. The drug price of rhTPO is RMB 7,714. So the total cost of the two arms was RMB 19,049.5 (with rhTPO) and RMB 19,020.4 (without rhTPO). The gap is only RMB 29.2. **CONCLUSIONS:** The use of rhTPO for emergency treatment in ITP patients could reduce the rate of usage of platelet transfusion and intravenous immunoglobulin without significantly increase medical cost.

PSY48

CLINICAL AND ECONOMIC BURDEN OF ACQUIRED HEMOPHILIA (AH) AMONG HOSPITALIZED PATIENTS IN THE US USING HEALTHCARE COST AND UTILIZATION PROJECT (HCUP)

Shah A, Narayanan S
Market Access Solutions LLC, Raritan, NJ, USA

OBJECTIVES: Acquired hemophilia (AH) is a severe autoimmune disease characterized by the spontaneous development of autoantibodies against coagulation factor VIII (FVIII). The economic and clinical burden of this rare condition is poorly described. The objective of this study is to determine the clinical and economic burden of hospitalized AH patients in the US using HCUP database. **METHODS:** A retrospective cohort study using the HCUP Nationwide inpatient sample (NIS) from January 2009 to December 2013 was conducted. HCUP NIS includes discharge data on approximately 20% of all hospitalizations in the U.S. Hospital admissions for AH were identified using records with a principal diagnosis of AH (ICD-9 286.52). Total inpatient costs (converting charges to cost using cost-to-charge ratio), hospital length of stay, comorbidities and mortality during the inpatient visit were assessed. **RESULTS:** A total of 71 inpatient admissions were identified from discharges in 2009, 2012, and 2013 while no discharges for AH were found in the year 2010 and 2011. The mean age of hospitalized patients was 68.7 years (SE:1.75; median:70.7) and 57.7% admissions were male patients. Three (4.1%) deaths occurred during the inpatient stay. Mean number of chronic conditions were 7.12 (SE:0.3; median:6.6) in this cohort with hypertension being the most frequent in 72% of patients followed by deficiency anemia (38%), chronic pulmonary disease (35%), and uncomplicated diabetes (34%). Mean cost per inpatient admission was $177,668 (SE:33,991; median:$63,666) and varied widely (range: $2,260.08-$1,071,415). The mean length of stay was 11.8 days (SE:1.42; median:7.3). **CONCLUSIONS:** Inpatient stays to treat bleeding episodes due to AH lead to high economic and clinical burden, especially in the elderly population. Further research is required to understand treatment management and unmet needs in the hospital setting to minimize patient burden and improve outcomes.

PSY49

THE IMPACT OF RESPIRATORY DEPRESSION FOLLOWING PLANNED INPATIENT SURGERIES ON HOSPITAL RESOURCE UTILIZATION AND CHARGES ACROSS THE UNITED STATES

Ben-Joseph R[1], Gordon RJ[2], Chingcuanco F[1], Zhao S[1], Ni W[1], Divino V[3], DeKoven M[3], Meier A[2]
[1]Millennium Health, San Diego, CA, USA, [2]University of California at San Diego, La Jolla, CA, USA, [3]QuintilesIMS, Fairfax, VA, USA

OBJECTIVES: Respiratory depression (RD) is a potential adverse event after surgery partly due to the nature of the drugs used to anesthetize, sedate, and immobilize patients, as well as comorbid medial conditions and medications. To understand the impact of RD after surgery, the incidence and impact of RD on hospital charges and length of stay (LOS) were analyzed. **METHODS:** A retrospective cohort study using the QuintilesIMS Hospital Charge Data Master database was performed. Patients from over 450 hospitals across the United States were included if they were admitted for an inpatient surgery and were administrated an inhaled anesthetic during the period of July 1,2014 to June 30,2015. To avoid clinical conditions potentially associated with RD, patients who had a procedure for the nervous, respiratory and cardiovascular systems or had an obstetrical surgery were excluded. Based on procedures and prescribed medications, seven conditions were specified as indicators of RD. To evaluate the impact of RD, patients with RD were matched to patients without RD using propensity score matching. Hospital charges and LOS were compared between matched cases and controls. **RESULTS:** 17,727 patients were included in the study cohort and 715 (4.03%) patients were identified with RD. After matching, 538 patients were included in the case and control group, respectively. Both mean and median hospital charges for cases were significantly higher than controls (Mean: $78,190 vs. $69,010, $p=0.0026$; Median: $54,985 vs. $49,409, $p<0.0001$). Average LOS was significantly longer for cases compared to controls (3.8 days vs. 3.3 days, $p<0.0001$). **CONCLUSIONS:** In this study, respiratory depression was found to be associated with increased hospital charges and LOS. Moreover, this study may point to the need for improving the management of respiratory depression in the perioperative setting. Applying a personalized medicine approach utilizing pharmacogenomics may help reduce the occurrence of respiratory depression.

PSY50

EPIDEMIOLOGY AND ECONOMIC BURDEN OF SYSTEMIC SCLEROSIS – A SYSTEMATIC REVIEW

Zhong L[1], Pope M[1], Wu L[2]
[1]Texas A&M University, College Station, TX, USA, [2]Texas A&M University, Kingsville, TX, USA

OBJECTIVES: Systemic sclerosis (SS) is a rare debilitating autoimmune disease of the connective tissue with no cure. This study aimed to assess the recent epidemiologic and economic burden of systematic sclerosis across the world. **METHODS:** Using a systematic search strategy, PubMed/MEDLINE and Embase were searched to identify relevant studies published from January 2006 to June 2016. Two independent reviewers evaluated studies for inclusion, quality, and extracted data. The review was conducted and reported according to PRISMA statement. **RESULTS:** 1,449 references were retrieved using initial searching strategy, and 22 epidemiological and 6 economic publications were selected for data extraction following inclusion/exclusion criteria. SS has a female predominance with prevalence ranging from 7-74 per 100,000 as compared to 2-15 per 100,000 in male. Incidence ranges from 1.7-3.5 per 100,000 in females as compared to 0.5-1 per 100,000 in males. Direct annual healthcare costs vary with geographic locations and health care systems, ranging from 3,300 Euros in Hungry to 17,365 USDs in the US. From a societal perspective, indirect annual healthcare costs range from 5,390 Euros in Hungry to 10,560 Euros in France. Specific cost categories were examined in detail. It's important to note that heterogeneous methodologies were used to derive these numbers so comparisons were made with caution. **CONCLUSIONS:** This review provides an updated literature review on the current estimates of disease prevalence, incidence and economic burden of systemic sclerosis in different countries. The review reports slightly higher incidence/prevalence compared to previous studies. The economic burden is high from both societal and healthcare perspectives. Different healthcare stakeholders could benefit from understanding the epidemiological and economic aspects of SS.

PSY51

RESOURCE UTILIZATION, COST, AND UNPLANNED READMISSIONS ASSOCIATED WITH HEPATORENAL SYNDROME FROM THE UNITED STATES (US) HOSPITAL PERSPECTIVE: 2009-2015

Pham AT[1], Jamil K[1], Huang X[1], Lodaya K[2], Hayashida DK[3], Lovelace B[1]
[1]MALLINCKRODT PHARMACEUTICALS, HAMPTON, NJ, USA, [2]Boston Strategic Partners, Inc, Boston, MA, USA, [3]Boston Strategic Partners, Inc., Boston, MA, USA

OBJECTIVES: Hepatorenal Syndrome (HRS), the development of functional renal failure in patients with advanced chronic liver disease, is associated with high cost of patient care. The objective of this study was to examine total health care resource utilization, cost of care and outcomes, including mortality and readmission from US hospital perspective. **METHODS:** A retrospective, longitudinal analysis of the CERNER Health Facts®electronic health record (EHR) database was performed. Adult patients diagnosed with HRS based on ICD-9 code (572.4) between 2009 and 2015 were included in the analysis. Clinical data including serum creatinine were used to assess outcomes. **RESULTS:** We identified 1,571 male (62%) and 971 female (38%) patients (mean age: 57.9). The median cost for all patients was $22,911. The highest median cost associated with HRS was in patients between 18 and 35 years old. Overall, female patients incurred higher costs than males. The highest incidence of HRS was in 2013 with ~19% of all cases from 2009 to 2015 and the highest average cost per patient was in 2009 with $38,778. HRS mortality rate was 36.8% during initial hospitalization, and median cost of

hospitalization was higher for deceased vs. surviving patients ($24,667 vs. $21,360). HRS readmission rate was 17.62%, with 10.62% planned and 7.32% unplanned readmission. Unplanned readmissions were associated with higher median costs ($31,946 vs. $17,357). **CONCLUSIONS:** From a hospital perspective, results from this analysis of large US hospital EHR database indicate that HRS is a very severe disease with high mortality. Managing patients with HRS is associated with high burden in resource utilization, cost-of-care, and especially around the unplanned readmissions, which presents a potential opportunity for improvement.

PSY52

EXAMINING THE HEALTH CARE RESOURCE USE AND ECONOMIC COSTS ASSOCIATED WITH ACUTE MYELOID LEUKEMIA AMONG MEDICARE PATIENTS

Xie L[1], Zhang Q[1], Baser O[2], McGuire M[3]
[1]STATinMED Research, Ann Arbor, MI, USA, [2]Columbia University, New York, NY, USA, [3]Celgene Corporation, Summit, NJ, USA

OBJECTIVES: To examine health care utilization and costs associated with acute myeloid leukemia (AML) among patients in the Medicare population. **METHODS:** Medicare patients aged ≥65 years with an AML diagnosis (International Classification of Disease, 9th Revision, Clinical Modification [ICD-9-CM] code: 205.xx) were identified from 01/01/10 to 12/31/14. The first AML treatment date within 30 days after the incident diagnosis was the index date. Patients with an ICD-9-CM code for relapse (205.02), or claims of chemotherapy after a ≥120-day treatment-free gap, were considered relapse cases. Patients were required to have continuous enrollment 12 months before the initial AML diagnosis. Patients with blood cancer, chemotherapy, radiotherapy, or AML-related surgery prior to the initial diagnosis were excluded from the study. Health care costs and utilization of patients with only first-line therapy (Cohort A), and relapse patients with first- and second-line therapies (Cohort B) were examined descriptively. **RESULTS:** A total of 6,281 and 1,726 patients were included in Cohorts A and B, respectively. During the first-line therapy, the percentages of patients with ≥1 inpatient, emergency room (ER), and hospice visits were 89.1%, 35.6%, and 39.7% in Cohort A, respectively (mean follow-up: 247 days). During first-line therapy (mean 396 days), the percentages of patients with ≥1 inpatient, ER, and hospice visits were 88.9%, 42.0%, and 2.5% in Cohort B, respectively. Per patient per month (PPPM) costs for inpatient admission ($10,451), outpatient ($6,213), and total costs ($17,622) were high. During second-line therapy (mean 256 days), the percentages of patients with ≥1 inpatient, ER, and hospice visits were 75.2%, 32.2%, and 40.9% in Cohort B, respectively. PPPM costs for inpatient admission ($21,982), outpatient ($6,178), and total costs ($29,718) increased compared with the first-line period. **CONCLUSIONS:** AML patients in the Medicare population incurred significant health care utilization and costs – especially during the relapsed period.

PSY53

DIRECT AND INDIRECT COSTS OF CYSTIC FIBROSIS PATIENTS AT A UNIVERSITY HOSPITAL IN OMAN

Al-Rashdi I[1], Hinder M[2], Al-Kindi H[3], Al-Zakawani I[3]
[1]SQUH, Al-Khoud, Oman, [2]Hochschule Fresenius University, Idestein, Germany, [3]SQUH, Muscat, Oman

OBJECTIVES: This study aimed to estimate the patterns and cost burden among CF patients by focusing on annual and lifetime direct and indirect costs. **METHODS:** Data were collected by using a study with a cross sectional design in 30 patients who visited the CF clinic of the Sultan Qaboos University Hospital (SQUH) in Oman between December 2014 and February 2015. Direct health-care costs reflecting the governmental perspective were determined retrospectively by Hospital Information System (HIS) whilst indirect costs reflecting the social perspective were collected prospectively by means of a questionnaire. Most sources for unit's costs were acquired from SQUH's administrative price list of 2014. Prices of admissions, emergency, specialist and general practitioner (GP) visits were acquired from Muscat Private Hospital to reflect the actual market costs. **RESULTS:** The total annual cost per patient averaged at €27,128 ± 42631 (year 2014 values). The majority of costs were spent on direct health costs with 91.8% (mean €25,508 ± 43014) while indirect costs were only 8% (mean €2,275 ± 56523). Pharmaceuticals represented 73.5% of the total costs with mean costs of €20,429 ± 41018. Of the total costs, 7% resulted from admissions and 2.9% were from laboratory tests. Lifetime costs were averaged nearly at €543,300 ± 763,832 (3% discount rate). **CONCLUSIONS:** CF is associated with high annual direct and indirect cost in Oman. Pharmaceuticals, productivity losses and admissions accounted for the majority of total cost. The calculated lifetime costs were 20 fold higher than total annual costs.

PSY54

THE TREATMENT OF PATIENTS WITH INJECTABLE OPIOIDS FOR UNCONTROLLED POSTOPERATIVE PAIN IN THE INPATIENT SETTING: INCIDENCE AND IMPACT ON HOSPITAL CHARGES

Chingcuanco F[1], Divino V[2], DeKoven M[2], Gordon RJ[3], Meier A[3], Ben-Joseph R[1]
[1]Millennium Health, San Diego, CA, USA, [2]QuintilesIMS, Fairfax, VA, USA, [3]University of California at San Diego, La Jolla, CA, USA

OBJECTIVES: Adequate management of postoperative pain is a crucial component of patient care. Not only is pain management closely tied to patient satisfaction, but mismanaged pain can potentially negatively impact important clinical and economic outcomes. The objective of this study was to quantify the incidence of patients treated with injectable opioids for uncontrolled postoperative pain and assess how this issue impacts hospital charges. **METHODS:** A retrospective study was conducted using billing data from the QuintilesIMS Hospital Charge Data Master database. Adult patients were included if they underwent a non-emergent surgical procedure, were administered an inhaled anesthetic (sevoflurane, isoflurane or desflurane) and stayed in the hospital for >24 hours between July 1, 2014 and June 30, 2015. Patients undergoing obstetrical surgeries or surgeries of the nervous, respiratory, or cardiovascular systems were excluded. Uncontrolled pain was defined as having received 3 or more different injectable opioids on the same day of the surgery. Patients treated for uncontrolled pain (cases) were matched to patients not treated for uncontrolled pain (controls) using propensity score matching (nearest neighbor approach). Total hospital charges were compared between cases and controls. **RESULTS:** The study cohort was comprised of 17,727 patients. Mean (SD) age was 56.3 years (15.2); Most patients were female (61.2%). One-third (33.6%, n=5,950) of patients were treated with 3 or more injectable opioids for uncontrolled pain, and propensity score matching resulted in 2,788 matched pairs. The total hospital charges for cases were significantly higher than for controls (Mean: $64,183 vs. $61,624, $p<0.001$; Median: $50,297 vs. $48,744, $p<0.001$). **CONCLUSIONS:** Patients treated with injectable opioids for uncontrolled pain were associated with higher hospital charges. Further research is warranted to quantify the burden of this complication and to assess potential methods for improving pain management. Applying a personalized medicine approach utilizing pharmacogenomics may help address the burden of pain in the postoperative setting.

PSY55

TRENDS IN ECONOMIC BURDEN OF CROHN'S DESEASE AND ULCERATIVE COLITIS IN THE UNITED STATES

Chen C, Hartzema A, Xiao H
University of Florida, Gainesville, FL, USA

OBJECTIVES: Inflammatory bowel disease, which includes mainly two subtypes of the diseases: Crohn's Disease (CD) and Ulcerative Colitis (UC), is a chronic autoimmune gastrointestinal disease associated with significant economic burden. Several new biologic treatments have become available and showed effectiveness in improving patient outcomes in recent years. This study aims to estimate the trends in medical cost burden for CD and UC in a large commercial administrative claims database in US. **METHODS:** Retrospective analysis was conducted using Truven Health MarketScan database from 2008-2014. Newly diagnosed CD and UC patients were identified using ICD-9-CM code (555.* for CD and 556.* for UC) based on a previously validated algorithm. Patient continuous eligibility at least 12 months before and after the index date (first diagnosis of CD/UC) was required. One-year medical expenditures, including inpatient admissions, outpatient visits, emergency department visits, and outpatients prescription drugs, were summarized and compared with the expenditures among comparison groups, which were established using propensity score matching method adjusting for demographics, health service utilization and comorbidities. All the cost components were inflated to year 2015 value using consumer price index and reported to describe any temporal trends. **RESULTS:** On average, annual medical expenditures were significantly higher for commercially insured CD and UC patients compared to matched patient group ($30,392 vs $15,099 for CD patients, $24,981 vs $ 15,678 for UC patients). From 2009 to 2013, the medical cost from CD has increased by 62.1% from $11,724 to $18,999 and the medical cost from UC has increased by 61.1% from $7,848 to $12,644. **CONCLUSIONS:** CD and UC are associated with significant economic burden. Medical costs have increased substantially in recent years for newly diagnosed patients with these conditions who are covered by commercial health plans.

PSY56

COST ASSESSMENT OF GOUT: YOUNG PATIENTS AGAINST ELDERLY

Vorobiev P[1], Vorobiev A[1], Krasnova L[1], Eliseeva M[2], Tsurko V[2]
[1]Russian Society for Pharmacoeconomics and Outcomes Research, Moscow, Russian Federation, [2]First MSMU Secenov, Moscow, Russian Federation

OBJECTIVES: Gout has become is significant clinical problem in Russia, requiring costly to treat. Gout has many comorbid diseases: hypertension, chronic renal disease, coronary heart disease, heart failure, diabetes, kidney stones, which significantly increases the cost of treatment. When building a cost model based on the standards, which lists the medical intervention with the frequency of their use for diseases with high comorbidity is necessary to use the correction factor reducing margins (RM), which empirically has been calculated by RSPOR in 2007. The aim of the study was the prognostic assessment of patients with the cost of doing with gout during the year, taking into account polymorbidity and RM. **METHODS:** Were included 200 patients with gout, composed comorbid profile and matrix for all combinations of diseases, frequency combinations. Calculated the direct costs of treatment of gout and related diseases for each existing combination of comorbid pathology taking into account hospitalization rate for "young" and "old" populations and the RM (the value determined by the number of diseases, recorded in the preparation of models). **RESULTS:** In group A(age 57.9±11.3,N=150) was observed 2 comorbid disease to a patient, in the group B(age of 73.3±4.4,N=50) - 4. Elderly hospitalized significantly more often "young" – 1.2 hospitalizations per year, versus 0.7($p=0.001$). Direct projected costs of treating comorbid diseases 5 on 1 patient in the course of the year in the summation indices standards amounted to 21363$, and in view of the RM-12818$. Average direct costs for the year gout treatment in 1 patient out of a population of "young" amounted to 1315$ per year and 7201$ in view of comorbid diseases and the RM, in the "old" group, respectively 2033$ and 14982$. **CONCLUSIONS:** The marginality factor helps to make more accurate forecast of the cost of comorbid chronic diseases, the frequency of which increases significantly in older patients.

Napoleón Franco Pareja. Centro de Investigación e Innovación en salud, Cartagena de Indias, Colombia, [4]ALZAK Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia
OBJECTIVES: To estimate the healthcare costs in patients with hemophilia in a Colombian government's subsidized health insurer in Colombia. **METHODS:** patients diagnosed with hemophilia were identified from the individual risk database of the insurer. The Individual Health Services Delivery Registry (RIPS) and the billing database were reviewed to estimate the direct medical costs between June 2015 and May 2016. The results are shown in dollar PPP. **RESULTS:** A total of 51 patients were identified with hemophilia from 1.890.000 affiliates of the public health insurer. Of these, 78% were diagnosed with Hemophilia type A (FVIII), 14% with Von Willebrand disease (EVW) and 8% with hemophilia type B (FIX). The medical cost was 8,519,020 PPP$, of which 88.9% corresponded to medications, 6.0% to consultations, 2.0% to lab test and diagnostics images and 1.3% to hospitalization, in the year of study. The most expensive patient consumed 607,841 PPP$ in services and 75,683 PPP$ the less expensive. The highest annual cost per capita was caused by hemophilia Type B (238,741 PPP$), followed by type A (173,338 PPP$) and Von Willebrand with (90,075 PPP$). Von Willebrand disease is the less expensive, however, medications have a high participation of total medical costs (93%). **CONCLUSIONS:** Hemophilia type B is 1.3 times more expensive than hemophilia A and 2.6 times more than Von Willebrand. The treatment of this disease is drug intensive, therefore, price regulation tends to decrease the financial risk of health systems and contributes to the efficient allocation of resources.

PSY58

A PHYSICIAN BASED ASSESSMENT OF DISEASE ACTIVITY, QUALITY OF LIFE AND COSTS OF ULCERATIVE COLITIS IN POLAND

Kawalec P[1], Stawowczyk E[2]
[1]*Jagiellonian University Medical College Institute of Public Health, Kraków, Poland,* [2]*Jagiellonian University Medical College, Kraków, Poland*
OBJECTIVES: The aim of this study was to assess a disease activity and quality of life reported by patients with ulcerative colitis (UC) as well as to evaluate direct and indirect costs of UC in Polish settings. **METHODS:** A questionnaire, cross-sectional study among UC patients as well as physicians involved in therapy of the patients was conducted. Clinical Activity Index (CAI) was used to assess disease activity, and the WPAI questionnaire to assess productivity loss. The quality of life was presented as utility calculated using the EQ-5D-3L questionnaire. Indirect costs included absenteeism, presenteeism and informal care were assessed with the Human Capital Approach and expressed in euros (€). The productivity loss among informal caregivers was valuated with the average wage in Poland. Correlations were presented using the Spearman's coefficient, the between-group difference was assessed with Mann-Whitney U-test. **RESULTS:** 110 patients participated in the study, including 72 working persons. Mean cost of absenteeism and presenteeism was €1,737.5 (95%CI:622.9–2,852.2) and €4,059.8 (95%CI:2,545.1–5,574.6), respectively, per year per patient with a disease in remission. The mean yearly cost of productivity loss due to informal care was estimated to be €240.2 (range: 0.0–7,698.45). The corresponding values for patients with active disease were: €8,103.8 (95%CI:3,936.6–12,270.9), €4,742.0 (95%CI:1,357.6–8,126.5), and €1,296.6 (95% CI:97.3-2,495.8). The between-group difference in total indirect costs, cost of absenteeism and cost of informal care was statistically significant. The average weighted monthly costs of therapy with particular drugs categories (e.g. mesalazine or biologic drugs) differed significantly between active disease or remission patients. The difference in utility values between patients with a disease in remission (0.894, SD0.097) and patients with an active disease (0.680, SD:0.262) was statistically significant. **CONCLUSIONS:** Our study revealed the social burden of UC and high dependency of direct and indirect costs as well as quality of life on the severity of UC in Poland.

PSY59

NUMBER-NEEDED-TO-TREAT (NNT) AND COST OF RESPONSES ACHIEVED IN TYROSINE KINASE INHIBITOR (TKI) TREATMENT OF REFRACTORY CHRONIC-PHASE CHRONIC MYELOID LEUKEMIA (CP-CML) IN THE UNITED STATES (US)

Levy MY[1], McGarry L[2], Iannazzo S[3], Huang H[2], Chiroli S[4]
[1]*Baylor University Medical Center, Dallas, TX, USA,* [2]*ARIAD Pharmaceuticals, Inc., Cambridge, MA, USA,* [3]*SIHS Health Economics Consulting, Torino, Italy,* [4]*INCYTE, Epalinges, Switzerland*
OBJECTIVES: The emergence of targeted therapies with high efficacy in small patient populations such as TKI-refractory CP-CML has challenged decision-makers. We demonstrate a simple and intuitive approach to assessing the value of available TKIs (nilotinib, dasatinib, ponatinib and bosutinib) in this setting. **METHODS:** Using synthesized efficacy data from a published meta-analysis (Lipton 2014), we calculated NNT to achieve one additional response, defined as complete cytogenetic response (CCyR), for CP-CML patients treated with a TKI after failing ≥2 prior TKIs. NNT represents the expected number of treated patients required to achieve one additional response—i.e., the multiple of treated patients to responders. We assumed response is not evaluated prior to 3 months, per National Comprehensive Cancer Network (NCCN) guidelines. Therefore, the cost of achieving an additional response was estimated as the product of NNT and 3-month cost, based on US Wholesale Acquisition Costs (WAC) and recommended dosing for each TKI from US prescribing information (USPI). **RESULTS:** To achieve one expected response, the NNT is 1.7 (95%CrI: 1.5-1.9) patients for ponatinib, 3.8 (3.1-4.8) for nilotinib, 4.2 (2.2-11.1) for dasatinib, and 4.5 (3.4-6.7) for bosutinib (based on CCyR of 60%, 26%, 24% and 22%, respectively). With a 3-month WAC for ponatinib of $49,683, nilotinib:$33,892, dasatinib:$33,897 and bosutinib:$36,045, the estimated 3-month cost per response achieved is $82,800 ($73,100-$95,500) for ponatinib, $130,000 ($106,000-$161,000) for nilotinib, $141,000 ($75,300-$377,000) for dasatinib, and $164,000 ($124,000-$240,000) for bosutinib. **CONCLUSIONS:** Using published, synthesized efficacy estimates, the NNT to achieve response with ponatinib in TKI-refractory CP-CML is less than with nilotinib, dasatinib or bosutinib. Despite a higher WAC, ponatinib has the lowest estimated 3-month cost per response achieved, suggesting that use of less-effective therapy in TKI-refractory CP-CML may be a poor approach to cost management. Therapy choice should, however, consider both treatment cost and the benefit-risk profile of the individual patient.

DIRECT COSTS OF THE USE OF BIOLOGICAL THERAPIES, THE CASE OF A HEALTH MANTEINANCE ORGANIZATION IN COLOMBIA

Hoyos-Beltrán FJ[1], Moreno JA[2], Guarin NE[2], Arevalo HO[2], Muñoz-Galindo IM[2], Diaz JA[3]
[1]*Salud Total EPS, Bogotá, Colombia,* [2]*Salud Total EPS, Bogotá D.C., Colombia,* [3]*Universidad Nacional de Colombia, Bogotá D.C., Colombia*
Biological therapies are currently used for some diseases which include: autoimmune diseases, cancer, osteoporosis among others; These treatments are long term and costly for health systems, so it is important to know the economic impact of using these medicines. **OBJECTIVES:** to estimate the direct costs associated with the use of biological therapies in the health care of patients insured with a health manteinance organization (HMO) in Colombia during the period 2014-2016. **METHODS:** A retrospective cross-sectional study was conducted in a cohort of 2597 patients distributed in 7 pathologies (rheumatoid arthritis, autoimmune diseases, cancer, osteoporosis, ophthalmologic, skin and renal pathologies) in 16 cities nationwide, affiliated with a HMO, for a period from January 2014 to August 2016. Total and average costs for the pathology, therapy, city and patient were estimated. Costs were adjusted for inflation and expressed in 2017 US dollars. **RESULTS:** The total annual cost of using biological therapies for 2014 was: $ 10,128,248 for 2015: $ 12,844,339 and for 2016 (until August): $ 9,290,887. The most costly cities were Bogota with 27.7% of the total cost followed by Medellín with 15.0%. The most costly pathology was rheumatoid arthritis with 36.5% of the total cost. The average monthly cost per patient for rheumatoid arthritis was $ 594. Cancer: $ 1,545. Autoimmune diseases: $ 683 and ophthalmologic pathologies: $ 431. The therapy with the highest monthly cost was adalimumab with $ 366,224 followed by etanercept with $ 353,496. **CONCLUSIONS:** In general, rheumatoid arthritis is the most resource-consuming pathology, however, the average cost per patient of cancer patients is three times higher than patients with rheumatoid arthritis. In addition, although the target population has been increasing, the average costs of using biological therapies have remained stable over this period of time.

PSY61

WHAT IS THE HEALTH SYSTEM COST OF TREATING HAEMOPHILIA A IN AUSTRALIA?

Zabara R[1], Lynch K[2], Papadopoulos G[1], Booth J[3]
[1]*Emerald Consulting Group, Sydney, Australia,* [2]*Shire, Sydney, Australia,* [3]*Shire, Cambridge, MA, USA*
OBJECTIVES: To estimate the overall health system costs of treating haemophilia A (HA) in Australia, using recombinant factor VIII (rFVIII), ADVATE. **METHODS:** A literature-based cost study for treatment of people with severe HA in the absence of inhibitors was undertaken. ADVATE treatment was assumed to be given prophylactically to prevent bleeding episodes or "on-demand" for a bleeding episode. Utilisation data for rFVIII were derived from the Australian Bleeding Disorders Registry. Total health system costs were calculated by summing the cost of rFVIII (prophylaxis and "on-demand" use), and other direct medical costs for treating bleeding episodes and any adverse events. All costs are reported in AUD2016. **RESULTS:** Australian data were available for only five identified variables associated with treating HA: cost per international unit of rFVIII; cost of some adverse events; rFVIII usage by haemophilia severity and treatment regimen; and cost of orthopaedic surgeries. Australian data were unavailable for important variables such as hospitalisations from bleeds, home therapy, orthopaedic procedures, joint abnormalities, and median annualised bleed rates, all of which are necessary to derive costs from a health system perspective. Utilising Australian data and supplementing international data where necessary, approximate health system costs for rFVIII ADVATE patients in the absence of inhibitors receiving prophylaxis treatment was AU$92,000 (AU$83,000 rFVIII treatment cost) and "on-demand" was $38,000 (AU $31,000 rFVIII treatment cost) per severe HA patient per annum. The population cost per annum was approximately AU$51,612,000 (AU$45,966,000 rFVIII treatment cost) for 640 severe HA patients in Australia receiving treatment in 2014/15. **CONCLUSIONS:** Utilising Australian cost data supplemented with international data, finds the cost of rFVIII (ADVATE) is reasonable for a very effective treatment in preventing and/or treating bleeding episodes and comparable to other government funded highly specialised and/or life-saving drugs in Australia. Further research into the societal cost and benefits of treating HA in Australia is warranted.

PSY62

COST-EFFECTIVENESS ANALYSIS OF STANDARD PROPHYLAXIS VERSUS ON-DEMAND TREATMENT IN SEVERE HEMOPHILIA A IN CHINA

Fang H[1], Chen C[1], Han L[2], Wu J[3]
[1]*QuintilesIMS, Shanghai, China,* [2]*Bayer Healthcare Company Ltd., Beijing, China,* [3]*Tianjin University, Tianjin, China*
OBJECTIVES: To present the first cost-effectiveness analysis comparing standard prophylaxis, i.e. prophylaxis with recombinant factor VIII from 2 to 16 years old then switching to on-demand treatment, with on-demand treatment, in treating severe hemophilia A patients in China. **METHODS:** The cost-effectiveness analysis was conducted from a societal perspective with a lifetime horizon. A Markov model was developed to reflect clinical practice in China's setting. Major events, including joint and total bleeds, major surgery, intracerebral hemorrhage, inhibitor development, outpatient visits, productivity loss and death were all considered. Clinical data and utility values were derived from multiple published studies, and resource

utilization and costs were estimated based on studies conducted in China and opinions from local experts. Analysis results were presented with incremental cost-effectiveness ratio (ICER). A threshold of 3 times local GDP per capita was applied. To test the robustness of base-case results, one-way and probabilistic sensitivity analyses were performed. Besides, scenario analyses were also undertaken to assess the impact of low-dose prophylaxis and no treatment for inhibitor. **RESULTS:** The base-case analysis favored standard prophylaxis as it is associated with lower costs (1,278,101 CNY) and higher QALYs (6.24 QALYs) per patient in lifetime. According to the one-way sensitivity analysis, this result was sensitive to the dosage of infusion in both strategies, the frequency of infusion in standard prophylaxis, and the frequency of bleeding. Probabilistic sensitivity analysis results demonstrated that over 80% simulations were lower than the cost-effectiveness threshold. Low-dose prophylaxis was also considered dominant compared with on-demand treatment. Without consideration of treatment for inhibitor, the ICER was estimated at 87,794 CNY per QALY gained, implying a cost-effective option for patients with severe hemophilia A in China. **CONCLUSIONS:** In the local context of China, standard prophylaxis for hemophilia A patients is a dominant strategy compared with standard on-demand treatment.

PSY63

COST-EFFECTIVENESS ANALYSIS OF MORPHINE MONOTHERAPY VERSUS FENTANYL MONOTHERAPY IN THE MANAGEMENT OF NEONATES UNDERGOING MECHANICAL VENTILATION IN THE INTENSIVE CARE SETTING IN QATAR

AbuShanab D[1], Alsoukhni O[2], Al-Badriyeh D[1], Abounahia FF[3]
[1]College of Pharmacy, Qatar University, Doha, Qatar, [2]Al-Wakra Hospital, Hamad Medical Corporation, Al-Wakra, Qatar, [3]Women's Hospital, Hamad Medical Corporation, Qatar, Doha, Qatar

OBJECTIVES: This study was to evaluate the clinical and economic impact of morphine monotherapy versus fentanyl monotherapy in mechanically ventilated neonates with respiratory distress syndrome in the Qatari neonatal NICU. **METHODS:** A retrospective cohort evaluation of 126 critically ill neonates on mechanical ventilation (MV) at the NICU of Hamad Medical Corporation (HMC), the main healthcare provider in Qatar, was conducted based on the medical records in within the duration from 2014 to 2016. Out of 126, 63 patients received morphine (100-200mcg/kg, followed by 15-30mcg/kg/hour continuous infusion) and 63 received fentanyl (0.5-3mcg/kg, followed by 1-5mcg/kg/hour continuous infusion). A decision analytic model followed the possible consequences of both sedatives. The primary clinical endpoint was the successful drug sedation rate, via the Premature Infant Pain Profile scoring scale. All cost data were from the perspective of HMC. Sensitivity and uncertainty analyses were conducted to enhance results robustness. **RESULTS:** Morphine achieved a successful sedation rate of 68.25%, compared to 42.85% with fentanyl. It also reduced the duration of MV and NICU stay to 5.0 days and 5.3 days, versus 10.6 days and 7.2 days with fentanyl. Also, less patients required high doses and alternative sedatives with morphine compared to fentanyl. Withdrawal symptoms nevertheless, tended to be higher in the neonates receiving morphine (0.1% versus 0%). Morphine was associated with an incremental cost-effectiveness ratio of QAR 31,847 per extra case of sedation, compared to fentanyl. Results were reported with 80% power and 0.05 significance level. **CONCLUSIONS:** This is the first cost-effectiveness evaluation of morphine versus fentanyl in NICU in literature, and is the first local clinical and/or economic evidence in relation to these in Qatar. Morphine produces significantly improved sedation and agitation levels over fentanyl. This contributes to a shorter length of stay at NICU and greater weaning from mechanical ventilation. This however comes at an increased cost.

PSY64

COST CONSEQUENCE MODEL COMPARING ELTROMBOPAG AND ROMIPLOSTIM FOR ADULT PATIENTS WITH PREVIOUSLY-TREATED CHRONIC IMMUNE THROMBOCYTOPENIA

Tremblay G[1], Dolph M[1], Bhor M[2], Elliott B[2]
[1]Purple Squirrel Economics, New York, NY, USA, [2]Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA

OBJECTIVES: This study's objective was to develop a Cost-Consequence Model comparing eltrombopag versus romiplostim for adult patients with Chronic Immune Thrombocytopenia (cITP) in the US. **METHODS:** A cost-consequence model was developed using a decision tree approach to evaluate the costs relative to treatment success of eltrombopag (ELT), romiplastim (ROM), and watch and rescue (W&R) in previously treated patients. Data on platelet count response rate, bleeding events, and adverse events were derived from all identified phase III registered clinical trials. Since none of the included treatments were compared in head-to-head trials, health outcomes were compared via indirect treatment comparison. Costs incorporated in the model included drug and administration, routine care, rescue medication, bleeding-related adverse event, other adverse event and mortality costs. **RESULTS:** In the ITT population, overall estimated cost per patient for eltrombopag was $66,560, compared with $92,631 for romiplostim and $30,099 for W&R. Compared with the ITT population, this difference in cost between ELT and ROM was greater in splenectomised patients and slightly less in non-splenectomised patients, though the overall trend remained the same. When assessing cost per severe bleeding avoided in the ITT population, ELT dominated (was less expensive and more effective than) ROM. Regarding costs per responder, ROM showed an incremental benefit over ELT of 23.1%, yielding an ICER of $113,055. Sensitivity analysis results were also consistent with the basecase findings, with results most sensitive to variations in platelet response and changes in primary therapy prices. **CONCLUSIONS:** TPO-R agonists (including eltrombopag and romiplostim) are favourable options for the treatment of adults with chronic ITP who have had an insufficient response to corticosteroids or immunoglobulins. Eltrombopag was shown to be a relatively efficient use of resources to treat chronic immune thrombocytopenia when indirectly compared to romiplostim, largely driven by its favorable severe bleeding outcomes.

PSY65

COST PER RESPONDER ANALYSIS OF USTEKINUMAB VERSUS SECUKINUMAB FOR THE TREATMENT OF MODERATE TO SEVERE PSORIASIS UNDER THE BRAZILIAN PUBLIC HEALTHCARE SYSTEM PERSPECTIVE

Araujo RL[1], Scaccabarozzi L[2], Asano E[3]
[1]Janssen-Cilag Farmaceutica Ltda, São Paulo, Brazil, [2]Janssen, São Paulo, Brazil, [3]Janssen Pharmaceuticals, São Paulo, Brazil

OBJECTIVES: Recently, the treatment paradigm of plaque psoriasis (PsO) has evolved with the advent of biologic therapies, mainly novel interleukin inhibitors. This study aims to estimate the cost per responder of ustekinumab (UST) compared to secukinumab (SEC) in patients with moderate to severe PsO from the Brazilian public healthcare system perspective. **METHODS:** Treatment costs and cost per PASI response were calculated and compared between UST and SEC in year 1 and year 2 of treatment onwards. Annual treatment costs included only drug acquisition costs, gathered from the official price list for government purchase, and were calculated for an average patient weighting $\leq$ 100kg, following dosage described in each drug label. Efficacy data on PASI responses were derived from the CLEAR study, a head-to-head 52-week trial. Cost per PASI response was calculated as the annual cost divided by the proportion of patients reaching PASI90 response at week 52. Univariate sensitivity analysis was performed to test the robustness of the model. **RESULTS:** Treatment costs were lower for UST when compared to SEC in both year 1 and year 2 of treatment onwards, resulting in savings of BRL 54,208 after 2 years of treatment. UST also presented lower cost per PASI 90 response compared to SEC in both year 1 (BRL 76,692 versus BRL 104,150) and year 2 of treatment onwards (BRL 65,955 versus 78,113). Univariate sensitivity analysis showed that, for patients weighting $>$ 100kg or requiring UST dose escalation, SEC presented lower cost per PASI 90 response compared to UST. **CONCLUSIONS:** From the Brazilian public healthcare system perspective, UST was estimated to present lower treatment cost and lower cost per PASI 90 response compared to SEC for the majority of patients ($\leq$ 100 kg), still with the advantage of favorable dosing (four administrations per year).

PSY66

COST PER RESPONDER ANALYSIS OF USTEKINUMAB VERSUS SECUKINUMAB FOR THE TREATMENT OF MODERATE TO SEVERE PSORIASIS UNDER THE BRAZILIAN PRIVATE HEALTHCARE SYSTEM PERSPECTIVE

Araujo RL[1], Scaccabarozzi L[2], Asano E[3]
[1]Janssen-Cilag Farmaceutica Ltda, São Paulo, Brazil, [2]Janssen, São Paulo, Brazil, [3]Janssen Pharmaceuticals, São Paulo, Brazil

OBJECTIVES: Recently, the treatment paradigm of plaque psoriasis (PsO) has evolved with the advent of biologic therapies, mainly novel interleukin inhibitors. This study aims to estimate the cost per responder of ustekinumab (UST) compared to secukinumab (SEC) in patients with moderate to severe PsO from the Brazilian private healthcare system perspective. **METHODS:** Treatment costs and cost per PASI response were calculated and compared between UST and SEC in year 1 and year 2 of treatment onwards. Annual treatment costs included only drug acquisition costs, gathered from the official price list, and were calculated for an average patient weighting $\leq$ 100kg, following dosage described in each drug label. Efficacy data on PASI responses were derived from the CLEAR study, a head-to-head 52-week trial. Cost per PASI response was calculated as the annual cost divided by the proportion of patients reaching PASI 90 response at week 52. Univariate sensitivity analysis was performed to test the robustness of the model. **RESULTS:** Treatment costs were lower for UST when compared to SEC in both year 1 and year 2 of treatment onwards, resulting in savings of BRL 66,107 after 2 years of treatment. UST also presented lower cost per PASI 90 response compared to SEC in both year 1 (BRL 93,527 versus BRL 127,013) and year 2 of treatment onwards (BRL 80,433 versus 95,260). Univariate sensitivity analysis showed that, for patients weighting $>$ 100kg or requiring UST dose escalation, SEC presented lower cost per PASI 90 response compared to UST. **CONCLUSIONS:** From the Brazilian private healthcare system perspective, UST was estimated to present lower treatment cost and lower cost per PASI 90 response compared to SEC for the majority of patients ($\leq$ 100 kg), still with the advantage of favorable dosing (four administrations per year).

PSY67

PHARMACOECONOMICS ANALYSIS OF MORPHINE MONOTHERAPY VERSUS MORPHINE PLUS MIDAZOLAM COMBINATION FOR CRITICALLY ILL NEONATES UNDERGOING MECHANICAL VENTILATION AT THE INTENSIVE CARE SETTING IN QATAR

AbuShanab D[1], Alsoukhni O[2], Al-Badriyeh D[1], Abounahia FF[3]
[1]College of Pharmacy, Qatar University, Doha, Qatar, [2]Al-Wakra Hospital, Hamad Medical Corporation, Al-Wakra, Qatar, [3]Women's Hospital, Hamad Medical Corporation, Qatar, Doha, Qatar

OBJECTIVES: No clinical or economic literature evidence of how morphine compares to its use in a combination exists. The current study was to conduct a clinical and economic analysis of morphine monotherapy versus morphine plus midazolam combination as sedatives in critically ill neonates on mechanical ventilation (MV) with respiratory distress syndrome in ICU. **METHODS:** A comparative retrospective cohort study comprised of 64 medical records of mechanically ventilated neonates in 2014-2016 at the neonatal ICU (NICU) of Hamad Medical Corporation (HMC), the main health provider in Qatar, was carried out from the hospital perspective. Sample size calculations were to achieve 80% power and 0.05 significance. Patients received either morphine (100-200mcg/kg, followed by 15-30mcg/kg/hour continuous infusion) or morphine based analgesic using midazolam (0.1-0.2mg/kg, followed by 0.01-0.06mg/kg/hour). A decision analytic model that follows the possible therapy consequences was developed. As the primary clinical endpoint, sedation success was defined as per the Premature Infant Pain Profile scoring scale. Uncertainty Monte Carlo simulation analyses were performed to confirm robustness. **RESULTS:** The base case probabilistic

analysis demonstrated that morphine monotherapy dominated the combination of morphine and midazolam, with a net cost saving of QAR 13,067 per patient and a 65.6% successful sedation rate, compared to 34.4%. The administration of morphine alone without an analgesic reduced the duration of mechanical ventilation and NICU stays to 9.5 and 7.0 days, respectively, compared to 25.1 and 34.4 days with the morphine plus midazolam combination. Add to this that neonates receiving monotherapy regimen had less administrations of higher doses and alternative sedatives (9.1% and 9.1%, versus 34.37% and 23.80%, respectively). **CONCLUSIONS:** With significantly higher clinical effectiveness and lesser cost, morphine monotherapy is superior to the morphine plus midazolam combination in the critically ill neonates who require MV. This regimen was better tolerated; allowing for more optimal pain management and improved weaning process from MV.

PSY68

COST-EFFECTIVENESS ANALYSIS OF 5% LIDOCAINE MEDICATED PLASTER MONOTHERAPY VERSUS PREGABALIN OR GABAPENTIN IN THE TREATMENT OF POST HERPETIC NEURALGIA AND DIABETIC POLYNEUROPATHY UNDER THE PERSPECTIVE OF BRAZILIAN PUBLIC HEALTHCARE SYSTEM

Piedade AD[1], Kashiura D[1], Engel T[1], Rodrigues CR[2]
[1]*Evidências - Kantar Health, São Paulo, Brazil,* [2]*Grunenthal do Brasil Farmacêutica Ltda, São Paulo, Brazil*

OBJECTIVES: To evaluate the cost-effectiveness of the use of 5% lidocaine medicated plaster (LMP) monotherapy, compared with pregabalin and gabapentin, in the treatment of postherpetic neuralgia (PHN) and diabetic polyneuropathy (DPN) in the Brazilian public healthcare system. **METHODS:** A systematic review was performed to compare the use of LMP with placebo or active comparators on neuropathic pain management. Based on the results, disease and efficacy data were selected. PHN and DPN were the most studied neuropathic pain conditions and therefore selected. Since both diseases were evaluated together, the same structure could be used for both analyses, with minor adaptations. Two comparators were selected: pregabalin, the main comparator in clinical trials, and gabapentin, the most used drug in clinical practice. A Markov model was built based on published cost-effectiveness studies, and consisted of 6 states covering treatment, adverse events and discontinuation. The time horizon had 6 months with monthly cycles. Transition probabilities were extracted from clinical trials, head-to-head for pregabalin and placebo controlled for gabapentin. Benefits were measured in quality-adjusted life-years (QALYs), to account the improvement in adverse events. Resource use was retrieved from literature and direct medical costs were estimated based on public sources. A one-way sensitivity analysis was performed to evaluate model's robustness. Values were expressed in 2016 BRL. **RESULTS:** Incremental cost-effectiveness ratio (ICER) of LPM versus pregabalin and gabapentin were 19,256.33 BRL/QALY and 19,102.47 BRL/QALY for PHN, and 19,244.16 BRL/QALY and 23,208.75 BRL/QALY for DPN. All results from the sensitivity analysis were below the threshold recommended by WHO of 1 GDP per capita (27,229.00 BRL), and the most sensitive parameter was the mean number of plasters used. **CONCLUSIONS:** LDM monotherapy was considered highly cost-effective for the treatment of PHN and DPN compared with pregabalin or gabapentin in the Brazilian public healthcare system.

IFABOND (VITALITEC) SURGICAL GLUE IN LAPAROSCOPIC SLEEVE GASTRECTOMY: AN INITIAL EXPERIENCE AND COST EFFECTIVENESS ANALYSIS

Bourel G, Mercier G, Nocca D, Loureiro M, Georgescu V, Lefebvre P, Fabre JM
CHU Montpellier, Montpellier, France

OBJECTIVES: Laparoscopic sleeve gastrectomy (LSG) is one of the most common bariatric procedures. Gastric leaks and bleeding are the most frequent complications, associated with a high clinical and economic burden. The best method of staple line reinforcement in LSG is debated. Surgical glue is one of the options available. The aim of this study was to assess the safety, efficiency and relative cost-effectiveness of surgical glue used to perform laparoscopic sleeve gastrectomy in morbid obese adults as compared to standard stapling. **METHODS:** A prospective, observational and comparative before-after study was conducted. All consecutive patients undergoing LSG at Montpellier University Hospital in 2011 and 2012 were included and treated according to two groups: standard stapling (n=99, Group 1) and surgical glue reinforcement (n=94, Group 2). Clinical and economic outcomes were measured after 6 months. **RESULTS:** The duration of intervention was significantly shorter in Group 2 (68 vs. 82 minutes, p=0.001). There was no significant difference regarding complications but leaks in Group 1 were more severe. Group 2 was also associated with a reduced initial length of stay (4.8 vs. 5.2 days, p=0.01). Six-month readmissions, and total length of stay was also shorter in group 2 (5.5 vs. 6.1 days, p=0.003). Surgical glue use was associated with a significant reduction in the initial inpatient cost (5488 vs. 6152 €, p=0.005) and in the 6-month total inpatient cost including readmissions (6006 vs. 6754 €, p=0.005). The incremental cost of glue to avoid a severe complication was -5446.33 € (95CI: -8202.01; -2690.66). **CONCLUSIONS:** IFABOND® surgical glue might be a safe and cost-effective intervention in laparoscopic sleeve gastrectomy.

PSY70

COST-EFFECTIVENESS OF RITUXIMAB-BASED CHEMOTHERAPY COMBINATIONS FOR THE INTIAL THERAPY OF FOLLICULAR LYMPHOMA

Shah G[1], Winn A[2], Kumar A[3], Lin P[3], Parsons S[3]
[1]*Memorial Sloan Kettering Cancer Center, New York, MA, USA,* [2]*The University of North Carolina at Chapel Hill, Chapel Hill, MA, USA,* [3]*Tufts Medical Center, Boston, MA, USA*

OBJECTIVES: Rituximab based chemotherapy combinations are used to treat elderly patients with follicular lymphoma (FL), but the optimal regimen is unknown. We aimed to identify the cost-effectivness of first line rituximab-based combinations. **METHODS:** Stage II-IV grade 1-3 FL patients >65 diagnosed between 2001-2010 who received chemotherapy within 6 months of diagnosis were identified using SEER. Healthcare costs from linked Medicare claims through 2014 were used to estimate costs using a phase of care approach and to calculate the incremental cost-effectiveness ratio (ICER). **RESULTS:** Of the 2,827 pts, 587 received rituximab, cyclophosphamide, doxorubicin, vincristine, and prednisone (R-CHOP); 422 rituximab, cyclophosphamide, vincristine, and prednisone (R-CVP); and 576 another rituximab combination (R-other). R-CHOP was more common in pts <75 (p<0.01), males (p=0.01), less comorbid (p<0.01), advanced stage disease (p=0.05), married (p<0.01), and those treated in a big metro area (p<0.01). Propensity weighting adjusted these differences prior to the analysis. Mean overall survival was 9.19 years for pts treated with R-CHOP, which was 0.19 years longer than R-CVP and 0.87 years longer than R-other. Total cost of care was $162,300 for R-CHOP, $141,000 for R-CVP, and $145,100 for R-other. The ICER for R-CHOP vs R-CVP was $19,800/LY, while for R-CHOP vs R-other $21,200/LY. For pts living longer than 2 years, mean monthly cost for the 1styear after diagnosis was $1800, $1600, & $1600; and for the last year of life, $5900, $5700, & $4700 for R-CHOP, R-CVP, and R-other, respectively. **CONCLUSIONS:** In this first real world analysis comparing rituximab based combinations in older paients with FL, the addition of an anthracycline significantly prolongs overall survival after adjusting for baseline factors and is cost-effective. Additional research is needed to compare therapy after relapse as newer agents are expensive and likely contribute to the dramatic difference in cost between the first year after diagnosis and the last year of life.

PSY71

INCREMENTAL COST-EFFECTIVENESS ANALYSIS OF BIOLOGICAL DRUG THERAPIES FOR THE TREATMENT OF ANKYLOSING SPONDYLITIS IN BULGARIA, 2016

Djambazov S, Vekov T
Medical University Pleven, Pleven, Bulgaria

OBJECTIVES: Biological therapies, alone or in combination with other medications, are used as second or subsequent therapy line in the treatment of ankylosing spondylitis (AS). The biologics authorized in Bulgaria in August 2016 are etanercept (ETA), infliximab (INF), adalimumab (ADA), golimumab (GOL), cetrolizumab (CER), and secukinumab (SEC). The objective of the study is to assess the incremental costs (Δcosts), incremental health benefits (ΔQALY) and incremental ratio (ICER) of the biological therapies for AS in Bulgaria. **METHODS:** The data on SEC efficacy have been derived from two randomized multicenter clinical trials: MEASURE-1 and MEASURE-2. Long-term data on therapeutic efficacy have been modelled using a model of RTI Health Solutions. The data on therapeutic efficacy are directly transferred in the local environment from the clinical trials and the applied model. The data on costs of the alternatives are based on the reference prices of ETA, INF, ADA, GOL, CER and SEC published in the Positive Drug List. Other direct or indirect health costs, besides the drug therapy costs, are not included in the analysis as they are considered comparable in the various therapeutic alternatives in the Bulgarian healthcare setting. **RESULTS:** The analysis of adapted data on SEC cost-effectiveness of AS in Bulgaria shows that SEC dominates CER, ETA, ADA, GOL and if we consider a cost-effectiveness threshold three times GDP per capita in Bulgaria (WTPth 36 221 BGN, 2015), is a cost-effective therapy in comparison to INF (ICER 27 552 BGN/QALY). **CONCLUSIONS:** The pharmacotherapeutic guidelines based on both clinical data on therapeutic efficacy and safety and economic data on comparative cost-effectiveness of potential biological therapeutic alternatives for the treatment of AS, recommend SEC as first choice for second line in AS treatment in Bulgaria, after failure of conventional therapy, as well as for third line after failure of anti-TNFα therapy.

PSY72

SYSTEMATIC ASSESSMENT OF DECISION ANALYTIC MODELS FOR THE COST EFFECTIVENESS OF BARIATRIC SURGERY

Alsumali A[1], Al-Hawage A[1], Samnaliev M[2], Rittenhouse B[1], Seoane-Vazquez E[3], Eguale T[1]
[1]*MCPHS University, Boston, MA, USA,* [2]*Harvard University, Boston, MA, USA,* [3]*Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA*

OBJECTIVES: To systematically review the methodological approaches in published cost effectiveness models of bariatric surgery. **METHODS:** A systematic literature search from different databases with an end date of September 4, 2016 was done. The search was limited to English studies, cost effectiveness models comparing bariatric surgeries with non-surgical interventions and those reporting quality adjusted life years. The quality of reporting the models was performed by using CHEERS statement. **RESULTS:** The initial search for title and abstract screening resulted in 691 articles. 18 economic evaluation studies were included in the final review. The reporting quality scores of most articles were rated as acceptable, between 61% and 100%. Of the included 18 studies, 8 only were done in the USA. Most studies (89%) were modeled for adult age range between 25 and 75 years old. Half of the studies evaluated bariatric surgery versus no treatment and the other half compered bariatric surgery to medical management or conventional therapy. Sixty one percent of studies defined their health states by the existence or absence of different obesity-related comorbidities. Only 11% of studies took the societal prospective. Productivity was not captured in the societal prospective but travel time was accounted for. The time horizons varied, but 61% of studies used a lifetime horizon. Thirty nine percent of studies identified the extent of weight loss as the most sensitive and influential parameter. Seventeen percent of studies did not conduct any model validation.**CONCLUSIONS:** Cost effectiveness models of bariatric surgery had different modeling approaches and quality levels. Future cost effectiveness models should consider the adolescent population because few cost-effectiveness studies have addressed this population in which the use of bariatric surgery is rising. Also, future models should include class I obesity and overweight patients, since some studies have claimed that bariatric surgery is of benefit to lower BMI patients also.

PSY73

ECONOMIC EVALUATION OF THE USE OF IBUPROFEN AS AN NSAID WITH ANALGESIC ACTION FOR THE TREATMENT OF PATIENTS WITH ACUTE PAIN

Gonzalez E[1], Morales E[1], Figueroa A[2], Gutierrez M[2], Ortiz M[2]
[1]Progela S.A. de C.V., Mexico City, Mexico, [2]Pharmamanagement EAS S de RL de CV, Cuidad de México, Mexico

OBJECTIVES: To perform a complete economic evaluation of Ibuprofen as an NSAID with analgesic action for the treatment of patients with acute pain, compared to the therapeutic alternatives considered in the Basic Medication Formulary of IMSS (CBMIMSS for its acronym in Spanish). **METHODS:** A systematic review of the use of Ibuprofen as a non-steroidal anti-inflammatory with analgesic action for the treatment of acute pain was carried out. A meta-analysis was necessary to verify the therapeutic similarity of Ibuprofen vs available CBMIMSS comparators. Given the therapeutic similarity of these options, a cost minimization was the economic analysis performed, in addition to a budget impact analysis (BIA). **RESULTS:** The cost of treatment with ibuprofen represents one-third of the cost of treating patients with acute pain with the most expensive alternative (Lysine Clonixinate) $5.88 vs $18.53 (MXN), while the difference in cost vs Paracetamol is $4.27 for the presentation of 200mg and $2.93 for the presentation of 400mg. The BIA showed that the introduction of Ibuprofen would generate a saving of $23,652.27 in the first year; on average it will have a potential saving of $73,301.74 and an average saving percentage of 0.00015583% of the total budget. **CONCLUSIONS:** Based on the results found in the present study, it is possible to conclude that the use of Ibuprofen 400mg, is a cost-saving alternative in compatison to the therapeutic alternatives available in the CBMIMSS such as paracetamol, acetyl salicylic acid, Ketorolac, Lysine, clonixinate and metamizole.

PSY74

COST EFFECTIVENESS OF BARIATRIC SURGERY FOR MORBID OBESITY IN USA

Alsumali A[1], Eguale T[1], Rittenhouse B[1], Bairdain S[2], Seoane-Vazquez E[3], Samnaliev M[4]
[1]MCPHS University, Boston, MA, USA, [2]George Washington University, Washington, DC, USA, [3]Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA, [4]Harvard University, Boston, MA, USA

OBJECTIVES: To evaluate the cost–effectiveness of bariatric surgery using three different techniques – (Laparoscopic Roux-en-Y Gastric Bypass (LRYGB), Laparoscopic Adjustable Gastric Banding (LAGB) and Laparoscopic Sleeve Gastrectomy (LSG)) – as treatment for morbid obesity in USA. **METHODS:** A microsimulation model was developed over a lifetime horizon to simulate weight change, cardiometabolic comorbidities status, health consequences and costs of bariatric surgery for morbid obesity. Incremental cost-effectiveness ratios (ICERs) in terms of cost per quality-adjusted life-year (QALY) gained were used in the model. Surgical effectiveness was derived from observational studies and randomized clinical trials. Surgical complication rates, adverse events, the remission of cardiometabolic comorbidities, mortality rates, costs, utilities and other model parameters were estimated from publicly available databases and published literature. The discount rate for costs (2016 US dollars) and QALYs was 3%. **RESULTS:** Under conservative assumptions, all techniques enhanced health outcomes at lower cost (cost saving) compared to no surgery for patients with cardiometabolic comorbidities (type 2 diabetes, hypertension and or dyslipidemia). However, bariatric surgery was not cost saving for patients without comorbidities. LRYGB is cost effective with higher QALYs (16.44) and lower cost ($168,927) than LSG (15.74 QALY; $187,587), LAGB (15.08 QALY; $200,539) and no surgery (13.43 QALY; $251,917) for patients with cardiometabolic comorbidities. In addition, LRYGB is cost effective for patients without comorbidities (17.53 QALY; $137,879) compared with LSG (17.16 QALY; $136,041), LAGB (16.68 QALY; $130,971) and no surgery (15.15 QALY; $117,367), having the maximum net monetary benefit (NMB) over a willingness to pay (WTP) range form $0-250,000. Sensitivity analysis showed robustness to reasonable variation in overall model parameters. **CONCLUSIONS:** All types of bariatric surgeries showed significant weight loss compared to no surgery. LRYGB is the optimal bariatric technique, being cost effective compared with LSG, LAGB and no surgery options.

PSY75

COST-UTILITY ANALYSIS FOR BARIATRIC SURGERY COMPARED WITH USUAL CARE FOR THE TREATMENT OF OBESITY IN AUSTRALIA

James R[1], Salton R[2], Byrnes J[1], Scuffham P[1]
[1]Griffith University, Brisbane, Australia, [2]Center for Applied Health Economics, Brisbane, Australia

OBJECTIVES: To determine the cost-effectiveness of adjustable gastric banding (AGB), Roux-En-Y gastric bypass (RYGB) and sleeve gastrectomy (SG) versus usual care (UC) from the perspective of the Australian public healthcare system. **METHODS:** A Markov model was constructed to simulate the costs and outcomes for four approaches to managing obesity. The base-case was a 30-year-old Australian female with a body mass index (BMI) > 35. Subgroup analysis was conducted to account for the effect of diabetes as well as various differences in cohort characteristics. Uncertainty was characterised by one-way and probabilistic sensitivity analyses. **RESULTS:** All bariatric surgeries were effective. The incremental cost-effectiveness ratios were similar at $24,454 for AGB, $22,645 for RYGB and $27,523 for SG compared to UC. At a willingness to pay threshold of $70,000 per quality-adjusted life year (QALY), the probabilities of being cost-effective were 64%, 75% and 71% for AGB, RYGB and SG, respectively. Subgroup analysis showed that bariatric procedures are less cost-effective for older cohorts. For those with diabetes, all the procedures were dominant in comparison to UC. **CONCLUSIONS:** This model shows that all bariatric procedures are a cost-effective treatment for the management of obese patients. When given to a subgroup with diabetes, bariatric interventions become cost-saving.

PSY76

REAL-WORLD HEALTH CARE UTILIZATION COSTS IN HEMOPHILIA B PATIENTS USING STANDARD AND EXTENDED HALF-LIFE RECOMBINANT FACTOR IX PRODUCTS

Chhabra A[1], Alvir J[1], Tortella BJ[2], Fogarty PF[2], Spurden D[3], McDonald M[3], Pleil A[4]
[1]Pfizer Inc, New York, NY, USA, [2]Pfizer Inc, Collegeville, PA, USA, [3]Pfizer Limited, Surrey, UK, [4]Pfizer, Inc, San Diego, CA, USA

OBJECTIVES: Management of hemophilia B includes replacement of factor IX (FIX) by intravenous infusion. The recent introduction of an extended half-life (EHL) FIX product enabled comparison of health care costs and factor utilization for hemophilia B patients who switched from a standard half-life (SHL) to EHL FIX product. **METHODS:** The Truven MarketScan US claims database (January 2010–July 2016) was used to compute health care utilization costs for patients with claims data for ≥3 months prior to and after switching from SHL to EHL product. Total health care costs included FIX replacement cost (drug cost) as well as hemophilia-related inpatient and outpatient costs. Data were analyzed 12 months before and after switching FIX products. **RESULTS:** Fourteen patients with hemophilia B in Truven database switched to EHL product. Total health care utilization costs were uniformly higher in the EHL phase (post-switch) in each of the corresponding 3-month time periods examined before and after the switch. Factor replacement accounted for 96%–100% of quarterly total health care utilization costs. Median quarterly total health care costs were $51,881, $80,589, $89,389, $56,076 (SHL), and $205,845, $185,988, $147,514, $175,667 (EHL), while median quarterly factor costs were $51,881, $77,523, $89,389, $55,726 (SHL), and $205,724, $183,451, $147,363, $173,515 (EHL) in the 12–10 (n=9), 9–7 (n=10), 6–4 (n=12), 3–1 and 1–3, 4–6 (n=12), 7–9 (n=8), and 10–12 (n=7) months pre- and post-switch, respectively. Median quarterly FIX IUs were 39,000, 58,465, 68,790, 43,310 (SHL), and 74,056, 64,111, 53,083, 43276 (EHL), respectively, in these periods. **CONCLUSIONS:** This real-world data analysis showed switching from SHL to EHL product was associated with more variable and higher health care costs in the US. Factor cost was the biggest driver of total health care costs. Further real-world analyses incorporating larger numbers of patients should be explored.

PSY77

HEALTHCARE AND MEDICAL SERVICE USE AMONG PATIENTS WITH ANGELMAN SYNDROME (AS): RESULTS FROM THE AS NATURAL HISTORY STUDY

Cabo R[1], Khan N[1], Tan W[2], Tayag R[3], Bedadala P[3], LaVallee N[3], Bird LM[4]
[1]Ovid Therapeutics, New York, NY, USA, [2]Boston Children's Hospital, Boston, MA, USA, [3]Prometrika, LLC, Cambridge, MA, USA, [4]University of California San Diego, San Diego, CA, USA

OBJECTIVES: Angelman syndrome (AS) is a rare neurodevelopmental genetic disorder. There are four etiologies of AS, with maternal chromosome 15q11q13 deletion accounting for most cases. This study describes healthcare resource use (HRU) and medical service use (MSU) among patients with AS and compares use by molecular subtype. **METHODS:** The AS Natural History study (NHS) is a longitudinal observational study on the development, behavior, and medical problems of individuals with AS. Caregiver-reported information collected at the baseline visit was used to assess HRU and MSU. HRU measures included hospitalization, surgery, and medication use. MSU included early childhood intervention (EI), physical therapy (PT), occupational therapy (OT), and speech therapy (ST). **RESULTS:** Data were available on 302 patients. Mean age at baseline visit was 6.0+5.9 years (range: 0.4 to 40.6) and 70% had deletion subtype. Sixty-eight percent of patients had at least one hospitalization; average number of hospitalizations was 2.3 (95% CI: 2.1-2.5) and average length of stay was 4.5 days (95% CI: 3.8-5.2). Most common reasons for hospitalization were seizures (40%), lower respiratory infection (21%), and surgery (11%). Fifty-seven percent of patients had at least one surgery, for insertion of ear tubes (34%), strabismus (30%), tonsillectomy and adenoidectomy (25%), and G-tube/fundoplication (8%). The most frequently prescribed medications were anticonvulsants (clonazepam (24%), levetiracetam (22%), valproic acid (22%), and topiramate (16%)) and gastro-esophageal reflux disease medications (ranitidine (24%) and lansoprazole (19%)). Non-prescription medication use included melatonin (42%) and various supplements (34%). Resource use was high, with participants receiving EI (95%), PT (90%), OT (88%) and ST (86%). HRU and MSU were similar when comparing patients with deletions to those with other molecular subtypes. **CONCLUSIONS:** This is the first study to evaluate HRU and MSU among AS patients. Results show high hospitalization rate and high MSU; use does not vary with molecular subtype.

PSY78

TREATMENT PATTERNS AND RESOURCE COSTS ASSOCIATED WITH THE MANAGEMENT OF PRIMARY BILIARY CIRRHOSIS

Ghali P[1], Baribeau V[2], Lachaine J[3]
[1]Research Institute of McGill University Health Centre, Montreal, QC, Canada, [2]PeriPharm Inc., Montreal, QC, Canada, [3]Université de Montréal, Montreal, QC, Canada

OBJECTIVES: The purpose of this study was to describe treatment patterns, resource utilization and costs associated with the management of PBC in a real life setting. **METHODS:** This study was performed using data from the Quebec public drug plan database (RAMQ). Patients with at least two diagnoses of biliary cirrhosis and a prescription of ursodiol between January 2008 and May 2015, and with enrolment in the drug plan during the study period were selected. A control group of non-PBC patients matched for age group and gender was selected from a random sample of individuals covered by the RAMQ in a 1:10 ratio. **RESULTS:** A total of 158 PBC patients and a control group of 1,580 matched non-PBC patients were included in this study. The average age was 63.2 years (SD=12.7) and 84.2% of PBC patients were women. The treatment with ursodiol had an average duration of 4.1 years (SD=2.5) and the majority of users did not use other medications before (91.8%), during (57.0%) and after (88.6%) ursodiol treatment. Prednisone was the treatment most often used in concomitance with ursodiol (22.2%). The 1-year rate of ursodiol discontinuation was 10.8% (95% CI:5.9-15.7)

and the 4-year rate was 22.1% (95% CI:15.2-29.0). The mean total health care cost per patient per year was significantly higher among PBC patients than non-PBC patients (17,283$CAN; SD=35,046 vs. 3,970$CAN; SD=6,426, mean difference=13,313$CAN). The primary driver of PBC patients' total health care cost was the hospitalization cost (8,809$CAN) while the prescription drug cost was 5,365$CAN and the physicians' visit and procedure cost was 2,855$CAN. The mean number of hospitalization per year was 0.9 (mean duration=8.9 days), with 73.4% of PBC patients with at least one hospitalization. **CONCLUSIONS:** Total health care costs incurred by PBC patients in comparison with non-PBC patients confirm the significant economic burden associated with this condition.

PSY79

HOSPITAL RESOURCE UTILIZATION IN HEREDITARY AND NON-HEREDITARY HYPOGAMMAGLOBULINEMIA PATIENTS

Belk K, Craver CW
Vizient Inc., Mooresville, NC, USA

OBJECTIVES: Hypogammaglobulinemia (HG) is an immune disorder characterized by a lack in production of gamma globulins. Due to immune deficiencies, patients with HG often have recurrent infections. The purpose of this analysis is to examine hospital resource utilization in patients diagnosed with HG. **METHODS:** A retrospective analysis was conducted on a cross-section of HG discharges in the MedAssets health system data for October 2015 through September 2016 discharges. Between group differences were tested using Chi-Square for categorical variables and ANOVA for continuous variables. Multivariable logistic regression was used to identify significant drivers of inpatient admission. **RESULTS:** The sample population included 8670 patients treated in 283 U.S. hospitals. Only 3.1% were diagnosed with hereditary HG (HHG). Not surprisingly the HHG cohort was primarily male (72.1%) however the non-hereditary HG (NHHG) cohort had more females (59.5%). HHG patients were significantly younger (32.7 vs 59.7, $p<.0001$) and had significantly lower Charlson Comorbidity Index scores (1.1 vs 3.0, $p<.0001$). The most common comorbidities for HHG included chronic pulmonary disease (CPD, 34.6%), cancer (11.2%), and anemia (10.4%). Cancer (42.5%), CPD (37.5%), other metabolic disorders (29.1%), and anemia (25.5%) were most prevalent in NHHG. Infections were more common in the NHHG cohort (12.2% vs 6.9%, $p<.0001$). HHG patients had slightly more visits overall (4.0 vs 3.4, $p=.0308$). Inpatient utilization was higher for NHHG (9.8% vs 5.0%, $p<.0001$) with longer lengths of stay (11.5 vs 6.3 days, $p<.0001$). The greatest predictors of inpatient admission included respiratory failure (OR=17.6, $p<.0001$), infection (OR=8.6, $p<.0001$), malnutrition (OR=7.1, $p<.0001$), and epilepsy (OR=4.5, $p<.0001$). **CONCLUSIONS:** Although HHG and NHHG are both characterized by decreased production in antibodies, many differences exist in the characteristics and comorbidities between these patients. Furthermore, hospital resource utilization varies across these cohorts.

PSY80

A COMPARISON OF GDP-ADJUSTED ORPHAN DRUG PRICES IN 12 EUROPEAN COUNTRIES

Young KE[1], Soussi I[2], Toumi M[3]
[1]*Creativ-Ceutical, Paris, France,* [2]*Creativ-Ceutical, Tunis, Tunisia,* [3]*Aix-Marseille University, Marseille, France*

OBJECTIVES: The study compared the price differences of orphan drugs among countries by comparing the annual treatment cost per patient adjusted by nominal GDP per capita, GDP in PPP per capita, % GDP contributed by the government, government budget per inhabitant, % GDP spent on healthcare, % GDP spent on pharmaceuticals, and average annual salary of similarly available orphan drugs in low and high GDP countries in Europe: France, Germany, Italy, Norway, Spain, Sweden, UK, Greece, Poland, Bulgaria, Romania, Hungary. **METHODS:** Orphan drugs granted market authorisation up to June 13, 2016 were extracted from the European Medicines Agency (EMA) website. The annual treatment costs per drug were calculated using ex-factory prices from IHS POLI and country price databases. GDP-related figures were extracted from the OECD website. The annual treatment costs were divided by each GDP-related variable to compute for the relative costs. An international comparison of the relative costs was done and results were analysed. **RESULTS:** 120 orphan drugs were included in the analysis. The median annual costs of orphan drugs in all countries varied minimally with cost ratios ranging from 0.87 to 1.08. When the annual costs were adjusted by GDP per capita, EU-5 and the Nordics maintained the minimal differences in median cost ratios: UK 1, FR 1.26, DE 1.15, IT 1.55, ES 1.65, SE 0.91, NO 0.51. However, the lower GDP countries showed relevantly higher relative costs: GR 2.47, PL 3.44, BG 6.27, RO 4.56, HU 3.29. The same relative cost pattern was evident when adjusted with the other GDP-related variables. **CONCLUSIONS:** Individual orphan drug prices may vary widely across European countries but the median differences are relatively minor. However, when the country's ability to pay was taken into consideration using GDP indicators, lower GDP countries pay relatively higher costs for similarly available orphan drugs in Europe.

SYSTEMIC DISORDERS/CONDITIONS – Patient-Reported Outcomes & Patient Preference Studies

PSY81

ASSESSING UTILITY VALUES FOR TREATMENT-RELATED HEALTH STATES OF ACUTE MYELOID LEUKEMIA IN THE UNITED STATES

Stein EM[1], Yang M[2], Gao W[2], Galebach P[2], Xiang CQ[2], Bhattacharyya S[3], Bonifacio G[4], Joseph GJ[4]
[1]*Memorial Sloan Kettering Cancer Center, New York, NY, USA,* [2]*Analysis Group, Inc., Boston, MA, USA,* [3]*Novartis Healthcare Pvt. Ltd., Hyderabad, India,* [4]*Novartis Pharmaceuticals, East Hanover, NJ, USA*

OBJECTIVES: Preference valuations of health status are essential in health technology and economic appraisal. This study estimated utilities for treatment-related health states of acute myeloid leukemia (AML) and dis-utilities of severe adverse events (SAEs) using a sample of individuals representative of the adult general population of the United States. **METHODS:** Applying the discrete choice experiment (DCE) methodology, an online survey was designed to capture the preference responses for pairs of health status scenarios including treatment-related AML health states and key grade 3/4 AEs of chemotherapies. Treatment-related AML health states, developed based on literature review and interviews with clinicians, included complete remission (CR), no CR, relapse, stem cell transplant (SCT), and post SCT short-term recovery. Six attributes, including fever, lack of energy, problems with daily function, anxiety/depression, blood transfusions, and hospitalization, each with 2 to 4 varying levels were used to define health states. Coefficients from conditional logistic regression model with generalized estimating equations were used to generate utilities of the predefined health states and dis-utilities of SAEs. **RESULTS:** 300 respondents completed the survey. The distribution of respondent demographics (age, race, gender, region, and income) was within a 3% margin of the distribution reported in the 2010 US Census data. CR had the highest utility value (0.875), followed by post SCT short-term recovery (0.398), relapse (0.355), no CR (0.262), and SCT (0.158). Of the key AEs, serious infection leads to the highest decline in utility by 0.218, followed by severe diarrhea (0.176), abnormally low blood cell counts (0.100), and redness/skin peeling (0.060). **CONCLUSIONS:** AML and treatments can be associated with a reduced quality of life and impaired ability to perform daily activities. The level of impairment depends on health status, including SAEs experienced during treatment. Findings from this study supported DCE methodology as a valid approach to obtain societal preference values for treatment-related health states.

PSY82

CLINICAL CHARACTERISTICS AND HEALTH STATE UTILITIES IN PATIENTS WITH TRANSTHYRETIN FAMILIAL AMYLOID POLYNEUROPATHY IN BRAZIL

Stewart M[1], Mundayat R[2], Alvir J[2], Grima D[3], Tran D[3], Ong M[2], Rill D[2]
[1]*Pfizer Inc, Groton, CT, USA,* [2]*Pfizer Inc, New York, NY, USA,* [3]*Cornerstone Research Group, Burlington, ON, Canada*

OBJECTIVES: To obtain clinical characteristics and quality of life data using an international rare disease registry to inform development of a cost-effectiveness model for treatment of transthyretin familial amyloid polyneuropathy (TTR-FAP) in Brazil. **METHODS:** A retrospective analysis of data from the ongoing, international Transthyretin Amyloidosis Outcomes Survey (THAOS), a rare disease registry for transthyretin amyloidosis, was conducted (cut-off date: January 14, 2016). Descriptive analyses were performed on subject data collected during clinical evaluations using a variety of standard assessments, including a neurological examination that allows derivation of a Neurological Impairment Score-Lower Limb (NIS-LL), ambulatory status (for disease staging), and patient-reported health status (EQ-5D-3L). **RESULTS:** An overall total of 1,205 symptomatic subjects were included, most with the Val30Met mutation (N=970). Data were available for 93 Brazilian subjects, the majority of whom had the Val30Met mutation (N=88). Derived NIS-LL scores increased (worsened) with longer disease duration. For the transitions between the three Coutinho-based disease stages, cut-offs for the derived NIS-LL scores were established using the 25th and 75th percentiles of the second stage (46 and 63, respectively). Similar to the overall sample, Brazilian subjects with the Val30Met mutation were primarily in stage 1 (N=55, 71%) with fewer subjects in stages 2 (N=15, 19%) and 3 (N=8, 10%). EQ-5D-3L health state utilities calculated with Brazilian tariffs showed similar decrements with advancing stage in the Val30Met mutation group [mean (SD); stage 1: 0.70 (0.19), stage 2: 0.44 (0.18), and stage 3: 0.10 (0.20)] and other mutations group [stage 1: 0.68 (0.21), stage 2: 0.40 (0.16), and stage 3: 0.05 (0.11)]. **CONCLUSIONS:** Brazilian TTR-FAP subjects are similar to the overall THAOS registry cohort and exhibit lower quality of life as the disease worsens. Global disease registries such as THAOS play an important role in characterizing health status in rare diseases like TTR-FAP.

PSY83

EXPLORATION OF NURSES KNOWLEDGE REGARDING PAIN MANAGEMENT IN POST-OPERATIVE PATIENTS IN QUETTA PAKISTAN

Haq N[1], Anum H[2], Nasim A[1], Yasmin R[1], Riaz S[1]
[1]*University of Balochistan, Quetta, Pakistan,* [2]*Department of Pharmacy Practice, University of Balochistan, Quetta, Pakistan*

OBJECTIVES: The Study aimed to explore Nurses knowledge regarding pain management in post-operative patients in Quetta Pakistan. **METHODS:** A cross-sectional descriptive study was conducted in post-operative patients of various hospitals of Quetta. Data obtained from 194 STEMI patients' during August to October 2016 by using self-designed proforma which consist of vital signs, prescribed drugs, positive and negative outcomes. Statistical analysis was done by using SPSS version 20. Descriptive and inferential statistics used where applicable. **RESULTS:** Result showed that majority of nurses (n=139 (66.8%) were staff nurse having 1-10 years of experience in hospitals. Majority of nurses 70.95% incorrectly answered regarding giving of narcotics on a continuous timetable is favored over a pro schedule for regular pain. 89.05% showed incorrect response that constant calculation of pain and medication efficiency is must for good management of the pain. 86.67% showed incorrect response that patients feeling pain can bear large doses of narcotics without respiratory depression or sedation. 88.57% nurses stated wrong response regarding she should contact the physician, if a patient still feels pain despite giving medication. **CONCLUSIONS:** Study concluded that most of the responses regarding pain management was incorrect by nurses, hence, it will be helpful to assess the efficiency of quality improvement steps such as training programs on nurses' knowledge, attitudes, and subsequent practices in pain management which ultimately results in better patient outcomes regarding pain management.

PSY84

ESTIMATING HEALTH STATE UTILITIES FOR PATIENTS WITH ACUTE MYELOID LEUKEMIA

Castejón N[1], Cappelleri JC[2], Cuervo J[3], Lang K[4], Mehta P[5], Mokgokong R[4], Mamolo C[6]
[1]HEOR Senior Consultant, Celorio, Spain, [2]Pfizer Inc., Groton, CT, USA, [3]LA-SER Research España, Madrid, Spain, [4]Pfizer Ltd, Tadworth, Surrey, UK, [5]University Hospitals Bristol NHS Trust, Bristol, UK, [6]Pfizer Inc, Groton, CT, USA

OBJECTIVES: To develop clinically validated health states (HS) for acute myeloid leukemia (AML) and to assign utility values based on preferences of the general UK population. **METHODS:** This study followed NICE guidance for generating HS utility values and comprised two stages: (1) AML HS were drafted based on evidence from a literature review of AML clinical and health-related quality-of-life studies (published January 2000–June 2016). A panel of UK hematologists with AML experience validated the clinical relevance and accuracy of the HS. (2) Validated HS were valued in an elicitation survey with a representative UK population sample using the time trade-off (TTO) method (the primary outcome) and also the visual analogue scale (VAS) as a secondary outcome to estimate preference values. **RESULTS:** Eight HS were developed and clinically validated: treatment with chemotherapy, consolidation therapy, transplant, graft-vs-host disease (GVHD), remission, relapse, refractory, and functionally cured. In total, 125 subjects participated (mean age, 49.6 years [range, 18–87 years], 52.8% female). Mean (95% CI) TTO preference values (n=120), ranked from lowest (worst health state) to highest (best health state) were: refractory −0.11 (−0.21 to −0.01), relapse 0.10 (0.00–0.20), transplant 0.28 (0.20–0.37), treatment with chemotherapy 0.36 (0.28–0.43), GVHD 0.43 (0.36–0.50), consolidation 0.46 (0.40–0.53), remission 0.62 (0.57–0.67), and functionally cured 0.76 (0.72–0.79). Mean (95% CI) VAS preference values followed the same rank order, ranging from 0.15 (0.13–0.17) for refractory to 0.71 (0.68–0.73) for functionally cured. **CONCLUSIONS:** To our knowledge, this is the first study to report utility values for AML from the UK societal perspective. Although utility values were quite low, subjects were able to distinguish differences in severity among AML HS and clearly recognized the seriousness of the disease. Preference values were consistent with clinical perception of HS severity.

PSY85

DETERMINANTS OF PATIENT AND PHYSICIAN TREATMENT SATISFACTION IN MODERATE TO SEVERE PSORIASIS: A MULTINATIONAL ASSESSMENT

Teeple A[1], Villacorta R[1], Lee S[1], Fakharzadeh S[1], Lucas J[2], McElligott S[1]
[1]Janssen Scientific Affairs, LLC, Horsham, PA, USA, [2]Adelphi Real World, Bollington, UK

OBJECTIVES: To explore disease severity and Dermatology Life Quality Index (DLQI) score as determinants of patient and physician treatment satisfaction, comparing patients across treatment groups in the US and European Union Five (EU5) countries. **METHODS:** This is a retrospective study of eligible adult patients with psoriasis and their consulting Dermatologists from the 2015 Adelphi Psoriasis Disease Specific Program (DSP). Patients' self-reported responses for the DLQI, a validated questionnaire of 10 items with a composite score of 0-30, used to measure quality-of-life (QoL). Higher scores indicate more severe QoL impairment. Physicians and patients self-reported treatment satisfaction, and physicians reported severity using Body Surface Area (BSA) measurement. Study groups considered included patients receiving no therapy, topical/phototherapy, conventional systemic agents, and biologic therapies. Statistical analyses controlling for patient and physician demographics and clinical characteristics were conducted. **RESULTS:** 1,651 patients (23.9% US and 76.1% EU5) and 282 physicians completed paired responses. From the patient sample, 44.6% were female, and mean age and DLQI score were 44.6 years and 5.2, respectively. From the physician sample, 45.6% were female and median time in practice was 14 years. Median baseline BSA involvement for patient respondents was 18%. Patients satisfied with biologics showed lower DLQI scores (Mean: 3.21; 95%CI: 2.85-3.56) compared to patients not satisfied with biologics (Mean: 9.11; 95%CI: 8.29-9.93). Itching, soreness, pain, and stinging of the skin contributed most to overall DLQI score among unsatisfied patients. Comparing across treatment groups, patients not satisfied with current therapy had mean DLQI scores ranging from 8.9-13.25 after treatment. Greater proportions (75-93%) of unsatisfied patients across treatment groups had a BSA of moderate to severe psoriasis (BSA > 3%) after treatment. **CONCLUSIONS:** Patients unsatisfied with current treatment reported higher DLQI scores/worse QoL and higher BSA severity across treatment groups, which may indicate that there remains an unmet medical need for psoriasis patients.

PSY86

ASSESSING THE EXPERIENCE OF RECEIVING OBESITY MEDICATION THROUGH TELEMEDICINE: DEVELOPMENT OF A PATIENT REPORTED SURVEY

Booth M[1], DiBonaventura M[2], Shah-Manek B[3], Rosenblatt-Farrell N[2], Griffing R[1], McLin D[1]
[1]Orexigen Therapeutics, La Jolla, CA, USA, [2]Ipsos Healthcare, New York, NY, USA, [3]Ipsos Healthcare, San Francisco, CA, USA

OBJECTIVES: Telemedicine allows for a two-way, real time interactive communication between the patient and the physician at a distant site in order to diagnose conditions and prescribe treatments. Technology advancements have made telemedicine more common, particularly when addressing healthcare access issues associated with isolated populations. This study sought to develop a questionnaire to assess the overall patient experience and perceived quality of care of those seeking pharmacological obesity treatment via telemedicine vis-à-vis usual care. **METHODS:** A multi-phased study was conducted in the United States, which included concept evaluation, item generation, and cognitive interviewing. Adhering to ISPOR Good Research Practices, desk literature was reviewed and physicians (N=3) were interviewed to develop a draft survey to assess the patient experience of seeking pharmacological obesity treatment. Patients who were evaluated and diagnosed with obesity and recently received a prescription weight loss medication via enrollment in a savings card program were invited to participate in two rounds of cognitive interviews (N=10). **RESULTS:** Desk research and physician interviews suggested concepts relating to convenience of meeting with a physician, the environment of the (physician-patient) interaction, interpersonal manner of the physician, quality of the interaction, value of the interaction, and overall satisfaction. These concepts were confirmed during the cognitive interviews with no new concepts uncovered. Respondents improved wording of items by emphasizing the importance of the physician asking "appropriate" and "non-judgmental" questions and knowing "how to consult on obesity issues" with patients, rather than just being medically knowledgeable about obesity. Patients also emphasized the importance of capturing the entire process (inclusive of obtaining the prescription itself), rather than just the physician-patient interaction. **CONCLUSIONS:** This study provided sufficient content validity for the newly developed patient experience questionnaire. Future research can implement this instrument to evaluate the patient experience of seeking pharmacological obesity treatment through telemedicine or usual care.

PSY87

ADEQUACY OF CANCER PAIN MANAGEMENT AND PAIN INTERFERENCE WITH DAILY FUNCTIONING AMONG PATIENTS VISITING ONCOLOGY WARD OF AN ETHIOPIAN UNIVERSITY

Tegegn HG, Gebreyohannes EA
University of Gondar, Gondar, Ethiopia

OBJECTIVES: we aimed to assess adequacy of cancer pain treatment, its subsequent interference on functioning and the associated factors in the oncology ward of Gondar University Hospital(GUH). **METHODS:** This is a cross-sectional study conducted from February 15 to May 15, 2016 in the oncology ward of GUH. A questionnaire-based interview using Brief Pain Inventory-Short form (BPI-sf) and chart review were used as data collection procedures. **RESULTS:** Of 83 patients, 76 (91.6%) cancer patients experienced pain with varying degree of severity. Fifty four (65%) patients were receiving inadequate cancer pain treatment with negative PMI. Of 76 cancer patients with pain, 68(89.2%) experienced pain interference with their daily activities. Educational level, metastasis status, number and types of analgesics for adequacy of cancer pain management, where as stage of tumor, presence of metastasis, history of treatment modality, history of pain and pain management adequacy for pain interference on patient's daily functioning were identified as statistically significant predicting factors. **CONCLUSIONS:** It is vital to anticipate and assess pain of the cancer patients as routine clinical practice to optimize analgesic therapy through identifying and intervening barriers of adequacy of pain management, thereby improving patient health outcome and quality of life.

PSY88

VALUE OF TRANSFUSION INDEPENDENCE IN SEVERE APLASTIC ANEMIA FROM PATIENTS' PERSPECTIVES - A DISCRETE CHOICE EXPERIMENT

Pickard AS[1], Huynh L[2], Ivanova JI[3], Totev T[2], Graham S[4], Mühlbacher AC[5], Roy A[6], Duh MS[2]
[1]Second City Outcomes Research, Oak Park, IL, USA, [2]Analysis Group, Inc., Boston, MA, USA, [3]Analysis Group, Inc., New York, NY, USA, [4]Analysis Group, Inc., Menlo Park, CA, USA, [5]Hochschule Neubrandenburg, Neubrandenburg, Germany, [6]Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA

OBJECTIVES: Aplastic anemia is a rare (600-900 US cases/year), serious blood disorder due to bone marrow failure to produce blood cells. Transfusions are used to reduce risk of bleeding, infection and relieve anemia symptoms. In severe patients, transfusions may be required more than once/week. The study aimed to elicit patient preferences for attributes associated with severe aplastic anemia (SAA) treatment, including transfusion independence. **METHODS:** An online discrete choice experiment (DCE) was conducted among patients with SAA who experienced insufficient response to immunosuppressive therapy (IST) and transfusion dependence for ≥3 months in the past 2 years. Recruitment occurred through an International Foundation and clinical sites. The DCE elicited preferences between hypothetical treatment pairs characterized by a common set of attributes: transfusions frequency, fatigue, risk of infection, and risk of serious bleeding. Conditional logit model with effects coding was used to estimate part-worth utilities for different attribute levels and assess the relative importance of each attribute. Predicted utility scores for transfusion frequency levels were reported. **RESULTS:** Thirty patients completed the survey. Most were age ≥40 years (73%), female (70%), and from the US (87%). 33% underwent bone marrow transplant; 37% received iron chelation therapy. Patients largely agreed that transfusion independence would bring less burden on time and costs, greater control and quality of life, less fatigue (87% noted each) and less scheduling around medical appointments (83%). The DCE found highest relative importance for risk of bleeding (0.30), followed by risk of infection (0.28), fatigue (0.23), and frequency of transfusions (0.20). More frequent transfusions resulted in lower utility, particularly increasing monthly transfusions frequency from 4 (0.57) to 8 (0.35). **CONCLUSIONS:** Among SAA patients with insufficient response to IST, estimated utility was higher with fewer transfusions. While risk of bleeding, risk of infection, and fatigue were more important for patient treatment preferences, frequency of transfusions was also important.

PSY89

PATIENT AND PHYSICIAN PREFERENCES IN SELECTING A BIOLOGIC FOR MODERATE-TO-SEVERE CROHN'S DISEASE

Athavale A[1], Lau G[1], Muser E[2], Ingham M[2], Deshpande A[1], Hadker N[1]
[1]Trinity Partners, Waltham, MA, USA, [2]Janssen Scientific Affairs, LLC, Titusville, NJ, USA

OBJECTIVES: To understand the relative importance Crohn's Disease (CD) patients and gastroenterologists place on treatment-related attributes when selecting a biologic for moderate-to-severe disease. **METHODS:** Two 30-minute online surveys were designed, pre-tested and fielded with 152 moderate-to-severe CD patients and 200 gastroenterologists. Preferences were assessed via a discrete choice experiment (DCE) where respondents made twelve treatment preference choices with three hypothetical

CD treatments per choice set. Each treatment profile in the DCE varied on: efficacy in non-biologic (standard therapy) failure, efficacy in TNF-α therapy failure, active treatment remission rates, onset of induction response, reduction/elimination of corticosteroid use, route of administration, induction and maintenance dosing frequency, black box warning, and prior authorization and staff time required. Data were analyzed using conditional multinomial logit regression. Overall relative importance (RI) of attributes was the difference between the highest and lowest relative preference weights for each attribute. **RESULTS:** Among patients, 'efficacy in non-biologic failure' was the most important driver (RI: 0.75 moderate, 0.50 severe CD). 'Black box warning' was the second most important attribute for moderate CD (RI=0.51), and 'reduction/elimination of corticosteroid use' for severe CD (RI=0.39). The third most important attribute was 'reduction/elimination of corticosteroid use' for moderate CD (RI=0.43), and 'active treatment remission rates at 12 months' for severe CD (RI=0.28). Among gastroenterologists, 'efficacy in non-biologic failure patients' was the most important driver of treatment choice for moderate and severe CD (RI=0.99 and 0.97, respectively), followed by 'reduction/elimination of corticosteroid use' (RI=0.70 and 0.71, respectively), and 'black box warning' for moderate CD (RI=0.63) and 'active treatment remission rates' for severe CD (RI=0.65). **CONCLUSIONS:** Patients and gastroenterologists prefer similar attributes when making treatment decisions across severities with 'efficacy in non-biologic failure patients' the most important attribute suggesting that both prefer access to the most effective biologic after failing standard (non-biologic) therapy.

PSY90

ADVANCING THE MEASUREMENT OF TREATMENT PREFERENCES IN DUCHENNE MUSCULAR DYSTROPHY

Bridges JF[1], Tsai J[1], Janssen EM[1], Fischer R[2], Peay H[3]
[1]Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, USA, [2]Parent Project Muscular Dystrophy (PPMD), Hackensack, NJ, USA, [3]RTI International, Research Triangle Park, NC, USA

OBJECTIVES: Parent Project Muscular Dystrophy (PPMD) has been a leader in the measurement of treatment preferences for pediatric rare diseases by demonstrating the value of using relatively simple stated-preference methods such as best-worst scaling (BWS) and conjoint analysis. We tested the feasibility of several advanced approaches (including discrete-choice elicitation (DCE) format, incorporating treatment uncertainty, quantitative measure of risk and use of risk grids, and measurement of maximal acceptable risk) to measure the preferences of patients, caregivers, and professionals for treating Duchenne muscular dystrophy (DMD). **METHODS:** A novel DCE was developed using a vignette focused clinical-trial data and comparison to placebo. Benefits were described as (qualitative) changes in muscle strength and harm was described as the probability that the treatment would not work, risk of kidney damage, and increase risk of fracture. Respondents, recruited at PPMD's annual meeting, received 14 choice tasks identified using an orthogonal experimental design. Preferences were estimated using maximal acceptable risk estimated via the delta method in STATA. The Wald and Swait-Louviere test was used to assess differences in preferences and scale. **RESULTS:** We had 161 respondents (RR=38%) including 9 patients, 87 caregivers, and 65 professionals. Aggregate result indicated that the maximal acceptable risk for improved muscle function could be described in terms of a 21.7% increase that the drug would not work ($P<0.001$), a 9.0% increase in the risk of kidney damage ($P<0.001$), or a 26.0% increase in fracture risk ($P<0.001$). Patients were the least risk tolerant ($P<0.001$), a difference not attributable to scale ($P<0.001$). **CONCLUSIONS:** We provide clear evidence that more advanced stated-preference methods can be applied in pediatric rare disease such as DMD. We also demonstrate that value of these methods in making move policy relevant metrics such as maximal acceptable risk and demonstrate how they can be used to explore preference heterogeneity.

PSY91

FATIGUE IN SYSTEMIC LUPUS: THE ROLE OF DISEASE ACTIVITY AND ITS MEDIATORS

Azizoddin DR[1], Jolly M[2], Weinberg S[2], Ghandi N[2]
[1]Jesse Brown VA, Chicago, IL, USA, [2]Rush University Medical Center, Chicago, IL, USA

OBJECTIVES: Systemic Lupus Erythematosus(SLE) is a chronic autoimmune disease that leads to a variety of negative health outcomes resulting from inflammation in various organ systems. Though treatment continues to advance, fatigue remains one of the highest-rated, unaddressed patient complaints. Understanding the mechanisms of fatigue can help guide appropriate interventions to improve overall outcomes. The aim was to evaluate if insomnia, depression, pain, and physical functioning mediated the relationship between disease activity and resulting fatigue in individuals with SLE. **METHODS:** 110 ethnically-diverse, primarily female participants (90%) with SLE, receiving care at university medical centers, completed assessments of disease activity, psychosocial factors, and quality of life outcomes (FACIT-FT, Insomnia Severity Index, Pain Inventory, PHQ-9). All patients met ACR classification criteria for SLE. Multiple mediation analysis was conducted utilizing the INDIRECT macro for SPSS which limits parameter bias when assessing for several mediators at once (Preacher & Hayes, 2008). **RESULTS:** Mean(SD) age was 40(14.10) years; 52% reported being African American, 23%Caucasian, 13%Hispanic, and 5%Asian. A multiple mediation analysis was conducted to assess the effects of disease activity on fatigue, through the effects of depression, pain, insomnia, and physical functioning. Disease activity (SLEDAI,Mean=4.89,SD=4.43) was significantly related to fatigue symptoms (FACIT-FT,M=18.30; SD=12.25). Results indicated that depression was a significant mediator of the effects of disease activity on fatigue, [ab=.219, BCa 95% CI(.013,.574),$p<0.01$], in that adding the mediating variables to the model, the relationship between disease activity and fatigue was no longer significant, [(without mediators) b=0.648,$p<0.05$;(with mediators) b=-0.058,$p>0.05$). Insomnia (M=9.26,SD=7.37,ab=.138, $p>0.05$), pain (M=5.93,SD=3.57,ab=.215,$p>0.05$), and physical functioning (M=81.40,SD=25.23,ab=.135,$p>0.05$) were not significant mediators in this relationship. **CONCLUSIONS:** Fatigue is a major issue among individuals with SLE. Depression mediated the effects of disease activity on fatigue. Interventions aiming at depression in addition to controlling disease activity may be useful to improve fatigue and overall outcomes in individuals SLE.

PSY92

PATIENT-REPORTED OUTCOME (PRO) INSTRUMENT DEVELOPMENT FOR CONGENITAL THROMBOTIC THROMBOCYTOPENIC PURPURA (cTTP, UPSHAW-SCHULMAN SYNDROME [USS], HEREDITARY THROMBOTIC THROMBOCYTOPENIC PURPURA, hTTP)

Oladapo A[1], Ito D[1], Hibbard C[1], Bean SE[2], Krupnick RN[3], Ewenstein BM[1]
[1]Shire, Cambridge, MA, USA, [2]QuintilesIMS, New York, NY, USA, [3]QuintilesIMS, Cambridge, MA, USA

OBJECTIVES: Hereditary thrombotic thrombocytopenic purpura (hTTP) (severe ADAMTS13 deficiency) is characterized by microangiopathic hemolytic anemia, thrombocytopenia, and diverse clinical signs and symptoms. Prophylactic plasma infusions are typically administered every 2-3 weeks to reduce the incidence of acute events and less severe manifestations. Need exists for an hTTP-specific patient-reported outcome (PRO) tool to assess patient burden and treatment outcomes, as existing tools do not adequately capture the range of hTTP symptoms and impacts. The objective is to develop a disease-specific instrument to measure salient symptoms and impacts of hTTP. **METHODS:** A conceptual model of hTTP symptoms and impacts was developed through an iterative process of literature review and interviews with hematologists (N=5) and patients (N=11). Items in the model were compared with currently available instruments, including HIT-6, MMSE, PHQ-8 and SF-36, and scales for analogous conditions, to assist in item generation. Two rounds of cognitive debriefing patient interviews (N=10) were conducted to revise the tool. **RESULTS:** Many of the salient symptoms and impacts in the conceptual model are not captured by comparator instruments. The newly-developed instrument contains 26 items measuring the intensity of patient-reported symptoms and impacts. It includes fatigue and pain types (11-point numerical scales) over the past 24 hours; bruising (numerical scale), symptoms of cognitive impairment, vision problems, and headache (Likert scales of frequency) over the past 7 days; impacts of symptoms (daily activities, depression, anger, irritability, frustration, anxiety, mood swings; Likert scales of frequency) over the past 7 days; and treatment experiences (numerical and Likert scales) over the past 2 weeks. **CONCLUSIONS:** This is the first PRO instrument developed to assess the salient symptoms and impacts of hTTP. Cognitive debriefing interviews conducted with patients confirmed the instrument is appropriate, comprehensive, and understandable. It provides information regarding burden of disease and may be useful in assessing outcomes of treatment.

PSY93

RELIABILITY AND VALIDITY EVALUATION FOR A PATIENT-REPORTED SYNDROME SCALE: BLOOD-STASIS SYNDROME (PRS-BSS)

Yu L[1], Zhang HY[1], Yang KX[2], Chen ZH[2], Zhang MC[2], Li Q[2], Yuan dC[2], Yang GL[2]
[1]Affiliated Hospital of Liaoning University of Traditional Chinese Medicine, Shenyang, China, [2]Liaoning university of Traditional Chinese Medicine, Shenyang, China

OBJECTIVES: We have established a self-rating scale for a patient-reported syndrome scale: blood-stasis syndrome(PRS-BSS). This study aims to evaluate reliability, validity of PRS-BSS in order to provide a clear quantitative tool for the patients with blood stasis. **METHODS:** A cross-sectional study was conducted for data collecting. 80 participants were recruited including 50 patients with blood stasis and 30 healthy ones.20 patients were randomly selected to fill the same scale again after 24 to 48 hours for retest realiability.The content mainly includes: the time required to complete inventory, basic demographic information such as general information. The internal consistency reliability was measured by Cronbach's coefficients .The validity of the PRS-BSS were examined by content validity, construct validity and criterion validity.The content validity was measured by completion rate,ceiling and floor effect. The construct validity was mesured by factor analysis . **RESULTS:** The PRS-BSS had extremely good accepting rate and completion, 92.6% of the patients completed the questionnaire. The scale was composed of 4 dimensions (activity, sleep, mood, and aggravation), and 10 items. The retest reliabilities of summary and 4 dimensions are 0.954, 0.921, 0.877, 0.863, 0.941. The Cronbach's coefficients were 0.829, 0.813, 0.614, 0.675, respectively. The correlation coefficient of each entry and the total score were higher than 0.4. KMO test results is 0.747, Bartlett ball test shows that P is less than 0.000, comply with the requirements for factor analysis. It showed 5 factors and the contribution rate reached 80%.The results showed that the structure is clear, consistent with the theoretical fraymework of setting. **CONCLUSIONS:** The final PRS-BSS is from the perspective of the patient's own, and easy to accept. It is proved to have a good reliability, validity in the clinical curative effect analysis.

PSY94

INCORPORATING PATIENT INPUT IN SELECTING PATIENT REPORTED OUTCOMES INSTRUMENTS FOR CLINICAL STUDIES IN MULTIPLE MYELOMA

Fleming S[1], Eremenco S[2], Gleeson S[3], Brooks A[3], Chiou C[4]
[1]Janssen, Raritan, NJ, USA, [2]Critical Path Institute, Tucson, AZ, USA, [3]Evidera, Bethesda, MD, USA, [4]Janssen, Singapore, Singapore

OBJECTIVES: To conduct a literature review and concept elicitation interviews generating supportive evidence for multiple myeloma (MM) clinical trial PRO selection incorporating direct patient disease experience. **METHODS:** A provisional conceptual model was developed from a literature review (2005-2015) of studies which included signs, symptoms, and functional impacts of MM. Concept mapping was against EORTC QLQ-C30, EORTC QLQ-MY20, FACT-MM, FACT-Anemia, FACIT Fatigue Scale, and BFI. A qualitative, cross-sectional study confirmed key symptoms and impacts from the literature review. Concept elicitation telephone interviews were conducted with 10 US patients (4 sites) using a semi-structured discussion

guide. Thematic content analysis on interview transcripts was performed using qualitative software (ATLAS.ti). Results were incorporated into the concept mapping exercise and the conceptual model was revised. **RESULTS:** In 44 articles, 21 symptoms/signs and 23 functional impacts were identified. 13/44 studies used EORTC QLQ-C30 for symptom and functional impacts. Interview sample included newly diagnosed (5), relapsed refractory (RR; 4), and maintenance (1) non-Hispanic White patients (mean 65 years; range 52-78). Patients endorsed all 23 impacts and 22 symptoms, 16 were in the literature and 6 were new. 90% endorsed fatigue, pain; 70% endorsed bone pain, back pain, pain elsewhere, hematologic abnormalities. EORTC QLQ-C30 covered 10 symptoms/17 impacts; EORTC QLQ-MY20 an additional 7 symptoms/4 impacts. FACT-MM included comparable symptoms, and 19 impacts but no activities of daily living (ADLs or IADLs) unlike EORTC-QLQ-C30. FACT-An and FACIT Fatigue covered anemia and fatigue-related symptoms and impacts more than other instruments including BFI. **CONCLUSIONS:** EORTC QLQ-C30 generally supported the conceptual model with enhanced coverage with MY20. Endorsement of fatigue by newly diagnosed and RRMM patients indicates that this is not treatment-related alone. This population could benefit from FACT-An or FACIT Fatigue Scale in future trials to provide better coverage. Quantitative research will further enable PRO selection to fit the purpose of clinical studies.

PSY95

A QUALITATIVE ANALYSIS OF DISEASE BURDEN IN PATIENTS WITH ACUTE INTERMITTENT PORPHYRIA AND RECURRENT ATTACKS

Simon A[1], Pompilus F[2], Querbes W[1], Penz C[1], Agarwal S[1], Strzok S[3], Wei A[1], Denoncourt RN[1], Howe DL[4], Hungate J[4], Marquis P[2]
[1]*Alnylam Pharmaceuticals, Cambridge, MA, USA,* [2]*Modus Outcomes, Newton, MA, USA,* [3]*Concentrated Consulting, Minneapolis, MN, USA,* [4]*American Porphyria Foundation, Houston, TX, USA*

OBJECTIVES: Acute intermittent porphyria (AIP) is a metabolic disease characterized by acute attacks that result in nervous system dysfunction and can lead to hospitalizations and debility. The objective of this qualitative research was to elicit concepts about symptom experience and impacts from patients living with AIP who experience recurrent attacks (defined as ≥ 4 attacks per year). **METHODS:** Patients were enrolled after meeting eligibility criteria and giving informed consent. Patients completed a telephone interview in which they responded to open-ended questions about AIP, the symptoms experienced, and the impact of these symptoms and of treatment on their lives. Interviews were anonymized, transcribed and qualitatively coded. The inductive coding approach targeted textual data related to AIP symptoms, impact, and treatment. **RESULTS:** The mean age of the 19 patients interviewed was 40 years old; 15/19 were female and 11/19 used hematin prophylactically. Patients reported 0-20 attacks (mean: 9.5) in the prior 12 months. Based on patient responses, AIP attacks were defined as the rapid onset of unmanageable symptoms that prevent the performance of daily activities and may lead to hospitalization. Patients reported a total of 113 symptoms; 78 occurred during an attack and 35 between attacks (chronically). Pain was the most frequently reported symptom during attacks (n=19), followed by nausea (n=16), and vomiting (n=15). The majority of patients (n=15) reported chronic symptoms outside attacks, most commonly pain (n=15). All patients reported that their symptoms impacted their lives, with the greatest negative impact on sleep, work/education, personal finances, mobility and socialization. **CONCLUSIONS:** Data from these qualitative interviews highlight the high burden of disease in patients living with AIP that experience recurrent attacks. Importantly, AIP is not just an intermittent disease as its name implies, but has chronic manifestations (most commonly pain) that, along with attacks, negatively impact multiple domains of patients' lives.

PSY96

BURDEN OF DISEASE IN RETT SYNDROME: A QUALITATIVE ANALYSIS AND DEVELOPMENT OF A CONCEPTUAL MODEL

Williams K[1], Keeley T[1], Malmenas M[2], Phelps H[1], Jordan J[3], Anand R[4], Kaminsky S[5], Bartolotta T[6], Curfs L[7], Kaufmann W[8], Mariotti O[9], Neul J[10], Nues P[11], Percy AK[12], Sharma G[13], Townend G[7]
[1]*PAREXEL International, London, UK,* [2]*PAREXEL International, Stockholm, Sweden,* [3]*PAREXEL International, Durham, NC, USA,* [4]*Neuron Pharmaceuticals SpA, Bresso (Mi), Italy,* [5]*International Rett Syndrome Foundation, Cincinnati, OH, USA,* [6]*Stockton University, Galloway, NJ, USA,* [7]*Maastricht University Medical Centre, Maastricht, The Netherlands,* [8]*Greenwood Genetic Center, Greenwood, SC, USA,* [9]*Pro Rett Ricerca Onlus, Felonica (MN), Italy,* [10]*University of California, San Diego, La Jolla, CA, USA,* [11]*Rettsyndrome.org, Cincinnati, OH, USA,* [12]*University of Alabama at Birmingham, Birmingham, AL, USA,* [13]*Rush University Medical Center, Chicago, IL, USA*

OBJECTIVES: Rett syndrome is a rare neurological disorder, requiring lifelong 24-hour care. Beyond its clinical symptoms, it poses a significant physical, psychological, social and financial burden on individuals and their families, which can have a detrimental impact on quality of life. However, relatively few studies have examined the extent of this burden. The aim of this study is to qualitatively describe the burden of disease in individuals with Rett syndrome and their caregivers. **METHODS:** A targeted literature search was conducted to identify qualitative research examining the impact of disease on individuals and/or caregivers. Studies were reviewed to identify reported clinical symptoms and impacts, contributing to overall burden of disease. This information will be supplemented with findings from ongoing qualitative interviews with caregivers (N=15) and healthcare professionals (N=5). Due to the nature of the disease, caregivers are uniquely placed to provide an understanding of the burden of disease on individuals with Rett syndrome, and on themselves. Healthcare professionals add a clinical perspective. The interviews will be analyzed using a thematic analysis. The results of the literature review and interviews will be summarized in a conceptual model of the burden of Rett syndrome. **RESULTS:** Five qualitative papers were identified from the 383 search results. Most studies focused on one specific impact of Rett syndrome (e.g. hand movements), with only two studies assessing the broader burden of disease. Both were limited to either patient or caregiver burden; neither examined the broader burden on both groups. The interview results are expected in spring 2017. **CONCLUSIONS:** This will be the first study to provide an overview of the factors influencing burden of disease in both individuals with Rett syndrome and their caregivers. The conceptual model will provide a useful tool to inform the development of future questionnaires, including a large-scale international burden of disease survey.

POSTOPERATIVE PAIN PERCEPTION AFTER OPEN, LAPAROSCOPIC VS. ROBOTIC-ASSISTED INGUINAL HERNIA REPAIR

Cesnik L[1], Kirwan T[2], Wolf L[2]
[1]*Intuitive Surgical, Sunnyvale, CA, USA,* [2]*Bruno & Ridgway Research Associates, Lawrenceville, NJ, USA*

OBJECTIVES: This study aimed to compare patients' perceived postoperative pain after robotic-assisted inguinal hernia repairs (R-IHR) vs. open IHR (O-IHR) vs. laparoscopic IHR (L-IHR). **METHODS:** A retrospective survey was conducted among patients who had O-IHR, L-IHR and R-IHR in the past 12 months. Patients were recruited from a national marketing research panel and 10 surgical practices across the United States. A questionnaire, including a 0 to 10 pain scale, was used to assess pain level perception, interruption of daily activities, and time to return to normal activity. T-tests and Z-tests were performed between R-IHR vs. L-IHR and vs. O-IHR, respectively. Subanalyses were performed for patients age≤/>60, having/not having previous IHRs and using/not using pre-operative pain medication. **RESULTS:** The study included 214 O-IHRs, 214 L-IHRs, and 98 R-IHRs. Of them, 35.4% had a previous IHR , and 39.2% took pain medication before surgery. R-IHRs had significantly lower perceived pain level (4.0±2.9 vs.6.5±2.7 score), less perceived disruption of daily activities (6.2±3.0 vs. 7.6±2.0 score), less time between surgery and stopping prescription pain medication (8.9±11.3 vs. 14.2±18.8 days) than O-IHRs. Similar patterns were observed among patients aged>60, among those having previous IHRs and among those using pre-operative pain medications. A significantly higher proportion of R-IHR patients reported having only one follow-up visit than O-IHR patients (54% vs. 34%). Compared to L-IHR, significantly lower perceived pain (4.0±2.9 vs.4.8±2.8 score) and fewer days from surgery to stopping prescription pain medication(8.9±11.3 vs. 11.8±13.5 days) were observed in R-IHR. For patients having previous IHRs, post-operative perceived pain level and duration of pain medications were significantly lower in R-IHR than L-IHR. All p-values were<0.1 **CONCLUSIONS:** Robotic-assisted IHR is associated with lower post-operative pain perception, less disruption of daily activities, and shorter duration of pain medicines compared to open or laparoscopic. Further prospective studies are needed to determine the long term patient benefits.

PSY98

PATIENT REPORTED OUTCOMES (PROS) ARE SUBJECT TO INTERPRETATION ERRORS: PATIENTS' UNDERSTANDING OF HOW TO REPORT PAIN SEVERITY OVER A PERIOD OF TIME

Yamamoto RT, Durand EM, Gary ST, Tuller JM, Dallabrida SM
ERT, Boston, MA, USA

OBJECTIVES: To determine if people understand a sample instruction from a PRO on pain severity. Patient reported outcomes (PROs) are often primary endpoints in clinical trials, serving to determine treatment safety and/or efficacy. In clinical trials for pain treatments, it is important to accurately determine pain severity to assess treatment efficacy. If data are unreliable, due to variability resulting from subject interpretation errors, results will be unreliable. **METHODS:** 485 people responded to an online survey. People were asked to select one of three answers to the following: "If you were participating in a clinical trial that asked you to report how severe your pain was on a daily basis, you should report." **RESULTS:** 436 people responded to the question. Significantly more people (66.7%) chose the wrong answer ($\chi 22=22.6$, $p<0.001$); 42.7% (186 people) selected "Average the pain you had throughout the day and report the average," while 24.1% (105 people) selected "The pain level that you are experiencing when you record the pain rating" and 33.3% (145 people) of respondents answered correctly that they should report "The pain level at its worst point." Selecting only those who reported "pain" diagnoses, 61.8% (126 of 204 people) chose the wrong answer ($\chi 22=12.8$, $p=0.002$). Results were similar for those who previously participated in clinical trials, even though 90.6% felt they understood a lot or completely understood what to do. **CONCLUSIONS:** These findings suggest that people often fail to understand instructions and concepts they are being asked to report on. When patients fail to interpret the PROs as intended and use various criteria when responding, variability is introduced impacting data quality. Failure to train subjects on instructions and concepts could lead to the erroneous assumption that data are reliable. Our findings support the need for custom training on PROs in clinical trials.

PSY99

EXPLORING THE SIGN AND SYMPTOM EXPERIENCE OF BARTH SYNDROME IN ADULT AND ADOLESCENT POPULATIONS

Stokes J[1], Aiudi A[2], Mazar I[1], Elliott M[2], Dillard S[1], Ollis S[1], Love E[1], Shields AL[1], Gwaltney C[3]
[1]*Adelphi Values, Boston, MA, USA,* [2]*Stealth BioTherapeutics, Newton, MA, USA,* [3]*Gwaltney Consulting Group, Westerly, RI, USA*

OBJECTIVES: Barth Syndrome (BTHS) is a rare genetic condition with a variable expression of symptoms. This research aimed to better understand BTHS signs/symptoms in adolescent (ages 15 years and younger) and adult populations (ages 16 years and older). **METHODS:** Concept elicitation interviews (CEIs) were conducted with adolescent (n=18) and adult (n=15) patients and caregivers (N=33) to identify and describe the signs/symptoms that characterize the BTHS experience. In open-ended, face-to-face interviews with trained researchers, subjects discussed their condition-related experiences. Transcribed interviews were coded and analyzed and results were summarized in two BTHS conceptual models for each the adolescent and

adult populations. **RESULTS:** A total of 57 BTHS sign/symptom concepts were reported across samples (N=33) with saturation analyses confirming adequacy of sample size for each. Adolescents most frequently reported fatigue/tiredness (n=17, 94.4%), cardiomyopathy (n=14, 77.8%), muscle weakness (n=14, 77.8%), eating small quantities (n=11, 61.1%), and physical developmental delay (n=10, 55.6%). Fatigue/tiredness (n=9, 50.0%), headache (n=4, 22.2%), eating difficulty (n=3, 16.7%), and muscle weakness (n=3, 16.7%) were rated as the most bothersome symptoms. Adolescents most frequently reported muscle weakness (n=10, 88.9%) and fatigue/tiredness (n=8, 44.4%) as important to improve with treatment. Adults (n=15) most frequently reported fatigue/tiredness (n=15, 100.0%), cardiomyopathy (n=13, 86.7%), muscle weakness (n=12, 80.0%), neutropenia (n=12, 80.0%), and infection (n=9, 60.0%). Fatigue/tiredness (n=7, 46.7%), muscle weakness (n=6, 40.0%), and neutropenia (n=3, 20.0%) were rated as the most bothersome symptoms. Adults most frequently reported fatigue/tiredness (n=13, 86.7%) and muscle weakness (n=9, 60.0%) as important treatment targets. **CONCLUSIONS:** Though there were some differences, results suggest symptomatic similarities in the experience of BTHS as an adolescent and as an adult and, moreover, that both patient populations would find treatment meaningful if it targeted and reduced fatigue/tiredness and muscle weakness.

PSY100

MODELING JOINT STATUS AND OTHER FACTORS ASSOCIATED WITH PERCEPTION OF PAIN SEVERITY/INTERFERENCE AND FUNCTIONAL IMPAIRMENT IN US ADULTS WITH HEMOPHILIA: ANALYSIS OF THE PAIN, FUNCTIONAL IMPAIRMENT, AND QUALITY OF LIFE (P-FIQ) STUDY

Kempton C[1], Buckner T[2], Fridman M[3], Iyer NN[4], Cooper DL[4]
[1]*Emory School of Medicine, Atlanta, GA, USA,* [2]*University of Colorado School of Medicine, Aurora, CO, USA,* [3]*AMF Consulting, Los Angeles, CA, USA,* [4]*Novo Nordisk Inc., Plainsboro, NJ, USA*

OBJECTIVES: To assess factors associated with pain and functional capabilities independent of hemophilia-related arthropathy. **METHODS:** US adults with hemophilia completed patient-reported outcome instruments to assess pain (Brief Pain Inventory, BPI), functional impairment (Hemophilia Activities List, HAL), and quality of life (EQ-5D-5L). Physiotherapists optionally completed joint evaluation (Hemophilia Joint Health Score, HJHS). The association of BPI scores and HAL with HJHS and other covariates was examined using simple regression models and by a multiple regression model where HJHS, age, hemophilia severity, and treatment were included with other covariates having bivariate correlations with BPI/HAL scores ($\alpha<0.05$) using forward selection. **RESULTS:** Of 381 adults enrolled, 240 had complete HJHS scores (median age 32, 64% severe hemophilia, 9% hemophilia with inhibitors). In simple regression, higher EQ-5D-5L pain/discomfort score had strong association with worse BPI outcomes, but this association did not remain when adjusted for other covariates. For BPI pain-severity (R-squared=0.422) and BPI pain-interference (R-squared=0.386), the most consistent significant predictors of worse outcomes after adjusting for HJHS were non-employed status, use of opiates, and anxiety/use of anxiolytics. For HAL overall score (R-squared=0.700), the most significant predictors of worse outcomes after adjusting for HJHS were older age, non-employed status, more severe hemophilia (with inhibitor patients as most severe), BPI pain-severity, and higher EQ-5D-5L pain/discomfort. EQ-5D-5L anxiety/depression and use of anxiolytics/antidepressants/opiates were significant in simple regression only. Sensitivity analysis removing hemophilia severity lowered R-squared values for BPI (severity 0.38, interference 0.36) but not for HAL. **CONCLUSIONS:** Independent of joint status, employment, anxiety, and depression were associated with both pain and functional abilities; pain severity was also associated with functional abilities. The predictive power of the studied covariates was higher for functional outcomes than pain, possibly due to the closer correlation of objective joint status with reported disability, and increased day-to-day variability of pain.

PSY101

EXPLORING AND DOCUMENTING THE SIGNS, SYMPTOMS, AND IMPACTS OF PRIMARY MITOCHONDRIAL DISEASE

Stokes J[1], Aiudi A[2], Covino J[2], Mazar I[1], Dillard S[1], Ollis S[1], Love E[1], Shields AL[1], Gwaltney C[3]
[1]*Adelphi Values, Boston, MA, USA,* [2]*Stealth BioTherapeutics, Newton, MA, USA,* [3]*Gwaltney Consulting Group, Westerly, RI, USA*

OBJECTIVES: Primary mitochondrial disease (PMD) is characterized by a variety of signs/symptoms that can negatively impact patients' daily lives. This research aimed to describe the key PMD signs/symptoms and disease impacts from the perspective of PMD patients. **METHODS:** Concept elicitation interviews were conducted with PMD patients (N=20) to identify and better understand the signs/symptoms and impacts that characterize the disease experience. In open-ended, one-on-one interviews with trained researchers, subjects discussed their PMD experiences and rated the bother of their signs/symptoms. Transcribed interviews were coded and analyzed and results were summarized in a PMD conceptual model. **RESULTS:** Saturation analysis of the 47 PMD sign/symptom concepts elicited from patients confirmed the adequacy of the sample size. Mean age of participants was 42.7 years (SD=13.5), 11 were male (55.0%), and a range of PMD phenotypes were represented. The most frequently reported signs/symptoms were fatigue/tiredness (n=15, 75.0%), impaired vision (n=12, 60.0%), memory problems (n=7, 35.0%), balance problems (n=7, 35.0%), numbness (n=6, 30.0%), headache (n=6, 30.0%), muscle pain (n=6, 30.0%), and muscle weakness (n=6, 30%). Of concepts rated by at least two participants, balance problems and fatigue/tiredness had the highest mean bother ratings (8.5 and 8.09, respectively, on a 0-10 numeric rating scale). All 15 participants who reported fatigue deemed it an important symptom to improve with effective treatment. Though participants reported a variety of ways that PMD impacts their daily life (n=59), the most frequently reported were on ability to work/attend school (n=16), interact socially (n=15), exert oneself physically (n=15), and perform at work/school (n=14). **CONCLUSIONS:** Results confirmed PMD to be a symptomatically bothersome and impactful condition from the perspective of patients with the disease and, moreover, will be of immediate use to researchers and healthcare providers wishing to identify meaningful outcomes for their PMD patients.

PSY102

ACUTE PAIN AND RELATED OUTCOMES IN SURGICAL PATIENTS: RETROSPECTIVE ANALYSIS OF A LARGE US ELECTRONIC HEALTH RECORD DATABASE

Peyerl FW, Khangulov VS, Hayashi DE, Talaga AK, D'Souza FT
Boston Strategic Partners, Inc., Boston, MA, USA

OBJECTIVES: Adequate treatment of acute pain remains lacking in the post-operative setting. The objective of the study was to examine progression in postsurgical pain and association of pain with hospital length of stay (LOS), in a large sample of US surgical patients. **METHODS:** This study examined prospectively collected data from a US electronic health record database (Cerner HealthFacts™). Adult patients who underwent a wide range of surgical procedures (identified via ICD-9 coding) between January 2000 and March 2015 were included in the analysis. Patients were required to have at least one pain score (using a 0-10 numerical pain scale) prior to and following surgery. Baseline pain was assessed as the maximum pain score within 7 days prior to surgery and was used to stratify patients into mild, moderate or severe pain category. Pain on day of surgery and postsurgical days 1-14 was defined as the maximum pain score on each day. **RESULTS:** The study identified 110,145 surgical patients. Patients with severe baseline pain experienced a decrease in pain following surgery from a mean(SD) of 8.9(1.1) pre-surgery to 6.2 (3.3) on the day after. Patients with moderate baseline pain experienced minimal changes in pain, from a mean of 5.0(0.8) to 4.4(3.2) of the first day after surgery, and patients with no/mild pain experienced an increase following surgery from a mean pain of 0.7(1.2) to 3.0(3.3). There was an association between the baseline pain category and LOS such that patients with severe pain had, on average, the longest LOS (8.2 days), followed by patients with moderate pain (7.2 days), and no or mild pain (6.8 days). **CONCLUSIONS:** This analysis is suggestive of a needed improvement in management of mild-to-moderate postoperative pain and of a positive association between pre-surgical pain severity and LOS. These findings provide initial insights into potentially relevant risk factors in a broad surgical population.

PSY103

USING EXISTING DATA TO IDENTIFY CANDIDATE ITEMS TO MEASURE HEALTH-RELATED QUALITY OF LIFE IN INDIVIDUALS WITH LOW BACK PAIN

Eilayyan O, Ahmed S, Visca R, Mayo N
McGill University, Montreal, QC, Canada

INTRODUCTION: In low back pain (LBP), the use of health-related quality of life (HRQOL) measures is limited to generic measures; there is no availability of LBP-HRQOL measures. The generic measures may ask questions that are irrelevant for individuals with LBP, which may reduce the accuracy of patients' reports. **OBJECTIVES:** To: 1) identify items best reflecting the domains of HRQOL important to individuals with LBP, and 2) provide evidence for the discriminative capacity of the response options by mapping them onto general health perception. **METHODS:** This study is a secondary analysis of an existing dataset that consisted of 64 items relating to patients' symptoms, functional status, and general health perception. Nine important HRQOL domains were identified in previous work using individual interviews with patients, and by National Institute of Health (NIH). The 64 items were classified into different HRQOL domains by 12 participants using the Delphi method. Item response theory (IRT) was then used to estimate the properties of items for each identified domain in order to select items best reflecting each domain of HRQOL important to individuals with LBP. The best item for each domain was selected according to the distribution of the threshold values across the latent scale and the discrimination value. **RESULTS:** The LBP-HRQOL assessment tool consisted of nine items with three response levels per item. The regression coefficient was consistently decreased between response options and the linear trend test was significant for all selected items. This indicates that the response option for each item had a discriminative capacity for patients' general health perception. The LBP-HRQOL assessment tool showed a good convergent validity at both item level and total score. **CONCLUSIONS:** This study identified the items best reflecting the domains of HRQOL in LBP, forming a LBP-HRQOL assessment tool. The selected items need to be reviewed for clarity by patients and clinicians.

PSY104

HEALTH STATE UTILITY AND QUALITY OF LIFE IN FIRST REMISSION FROM DIFFUSE LARGE B-CELL LYMPHOMA (DLBCL)

Tran I[1], Campbell V[1], Lawson C[1], Bottomley CJ[2], Al-Jassar G[2], Glen F[2], Lloyd AJ[3]
[1]*Roche Products Ltd, Welwyn Garden City, UK,* [2]*pH Associates (an Open Health company), Marlow, UK,* [3]*Bladon Associates, Ltd, Oxford, UK*

OBJECTIVES: DLBCL is the most common form of Non-Hodgkin Lymphoma. Most DLBCL is successfully treated with immunochemotherapy resulting in long term remission. Although there is some evidence on the impact of therapy on quality of life (QoL), data are lacking on the long term impact of previous DLBCL diagnosis and treatment on QoL. The aim of this study was to describe the health state utility value and determinants of QoL in DLBCL patients in remission who are no longer receiving treatment. **METHODS:** UK patients in first remission (>12 months) from DLBCL were recruited via a lymphoma patient organisation and a patient recruitment agency in this cross-sectional, observational, questionnaire based study [NCT02708732]. Utility scores were calculated from the EQ-5D-5L and quality of life was assessed using the FACT-Lym. Utility scores were compared to published UK population norms. **RESULTS:** 91 patients (69% female) were recruited into the study with a mean age of 50 years (range= 21-77). The mean utility for the patient population was 0.78 (range -0.01-1.00; SD 0.24). Patients most frequently reported problems in the EQ-5D Pain and Discomfort and Anxiety and Depression domains. The mean FACT-Lym score was 114 points (SD 31.37; maximum possible score 168). The items of the FACT-Lym Lymphoma-specific domain with the worst scores related to tiredness, worry and emotional distress and pain. **CONCLUSIONS:** Our study describes the real world utility values reported by DLBCL patients in first remission. People in this study report decrements in QoL. They,

although deemed to be in clinical remission, are affected by tiredness, worry and pain. Although people with DLBCL have a high chance of a full cure after treatment, this is evidence that quality of life, particularly emotional functioning, is impacted during remission. Further analyses will be conducted to understand characteristics impacting responses and utility values in relation to age adjusted norms.

PSY105
DIFFERENCES IN HEALTH-RELATED QUALITY OF LIFE BASED ON ANALGESIC REGIMENS IN PATIENTS WITH CHRONIC PAIN
Thornton JD, Dwibedi N, Sambamoorthi U
West Virginia University, School of Pharmacy, Morgantown, WV, USA
OBJECTIVES: Chronic non-cancer pain can be managed with prescription drugs containing opioids or other analgesics. However, the relationship between analgesic regimens and long-term Health-Related Quality of Life (HRQoL) has not been examined. The objective of this study was to examine the association between various types of analgesic regimens and HRQoL among adults with chronic non-cancer pain. **METHODS:** We used a retrospective longitudinal design for this study with a baseline period (1 year) and follow-up period (1 year). Using the Medical Expenditures Panel Survey data for 2005-2012, patients >21 years with chronic pain conditions and without cancer were identified, and analgesic regimen were classified into: (1) opioid containing, (2) non-opioid containing, or (3) no analgesics. HRQoL was measured with the SF-12 physical component summary (PCS) scores. **RESULTS:** Overall, 26.9% of the sample (n=12,451) received an opioid-containing regimen, 16.2% non-opioid regimen, and 56.9% were not on prescription analgesics. At follow-up, compared to opioid-containing analgesic regimens, non-opioid regimens had higher PCS scores (beta=2.63, SE=0.17, $p<0.0001$) after controlling for HRQOL comorbidity index score. However, by controlling for baseline PCS score, the difference between opioid and non-opioid regimens in follow up PCS score was diminished (beta= 0.42, SE=0.13, p=0.001). **CONCLUSIONS:** HRQoL was higher when chronic non-cancer pain is managed with non-opioid containing analgesics. The study findings suggest that physicians may need to consider HRQoL while managing opioid therapy for non-cancer pain.

PSY106
LONGITUDINAL ASSOCIATIONS BETWEEN HEALTH-RELATED QUALITY OF LIFE AND HEALTHCARE UTILIZATION IN AL AMYLOIDOSIS
Bayliss M[1], Quock TP[2], Guthrie S[2], White MK[1], McCausland KL[1]
[1]*Optum, Lincoln, RI, USA,* [2]*Prothena Biosciences Inc, South San Francisco, CA, USA*
OBJECTIVES: Light chain (AL) amyloidosis is a rare, complex disease associated with significant organ dysfunction, disability, and death. AL amyloidosis patients interact with the health care system in myriad ways; however, few studies have quantified health care utilization (HCU) in this condition. **METHODS:** A noninterventional, longitudinal online study was conducted among patients with AL amyloidosis who were recruited with assistance from patient advocacy groups. Initial (n=341) and 6-month follow-up (n=226) surveys assessed demographics, disease and treatment characteristics, and health-related quality of life (HRQoL), measured by the SF-36v2® Health Survey physical and mental component summary scores (PCS and MCS). HCU (eg, outpatient doctors' visits, emergency room [ER] visits, hospitalizations, and insurance coverage) was measured during the 6-month follow-up. The prevalence of HCU, including its bivariate associations with patient characteristics, was evaluated. Multivariable logistic regression models were used to test for associations between patient characteristics, HRQoL, and ER visit or hospitalization in the past 6 months. **RESULTS:** Overall, visits with specialists and other health care providers during the previous 6 months were nearly ubiquitous (92.0% and 94.6%, respectively). Collectively, 56.0% of patients reported ≥1 ER visit or hospitalization. ER visits and hospitalizations were not associated with number or type of organ involvement or with duration of disease. There were significant associations between PCS and ER visits ($P<0.05$) and between both PCS and MCS and hospitalizations ($P<0.05$ for all) based on multivariable analyses. **CONCLUSIONS:** There is a lack of real-world evidence regarding HCU among patients with AL amyloidosis. This research identified longitudinal associations between HRQoL and HCU, indicating there is potential for using HRQoL surveys as screening tools to predict future HCU for AL amyloidosis patients. The development of prediction models for HCU in AL amyloidosis should consider incorporating HRQoL as well as disease staging and treatment type.

PSY107
STUDY OF QUALITY OF LIFE WITH THE HELP OF IT-TECHNOLOGIES IN PATIENTS WITH HEMOPHILIA
Vorobiev P[1], Vorobiev A[1], Dugin D[1], Krasnova L[1], Zhulev Y[2], Zykova A[1]
[1]*Russian Society for Pharmacoeconomics and Outcomes Research, Moscow, Russian Federation,* [2]*Russian Hemophilia Society, Moscow, Russian Federation*
OBJECTIVES: Since 2007, patients with hemophilia enable treatment of blood coagulation factors in the amount of 5IU per capita, in Europe the figure is about 4, (2 to 11IU in different countries). In 2008-2011, we have examined the patients QoL with hemophilia in Russia, Ukraine and Kazakhstan. Availability of Internet allows you to implement this task with the help of software. In 2015, it was developed a program MeDiCase to assess the QoL of remote villages residents with a smartphone. **METHODS:** The questionnaire, including an assessment of the quality of life for the EQ-5D with a VAS was posted on the web-site of the Russian Society of hemophiliacs (http://hemophilia2016.tilda.ws.) **RESULTS:** The web-survey completed by 79 people - about 1.2% of patients receiving therapy with clotting factors on a government program(N=6793): 88%with "A"hemophilia and 12%"B". The average age - 30 years. In large cities live 67%, in small cities 17%, 16%in villages. QoL assessment on the EQ-5D questionnaire revealed that there are no problems with movement in space in 50% of people, small problems -49% extreme problems at 1%. Self-service: no problems -79% of patients with minor problems -17% extreme problems at 4%. Daily Activity: there are no problems in 51% of patients with minor problems -45% extreme problems at 4%. Pain and discomfort: there are no problems in 25%, small problems -63% extreme problems 12%. Anxiety and depression: there are no problems in 46%, small problems -43% extreme problems -11%. Respondents rated their quality of life (VAS) as a 63(19to100). In 2008, the quality of life (VAS) was exactly 60, patients with the presence of antibodies to coagulation factors - 52. **CONCLUSIONS:** The use of IT-technologies allows patients studies via the Internet, including - with hemophilia, to assess the QoL with the EQ-5D questionnaire.

SYSTEMIC DISORDERS/CONDITIONS – Health Care Use & Policy Studies

PSY108
ALIGNMENT BETWEEN PATIENT-PRIORITIZED SYMPTOMS AND ENDPOINTS USED IN CLINICAL TRIALS: A CASE STUDY ON SICKLE CELL DISEASE
Oehrlein EM[1], Ganser TR[1], Perfetto EM[2], Ziadeh M[1], El-Gendi S[1], Ghorashi B[1], El-Gendi H[1], Hanna ML[1], Bjoernebo L[3]
[1]*University of Maryland, School of Pharmacy, Baltimore, MD, USA,* [2]*University of Maryland School of Pharmacy, Baltimore, MD, USA,* [3]*Karolinska Institutet, Solna, Sweden*
OBJECTIVES: Recently, the US Food and Drug Administration (FDA) has hosted Patient-Focused Drug Development (PFDD) meetings with the objective of identifying: symptoms/impacts on daily living most important to patients and their experiences with treatments. Voice-of-the-Patient (VoP) summary reports are published following each meeting. This pilot study examined whether symptoms prioritized by patients during the sickle cell disease (SCD) meeting (February 2014) were assessed as endpoints for indicated treatments (iTX) and treatments under study (TXus). **METHODS:** Symptoms identified by patients as "most important" were extracted from the SCD VoP report. Product labels and clinicaltrials.gov were used to identify endpoints for iTX, and Phase 2 or 3 trials for TXus over the past 5 years. Endpoints were pooled for treatments with multiple studies. To examine uptake of the SCD VoP information, a sub-analysis was performed for "post-PFDD" studies with initial clinicaltrials.gov dates later than 2015. **RESULTS:** Hydroxyurea is the only SCD iTX (N=1); ten treatments under study (TXus, N=10). VoP reported "most-important symptoms" include: acute pain crises (iTX=1/1; TXus=5/10); chronic pain (iTX=1/1; TXus=4/10); fatigue (TXus=1/10); difficulty concentrating/cognitive issues (none); intolerance to cold/weather changes (none); cardiovascular events (none specifically, adverse events generally); organ damage (TXus1/10); Chronic leg/skin ulcers (TXus=1/10); Bone/osteopathic disorders (none); Hearing loss (none); Loss of sight/eye issues (none); Pregnancy complications (none); Complications of long-term treatment (none). Four treatments were studied post-PFDD; of these, three included VoP outcomes, including two beyond pain: organ damage (TXus 1/10) and chronic leg ulcers (TXus 1/10). **CONCLUSIONS:** This pilot study demonstrates that PFDD meetings may be having an impact on endpoint selection for trials. As patient engagement becomes more widespread, incorporation of additional patient-prioritized endpoints can be anticipated. Additionally, not all patient-prioritized symptoms are ethical for evaluation during intervention studies and may be good candidates for observational studies.

PSY109
SUGAR-SWEETENED BEVERAGES CONSUMPTION AND PRICE SENSITIVITY AMONG BRAZILIAN ADULTS: IMPLICATIONS FOR OBESITY POLICIES
Balbinotto Neto G[1], Cardoso L[2]
[1]*Universidade Federal do Rio Grande do Sul, Porto Alegre, Rio Grande do Sul, Brazil,* [2]*Universidade Federal de Goias, Goiânia, Brazil*
BRACKGROUND: The prevalence of overweight and obesity has reached alarming rates worldwide in the past 30 years. In Brazil, specially, existing data shows that 1 in 6 Brazilian adults are obese and this number is projected to reach 33% by 2025. Concomitantly to rising obesity, Brazilian citizens have changed their patterns food consumption patterns, raising substantially raising the consumption of sugar-sweetened beverage (SSB) consumption. **OBJECTIVES:** In this context, the challenge of this essay is to estimate the price elasticity for soda and fruit drink in Brazil and the price effects on weight outcomes and obesity prevalence. **METHODS:** The elasticity was measured through a two-part model (TPM) estimated for all sample and different subgroups. The empirical model explains the quantities of SSB demanded as function of its prices and other variables. **RESULTS:** Overall, the results display a smaller prevalence and lower consumption with higher prices. The TPM model predicts a reduction of 348.3g in weekly soda consumption and 4.5g of fruit drink to each one Real increased price. For all sample estimates, price elasticity is -0.61 for soda and -1.32 for fruit drinks, suggesting that a 20% increase in price was associated with a decline of soda and fruit drink in weekly consumption by 12.2% and 26.4%, respectively. This evidence shows a higher sensitivity to price changes for juice drinks than for soda, in spite of the higher consumption of soda. **CONCLUSIONS:** Our main findings suggest that tax policy might be an effective tool to reduce the soda and juice drink consumption and body weight. We also identified that subgroups who consume higher amounts of SSB are relatively more price sensitive and in these cases pricing policies have an expressive potential in reducing SSB consumption and body weight.

PSY110
APPLICATION OF MULTIPLE CRITERIA DECISION ANALYSIS IN PROPHYLACTIC THERAPY ON HAEMOPHILIA A IN CHINA
Hu S
School of Public Health, Fudan University, Shanghai, China
OBJECTIIVES: Using MDCA approach to evaluate the main attributes impact on the clinical efficacy and analyzes the strengths and weakness between FVIII treatment on-demand and prophylaxis in order to make consensus building in Chinese clinical key opinion leaders. **METHODS:** Ten attributes are selected to compare the clinical efficacy,

health utility, economic burden and treatment compliance. The weight value was investigated from 31 top hematologists. The total scores and relative ratio in each attribute are calculated by using Microsoft Office Excel software. The number of scores in each attribute is at the range from 1 to 10. **RESULTS:** The important attributes are reducing the number of bleedings, disability rate, and days of absenteeism from work/school, improve quality of life, return back to normal life, study and work (>0.10). However, the factor of reducing inhibitor development and the number of infusing per week is less importance (<0.10). The total scores in treatment on-demand is the lowest one (160.54), low-dose prophylactic therapy is in the middle (234.76), the highest score is standard prophylactic therapy (263.84). **CONCLUSIONS:** MCDA method can be used on clinical decision making on selecting haemophilia therapy. General speaking, the cost of lifelong prophylaxis is much less than that of treatment on-demand. However, In China, although the cost of FVIII treatment on-demand can be reimbursed by basic medical insurance system and catastrophic insurance scheme, it is inequity; the ratio of reimbursement and ceiling threshold various region by region. Prophylaxis therapy is a cost-effective regimen if it can be started in childhood stage. The concept of prophylactic therapy needs to be further dissemination in patients, providers and third-party policy makers.

THE EFFECTIVENESS OF THE FDA PRIORITY REVIEW VOUCHER FOR NEGLECTED TROPICAL DISEASES AND RARE PEDIATRIC DISEASES

Wang A, Chowdhury C
CBPartners, New York, NY, USA

OBJECTIVES: To understand how the FDA Priority Review Voucher (PRV) program has incented the development of new treatments for neglected, tropical diseases, and its effect on patient need. **METHODS:** The study employed a pragmatic literature review to determine which diseases experienced an increase in development research, as well as an analysis of the effect on treatment options and algorithms, as well as epidaemiology **RESULTS:** Between 1975 and 1999, less than 1% of newly approved drugs were for tropical diseases. Between 2007-2016, 12 PRVs were awarded; four have contributed to development programmes for tropical diseases, while the remaining eight were awarded for developments in rare pediatric diseases. The rare pediatric diseases that now have a treatment option are Morquio A syndrome, high-risk neuroblastoma, rare bile acid synthesis disorder, hereditary orotic aciduria, hypophosphatasia, lysosomal acid lipase deficiency, Duchenne muscular dystrophy, and spinal muscular atrophy. The neglected tropical diseases with newly developed treatment options are malaria, tuberculosis, leishmaniasis, and cholera. Rare diseases affect about 12.5 million pediatric patients in the US, and the use of these new treatments allows for a significant increase in overall survival and quality of life. However, some critics believe this program addresses goals for neither tropical diseases, nor rare pediatric diseases. This is due to the lack of accountability with regard to development and regulatory follow-through. In support of this, manufacturers do not cite an expedited review process as a main consideration for initiating a development in neglected tropical or rare diseases. **CONCLUSIONS:** The PRV program has rewarded the development of 12 new drugs for neglected disease areas. While there are still many rare diseases that lack even one treatment option, and can thus benefit from the priority review voucher program, it is uncertain if the incentive is strong enough for manufacturers to initiate developments in these areas

PSY112

PATIENT ACTIVATION IN INFLAMMATORY BOWEL DISEASE PATIENTS

Kanu CN[1], Brown CM[1], Barner JC[1], Chapman CJ[2], Walker HA[2]
[1]*The University of Texas at Austin, College of Pharmacy, Austin, TX, USA,* [2]*Gastroenterology Associates, Baton Rouge, LA, USA*

OBJECTIVES: To describe the demographic characteristics of inflammatory bowel disease (IBD) patients in different patient activation stages. **METHODS:** A total of 50 adult patients with IBD consented to participate in this prospective study. Convenience sampling was used by the clinic staff in a gastroenterology clinic to select adult IBD patients from medical records who had scheduled office visits from April to August 2016. Selected patients were offered participation in the study. To obtain baseline activation and demographics, patients who agreed were sent an electronic or paper survey consisting of the patient activation (PAM-13) instrument and demographic questions. Responses to the PAM-13 items were converted to a PAM score using the PAM-13 score spreadsheet and the scores were then used to group each patient into one of the four progressive patient activation stages, such that patients in stage 1 generally had no knowledge/skill to manage their health while stage 4 patients were fully active in managing their health. Demographics were analyzed descriptively and compared per activation stage. **RESULTS:** The mean age of patients was 48 years (± 18years) and most were Caucasian (88%), female (64%), college graduates (56%), and had Crohn's disease (59.2%). Half of the patients had an active inflammation and had been diagnosed with IBD for over 5 years. A larger percentage were highly activated with 8%, 14%, 46%, and 32% in stages 1, 2, 3, and 4, respectively. Over 50% of the higher level stage 3 and 4 patients were female, Caucasian, college graduates, and over 40 years old. Demographic and stage comparisons were not significant. **CONCLUSIONS:** Patient activation is an indicator of health behavior and health outcomes. Its routine measurement could provide useful information to healthcare providers to guide customized information exchange with individual patients. This could foster greater patient engagement in health management and enhance the patient-provider interaction.

PSY113

QUALITATIVE STUDY REGARDING THE IMPACT OF HYDROCODONE RESCHEDULING ON GERIATRIC PAIN MANAGEMENT: PRESCRIBERS' PERSPECTIVE

Fleming ML, Lewing B, Bapat SS, Rege SA, Xu Q, Fernandez J
College of Pharmacy, University of Houston, Houston, TX, USA

OBJECTIVES: To qualitatively assess prescribers' perceptions regarding the consequences associated with hydrocodone rescheduling among geriatric patients being discharged from inpatient settings. **METHODS:** Two focus groups were conducted by a trained facilitator via a semi-structured interview in a metropolitan academic medical center in January 2016. Prescribers who manage pain for geriatric patients were recruited to explore the impact of hydrocodone rescheduling on patient care (e.g., transition of care) following discharge. Focus groups were recorded, transcribed and then analyzed using ATLAS.ti Qualitative Data Analysis software. Codes were derived from six primary research questions and results from the focus groups were summarized into key themes regarding the impact of rescheduling. **RESULTS:** Emerging themes included both positive and negative views regarding hydrocodone rescheduling. Physicians' expressed concern regarding the required special serialized prescription forms needed to issue schedule II prescriptions in Texas. Issues included substituting hydrocodone with potentially less effective pain medications (e.g., tramadol) and the inability to issue refills on hydrocodone prescriptions. Attending physicians expressed ethical concerns regarding legal questions related to prescribing hydrocodone to patients not under their direct care, since most medical residents and fellows do not have the required serialized prescription forms. Additionally, rescheduling has affected the coordination of pain management care upon discharge, as patients moving to long-term care or skilled nursing facilities may not have adequate pain management when transferred. Prescribers mentioned that they review the prescription monitoring program (PMP) more often before prescribing opioids after rescheduling. **CONCLUSIONS:** A majority of physicians felt rescheduling negatively impacted both practical and ethical aspects of patient care related to pain management. Meanwhile, rescheduling has changed physicians' hydrocodone prescribing patterns, leading to more caution when prescribing hydrocodone and greater use of the PMP. Future studies should assess geriatric patients' satisfaction and quality of life regarding pain management since hydrocodone was rescheduled.

PSY114

ORPHAN DRUG PRICING: DIFFERENCES BETWEEN US AND EUROPE, INFLUENCING FACTORS AND FUTURE DIRECTIONS

Chen X, Weisse S
Pope Woodhead, St Ives, UK

OBJECTIVES: Orphan drugs market access landscape has changed rapidly over recent years. This research aims to provide an update on OD pricing environment between US and Europe, and investigate differences, influencing factors and future trends. **METHODS:** Recent OD analogues were assessed covering different therapy areas. Market-specific pricing websites (EU5 and US) and reports from HTA bodies were analysed to understand their price level and reimbursement decisions. Payers (1-2 per market) were interviewed to validate the insights from secondary research. **RESULTS:** Price differences of ODs between US and Europe vary, depending on disease / product-related factors and market dynamics. Not all ODs have higher price in US compared to Europe. Some of the ODs (e.g. Vimizim) have similar price in Europe as US, while for other ODs, the price differences are 2-3 folds (e.g. Opsumit). Even within Europe, the price of ODs is not uniform. Several factors impact the price differences of ODs between US and Europe. For ODs with substantial benefits esp. in debilitating diseases with no/limited treatment options currently, their prices tend to be similar between US and Europe. But for ODs with no/small incremental benefits where other treatment options already exist, their prices tend to be lower in Europe vs. US. In the future, ODs will face increasing scrutiny from payers and discussions already started in Europe to re-examine the pathways for ODs. In the US, mixed messages have been given post presidential election, raising further uncertainties for OD pricing in the US. **CONCLUSIONS:** There will be increasing demand on ODs to justify their prices as healthcare systems are under increasing budget pressure. Flexible pricing with innovative contracting agreements / managed entry agreements will become increasingly important for ODs to address data uncertainties and support access in Europe and US.

PSY115

DIFFERENCES IN OPIOID UTILIZATION BETWEEN COMMERCIALLY INSURED AND TRADITIONAL MEDICAID FOR LOW INCOME ADULTS

Chopra DA[1], Bhandari NR[1], Kathe N[1], Shah AB[1], Moore G[1], Li C[1], Thompson J[2], Martin BC[3]
[1]*University of Arkansas for Medical Sciences, Little Rock, AR, USA,* [2]*Arkansas Center For Health Improvement, Little Rock, AR, USA,* [3]*University of Arkansas for Medical Sciences College of Pharmacy, Little Rock, AR, USA*

OBJECTIVES: Opioid-related deaths and overdoses have paralleled increases in opioid prescribing, however the influence of health payers on opioid prescribing is unclear. Under the Affordable Care Act, Arkansas expanded coverage to poor and near poor by enrolling persons into qualified health plans (QHPs) or Medicaid based on frailty level and income. This study sought to compare opioid use, chronic opioid use, and geographic variability in opioid use between individuals enrolled in Medicaid and QHPs. **METHODS:** Administrative claims data of newly enrolled subjects with at least six months of continuous coverage in 2014 were analyzed. Chronic use was defined as having at least ten opioid prescriptions over a minimum period of 90-days. A regression discontinuity design using a frailty-score which assigned subjects to Medicaid or QHPs was used to estimate the plan effect on opioid use and chronic opioid use. **RESULTS:** The final sample comprised of 151,429 individuals with a mean age of 39.78 years, 59.07% females, and 24.69% and 4.64% had a mental health and substance use disorder. There were 21,899 persons enrolled in FFS Medicaid and 129,530 in QHPs. Rates of opioid use among Medicaid and QHPs were 50.11% (49.44% - 50.77%) and 38.96% (38.69% - 39.22%) respectively. Chronic use rates among opioid user for Medicaid and QHPs were 19.97% (19.22% - 20.72%) and 13.25% (12.96% - 13.55%) respectively. Any opioid use was highest in the South-Central region (44.96%) and lowest in the North-West (36.19%). The regression discontinuity model showed that any opioid use

(OR = 0.905, p=0.128) and chronic opioid use (OR = 0.973, p=0.891) did not differ between QHPs and Medicaid. **CONCLUSIONS:** Overall, high rates of opioid use and chronic use were found, which did not differ by Medicaid or QHP enrollment. Opioid use and chronic use only showed modest variability across geographic regions in the state.

PSY116

ASSESSING THE IMPACT OF HYDROCODONE RESCHEDULING ON OPIOID PRESCRIBING USING PRESCRIPTION MONITORING PROGRAM DATA

Hatfield MD[1], Sansgiry SS[2], Johnson ML[3], Essien EJ[3], Todd KH[2], Fleming ML[2]
[1]Amgen, Pearland, TX, USA, [2]College of Pharmacy, University of Houston, Houston, TX, USA, [3]University of Houston, Houston, TX, USA

OBJECTIVES: Patients, healthcare providers, policymakers, and payers are intent on finding solutions to the opioid epidemic in the US. One solution enacted by the Drug Enforcement Administration in 2014 was to reschedule hydrocodone combination products (HCPs) from C-III to C-II. This change was aimed at restricting the availability of the most commonly prescribed prescription in the US. The objective of this study was to assess the immediate change in opioid utilization at the time of rescheduling, focusing on the substitution of HCPs with acetaminophen/codeine (APAP/codeine, C-III) and tramadol (C-IV), using prescription monitoring program (PMP) data. **METHODS:** An interrupted time-series design was used with data from the Texas PMP spanning June 1, 2013 to April 8, 2015. The PMP captures all controlled substance prescriptions (C-II – CV) dispensed from outpatient pharmacies. An interrupted time series design was employed to address the study objective. Opioids were grouped into four categories: 1) HCPs; 2) other C-II opioids; 3) APAP/codeine; and 4) tramadol. Each prescription was converted to daily morphine milligram equivalents (MMEs) per 100 population for analysis. **RESULTS:** The total number of prescription opioids dispensed was 30,745,113. Most were for HCPs (67.4%), followed by all other C-II opioids (12.1%), APAP/codeine (10.1%), and tramadol (10.4%). At the time of rescheduling, the mean utilization of opioids (in daily MMEs per 100 population) decreased from 67.4 to 45.2 (-32.9%) for HCPs, increased from 1.4 to 5.0 (271.5%) for APAP/codeine, and increased from 3.1 to 11.0 (256.2%) for tramadol. After rescheduling, the rate of change of APAP/codeine utilization increased by 0.06 daily MMEs per 100 population per day. **CONCLUSIONS:** Rescheduling resulted in increased use of APAP/codeine and tramadol. HCP use was restricted, as intended. The unintended consequences of increased heroin usage and potential negative impacts to patients' quality of life should also inform future policy.

PSY117

PRICE TRENDS OF ORPHAN DESIGNATED HEMOPHILIA DRUGS IN THE UNITED STATES

Lim-Watson M[1], Ida F[1], Kodeih R[1], Seoane-Vazquez E[2]
[1]MCPHS University, Boston, MA, USA, [2]Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA

OBJECTIVES: To assess price trends of hemophilia A and B drugs in the United States in the period January 1, 1992 to October 9, 2016. **METHODS:** A list of drugs approved for hemophilia A and B were obtained from the Food and Drug Administration web page from January 1, 1983 to October 9, 2016. Pricing data from January 1, 1992 to October 31, 2016, for the compiled drugs, were extracted from RedBook (Truven Health Analytics). Prices were adjusted for inflation. **RESULTS:** A total of 9 manufacturers are responsible for the commercialization of 21 proprietary drugs; 15 drugs are indicated for the treatment of hemophilia A and 6 for hemophilia B as of October 9, 2016. For hemophilia A plasma drugs, initial flat price trends upon market entry were observed with an AWP per unit range from $0.75 to $0.92. For hemophilia A recombinant drugs, the initial market AWP hovered below $2.00, until 2013, when 3 new human plasma derived drugs were launched in the US drug market. Over time, these three new drugs alone, increased in price by an average of 54%. On average, recombinant drugs for hemophilia A escalated by 12% over a period of 14 years. Hemophilia B Plasma drugs entered the market in 1992 within an AWP per unit of $0.06 and had an average cumulative price increase of 56% over 14 years. Hemophilia B recombinant drugs also increased over time at an average of 28%. **CONCLUSIONS:** The prices of hemophilia drugs at market entry increased overtime. Prices of marketed drugs increased faster than inflation. The rising price trend in hemophilia drugs may be largely due to changes in treatment regimens that support prophylactic utilization of hemophilia drugs versus on demand treatment, small number of competitors, R&D cost, and limited drug pricing regulations.

PSY118

TREATMENT COVERAGE FOR ACUTE AND CHRONIC BACK PAIN: A PILOT STUDY

Lin DH[1], Murimi IB[1], Tierce J[1], Jones CM[2], Alexander GC[1]
[1]Johns Hopkins Bloomberg School of Public Health, Center for Drug Safety and Effectiveness, Baltimore, MD, USA, [2]US Department of Health and Human Services, Washington, DC, USA

OBJECTIVES: To determine the extent of coverage for opioids and other pharmacological and nonpharmacological treatments for low back pain, we examined coverage policies for 63 pharmacologic and 12 non-pharmacologic treatments for low back pain in Medi-Cal, California's Medicaid program, Anthem, a large private insurer and CVS Caremark, a large pharmacy benefit manager. **METHODS:** We assessed the extent of and barriers to coverage using Medi-Cal's Contract Drug List, Anthem's 4-Tier National Formulary and CVS Caremark's Value Formulary for medication coverage, and provider manuals and medical policies for coverage of non-pharmacologic treatments. **RESULTS:** Of 63 prescription drug products for back pain, Medi-Cal covered 23 (37%) products, Anthem covered 52 (83%), and CVS Caremark covered 30 (48%). Medi-Cal and Anthem covered roughly the same number of opioids as non-opioids, while CVS Caremark covered twice as many non-opioids as opioids. Eighteen (29%) products were covered by all three payers and 8 (13%) were not covered by any, totaling 26 (41%) products unanimously covered or not covered across all three programs. Prior authorization was more frequently required for Medi-Cal non-opioids (31%) and CVS opioids (50%) than for other payers and product groups. Quantity limits were very often imposed for opioids. Among non-pharmacological therapies, Medi-Cal covered occupational therapy, acupuncture and chiropractic care up to 2 visits per month. Anthem covered a modestly greater variety of non-pharmacological treatments with fewer limits on the number of visits covered. Neither Medi-Cal nor Anthem covered treatments such as biofeedback, transcranial magnetic stimulation, cognitive behavioral therapy, or yoga. **CONCLUSIONS:** Coverage is an important driver of utilization of specific healthcare services. Our analysis found substantial variability in the coverage of non-opioid pharmacologic and non-pharmacologic treatments for low back pain among these payers. Coverage restrictions may diminish the use of alternatives to opioids in settings where such alternatives have a favorable risk-benefit balance.

PSY119

PRELIMINARY REAL WORLD DATA ON SWITCHING BETWEEN ETANERCEPT AND ITS RECENTLY MARKETED BIOSIMILAR COUNTERPART

Alten R[1], Jones HE[2], Singh E[2], Curiale C[3], Meng T[4], Gossen N[5], Lucchese L[6], Miglio C[6]
[1]Schlosspark-Klinik Teaching Hospital of the Charité, University Medicine Berlin, Berlin, Germany, [2]Pfizer Inc., Collegeville, PA, USA, [3]Pfizer, Rome, Italy, [4]Pfizer Pharma GmbH, Berlin, Germany, [5]QuintilesIMS, Frankfurt am Main, Germany, [6]QuintilesIMS, London, UK

OBJECTIVES: In February 2016, the first etanercept biosimilar (EtnBS) has been launched in Germany, which may represent a cheaper option to the original biologic agent (EtnBA). The objective of this study was to provide initial real-world data on the penetration of EtnBS within the EtnBA market by evaluating switching dynamics between the two drugs in real world clinical practice. **METHODS:** Patients receiving first EtnBS prescription, with or without previous treatment with EtnBA, were retrospectively identified using the Longitudinal Prescriptions database (QuintilesIMS® LRx) between January 2008 (beginning of database) and September 2016 (last available data). The representativeness of the database based upon current population and pharmacy coverage in 2016 is around 60% of the statutory health insurance market. For patients with prior EtnBA treatment, the mean treatment duration prior to switch was reported. In addition, the proportion of those who switched back to EtnBA and the mean time to switch were evaluated. For all patients, the drug device used was recorded. **RESULTS:** A total of 1,536 patients on EtnBS (62% using pens and 38% pre-filled syringe) were identified, of which, 813 (52%) had, on average, around 3 years of prior treatment with EtnBA. Among these, the large majority were using pre-filled syringe (70%) and kept the same kind of device when switching to EtnBS (61%). After changing to EtnBS, a total of 65 patients (8%) switched back to EtnBA after only 2 months. The 72% of the patients who switched back to EtnBA chose the same kind of device (pre-filled syringe). **CONCLUSIONS:** Despite many patients change from etanercept to its biosimilar treatment, 8% switch back to the original biologic agent in the short term. Longer term studies are required to confirm these preliminary results and investigate the reasons for changing back to the original product.

PSY120

COMPARISON OF INTRAVENOUS IRON SALES IN DIFFERENT MEASUREMENT UNITS

Zhu Y[1], Mohamoud M[2], Bird S[2], Eworuke E[2]
[1]University of Florida, Gainesville, FL, USA, [2]U.S. Food and Drug Administration, Sliver Spring, MD, USA

OBJECTIVES: To compare drug utilization estimates by different measurement units – Eaches, Extended Units and Kilograms – using aggregated sales data for intravenous (IV) iron products. **METHODS:** We conducted a cross-sectional study using IMS Health National Sales Perspectives database (2014) to evaluate the utilization of IV iron products using three measurement units: 1) Eaches – number of vials sold, 2) Extended Units – amount of volume sold in milliliters; 3) Kilograms – amount of active ingredient sold in kilograms. The use of each IV iron product was calculated as a proportion of the number of Eaches/Extended Units/Kilograms of each IV iron product as the numerator with the total number of Eaches/Extended Units/Kilograms of all IV iron products as the denominator. **RESULTS:** The utilization patterns varied by measurement units. Irrespective of the measure used, iron sucrose and ferric gluconate were the first and second most sold products, and ferric carboxymaltose was the least sold product. The ranks of the proportion of sales of ferumoxytol and iron dextran differed by measurement unit. The ranking of sales for iron dextran and ferumoxytol remained the same (third and fourth respectively) for the Eaches and Kilogram units. However, the estimated proportion of sales of iron dextran in Extended Units (4.06%) ranked lower than the estimate for ferumoxytol in Extended Units (5.29%). The estimated proportion of sales of ferumoxytol in Eaches (1.25%) was only one fourth of the estimate in Extended Units (5.29%) and one sixth of the estimate in Kilograms (7.58%). Similarly, the estimated proportion of sales of ferric carboxymaltose in Eaches (0.31%) was approximately one fourth of the estimate in Extended Units (1.26%) and one tenth of the estimate in Kilograms (3.03%). **CONCLUSIONS:** Estimates of drug utilization using aggregated sales data largely depend on the measurement unit selection, as well as the characteristics of the product in consideration.

PSY121

REAL-WORLD DOSING AND PATIENT CHARACTERISTICS OF RECENTLY APPROVED RECOMBINANT FVIII THERAPIES IN HEMOPHILIA A PATIENTS

Buckley BC, Hagberg B, Su J
Biogen, Weston, MA, USA

OBJECTIVES: To evaluate real-world patient characteristics and treatment regimens in patients with hemophilia A using recently approved rFVIII therapies in the US, based on specialty pharmacy dispensing records. **METHODS:** A retrospective analysis

was performed using a database composed of aggregate, de-identified US Specialty Pharmacy Provider (SPP) records from July 2014 through November 2016. Patients eligible for this analysis had received ≥1 shipment of a recently approved rFVIII factor therapy. Recently approved factor therapies were defined as therapies approved in 2014 or later, which includes: ELOCTATE, ADYNOVATE, ALFSTYA, NUWIQ, KOVALTRY, and NOVOEIGHT. Patients were categorized based on their age, regimen and prescribed dosing frequency. Analysis of prophylactic regimens included only ELOCTATE and ADYNOVATE because of the low number of patients on other therapies. **RESULTS:** A total of 1174 patients with hemophilia A of unknown severity were included in this analysis. Forty-three percent of patients were >18 years of age, 41% were 18-39, and 16% were >40; average weights were 39kg, 84kg, and 84kg, respectively. Most patients were treated with a prophylaxis regimen (88%) with the remaining being treated on-demand (12%). ELOCTATE (71% of patients) was the most frequently dispensed therapy followed by ADYNOVATE (17%), NOVOEIGHT (8%), KOVALTRY (2%), NUWIQ (2%), ALFSTYLA (0%). The most commonly prescribed prophylactic infusion frequency was twice weekly, representing 48% of patient records. Patients on ELOCTATE (37%) were more likely to have an infusion frequency longer than twice weekly than patients treated with ADYNOVATE (13%). **CONCLUSIONS:** Recently approved rFVIII therapies have been prescribed for a large number of patients with hemophilia A in the United States. ELOCATATE is the most frequently utilized of these rFVIII therapies based on SPP dispensing records. Patients prescribed ELOCTATE and ADYNOVATE achieved extended prophylactic infusion frequencies. Those on ELOCATE therapy were more likely to be prescribed an infusion frequency longer than twice weekly.

PSY122

LOCAL ANESTHETIC ACTIVITIES OF NEW PIPERIDINE DERIVATIVES ON THE INFILTRATION ANESTHESIA MODEL

Kadyrova D, Smagulova G, Kim I, Satbayeva E, Amirkulova M, Nekoliczak A, Myrzabek B
Asfendiyarov Kazakh National Medical University, Almaty, Kazakhstan

OBJECTIVES: Identify local anesthetic activity of new derivatives of piperidine (LAS - local anesthetic substances) - LAS-202, LAS-203 and LAS-204 - for infiltration anesthesia. **METHODS:** The studies of infiltration anesthesia were conducted on guinea pigs by methods of Byulbring and Wade in 0,25% solutions, acute toxicity was investigated on white mice. Experimentally determined the strength of action and duration of anesthesia. **RESULTS:** Most local anesthetic activity noted in LAS-202, which power of action was equal to trimecaine, significantly exceeded lidocaine by 1.4 times, and novocaine by 1.3 times. The duration of complete anesthesia of LAS-202 is equal to trimecaine, and exceeds lidocaine and novocaine. Total duration of the local anesthetic effect of LAS-202 is significantly higher than trimecaine by 1.39 times, 1.79 times that of lidocaine, and 1.83 times that of novocaine. The index of anesthesia of LAS-203 and LAS-204 approaches the corresponding parameter of trimecaine. The complete skin insensitivity of guinea pigs in the administration of compounds is few shorter than that for trimecaine, equal to lidocaine, and longer than novocaine. The total duration of the LAS-203 is 1.06 times more than trimecaine, but LAS-204 more by 1.2 times. LAS-203 and LAS-204 exceeded the corresponding index of lidocaine by 1.3 times and 1.5 times, respectively, but exceeded novocaine by 1.4 times and 1.6 times, respectively. The LD50 of tested compounds are in the range of 425 mg / kg - 472.3 mg / kg. **CONCLUSIONS:** Of greatest interest is the compound LAS-202, which in force and duration of complete anesthesia is equal to trimecaine and exceeds lidocaine and novocaine. In general duration of action, it is superior to all the reference drugs and belongs to the low-toxic group of drugs. Therefore, LAS-202 is recommended for further studies.

PSY123

PAIN MEDICATION (OPIOID AND NON-OPIOID) USE AMONG TEXAS MEDICAID ENROLLEES WITH SICKLE CELL DISEASE

Kang HA[1], Barner JC[2]
[1]*The University of Texas at Austin, Austin, TX, USA,* [2]*The University of Texas at Austin, College of Pharmacy, Austin, TX, USA*

OBJECTIVES: To describe pain medication use among Texas Medicaid enrollees with sickle cell disease (SCD) and to determine the factors predicting opioid use. **METHODS:** This was a retrospective study using Texas Medicaid claims data from 9/1/11-8/31/15. Medication use of patients who were ≤62 years, had at least 1 hydroxyurea prescription, and had at least 1 inpatient or 2 outpatient SCD diagnoses during the study period were analyzed between 6 months before and 1 year after the first prescription of hydroxyurea. Descriptive statistics and logistic/poisson regressions were conducted to determine the prevalence of pain medication use and to identify predictors of opioid use, respectively. **RESULTS:** A total of 1,025 patients (18.0 ±12.6 years) met the inclusion criteria. Of these, 935 patients (91.2%) had pain medication(s) during the study period. A total of 883 patients (86.1%) had at least one opioid prescription and the mean opioid prescriptions per person was 13.0±14.0. Among opioid medications, 21.3% were among the strongest opioids such as morphine, hydromorphone and fentanyl and 78.7% were less strong opioids including codeine, hydrocodone and tramadol. NSAIDs were the most frequently prescribed non-opioid medication for pain management of SCD patients (92.4%). Poisson regression showed that the number of hydroxyurea prescriptions, female, older patients, and African American were significant positive predictors of the number of pain medication prescriptions. Logistic regression showed that adult patients (≥18 years) were 6.691 times more likely to have at least one opioid prescription than pediatric patients (<18 years) while controlling for other covariates ($p<0.001$, OR=6.691; 95% CI: 2.628-17.033). **CONCLUSIONS:** Appropriate use of pain medications is important for the management of the acute painful crisis that is a major contributor to the costs for the patients with SCD. Pediatric pain management should be addressed to assess if they receive appropriate care for their pain crises.

PSY124

ACUTE PAIN OUTCOMES FOLLOWING ORTHOPEDIC AND ABDOMINAL SURGERY

Peyerl FW, Khangulov VS, Hayashi DE, Talaga AK, D'Souza FT
Boston Strategic Partners, Inc., Boston, MA, USA

OBJECTIVES: US national survey data indicates that acute postsurgical pain is inadequately relieved in patients and multiple studies report a high prevalence of moderate to severe pain following surgery. The objective of this study was to examine acute pain outcomes, including hospital length-of-stay (LOS), medications, and pain scores, following orthopedic and abdominal surgery using retrospective data for a large cohort of adult patients. **METHODS:** Using an electronic health record database with information from 614 hospitals across the US (Cerner Health Facts®), we evaluated trends in pain measurement, treatment, and outcomes associated with acute postsurgical pain management (n=1,581,795 adult patients from 2009-2015). The analysis included orthopedic (ICD9 codes of 76-84.X, 00.7-00.8) and abdominal surgery (ICD9 codes of 42.X-71.X) patients. Patients included in the analysis had to have at least one recorded pain score (0 to 10 scale) before and after surgery. Pain score, hospital LOS, and type of medications received were examined. **RESULTS:** Pre and post-operative pain was examined in orthopedic (n=328,893) and abdominal surgery (n=719,428) patients. Mean hospital length-of-stay was similar between the two surgery groups (4.6 and. 4.7 days for abdominal and orthopedic surgery, respectively). Following surgery, 58% of patients undergoing abdominal/pelvic surgery were treated with polytherapy (more than one type of pain medication administered) for pain and 79% of orthopedic surgery patients were treated with polytherapy (vs. monotherapy). 53% of abdominal surgery patients received multimodal therapy (combination of opioid and non-opioid medications), 40% received opioid-only treatment while 7% received non-opioid only therapy. 77% of orthopedic patients received multimodal therapy while 19% received opioid only and 4% received non-opioid only therapy. **CONCLUSIONS:** Postsurgical length-of-stay is similar between orthopedic and abdominal surgery patient groups. In orthopedic patients, providers rely more heavily on polytherapy and opioid treatment methods to effectively manage pain.

PSY125

RECENT TRENDS IN EMERGENCY DEPARTMENT VISITS RESULTING FROM UNINTENTIONAL OVERDOSE OF NON-OPIOID ANALGESICS, ANTIPYRETICS, AND ANTIRHEUMATICS IN THE UNITED STATES

Goyal RK, Ajmera MR, Davis KL
RTI Health Solutions, Research Triangle Park, NC, USA

OBJECTIVES: Drug-related overdoses result in >1 million emergency department (ED) visits in the United States (US) annually. The US Food and Drug Administration (FDA) has taken significant steps in recent years to increase awareness about medication safety and reduce risks associated with unintentional drug overdoses. To assess the impact of FDA initiatives, we explored recent trends in ED visits resulting from unintentional drug overdoses, with a particular focus on non-opioid analgesic, antipyretic, and antirheumatic (NOAAA) drugs. **METHODS:** Data from the National Hospital Ambulatory Medical Care Survey (NHAMCS), a nationally representative annual sample of hospital outpatient and ED visits in the US, were analyzed for years 2002-2013. ED visits associated with overdose/poisoning of NOAAA drugs were identified using applicable ICD-9-CM diagnosis and cause of injury codes. Unintentional nature of overdose/poisoning was determined using the intent data collected in NHAMCS. Data were weighted to produce national estimates. Three-year blocks of data were combined into four observation periods (2002-2004, 2005-2007, 2008-2010, and 2011-2013). The rates of ED visits due to unintentional overdoses of NOAAA drugs were assessed per 1,000 all-cause ED visits. **RESULTS:** Total numbers of ED visits resulting from unintentional overdoses of NOAAA drugs during the observation periods 2002-2004, 2005-2007, 2008-2010, and 2011-2013 were 144,946, 146,730, 170,559, and 144,360, respectively. The rate of ED visits for unintentional overdoses of NOAAA drugs was 0.43 per 1,000 ED visits during 2002-2004, which remained fairly constant through periods 2005-2007 (0.42 per 1,000 ED visits) and 2008-2010 (0.44 per 1,000 ED visits), but decreased to 0.36 visits per 1,000 ED visits in the most recent period 2010-2013, representing a relative decrease of 18.2%. **CONCLUSIONS:** This analysis demonstrated a decline in the rate of ED visits for unintentional NOAAA drug overdoses in recent years. These findings suggest that FDA initiatives towards improving consumer awareness and medication safety may be effective.

PSY126

TREATMENT PATTERNS, TREATMENT SATISFACTION, AND TREATMENT SWITCHING IN PATIENTS WITH NON-RADIOGRAPHIC AXIAL SPODYLOARTHRITIS

Sandoval D[1], Hunter TM[1], Lobosco S[2], Moon R[3], Birt J[1], Milligan G[3]
[1]*Eli Lilly and Company, Indianapolis, IN, USA,* [2]*Adelphi Real World, Macclesfield, UK,* [3]*Adelphi Real World, Bollington, UK*

OBJECTIVES: To describe biologic use, treatment satisfaction, and switching patterns among nr-axSpA patients. **METHODS:** Data from the 2015 SpA Disease Specific Programme, a cross-sectional, multi-national survey of patients and rheumatologists conducted in France, Germany, Italy, Spain, United Kingdom, and the United States were analyzed. Rheumatologists completed record forms containing information on current treatment therapy, reasons for switching biologics and treatment satisfaction. **RESULTS:** Data from 391 rheumatologists and 1,995 patients with nr-axSpA were included in this analysis. Of the 1,995 patients, 39% were receiving a biologic and no csDMARD, 15% biologic and a csDMARD, 14% csDMARD, 23% NSAIDS, 4% other therapy, and 5% were receiving no therapy. Patients receiving biologic therapy had significantly higher physician-reported severity immediately prior to initiation of the current treatment regimen ($p<0.0001$) than those patients not receiving biologic therapy. Patients receiving biologic therapy also had significantly higher levels of pain immediately prior to initiation of the current treatment regimen ($p<0.0001$). Of the 1,047 patients that received a biologic, 89.2% were receiving their first, 8.2% their second and 2.6% their third or more biologic. Of the 114 patients with known reasons

for switching from their previous biologic, 35% switched due to secondary lack of efficacy, in 33% the condition worsened, 24% switched due to poor pain control, and in 25% remission was not achieved. The proportion of patients that physicians categorized as "very satisfied" with their present regimen was significantly higher ($p<0.0001$) for biologic patients. **CONCLUSIONS:** Biologics are reserved for the most uncontrolled patients as evidenced by severity and the intensity of pain immediately prior to initiation of current regimen. Despite this, biologic patients are associated with the highest levels of physician reported satisfaction. While there is minimal switching of biologics, when this is done, it is usually due to lack of efficacy, lack of pain relief, and effort to accomplish remission.

PSY127

CHANGES IN PRESCRIBING BEHAVIOR FOLLOWING OPIOID DOSING GUIDELINES IN A WORKERS' COMPENSATION POPULATION

Heins SE, Castillo RC
Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, USA

OBJECTIVES: Prescription opioid misuse has increased markedly and is associated with greater medical spending and decreased productivity. Given the association between high daily dose of prescription opioids and negative health outcomes, state workers' compensation boards have implemented policies to reduce the morphine equivalent daily dose (MEDD) prescribed. The study objective is to evaluate the impact of MEDD guidelines among workers' compensation claimants. **METHODS:** Claims data from a large, national workers' compensation insurer were utilized. The treatment group consisted of injured workers from three states with workers' compensation board guidelines implemented in 2012 recommending against prescriptions >120 mg MEDD—Massachusetts, which developed its own guideline, and California and Utah, which adopted their guidelines from the American College of Occupational and Environmental Medicine (ACOEM). Three comparison states—Illinois, Indiana, and Pennsylvania—were selected based on having similar policy landscapes and opioid utilization trajectories, but no MEDD policy during the study period. Multivariate regression analyses used average mg MEDD post-policy implementation as the outcome. Covariates included demographics, employment status, state fixed effects, and average MEDD pre-policy implementation. Policy indicators and interaction terms between policy indicators and high dose use (>120 mg MEDD) pre-policy were also included. **RESULTS:** Among 3,799 users, high dose prescriptions were common (12%). There was no significant reduction in daily dose in Massachusetts as compared to control states. There was a small, statistically significant reduction in ACOEM states as compared to the control states (-6.8, $p<0.01$). However, individuals who received doses >120 prior to guideline adoption did not experience larger decreases in MEDD relative to those in control states. **CONCLUSIONS:** MEDD guidelines may not be sufficient to change prescribing behavior. Recent efforts by Medicaid agencies, such as implementing passive alert systems or requiring prior authorization before dispensing high dose opioids may be more effective in reducing high dose prescribing than guideline adoption and warrant further evaluation.

PSY128

DISEASE-STRATIFIED ADHERENCE TO IRON CHELATION THERAPY IN PATIENTS WHO SWITCHED FROM DEFERASIROX DISPERSIBLE TABLETS TO DEFERASIROX FILM-COATED TABLETS

Cheng WY[1], Duh MS[1], Xiao Y[2], Coe A[3], Hao Y[3], Vekeman F[2], Bobbili PJ[1], Blinder M[4]
[1]*Analysis Group, Inc., Boston, MA, USA,* [2]*Groupe d'analyse, Ltée, Montréal, QC, Canada,* [3]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA,* [4]*Washington University School of Medicine, St. Louis, MO, USA*

OBJECTIVES: To assess real-world adherence and persistence to iron chelation therapy (ICT) in patients switching from deferasirox (DFX) dispersible tablet (DFX-DT) to film-coated tablet (DFX-FCT), stratified by disease. **METHODS:** A retrospective pre-post cohort study was conducted in patients switching from DFX-DT to DFX-FCT using pharmacy/medical claims (06/2014 - 05/2016) from the Symphony Health Solutions' Integrated Dataverse (IDV®) database. Eligible patients were ≥2 years old, had a diagnosis of sickle cell disease (SCD), thalassemia, or myelodysplastic syndrome (MDS), ≥2 DFX-FCT claims (1st claim = index date), and ≥2 DFX-DT claims pre-index. Medication possession ratio (MPR) (percentage of time with access to medication) was computed for DFX-DT during the DFX-DT period (1st DFX-DT claim to index date) and for DFX-FCT during the DFX-FCT period (index date to end of observation). Proportion of days covered (PDC) and persistence (without a gap ≥30, 60 days) were assessed over DFX-DT- and DFX-FCT- periods of 3 and 6 months. Comparisons between the two periods were made using Wilcoxon sign-rank tests or McNemar's tests. **RESULTS:** A total of 348, 154, and 106 patients with SCD, thalassemia, and MDS were identified, respectively. Of all patients, 55% were female and 66% aged <35 years. Across all diseases, PDC and persistence to ICT were consistently higher during the DFX-FCT vs. DFX-DT periods, with the greatest improvement observed among MDS patients: DFX-FCT vs. DFX-DT, mean 3-month PDC: SCD 0.80 vs. 0.68, thalassemia 0.85 vs. 0.77, MDS 0.86 vs. 0.69; 3-month persistence: SCD 82.9% vs. 57.3%, thalassemia 90.3% vs. 71.8%, MDS 91.9% vs. 62.9% (all $p<0.01$). MPR was significantly different only in MDS patients (DFX-FCT: 0.88 vs. DFX-DT: 0.82, $p=0.05$). **CONCLUSIONS:** Adherence and persistence to ICT improved significantly after patients with SCD, thalassemia, or MDS switched from DFX-DT to DFX-FCT, with the most notable improvements seen in patients with MDS.

PSY129

A REAL-WORLD STUDY ON TREATMENT PATTERNS AND DOSE TITRATION OF PREGABALIN FOR NEUROPATHIC PAIN

Yeh Y[1], Ling Y[2], Shelbaya A[3], Lyndon G[4], Cappelleri JC[5], Varvara R[4], Gao X[2]
[1]*Pharmerit International, Newton, MA, USA,* [2]*Pharmerit International, Bethesda, MD, USA,* [3]*Pfizer Inc, Columbia University Mailman School of Public Health, New York, NY, USA,* [4]*Pfizer Ltd, Surrey, UK,* [5]*Pfizer Inc, Groton, CT, USA*

OBJECTIVES: To describe the patterns of therapy switch and discontinuation in patients receiving pregabalin for neuropathic pain (NeP), and to examine pregabalin dose titration and its impact on treatment adherence and duration. **METHODS:** MarketScan database (2009-2014) was used to extract a cohort of incident adult pregabalin users with NeP who had at least 12 months of follow-up data. Patients who had no pregabalin prescription fill within 90 days at the end of pregabalin coverage were considered to have discontinued therapy, while those with no prescription fill for pregabalin but had other NeP prescription fill were consider to have switched therapy. Adherence [measured by medication possession ratio (MPR)] and persistence (measured as the duration of continuous treatment) were compared between the cohorts with dose titration (dose augmentation within 45 days of the index date) and without dose titration. Logistic regressions and Cox proportional hazards models were used to identify the factors associated with adherence (MPR ≥ 0.8) and predictors of time to switch. **RESULTS:** Among the 5,186 patients in the analysis, approximately 75% discontinued pregabalin or switched to other NeP medication. Median time to discontinuation or switch was 6.2 months. Approximately 7% switched from pregabalin to generic gabapentin and 17% switched to other NeP medication. About half (51%) of the patients discontinued pregabalin and did not switch to other NeP medications. Approximately 18% of patients had dose titration. Patients who had dose titration were less likely to discontinue pregabalin or switch therapy (hazards ratio = 0.91, $p=0.016$) and more likely to be adherent (MPR ≥ 0.8) (odds ratio = 2.6, $P < 0.001$) than those who did not have dose titration. **CONCLUSIONS:** Three quarters of new pregabalin users discontinued or switched therapy. Pregabalin dose titration was associated with improved adherence and longer duration of therapy.

PSY130

FACTORS INFLUENCING THE CHOICE OF BARIATRIC PROCEDURES

Wei D[1], Hsiao C[2], Roy S[3], Johnston SS[1], Kalsekar I[1]
[1]*Johnson & Johnson Co., New Brunswick, NJ, USA,* [2]*Global Health Economics and Market Access, Ethicon Inc., Cincinnati, OH, USA,* [3]*Ethicon Inc, Somerville, NJ, USA*

OBJECTIVES: Laparoscopic roux-en-Y gastric bypass (RYGB) and laparoscopic sleeve gastrectomy (SG) are currently the two most commonly-performed bariatric surgeries. This study used a real-world dataset to examine factors that are associated with the choice between these two procedures. **METHODS:** The study was conducted using the Premier Perspective® Database, which contains a nationally representative sample of discharges from over 600 hospitals in the U.S. Included patients were >18 years of age and underwent laparoscopic RYGB or SG between January 2014-September 2015. A multivariable logistic regression model, in which the outcome was receipt of RYGB vs. SG (reference), was built with a broad range of predictor variables: patients' demographics, body mass index (BMI), and provider/hospital information. **RESULTS:** A total of 11,948 patients underwent RYGB, and 22,670 underwent SG. Compared to SG patients, RYGB patients had higher proportion in the BMI>50 category (29.3% vs 24.8%), but lower proportions in the BMI=35-39.9 (16.5% vs 19.2%) and BMI=40-50 (54.2% vs 56.0%) categories. In the logistic regression model, patients with BMI=40-50 and BMI>50 were more likely to have undergone RYGB, with ORs of 1.190 (95% confidence interval: 1.090-1.298, $p<0.0001$) and 1.417 (1.231-1.632, $p<0.0001$), respectively, treating patients with BMI=35-39.9 as the reference group. Other factors associated with an increased odds of undergoing RYGB included female (OR=1.188, $p<0.0001$) vs. male as reference group, comorbid conditions including diabetes (OR=1.587, $p<0.0001$), hypertension (OR=1.133, $p=0.0022$), and depression (OR=1.159, $p=0.0175$). Factors associated with a decreased odds of undergoing RYGB were older age (age 65-74 [OR=0.741, $p=0.0283$], age 75 and above [OR=0.426, $p=0.0366$] vs. age <45 as the reference group), and comorbid conditions including valvular disease (OR=0.779, $p=0.0366$), and rheumatoid arthritis (OR=0.708, $p=0.0175$). **CONCLUSIONS:** This study suggests that BMI level, age, gender, and the presence of selected comorbidities are important factors in whether patients undergo RYGB or SG.

PSY131

LONGITUDINAL ANALYSIS OF RESPONSE, COSTS AND RESOURCE USE OF PATIENTS WITH RHEUMATOID ARTHRITIS INITIATING BIOLOGIC DISEASE-MODIFYING ANTIRHEUMATIC DRUGS (BDMARDS) IN TAIWAN USING THE NATIONAL HEALTH INSURANCE RESEARCH DATABASE

Shi Q[1], Treuer T[2], Gaich CL[3], Lee C[4], Wu W[4], Li K[5]
[1]*Lilly China, Shanghai, China,* [2]*Lilly Hungary, Budapest, Hungary,* [3]*Eli Lilly and Company, Indianapolis, IN, USA,* [4]*Lilly Taiwan, Taipei, Taiwan,* [5]*National Taiwan University Hospital, Taipei, Taiwan*

OBJECTIVES: Rheumatoid arthritis (RA) is an inflammatory disorder associated with significant physical and psychological burden. This study utilizes Taiwan's National Health Insurance Research Database (NHIRD) which is a claims-based database recording all interactions with the National Health Insurance system. This study estimated the percentage of newly treated patients with inadequate response (IR) to biologic disease-modifying antirheumatic drug (bDMARDs). **METHODS:** Data were from the catastrophic illness file within the NHIRD from 1/1/2009 to 12/31/2013. The index period spanned 2010 with 365 day pre- and post-index periods. Biologically naïve patients with a healthcare event related to RA and a new claim for a bDMARD were included in this study. Patients were indexed upon their first claim for a bDMARD during the index year. A validated algorithm was used to examine the rate of inadequate response in the biologically-naïve cohort of patients. All-cause mean annual direct costs and resource use were measured in the year of follow-up. **RESULTS:** A total of 818 biologically-naïve patients initiated a bDMARD and were included in the study. At 1 year of follow-up, 66.01% (n=540) were classified as bDMARD inadequate responders, 31.54% (n=258) were classified as confirmed stable, and 2.44% (n=20) were of unknown response status. Inadequate responders had higher mean annual resource utilization in the follow-up year with increases in hospital admissions (0.46 vs. 0.1), hospital days (3.4 vs. 0.49), outpatient visits (42.50 vs. 37.66), and emergency department visits (0.51 vs. 0.3). **CONCLUSIONS:** A significant proportion of patients with RA initiating a bDMARD for the first time showed

an IR to their treatment within a year. Patients with an IR had increased resource utilization and higher non-medication costs than those with stable disease.

PSY132
COST OF PLATELET PURCHASE AND PRODUCTION: A SURVEY OF U.S. HOSPITALS
Lyons NM[1], Prioli KM[1], Pizzi LT[2]
[1]Thomas Jefferson University, Philadelphia, PA, USA, [2]Rutgers University, Piscataway, NJ, USA
OBJECTIVES: Platelet transfusions are commonly utilized to treat or prevent bleeding. Costs associated with platelet production and dynamics of platelet utilization in the hospital setting, however, remain opaque. Objective of this project was to survey U.S. hospital transfusion directors to determine basic facility characteristics and quantity, type, and cost of conventionally-processed platelets (CP) purchased, produced, and/or dispensed. **METHODS:** Survey was developed with input from 2 cost researchers and 2 transfusion directors, and consisted of 29 questions (25 quantitative, 4 qualitative). Sample frame included US hospitals of varied bed size and type. Survey administration occurred by email or telephone, depending on respondent's preference. Responses were analyzed using descriptive statistics. **RESULTS:** 160 invitations were issued resulting in 27 hospital interview completions. Hospital beds ranged from 196 to 1157 (mean 638, SD 307). Nineteen (70.4%) had trauma centers, 6 (22.2%) were pediatric centers, and 6 (22.2%) had a cancer center. Sixteen (59.3%) were located in the northeast geographic census region, 6 (22.2%) in the south, 3 (11.1%) in the midwest, and 2 (7.4%) in the west. All (n=27) purchased at least some of their platelet stock from a blood supplier, with 10 (37%) collecting and manufacturing platelets on-site. Majority of platelets (74%) were transfused in inpatient setting. Mean platelet age at dispensing was 3.6 days (SD 0.6), with over half transfused at >3 days storage. Mean monthly platelets dispensed was 489.5 units (SD 535.2). Mean per-unit CP purchase cost was $497.92 (SD $103.29) and mean monthly CP purchase volume was 106.0 (SD 137.3). For those hospitals manufacturing platelets on-site, mean per-unit CP production cost was $416.09 (SD $117.08) with mean 50.5 (SD 64.1) CP units produced monthly. **CONCLUSIONS:** Results demonstrate variability in platelet utilization and associated costs among hospitals. Further study involves comparing costs of CP to platelets processed with other methodologies.

PSY133
ALL-CAUSE HEALTH CARE EXPENDITURES AMONG PERSONS WITH SICKLE CELL DISEASE
Zhang S, Rajpura J, Thomas III J
Purdue University, West Lafayette, IN, USA
OBJECTIVES: This study aimed to assess all-cause health care expenditures among persons with Sickle Cell Disease (SCD). **METHODS:** A retrospective cohort study was conducted using a multi-state Medicaid claims database. Inclusion criteria were being continuously enrolled in a covered health plan from January 1, 2012 through December 31, 2012 and diagnosis with SCD. SCD diagnosis was identified based on having at least one inpatient claim or at least two outpatient claims with ICD-9-CM codes for sickle cell thalassemia with or without crisis, or SCD with or without crisis. There was no explicit exclusion criterion. Mean expenditure and 95 percent confidence intervals (95% C.I.) were calculated for inpatient expenditures, outpatient expenditures, emergency room (ER) expenditures, long-term care expenditures, prescription drug expenditures, and total expenditures. Individuals with SCD and Sickle Cell Crisis (SCC) were identified based on having at least one claim with ICD-9-CM code for SCD crisis. Wilcoxon Mann-Whitney tests were used to assess difference in health care expenditures between groups. **RESULTS:** A total of 8,191 individuals met study SCD inclusion criteria, of which 4,716 (58%) had SCC. The mean (±standard deviation) age was 22.0 ± 17.1 years. A majority of the sample was female (54.4%) and most were African American (74.6%). Mean annual all-cause total health care expenditure was $16,486 (95% C.I.=$15,491 to $17,482). Individuals between 15 and 34 years old tended to have higher expenditures than comparatively younger or older patients. Compared to those without SCC, individuals with SCC had significantly higher mean annual total expenditures ($20,723 vs. $10,737, $p<0.001$), which was primarily due to higher inpatient expenditures ($11,908 vs. $2,152, $p<0.001$) and ER expenditures ($1,960 vs. $443, $p<0.001$). **CONCLUSIONS:** Sickle Cell Disease is associated with high health care expenditures. Individuals with SCD and SCC had much higher health care expenditures compared to those with SCD without SCC.

PSY134
COMPARING PULMONARY ARTERIAL HYPERTENSION-RELATED HOSPITALIZATIONS BETWEEN HYPOTHETICAL COMMERCIAL AND MEDICARE PATIENTS USING A DECISION TREE MODEL
Highland K[1], Cole M[2], Bilir SP[3], Tsang Y[2], Drake W[2]
[1]Cleveland Clinic, Cleveland, OH, USA, [2]Actelion Pharmaceuticals, Inc., South San Francisco, CA, USA, [3]IMS Health, San Francisco, CA, USA
OBJECTIVES: To compare the effects of macitentan on length of stay (LOS), and cost savings due to averted pulmonary arterial hypertension-related hospitalizations stratified by insurance type, commercial or Medicare, using a decision tree model. **METHODS:** Published references informed the incidence and prevalence of PAH. Published SERAPHIN clinical trial data informed PAH-related hospitalization and mortality rates for placebo. The inputted reduction in hospitalizations was 50% for the macitentan-treated group which is the same for those over and under 65 years of age. Costs for PAH treatments (macitentan, and background therapies sildenafil and iloprost) were inputted from Medispan 2016. Reimbursement costs for hospitalization were calculated by averaging the costs for an initial hospitalization and readmission. For the commercial cohort, the averaged reimbursement cost was $53,679, and for the Medicare cohort, $18,994. Average LOS in days was 14.2 for commercial versus 16.7 for Medicare. Both the mean reimbursement costs and mean LOS were obtained from a published analysis of claims data. Total length of stay includes averted hospitalizations and reductions in the LOS. The model base-case analysis assumes constant mortality rate (2.6%) for the placebo arm. **RESULTS:** In a commercial plan of 20 million-covered lives, 1,473 PAH cases would be eligible for treatment with macitentan, leading to 143 (50% reduction) fewer hospitalizations/year, $7,694,706 in hospital-related savings, and 3,107 days (76% reduction) in total LOS. In a Medicare plan of 20 million covered lives, 1,386 PAH cases would be eligible for treatment with macitentan, leading to 135 (50% reduction) fewer hospitalizations/year, $2,561,392 in hospital-related savings, and 3,437 days (76% reduction) in total LOS. **CONCLUSIONS:** Both hypothetical cohorts experienced a reduction in total number and cost of hospitalizations, and length of stay. Due to differences in reimbursement, the commercial group experienced greater hospital-related savings. Further analyses will qualify the effect of macitentan on these outcomes.

PSY135
SYSTEMATIC LITERATURE REVIEW OF THE ECONOMIC BURDEN ASSOCIATED WITH DIFFUSE LARGE B CELL LYMPHOMA AND FOLLICULAR LYMPHOMA
Galaznik A[1], Bell J[1], Huelin R[2], Hoog M[3], Bhagnani TD[2], Guo Y[4], Stokes ME[5], Seal B[1], Shou Y[6]
[1]Millennium Pharmaceuticals, Inc., a wholly owned subsidiary of Takeda Pharmaceutical Company Limited, Cambridge, MA, USA, [2]Evidera, Waltham, MA, USA, [3]Evidera, Bethesda, MD, USA, [4]Evidera, London, UK, [5]Evidera, St-Laurent, QC, Canada, [6]Takeda Pharmaceuticals, Cambridge, MA, USA
OBJECTIVES: To identify evidence on the disease and economic burden associated with two major sub-types of Non-Hodgkin's lymphoma: diffuse large B-cell lymphoma (DLBCL) and follicular lymphoma (FL). **METHODS:** Searches were conducted in Medline and Embase (Jan 2012–May 2016) and supplemented with review of conference abstracts (2015–2016). Studies of any design reporting on treatment outcomes and resource use associated with DLBCL or FL, with a sample size ≥50 patients, from the United States (US), European Union 5 (EU5), or Japan were eligible for inclusion in this review. **RESULTS:** Twenty-five studies (13 focused on DLBCL and 12 on FL) from US and EU5 met inclusion criteria, with sample sizes ranging from 50 to 6,425 patients. Patients included in FL studies were younger (median age 58–66) compared to DLBCL (median age 43–83). Hospitalization was reported in several studies (3 DLBCL and 2 FL) as an outcome, resulting mainly from febrile neutropenia in patients treated with rituximab-based immunotherapy. Hospitalization rates ranged from 14% to 32% for DLBCL and 3%–11% for FL over a median follow-up period of 26.6–57 months; in one study a subset of patients were followed for 11 years. Of evidence on costs, using individual level data from the UK's Hematological Malignancy Network, one study estimated that the total medical costs were €23,184 for DLBCL curative treatment and €2,125 for palliative management over a period of 5 years. The other used a Markov cost-effectiveness model to examine treatment strategies in DLBCL, finding sub-type based treatment most cost-effective versus R-CHOP with or without lenalidomide. **CONCLUSIONS:** There is limited evidence published on the overall disease or economic burden of DLBCL/FL, with most literature focused on hospitalization from adverse events. More comprehensive research is needed to assess the impact of DLBCL/FL on patients and healthcare systems.

PSY136
ACQUISITION AND ADMINISTRATION COSTS OF BORTEZOMIB AND CARFILZOMIB TREATMENT FOR MULTIPLE MYELOMA IN FINLAND
Vihervaara VE[1], Mankinen PT[2], Soini EJ[2], Martikainen J[2], Torvinen S[1]
[1]Takeda Oy, Helsinki, Finland, [2]ESiOR Oy, Kuopio, Finland
OBJECTIVES: Information regarding intravenous and subcutaneous administration costs of multiple myeloma (MM) medications in Finland is scattered. Nevertheless, the need of acquisition and administration costs for health economic evaluations (HEE) of MM treatments is evident as these costs can be high. Furthermore, the first oral proteasome inhibitor (PI) treatment for MM, ixazomib, is available, potentially allowing reductions in the treatment acquisition and administration costs. We estimated the treatment acquisition and drug administration costs of infusion or subcutaneous PI treatments (carfilzomib, bortezomib) for MM in Finland. **METHODS:** Price tariffs of Finnish hospital districts are used as the basis of invoicing sent to health care service payer. Those prices were collected and analyzed to find costs for the relevant MM treatments. Furthermore, detailed inquiries were sent to all Finnish hospital districts to ensure the face validity of prices included. Two costing perspectives were applied: A] acquisition of treatment (until administered to the patient, i.e. both administration and drug cost included) and B] drug administration alone (administration included, drug costs excluded). **RESULTS:** 19 (95%) of the Finnish mainland hospital districts were included in the data collection. Relevant cost information was found from 15 (75%) districts (79% of the districts willing to participate). The mean acquisition cost was €1 923 (95%CI €1 540 – €2 305) [or $2 035] per acquisition. The mean administration cost alone was €270 (95%CI €189 – €351) [or $286] per administration (14% of the acquisition costs). **CONCLUSIONS:** The acquisition and administration of MM drugs given as infusions or subcutaneously in health care facilities cause significant and potentially avoidable costs. Due to the good coverage of providers' cost estimates, the present study provides useful cost estimate information for the future HEEs. Finally, novel oral medications including the first oral PI have significant potential in reducing the acquisition and administration costs.

PSY137
ORPHAN DRUGS TO TREATING RARE DISEASES: THE ITALIAN WAY FOR AN EARLY ACCESS
Prada M, Sansone C, Bisagni D, Mantovani M
Intexo, Roma, Italy
OBJECTIVES: Italy has two powerful tools granting early access for patients affected by rare diseases: the Italian off-label/compassionate use procedure, regulated by Law

648/96, and the Law 326/2003 for the reimbursement of orphan and life-saving drugs waiting for the market access. The study assesses the final timeline needed to gain the reimbursed status for orphan drugs, eventually passing over the mentioned steps and describing their impact on time to market. **METHODS:** The study reviews medicinal products designated orphan drugs for rare diseases published by EMA from January 2012 to December 2016 (CHMP opinion date). These data have been interpolated with data from Italian authorization decrees Official Journal (reimbursement decrees and compassionate use decrees) and with regional access data. **RESULTS:** Out of 20 orphan drugs authorized for the first time by the CHMP in the considered timeframe, and afterward valuated by AIFA, 8 (40%) obtained the reimbursement status in Italy in a medium time of 505 days. In the meantime, most of them passed over an early access granted by Italian Law 648/96 and/or by the Law 326/2003. Both these tools have guaranteed consistent savings in terms of time to patients (mean 337 days, median 168 days). Since various medicinal products have been authorized with a conditional approval, Managed entry agreement have been defined, in order to assess the real effectiveness in general population. **CONCLUSIONS:** This analysis shows the importance of the Italian structured healthcare system that permits to obtain a faster access to patients with ad hoc legislative keys and to revaluate, at patient's level, the real effectiveness, that reflects into a calibrated mechanism of the first availability and healthcare expenditure. This process ensures an expenditure monitoring of NHS, to collect additional effectiveness clinical data and to guarantee use of the right drug for the right patient.

PSY138

ACUTE PAIN RELATED LENGTH-OF-STAY AND MEDICATION USAGE FOLLOWING CARDIAC SURGERY

Peyerl FW, Khangulov VS, Hayashi DE, Talaga AK, D'Souza FT
Boston Strategic Partners, Inc., Boston, MA, USA

OBJECTIVES: Studies report a high prevalence of moderate to severe pain following surgery and data indicates that acute postsurgical pain is inadequately relieved in these patients. The objective of this retrospective study was to examine acute pain outcomes, particularly hospital length-of-stay (LOS) and medications administered following cardiac surgery using data from an electronic health record database. **METHODS:** Using a US electronic health record database (Cerner Health Facts®), we evaluated overall trends in pain measurement, treatment, and outcomes associated with acute postsurgical pain management of cardiac patients. Cardiac surgery (based on ICD9 code, 35.X-39.X) patients with at least one recorded pain score before and after surgery were included in the analysis. Hospital LOS and type of medications received were examined. **RESULTS:** Pre and post-operative pain was examined in cardiac surgery patients following surgery (n=367,836 from 2009-2015 for all cardiac surgery; mean age 62.8 yrs). Mean hospital postsurgical length-of-stay was 7.6 days. Following surgery, 74% of patients undergoing cardiac surgery were treated with polytherapy for pain (more than one type of pain medication administered). 71% of cardiac surgery patients received multimodal therapy (combination of opioid and non-opioid medications), 15% of patients received opioids only, and 14% received non-opioid only therapy. In the later stages of postoperative pain treatment (later stage refers to the use of treatment methods at the last time point where pain severity was assessed in the period of 14 days following surgery for each patient), 42% of patients received multimodal therapy, 25% received opioid only, and 34% received non-opioid only. **CONCLUSIONS:** Cardiac patients experience long hospital length-of-stays characterized by post-surgical pain treatment with mostly opioid-based methods. Later in the treatment period, there is a shift towards a less opioid-based pain treatment.

PSY139

BARIATRIC SURGERY – COSTS AND RESOURCES UTILIZATION IN TWO YEARS FOLLOW UP IN THE BRAZILIAN PRIVATE HEALTH CARE SYSTEM

Junqueira Junior SM[1], Luque A[2], Oliveira FM[1], Oliveira D[1], Cabra HA[3]
[1]*Johnson & Johnson Medical Brazil, São Paulo, Brazil,* [2]*Johnson&Johnson Medical Brazil, Sao Paulo, Brazil,* [3]*Johnson & Johnson Medical, Miami, FL, USA*

OBJECTIVES: Many health care systems are evolving to different payment models where they want to include the whole patient treatment in an episode payment. In order to achieve this goal, it is important to know not only procedure costs, but also patient complications and resources consumption costs in a certain period of time. Our main goal was to estimate the costs and resources utilization of bariatric surgery in the perioperative time and two years after the procedure in the Brazilian private health care system reality. **METHODS:** A longitudinal analysis was performed (2013-2015), using hospitalization records and outpatient information from private payers (Orizon). **RESULTS:** Records from 300 hundred patients were analyzed. Patients had 36 years old on average and 80% were female. The average length of stay was 2.25 days. 2.3% of the patients were readmitted in less than 30 days. 15% of the patients visited ER (1.5 visits on average) in the first 30 days post-surgery. 4% of the hospitalizations required ICU. The average patient cost of surgery plus two years follow up was USD 10,000 distributed: USD 7,541 (75%) in the perioperative time and USD 2,459 (25%)in the following two years after surgery. Variability in the post-surgery expenses ranged from USD 100 to USD 63,012. **CONCLUSIONS:** Payment models are moving towards a continuum of care payment where payers are looking for Bundle Payments. Costs variability in two years post-surgery after a bariatric procedure is huge, but on average consumes 25% of the total treatment cost. Payers and hospitals should be careful in order to consider what to include in a bundle payment to keep both financially sustainable. Studies considering more patients are needed to give a broader perspective.

PSY140

HEALTHCARE EXPENDITURES AND PATTERNS OF OPIOID USE FOR NON-CANCER PAIN

Shah DR, Patel J, Alhussain K, Stover A, Tan X
West Virginia University,School of Pharmacy, Morgantown, WV, USA

OBJECTIVES: About 20% of the United States (US) population is affected by non-cancer pain conditions (NCPCs). While prescription opioids are used commonly for NCPCs, their use is controversial due to the issues concerning their safety. We sought to: 1) characterize opioid use in US adults with NCPCs (back/neck pain, arthritis, headache/migraine and musculoskeletal pain/neuralgia and 2) estimate direct healthcare expenditures associated with opioid use in NCPCs. **METHODS:** This retrospective cross-sectional study used data from the 2014 Medical Expenditure Panel Survey (MEPS). The study sample consisted of adults with one or more recorded observations of NCPCs (N= 7,497). Chi-square tests were used to examine unadjusted subgroup differences and a multivariable logistic regression model was used to assess the association of opioid use and the type of NCPCs. To compare average healthcare expenditures between opioid users and non-users, we matched the two groups using propensity score matching, and also used generalized linear model (GLM) to adjust for other factors. **RESULTS:** A majority of individuals with NCPC reported arthritis (N=5,266, 70.5%) and 27.4% individuals reported using prescription opioids. Individuals with musculoskeletal pain/neuralgia were more likely to use opioids than individuals with back/neck pain (OR 1.3, 95% CI 1.01-1.64). After matching, opioid users had more than twice the total average healthcare expenditures than non-users ($13,956 vs. $6,140). Results from the GLM model showed that the total healthcare expenditures for those using opioids were significantly higher by $5,042 as compared to non-users ($p<0.001$). Further, those with arthritis and musculoskeletal pain/neuralgia had significantly higher healthcare expenditures than those with back/neck pain. **CONCLUSIONS:** The majority of opioid use was found among individuals with musculoskeletal pain/neuralgia. The total average healthcare expenditures were significantly higher among opioid users, highlighting the need to better evaluate the appropriate use of opioids for NCPCs in clinical practice.

PSY141

MAIN COMPONENTS OF PUBLIC POLICIES AND FINANCING STRATEGIES ADOPTED BY OECD COUNTRIES TO IMPROVE ACCESS TO DRUGS FOR RARE DISEASES: A SCOPING REVIEW

Quirland-Lazo C[1], Paredes Fernandez D[1], Lenz Alcayaga R[2]
[1]*Universidad de Chile, Santiago, Chile,* [2]*Lenz Consultores, Santiago, Chile*

BACKGROUND: Since the Orphan Drug Act in United States in 1983, several countries have been implementing courses of action to improve access to Drugs for Rare Diseases (DRD). Despite of the growing body of literature available to describe these efforts, until now, there's no systematic research in place to characterize and compare the wide range of OECD countrie activities to accomplish their task. **OBJECTIVES:** Describe the main components of public policies and financing strategies adopted by OECD countries to improve access to DRD. **METHODS:** We carried out a scoping review through its five first stages. Search strategy considered different sources, as electronic databases (Medline, Embase, Cochrane, CINAHL, LILACS, ECONLIT, Web of Science), key journals (Orphanet Journal of Rare Diseases, and Value in Health), grey literature from different institutions (we consult ISPOR Health Authority by Country inventory to identify their web sites in each OECD countries), and reference lists. The search algorithm was buid using the work of the ISPOR Rare Diseases Groups of Interest on terms and definitions. Categorization and result analysis were performed using the analytical-descriptive method, considering 3 conceptual frameworks: public policy definition (Subirats, 2008), financing function (Kutzin, 2000), and fourth hurdle systems (Hutton, 2006). **RESULTS:** 85 articles were included in this review, most of them referred to R+D activities in the form of incentives to preclinical and clinical research. More than 50% of the articles detailed variations in coverage decision making process, specifically quality of evidence needed to prove incremental benefits DRD. The European Union and the United States have the highest number of documents describing their policy. **CONCLUSIONS:** There is only a few of countries that actually have adopted policies to improve patients access to DRD (United States, Italy and France). Even in this group there's still work to do to influence the whole pharmaceutical system, therefore improve access.

PSY142

WHO GETS HIGH-DOSE OPOIOD THERAPY FOR SICKLE CELL DISEASE RELATED PAIN?

Zhou J[1], Han J[1], Saraf SL[2], Gordeuk V[2], Calip GS[1]
[1]*University of Illinois at Chicago, Chicago, IL, USA,* [2]*University of Illinois Comprehensive Sickle Cell Center, Chicago, IL, USA*

OBJECTIVES: To assess the prevalence of opioid therapy for pain management among commercially insured patients with sickle cell disease (SCD), and determine population-level characteristics of high-dose opioid users in United States. **METHODS:** The study was a retrospective cohort study using the Truven Health Analytics MarketScan® database. Eligible SCD patients (n=7,561) were identified between 2009 and 2013. Opioid use was determined based on the outpatient pharmacy dispensing records and opioid analgesic doses were converted to oral morphine equivalents (OME). A follow-up period of 24 months after the index SCD diagnosis was studied. **RESULTS:** 2,753 (36.4%) of patients received opioid therapy. The highest prevalence of opioid use was observed in the 20-29 years age group (48.5%). Oxycodone- and hydrocodone-containing medications were the most commonly used opioids. Seventy-five percentage of the pediatric patients (n=821) on opioid medications used 0-2 mg OME per day. In contrast, 32% of the adult patients (n=1,932) had daily requirements above 10 mg OME. In multivariate analyses, hydroxyurea use (OR 7.3, 95% CI 5.0-10.5), NSAID use (OR 5.3, 95% CI 3.9-7.1), and prior history of opioid use (OR 47.3, 95% CI 30.3-74.0) were significantly associated with high-dose opioid use. Patients aged 50 years and older had higher odds of being high-dose opioid users (OR 2.7, 95% CI 1.9-4.0) versus younger patient aged 18-29 years. Veno-occlusive crisis (OR 2.5, 95% CI 1.8-3.5) and avascular necrosis (OR 2.5, 95% CI 1.7-3.5) associated with high-dose opioid use. Additionally, 3+ annual emergency department visits (OR 2.7, 95% CI

1.8-4.1), and 2+ annual hospitalizations (OR 2.5, 95% CI 1.6-4.0) were also associated with high-dose opioid use. **CONCLUSIONS:** The high-dose opioid users among adult SCD patients represents a cluster of patients with severe disease requiring more healthcare resources. Optimization of care for this subset of patients with SCD may have the potential to reduce healthcare costs.

PSY143

RARE OR NEXT COMPETITIVE LANDSCAPE

Pereira L, Faulkner EC
Evidera, Raleigh, NC, USA

OBJECTIVES: More than 500 orphan products are in the pipeline. These include precision therapies, novel therapies and gene therapies representing the hope of first time treatments and potential cures. We sought to understand approval success rates and failure reasons that may lead to opportunities for HEOR evidence. **METHODS:** We conducted a targeted review of peer reviewed and grey literature to identify studies to evaluate trends in orphan drug designations, FDA approvals and Complete Response Letters (CRL). **RESULTS:** Since inception of the Orphan Drug Act of 1983, FDA approved 500 products to treat rare conditions. Over 200 orphan drugs were approved in the past decade. In 2015, 50% of new molecular entities (NME) were for rare diseases. This same year, Office of Orphan Product Development received 440 orphan status applications, granted 355, designated 20% as breakthrough status, granted 34% fast track status, and approved 21 NMEs. Not all orphan drug applications are approved despite recognition of unmet medical need in conditions such as, Idiopathic Pulmonary Fibrosis, Huntington's disease, and Fabry disease. CPLs denote product approval and designate failures. In the latter, clear descriptions of evidence required to adequately demonstrate patient benefit is provided. Our study identified the following evidence shortcomings: need for additional efficacy/safety data requiring new phase 3 trials; lack of response reliability; lack of evidence demonstrating patient benefits; inability to achieve sustained thresholds of clinical benefit, and failure to demonstrate expected outcomes. Products utilizing biomarkers and surrogate endpoints not well characterized or linked to clinical response also failed. **CONCLUSIONS:** Outcomes Researchers are well poised to develop much needed RWE that considers the heterogeneity in rare conditions to demonstrate patient benefit. Analyzing PROs by individual domains may provide a clearer picture of initial and durable patient response. Modeling and simulation may accommodate for limited patient populations and augment evidence.

PSY144

ESTIMATING THE BURDEN OF DISEASE OF OBESITY AND ITS MAIN CONSEQUENCES IN COLOMBIA

Gil Y[1], Lasalvia P[1], Polanía MJ[1], Pacheco B[1], Campos JF[1], Mosos JD[1], Barahona-Correa JE[1], Restrepo P[1], Salazar L[2], Garzón A[1], González D[1], Castañeda-Cardona C[2], Andrade PC[3], Rosselli D[1]
[1]*Pontificia Universidad Javeriana, Bogota, Colombia,* [2]*NeuroEconomix, Bogota, Colombia,* [3]*Johnson & Johnson Medical, Bogota, Colombia*

OBJECTIVES: High body mass index (BMI) has been associated with 5.47% of global Disability Adjusted Life Years (DALYs). High income countries tend to concentrate this burden (11.35% of total DALYs in USA) but even middle income countries like Colombia have above average overweight-associated DALYs (7.1%). Obesity represents the highest end of the spectrum in this disorder Burden of disease methodology allows the estimation of the impact of diseases on a population using a single and comparable measure: DALY. The purpose of this study was to evaluate the burden of obesity in Colombia. **METHODS:** Burden of disease was evaluated according to the WHO guidelines. A literature review was conducted in electronic databases (SCIELO, BVS, LILACS, MEDLINE) to search data on incidence, prevalence, complications and/or DALYs. Official sources (MoH, DANE) and international databases (IHME, GBD) were reviewed for epidemiological information regarding obesity and its main consequences. DALYs estimation used the methodology proposed in GBD 2010. **RESULTS:** Main diseases associated with obesity as a risk factor were type 2 diabetes mellitus (DM2), hypertension, dyslipidemia, cardiovascular disease, sleep apnea, osteoarthritis, cancer and depression. We estimated the relative risk (RR) of developing these conditions by each BMI 1-unit increment. For example, 30-44 years-old population's RR was 1.36 for DM2, 1.04 for osteoarthritis, 1.10 for endometrial cancer, and 0.89 for cardiovascular diseases (reducing 1 BMI unit). Comorbidities that generate more DALYs were: hypertension, back pain, DM2 and cardiovascular disease. Total burden in DALYs was 1 772 522; 36.4 DALYs per 1000 population (30.4 for males and 42.2 for females). **CONCLUSIONS:** Study shows the high burden of obesity in Colombia. Many non-pharmacological, pharmacological or surgical alternatives, ranging from public health policies to bariatric surgery, are available for obesity treatment. Cultural and system-level barriers, however, may limit interventions.

PSY145

EXAMINING UNCERTAINTY AROUND THE AMERICAN COLLEGE OF MEDICAL GENETICS (ACMG) RECOMMENDATIONS FOR NEWBORN SCREENING (NBS) FOR DEFECTS OF BIOPTERIN COFACTOR BIOSYNTHESIS (BIOPT BS) USING MANSKI BOUNDS AND BOOTSTRAPPING

Alsheikh M, Rittenhouse B
MCPHS University, Boston, MA, USA

OBJECTIVES: In 2006 the ACMG made recommendations for NBS based on an entry point to an algorithm (EPA) it designed, determined by scoring a survey about attributes of various conditions. The EPA determined a set of follow up questions that led to final recommendations. This study examined one of these conditions - BIOPT BS - and assessed if the influence of uncertainty related to the missing survey responses and/or sampling variation for this condition might change scoring sufficiently to modify the EPA and the recommendation. **METHODS:** This research explored the uncertainty relating to the missing data by using a boundary estimate (Manski, 1989), sampling variation uncertainty by bootstrapping, and their joint influence. We examined two questions of BIOPT BS (score, 1174) that ACMG reported data for: simplicity of therapy (SIMPLICITY) and confirmation of diagnosis (CONF). Total scores > 1200 indicate a new EPA and potentially a different NBS recommendation. **RESULTS:** The EPA did not change when estimating Manski bounds for SIMPLICITY (+/- = 5.1/1.6) and CONF had no missing values, so could not change. When bootstrapping the original data, and around the upper boundary SIMPLICITY estimate, the bootstrapped means implied that the EPA changed not at all or in only a very small percentage of cases (0. **CONCLUSIONS:** The score change from examining the uncertainty relating to missing data and sampling variation for the two questions ACMG reported for BIOPT BS condition is not sufficient to alter the EPA and potentially alter the recommendation. Further exploration of missing data for other questions is needed to fully assess the robustness of the ACMG recommendation.

PSY146

EFFECTIVENESS OF A SCHOOL-BASED PROGRAM IN PREVENTION OF OBESITY AMONG PRESCHOOL CHILDREN IN EGYPT

Mohamed SF, Elkalioby MI, Hassan FA
Suez Canal University, Ismailia, Egypt

OBJECTIVES: To assess the effectiveness of a school-based program in improving knowledge and practices of kindergarten children towards healthy diet and physical activity. **METHODS:** A Quasi-experimental Comparison-group Pre-Post program evaluation study was conducted at kindergartens at Port-Fouad city, in North-East Egypt. At baseline, a total of 1215 preschool children (634 intervention and 581 control) were surveyed for dietary and physical activity knowledge using picture scale activity. Anthropometric measurements were performed to assess body mass index percentiles (age-and-sex-specific). Besides, parents had filled in a self-administered questionnaire about family demographics as well as preschoolers' dietary and physical activity practices. A 4-month educational program; based on the social cognitive theory constructs, was implemented and included 16 class-room activities as well as family involvement activities. At 4-month follow-up, children's dietary and physical activity knowledge and practices were evaluated and compared to baseline evaluation. **RESULTS:** The mean age of children in this study was 5.2±0.6 years. On the age-and-sex-specific BMI percentiles, 12.5% were overweight, while 15.9% were obese. The mean change in overall knowledge level was significantly higher in the intervention than control groups (19.4% vs 6.3%). Practice level in the intervention group had significantly increased at 4-month follow-up assessment, while insignificant change was reported for control group (7.37% vs 0.17%). BMI percentiles had been changed variably among overweight and obese children in both groups. Overweight children had got 0.47 less percentiles in the intervention group compared to 0.33 in the control group, however, obese children had much decrease in BMI percentiles (0.51 vs 0.49, respectively). **CONCLUSIONS:** This 4-month school-based program had effectively improved children's knowledge and practices towards healthy diet and physical activity. This program could be integrated in regular kindergarten's curricula as a contribution to the prevention of obesity among preschool children.

PSY147

VALUE ASSESSMENT CRITERIA FOR ORPHAN DRUGS ACROSS EIGHT EUROPEAN COUNTRIES: HTA AND BEYOND

Tzouma V, Mills M, Kanavos P
London School of Economics and Political Science, London, UK

OBJECTIVES: We explore the criteria informing coverage decisions of orphan drugs across different diagnostic conditions to understand if different HTA processes result in preferential assessments, conflicting recommendations, and inequitable access to innovative treatment for rare diseases. **METHODS:** Countries included were England, France, Germany, Italy, Poland, Scotland, Spain, and Sweden. Through a selection of orphan drug appraisals between 2006 and 2012, twenty orphan (including ultra-orphan) drug-indication pairs were identified and selected. The sample was split equally between oncology and non-oncology indications. Submitted clinical and economic evidence was identified, collected and analysed systematically and on a case-by-case basis, and following a validated methodological framework. Coverage and funding options based on HTA recommendations as well as on criteria or policies other than HTA were also considered. **RESULTS:** There is huge heterogeneity in coverage recommendations depending on setting. In general, there seems to be a higher willingness to pay for orphan drugs, either through a higher ICER threshold, or only when costs are not exceeding the budget. Additional criteria related to the rarity of diseases or special considerations, particularly centered on unmet need and severity, seem to play an important and increasing role beyond strict cost-effectiveness criteria. Decisions about purchasing may be influenced by factors beyond HTA (e.g. early access schemes), which may be relevant to orphan drugs. Little uniformity exists in the time taken to assess a drug following marketing authorisation, leading to inequities in access. **CONCLUSIONS:** Despite the extensive and ever increasing use of HTA for orphan drugs, the variations in HTA recommendation outcomes across jurisdictions and the –often- very significant time lapses between the date of marketing authorisation, the final HTA recommendation and the eventual funding decision, imply variations in access and highlight the importance of establishing specific policies for orphan drugs to ensure fair assessment and equitable access to treatment for rare diseases.

PSY148

DRUG PROFILE REVIEW OF THE FDA U.S. ORPHAN DRUG ACT APPROVALS (2006-2016)

Jun K[1], Madhavan P[2], Richardson SK[2], Kuehn M[2]
[1]*GfK Market Access, New York, NY, USA,* [2]*GfK, New York, NY, USA*

OBJECTIVES: As of mid-2016, the 1983 U.S. Orphan Drug Act (ODA) has facilitated the approval of more than 400 innovative medicines for the treatment of small patient

groups with high unmet need. This pathway has been suggested as being a new industry product strategy to capitalize on regulatory and pricing benefits. In order to understand the actual level of innovation and therapeutic value present amongst orphan drug FDA approvals, a comprehensive review of novel orphan designated therapies in the past decade was conducted. **METHODS:** A review of all orphan-designated drug approvals spanning the period 2006–2016 in the FDA's Orphan Drug Product designation database identified 294 orphan designation approvals. A comprehensive data compilation of NDA and BLA approvals granted by CDER and CBER for the same period was then conducted, yielding 1,118 and 174 marketing approvals, respectively. Following data cleanup, 136 orphan designations were identified as being associated with CDER (112/1,118, or 10%) and CBER (24/174, or 14%) NME approvals. **RESULTS:** While the majority of approvals were associated with high therapeutic utility, 18 approvals (13%) for arguably less innovative products, such as ancillary treatments, radiopharmaceutical agents, and diagnostic assays. Excluding these products from the final sample (N=118), less than half of novel orphan designated approvals had been for biologics (41%). Oncology was the top therapeutic area (42%), with the majority of therapies targeting hematologic malignancies (58%), melanoma (14%), and NSCLC (12%). Despite the growing discussion over gene therapies and targeted treatments, only 7% of all agents mentioned the use of diagnostic testing or specific mutations in their labels. **CONCLUSIONS:** The analysis identified only a minority "non-innovative" products suggesting that the ODA pathway is supporting overall the launch of products with the intended profile targeting rare diseases with high unmet need.

ASSESSMENT OF DISEASE STATE KNOWLEDGE AND AWARENESS AMONG THE GUARDIANS OF THALASSEMIA PATIENTS ATTENDING DIFFERENT HEALTH FACILITIES IN QUETTA, PAKISTAN

Haq N[1], Masood N[1], Nasim A[1], Haider S[1], Masood I[2]
[1]University of Balochistan, Quetta, Pakistan, [2]Islamia University, Bahawalpur, Pakistan

OBJECTIVES: The current study was aimed to assess knowledge and awareness about thalassemia among the guardians of thalassemia patients of Quetta, Pakistan. **METHODS:** The cross-sectional descriptive study was undertaken by using structured questionnaire in different Thalassemia Centers of Hospitals of Quetta, Pakistan from March to July 2016. Convenient sampling was adopted for data collection. A total of 327 Patients diagnosed with thalassemia major were included for study while patients taking oral Iron overload treatment were excluded. Descriptive and inferential statistics (Mann Whitney U test and Kruskal Wallis tests, $p < 0.05$) were used to assess the significance among study variables. Analysis were performed using IBM SPSS v.20. **RESULTS:** The result showed that mean age of the respondents were 35.5 ± 15.45 years and 154 (60.6%) were males. Majority of the respondents (n=97, 38.2%) had primary level of education and belonged to urban area (n=174, 78.55%). The results also showed majority (n=242, 96.9%) of respondents had adequate knowledge regarding thalassemia. Health care providers were reported as major source of thalassemia information by more than 75% of the study participants. Comparison of mean score showed that education level, occupation, area of residence had significant ($p<0.05$) associated with the knowledge score. **CONCLUSIONS:** The study concluded that the guardians of the thalassemia patients had better understanding regarding their child diseases and this could be beneficial in better care of child.

ADVERSE EVENTS AND DEVICE MALFUNCTIONS ASSOCIATED WITH INTRAVENOUS PATIENT-CONTROLLED ANALGESIA: A RETROSPECTIVE ANALYSIS OF 2011-2016 MAUDE DATABASE

Lawal O, Mohanty M, Lanier R, Katz N
Analgesic Solutions, LLC, Natick, MA, USA

OBJECTIVES: To determine the magnitude and characteristics of adverse events and device malfunctions associated with intravenous (IV) patient controlled-analgesia (PCA) occurring in inpatient hospital settings. **METHODS:** IV PCA device-related events, occurring in inpatient settings were extracted from reports submitted to the FDA Manufacturer and User Facility Device Experience (MAUDE) database during January 1st, 2011 through September 12th, 2016. Descriptive analyses and qualitative review of text narratives were performed to characterize IV PCA errors. **RESULTS:** A total of 1430 IV PCA device-related events were included in this analysis. Approximately, 11% (n=157) of these events were associated with unfavorable outcomes including worsening of pain (n=62), death (n=20), therapy interruption (n=13), and hospitalization (n=13). Device safety issues were the leading cause of errors accounting for 93% of the 1430 events; other causes included operator errors (2.6%), patient errors (1%), and indeterminate (3.4%). Common factors contributing to device-related events included leak in systems (27%), defective equipment (22%), failure to deliver drug (14%), distal occlusion (10%), overdose (6%), under-dose (3.3%), faulty alarm system (19%) and pump programming issues (0.6%). Opioid-related adverse drug reactions (ADR) were observed in 5.5% (n=78) events; of which respiratory depression (n=40) and sedation (n=17) were the two most common ADRs reported. To prevent further occurrences of harm, IV PCA devices were recalled and replaced in a majority (58%) of the reported 1430 events, and emergent clinical interventions (such as administration of narcotic antagonist, intubation, transfer to intensive care unit) were necessary in 2.7% of these events. **CONCLUSIONS:** Despite the benefits of IV PCA, a substantial number of device malfunctions and adverse events associated with IV PCA devices were identified. Additional safety measures including training and novel PCA systems that could potentially circumvent some of these harmful events while still retaining the advantages associated with PCA in pain management are needed.

PMD2

A SYSTEMATIC LITERATURE REVIEW ON THE USE OF LOCKING COMPRESSION PLATE (LCP™) TECHNOLOGY FOR PROXIMAL AND DISTAL HUMERUS FRACTURE TREATMENT

Zanela OO[1], Sanchez D[1], Valls M[2], Osorio M[2], Cabra HA[3], Gay Molina JG[2]
[1]Johnson & Johnson Medical, Mexico City, Mexico, [2]T.I. Salud, Mexico D.F., Mexico, [3]Johnson & Johnson Medical, Miami, FL, USA

OBJECTIVES: Proximal & distal humerus fractures are common injuries in elderly population and usually associated with osteoporosis. Fracture reduction through surgical approach implies the use of plates & screws, such as commercially-available LCP™ (Locking Compression Plate) system, its branded Philos™ plate for proximal humerus, and DCP™ (Dynamic Compression Plate) technology; comparative clinical evidence on their utilization could support technology choice. This study's objective was to perform a systematic literature review to assess clinical outcomes derived from the use of LCP™, Philos™ & DCP™ technology for the treatment of proximal and distal humerus fractures. **METHODS:** A systematic search of PubMed, Cochrane Library and Medigraphic for published literature on the use of the former technologies was conducted; considered key words included "locking compression plate", "dynamic compression plate", "humerus fractures", "proximal/distal humerus", "distal humerus plate", "Philos plate", "meta-analysis", "clinical trial" and "systematic review". Inclusion criteria included RCTs, case reports, revisions/meta-analysis, as well as studies in English or Spanish and publications in indexed journals; exclusion criteria included clinical studies in experimental models and other treatment alternatives for proximal and distal humerus fractures. **RESULTS:** 1,064 studies were initially identified; duplicated articles and inclusion/exclusion criteria yielded 62 articles on LCP™ and DCP™ use, with 6 studies directly comparing LCP™ and DCP™ systems, 55 studies describing LCP™ outcomes and 1 case report on DCP™ use. Further analysis revealed no comparative evidence nor publications on DCP™ use on proximal or distal humerus fractures. Comparative studies focused on other non-humerus fractures, with no statistically-significant differences in terms of functionality, fixation & bone bonding time, complications and operating time between technologies. Positive outcomes favoring LCP™ in terms of pseudoarthrosis, 1-month consolidation rate and greater bone fixation rigidity were found. **CONCLUSIONS:** LCP™ technology seems a safe and effective treatment for proximal and distal humerus fractures, while DCP™ has no published evidence on such injuries.

PMD3

HEALTH OUTCOMES FOLLOWING UPPER GASTROINTESTINAL ENDOSCOPY PROCEDURES: AN UPDATED SYSTEMATIC LITERATURE REVIEW

Kline SE[1], Nguyen M[2]
[1]Pricing Solutions, Devon, PA, USA, [2]Teleflex, Morrisville, NC, USA

OBJECTIVES: Upper gastrointestinal (GI) endoscopy procedures are considered fairly routine in the United States and are one of the most common interventional procedures done globally. Patient safety during these procedures is paramount as there are multiple methods available for anesthesia, sedation and airway maintenance affecting morbidity and mortality. The purpose of this review is to specifically evaluate endotracheal intubation (ETT) and laryngeal mask airway (LMA) management options for patients undergoing upper GI procedures. **METHODS:** A Boolean search strategy was employed to identify manuscripts from the peer-reviewed literature published from 1996-2016 that reported results from upper GI endoscopy procedures and patient health outcomes. The search terms "upper GI endoscopy" AND "complications" OR "failures" OR "adverse events" were used to identify the scientific research papers that examined different airway management methods as well as clinical, humanistic and economic outcomes. **RESULTS:** A total of 247 abstracts were reviewed for content validity and the ability to compare health outcomes, including complications, of LMA and ETT used for upper GI endoscopy. The literature summary determined that when an ETT was used to protect the airway, a statistically significant greater incidence of laryngospasm, hoarse voice, coughing and sore throat was found compared with procedures that used an LMA to protect the airway. The differences in the risk of regurgitation, vomiting, nausea and the success of insertion on the first attempt were not statistically significant between the two airway management methods. **CONCLUSIONS:** Based on this comprehensive systematic literature review covering twenty years of clinical research it is clear that airway management techniques during out- and in-patient upper GI procedures are a key element effecting patient health outcomes. Morbidity and mortality rates can be greatly improved with successful airway management. Further head to head comparative clinical research is needed to identify the best methodologies for airway management during these common procedures.

PMD4

DIFFERENTIATING VALUE OF SHEAR WAVE ELASTOGRAPHY IN BREAST ULTRASOUND: A SYSTEMATIC REVIEW AND META-ANALYSIS

Park S, Hwang J, Kim S, Choi W
National Evidence-Based Healthcare Collaborating Agency, Seoul, South Korea

OBJECTIVES: To conduct a systematic review and meta-analysis to evaluate the effectiveness of Shear Wave Elastography (SWE) combined with Ultrasound (US), for the differential diagnosis of breast lesions. **METHODS:** The literature searches were conducted using KoreaMed, Ovid-MEDLINE, Ovid-EMBASE, and Cochrane Library on December 28, 2015. The studies that were excluded: animal experiments, preclinical experiments, abstracts, reviews, articles not published in Korean or in English, grey literature, case studies, and not breast tumors. Two authors independently selected articles and evaluated the articles quality using Scottish

Intercollegiate Guidelines Network (SIGN). The assessment was based on the following factors: biopsy reduction rate (change in the level of Breast Imaging Reporting and Data System, BI-RADS), and diagnostic performance. **RESULTS:** A total of 23 articles were included in the final assessment. The diagnostic cut-off value of the SWE varied: Emax (16 articles, cut-off 30~108.5 kPa), Emean (1 article, cut-off 41.6 kPa), qualitative index (5 articles), and qualitative and quantitative index (3 articles). In the 8 articles, when adding SWE to US, the level of BI-RADS changed from IV to III in 12.8~89% of cases with 0~3.8% false negative rate, and 27.1~73.7% rate of decrease in biopsy for patients who received US. Meta-analysis was performed on 21 articles (4,558 breast masses). The diagnostic performance of SWE + US vs. US were: pooled sensitivity was 0.94 (95% confidence interval [CI] 0.93~0.95, I2=79.0%) vs. 0.94 (95% CI 0.92~0.95, I2=83.3%), pooled specificity was 0.75 (95% CI 0.73~0.76, I2=96.4%) vs. 0.55 (95% CI 0.53~0.57, I2=98.6%). **CONCLUSIONS:** SWE is an effective test for discriminating benign and malignant tumors in patients suspected of breast cancer, which prevents unnecessary biopsy when used alongside the breast US.

PMD5

DEMOGRAPHIC TRENDS IN ADHD DIAGNOSIS IN U.S. CHILDREN USING NHANES DATA BETWEEN 2004 AND 2012

Zamil D, Wang X, Vadhariya A, Chen H
University of Houston, Houston, TX, USA

OBJECTIVES: To characterize changes in the demographic distribution of attention-deficit hyperactivity disorder (ADHD) diagnosis from 2004 to 2012 in the United States. **METHODS:** ADHD diagnosis data was extracted from the National Health and Nutrition Examination Survey (NHANES) Summary Health Statistics for U.S. Children, a source of nationally representative data on children in the United States. The ADHD cases were identified based on ICD9-CM diagnosis codes. Chi square tests were used to investigate differences in ADHD diagnosis rates by demographic characteristics (age, race, and gender) within each year and simple linear regression was applied to determine the extent of change over time. All statistical analyses were performed using SAS 9.2 (SAS Institute, Cary,NC) at a priori significance level of 0.05. **RESULTS:** The ADHD diagnosis rate was higher among males, Whites, and school aged children and adolescents (vs. preschoolers aged 3-4) in each year examined. The total number of ADHD cases as well as all demographic groups with the exception of African Americans and preschoolers aged 3-4 exhibited an increasing trend between 2004 and 2012. **CONCLUSIONS:** ADHD diagnosis among youth showed a significant increase in the U.S. between 2004 and 2012. Notable increases and group differences were also observed among demographic subgroups. These findings indicate a need for future research in reasons for such group differences as well as treatment differences.

PMD6

ROLE OF SERUM CYSTATIN C AND CREATININE IN IDENTIFYING STAGING OF ELDERLY CHRONIC KIDNEY DISEASE PATIENTS

Khan I[1], Khan AH[2], Adnan AS[2], Khan A[2], Sulaiman SA[3]
[1]*Universiti Sains Malaysia, Penang, Malaysia,* [2]*Universiti Sains Malaysia, Penang, Malaysia,* [3]*Universiti Sains Malaysia, Pulau Penang, Malaysia*

OBJECTIVES: To identify and compare the chronic kidney disease (CKD) staging by cystatin C and creatinine based estimated glomerular filtration rate (eGFR) equations among elderly CKD patients in later stages of CKD. **METHODS:** A total of 300 elderly Malay participants were included in the study aged ≥65 years at the Hospital University Sains Malaysia (HUSM), Kelantan Malaysia. Demographic data and past history were recorded. Serum creatinine was assayed by Chemistry Analyzer Model Architect-C8000 (Jaffe Method). While serum cystatin C was examined by Human cystatin C ELISA kit (SIGMA-ALDRICH) using Thermo Scientific VARIOSKAN Flash ELISA reader. CKD-EPIcr-cysequation was used as a reference equation to compare the eGFR equations result of other equations. In order to evaluate the agreement between various eGFR equations in staging CKD, Cohen kappa (k) analysis was used. **RESULTS:** Altogether 300 patients were recruited of which majority were female (n=169, 56.3%). Mean age of the study participants were 67.6 + 6.7 years. Overall majority of the male (64.4%) and (35.4%) female patients were aged 70-79 years. Cohen kappa (k) value of 0.01–0.2 was considered as negligible, 0.21–0.4 as fair, 0.41– 0.6 as moderate, 0.61–0.8 as substantial, and 0.81–1 as almost perfect agreement. The result of cystatin C based eGFR equation i.e. CKD-EPIcys was more efficient as compared to creatinine based eGFR equations i.e. MDRD and CKD-EPIcrwith $p<0.05$. **CONCLUSIONS:** The cystatin based eGFR equation was more accurate in identifying the correct staging of elderly CKD patients as compared to creatinine based eGFR equations. Cystatin C can possibly be used as alternative to creatinine as endogenous biomarker.

PMD7

EFFECT OF BMI ON ENDOGENOUS BIOMARKERS (SERUM CYSTATIN C AND CREATININE) AMONG ELDERLY CHRONIC KIDNEY DISEASE PATIENTS

Khan AH[1], Sulaiman SA[1], Khan I[2], Adnan AS[1], Khan A[1]
[1]*Universiti Sains Malaysia, Penang, Malaysia,* [2]*Univesiti Sains Malaysia, Penang, Malaysia,* [3]*Quaid-i-Azam University, Islamabad, Pakistan*

OBJECTIVES: To identify the effect of BMI on endogenous biomarkers i.e. cystatin C and creatinine among elderly CKD patients. **METHODS:** Four groups of participants were selected for this purpose on the basis of Body mass index (Normal, overweight, obese and underweight). Serum cystatin C and creatinine was determined by ELIZA and Jaffe Method respectively. A validated data collection form was developed to record patient demographics and relevant clinical data. Statistical analysis was performed via SPSS version 22. **RESULTS:** A total of 300 participants were included in the study at the Hospital University Sains Malaysia (HUSM), Kelantan Malaysia, in which majority of the study subjects were females 169 (56.3%). Mean age of patients was 67.6 + 6.7 years. Most of the male (64.6%) and (35.4%) female patients were aged 70-79 years. Mean body mass index (BMI) of the patients was 26 + 5.7 kg/m2. Fifty four (53.4%) male and 47 (46.6%) female patients were overweight whereas 27 (47.3%) male and 30 (52.7%) female patients were obese. The one-way ANOVA result reported significant difference for serum creatinine with $p<0.05$ for all the four groups on the basis of BMI. While for serum cystatin C the result was non-significant with $p>0.05$. **CONCLUSIONS:** Cystatin C can be used in place of creatinine to correctly identify the staging of elderly CKD patients as it is not affected by BMI level as compared to creatinine.

PMD8

EXAMINING UNCERTAINTY AROUND AMERICAN COLLEGE OF MEDICAL GENETICS (ACMG) RECOMMENDATIONS FOR NEWBORN SCREENING (NBS) FOR HYPERMETHIONINEMIA (MET)

Ndikumukiza C, Rittenhouse B
MCPHS University, Boston, MA, USA

OBJECTIVES: In a 2006 ACMG report, MET was recommended as a secondary NBS target based an algorithm whereby survey scoring determined an entry point to the algorithm (EPA) containing follow up questions, leading to a final recommendation. ACMG ignored any uncertainty regarding its scoring. We examined the potential impact of missing data in the classification of MET as a secondary target by the ACMG by first assessing whether missing data uncertainty could lead to a different EPA. **METHODS:** In survey scoring for MET, two questions out of 18 have individual responses reported by ACMG; the first question, "Burden If Untreated" (BURDEN), had 6 missing responses and the second, "availability of treatment " (AVAIL), had 5 missing responses. The total MET score was 1121; the cut off values for the EPA were at 1200 and at 1000. We assessed the potential impact of missing data to call into question the confidence in the original EPA by using boundary estimates (Manski 1989). **RESULTS:** The original score based on responders was 29 for BURDEN and 70 for AVAIL. Lower/upper boundary estimates were, respectively, (25/38) and (62/73). Neither of these changes, alone or combined, was sufficient to alter the EPA and the recommendation for MET. **CONCLUSIONS:** Scoring for MET is affected by uncertainty due to missing data. However, examining the uncertainty for only these 2 questions was not sufficient to change the EPA or the NBS recommendation. Additional examination of the potential influence of missing data for other survey questions and examining the influence of other sources of scoring uncertainty (e.g. sampling variation) is needed in order to confirm the robustness of the ACMG recommendation for MET.

PMD9

COMPARATIVE EFFECTIVENESS OF MRI VERSUS MAMMOGRAPHY FOR POST-TREATMENT SURVIELLANCE IN PATIENTS UNDERGOING BREAST-CONSERVING THERAPY FOR BREAST CANCER

Mehta HB[1], Adhikari D[1], Kuo Y[1], Riall TS[2]
[1]*University of Texas Medical Branch, Galveston, TX, USA,* [2]*University of Arizona, Tucson, AZ, USA*

OBJECTIVES: Magnetic resonance imaging (MRI) is a sensitive method of breast imaging. The goal was to compare the effectiveness of MRI vs. mammography for post-treatment surveillance in patients undergoing breast-conserving therapy for breast cancer. **METHODS:** This cohort study used the Texas Cancer Registry linked Medicare claims data from 2004-2012. The study cohort included older women (age>65 years) diagnosed with ductal carcinoma in situ or SEER Historic stage 0, 1 and 2 breast adenocarcinoma who underwent breast-conserving surgery+radiation therapy. The primary independent variable was use of MRI +/- mammography vs. mammography alone after definitive therapy. Outcomes included time to local recurrence, number of total biopsies, and number of negative biopsies defined as biopsy not followed by breast cancer diagnosis and treatment. Independent variables included patient demographics, comorbidities and clinical characteristics such as cancer stage and tumor size. Unadjusted and adjusted Cox proportional hazards regression models were constructed to evaluate the comparative effectiveness of MRI versus mammography on time to detection of recurrence. Unadjusted and adjusted zero-inflated Poisson regressions were constructed to compare the incidence of total and negative biopsies with MRI vs. mammography. **RESULTS:** Of 7,693 patients, 6,360 (82.7%) used mammography only, 483 (6.3%) used MRI and mammography and 850 (11.1%) had no post-treatment surveillance breast imaging. The use of MRI increased over time from 0.5% in 2004 to 17.7% in 2012 ($p<0.001$). In adjusted analysis, MRI was associated with higher detection of recurrence (HR 1.56; 95% CI, 1.15-2.13), but also associated with higher number of total biopsies (β=0.95[0.08]) and negative biopsies (β=1.01[0.09]). **CONCLUSIONS:** MRI use for post-treatment surveillance increased in Texas in the last decade. The use of MRI resulted in greater detection of recurrence. Use of MRI was also associated with an increased number of total and false positive biopsies; follow-up was not long enough to evaluate if the early detection improved survival.

PMD10

COMPARISON OF DELIRIUM DETECTION RATES IN DEMENTIA AND NON-DEMENTIA ELDERLY POPULATION BY FAMILY CAREGIVERS USING FAMILY CONFUSION ASSESSMENT METHODS (FAM-CAM) IN THE EMERGENCY DEPARTMENT – AN OBSERVATIONAL STUDY

Yeon H, Saczynski J
Northeastern University, Boston, MA, USA

OBJECTIVES: The Family Confusion Assessment Method (FAM-CAM) has been validated in outpatient populations but has not been tested in populations with dementia or in hospitalized patients. This study compared delirium detection rates using the Family Confusion Assessment Methods (FAM-CAM) in caregivers of dementia

patients versus those of non-dementia patients against a gold standard interviewer rating, Confusion Assessment Methods (CAM). **METHODS:** This observational study enrolled 108 elderly patient/family member dyads who presented to Emergency Department at the University campus of UMass Memorial Health Care. Upon admission, the research staffs used the Informant Questionnaire on Cognitive Decline in the Elderly (IQCODE) to assess dementia in the patients. Two interviews were conducted to assess delirium in the patients as follows: each patient was interviewed by a trained rater using the CAM, and each family caregiver was guided through the FAM-CAM questionnaires. **RESULTS:** The average age of enrolled patients was 81 years old. IQCODE identified 51% of patients as having dementia. The prevalence of delirium was 28% according to both the CAM and the FAM-CAM. The sensitivity of the FAM-CAM was 60.8% (CI= 41-81%) in patients with dementia and 42.8% (CI=6-80%) in patients without dementia. The specificity of the FAM-CAM was 74.3% (CI=59-88%) in patients with dementia and 90.1% (CI=82-99%) in patients without dementia. **CONCLUSIONS:** The sensitivity was 20% higher in dementia patients, which shows that FAM-CAM performs better than CAM at recognizing delirium in dementia patients and supports validation of its use in high-risk patient population with Delirium Superimposed on Dementia (DSD). The FAM-CAM offers critical knowledge of family caregivers on patient's baseline cognitive and physical function, therefore has great potential to help health care clinicians identify delirium during their patient assessment. Future studies with a larger sample size of different races and with education of caregivers on delirium-associated symptoms are encouraged.

PMD11

REAL-WORLD CLINICAL BENEFITS ASSOCIATED WITH FLOWABLE GELATIN HEMOSTATIC MATRIX FOR LUMBAR SURGERY IN CHINESE PATIENTS

Wang Z[1], Wu Y[1], Gong Q[2], Chen W[3]
[1]Chinese PLA General Hospital, Beijing, China, [2]Normin Health Technology Ltd, Changsha, China, [3]Normin Health Consulting Ltd, Mississauga, ON, Canada

OBJECTIVES: To assess real-world clinical benefits associated with flowable gelatin hemostatic matrix (SURGIFLOTM) for hemostasis in a pilot cohort of Chinese patients who underwent cervical vertebrae surgery (CVS). **METHODS:** A pilot cohort was created by randomly selecting 10% of patients who received CVS for cervical spondylosis in 2014 and 2015 in a tier III hospital in Beijing, China. The medical records related to CVS for the included patients were reviewed to extract patient baseline characteristics, surgery procedures, utilization of SURGIFLOTM, and selected outcome measures during and after the operation. Multiple regression analyses with adjustment assessed the impact of the utilization of SURGIFLOTM as hemostatic agent on measured outcomes during and after CVS. **RESULTS:** The created pilot cohort included 70 patients (24 with utilizing SURGIFLOTM and 46 without utilizing SURGIFLOTM). The utilization of SURGIFLOTM was associated with significantly higher proportion of urban worker insurance plan (75.0% vs. 43.5%, p=0.022) and higher proportion of cerebral infarction history (20.8% vs. 0%, p=0.004) at baseline. Significant association was only observed between the utilization of SURGIFLOTM and body temperature normalization three days after surgery [odds ratio (OR) 0.01, p=0.025]. Additionally, the utilization of SURGIFLOTM was strongly associated with lower bleeding volume during operation, shorter hospital stay length after operation, and less utilization of drainage catheter after operation. However, the sample size of this pilot cohort was not large enough to detect the statistical significance for these observed associations. **CONCLUSIONS:** Utilizing SURGIFLOTM for hemostasis in CVS led to significantly more patients with normalized body temperature three days after surgery. The potential clinical benefits associated with the utilization of SURGIFLOTM for CVS warrant confirmation by future studies with sufficient power.

CAN CLOSED INCISION NEGATIVE PRESSURE THERAPY IMPACT POST OPERATIVE OUTCOMES IN BREAST RECONSTRUCTION?

Gabriel A[1], Sigalove S[2], Storm-Dickerson T[3], Sigalove N[4], Griffin L[5], Parekh MH[6], Macarios D[7], Maxwell GP[8]
[1]PeaceHealth Medical Group, Vancouver, WA, USA, [2]DuPage Medical Group/ DMG Aesthetics, Glen Ellyn, IL, USA, [3]Compass Oncology, Vancouver, WA, USA, [4]Central DuPage Hospital/ Northwestern Medicine, Winfield, IL, USA, [5]Acelity, San Antonio, TX, USA, [6]LifeCell, an Acelity company, Bridgewater, NJ, USA, [7]LifeCell, an Acelity Company, Bridgewater, NJ, USA, [8]Loma Linda University Medical Center, Loma Linda, CA, USA

OBJECTIVES: Evidence suggests that incision management with negative-pressure therapy (ciNPT) may provide clinical benefit in various surgical applications such as orthopedic, sternotomy, abdominal wall repairs, colorectal procedures by protecting surgical incisions and removing fluid and infectious materials. This study compares post-operative outcomes including complication rates and drain use among patients using ciNPT* versus standard of care (SOC) after breast reconstruction. **METHODS:** This single-site, retrospective cohort study included data for breast reconstruction procedures from October 1, 2013 – March 31, 2016. Data collected included demographics, chemotherapy/radiation exposure, surgical technique, ciNPT use, number of drains, total drain duration, and 90 day post-operative complication rates. Two-sided T-test and Chi-square or Fisher's Exact tests were performed at α=0.05 **RESULTS:** The study included data on 155 patients (ciNPT=64, SOC=91) and 294 breasts (ciNPT=125, SOC=169). There were no significant differences in patient characteristics between the two groups except for prior breast surgery, radiation and chemotherapy exposure. More patients in the ciNPT group underwent a pre-pectoral technique of breast reconstruction compared to the control group. At the breast level, the overall complication rate was 7 (5.6%) in the ciNPT group compared to 24 (14.2%) in the SOC group (p=0.0176). There were significant differences in infection rates [0(0%) v. 10(5.9%)], dehiscence [0(0%) v. 11 (6.5%)], necrosis [1(0.8%) v. 16(9.5%) when comparing the ciNPT and SOC groups respectively. All patients in the ciNPT group had 2 drains compared to 81.7% of the SOC group (p<0.0001). The ciNPT group had significantly lower mean drain days per-drain (6.1 vs. 9, p<0.0001) and total drain days (12.2 vs. 18.1, p<0.0001) compared to SOC group. **CONCLUSIONS:** Our study demonstrated significantly lower complication rates and drain duration among the ciNPT group. These results may translate to improved patient outcomes and efficient use of resources in a hospital setting. Further studies are needed to corroborate the findings in our study.

PMD13

MEASURING ADALIMUMAB DRUG LEVELS BY ELISA TO DETECT TREATMENT RESPONSE IN RHEUMATOID ARTHRITIS: A SYSTEMATIC REVIEW AND BIVARIATE META-ANALYSIS

Gavan S, Payne K, Barton A
The University of Manchester, Manchester, UK

OBJECTIVES: In patients with rheumatoid arthritis (RA) receiving the anti-TNF therapy adalimumab, circulating drug levels are associated with treatment response. Commercial tests (using a method called ELISA) can monitor anti-TNF drug levels in routine practice but the accuracy of this approach is uncertain. This study aimed to synthesise all published evidence on the accuracy of adalimumab drug level measurement by ELISA to detect treatment response in RA. **METHODS:** A systematic review identified all published receiver operating characteristic (ROC) curve analyses that measured adalimumab drug levels by ELISA tests to detect treatment response in RA. Medline and Embase were searched electronically (from inception to August 2016). Two researchers identified studies using pre-defined inclusion criteria. Test outcomes were classified as positive if drug levels exceeded the study-specific cut-point. Data on study design characteristics, sample characteristics, and test outcomes from 2x2 tables (true-positive; false-positive; true-negative; false-negative) were extracted. QUADAS-2 was used to assess study quality. A hierarchical bivariate meta-analysis synthesised findings to account for between-study heterogeneity and correlation between sensitivity and specificity. **RESULTS:** 4,006 abstracts were identified and four studies met the review inclusion criteria. In all studies, patients received 40mg adalimumab every two weeks. Studies varied in their design and sample characteristics. Studies had low risk of bias and low concern of applicability to the research objective. The hierarchical bivariate meta-analysis estimated an average test sensitivity of 0.95 (95% CI: 0.85-0.98) and specificity of 0.68 (95% CI: 0.28-0.92). **CONCLUSIONS:** Measuring high adalimumab drug levels by ELISA testing appeared to be predictive of treatment response in RA. Low drug levels were less predictive of no treatment response. In practice, drug level measurement may be used in conjunction with anti-drug antibody testing to improve accuracy. The relative cost-effectiveness of using ELISA tests, and the implications of imperfect test accuracy, should be evaluated before being recommended in routine practice.

PMD14

COMPARISON OF ECONOMIC AND CLINICAL OUTCOMES BETWEEN STRATAFIX™ KNOTLESS TISSUE CONTROL DEVICES AND CONVENTIONAL SUTURES IN PATIENTS UNDERGOING KNEE REPLACEMENT FOR OSTEOARTHRITIS IN REAL WORLD CLINICAL PRACTICE

Johnston SS[1], Sutton N[2]
[1]Johnson & Johnson Co., New Brunswick, NJ, USA, [2]Ethicon Inc., Somerville, NJ, USA

OBJECTIVES: To compare economic and clinical outcomes between patients undergoing knee replacement for osteoarthritis with use of STRATAFIX™ Knotless Tissue Control Devices (SFX KTCD) vs. conventional sutures alone. **METHODS:** Retrospective, observational study using the Premier Hospital Database. Patients (aged ≥18 years) selected for study had an elective hospital admission, with discharge occurring between 1/1/2010-9/1/2015, carrying primary ICD-9-CM procedure and diagnosis codes for knee replacement and osteoarthritis (first qualifying=index admission). Patients with any billing record for use of SFX KTCD during the index admission were classified into the 'SFX KTCD group'; those with billing records only for conventional sutures were classified into the 'conventional group'. Primary outcomes were index admission's length of stay (LOS), total hospital costs, and discharge status (skilled nursing facility [SNF]/other vs. home/home health care); exploratory outcomes included surgical site infection (SSI) and operating room time (ORT) during index admission. The SFX KTCD and conventional groups were propensity score matched (1:1/nearest neighbor/caliper=0.10) on patient, hospital, and provider characteristics. Generalized estimating equations accounting for hospital-level clustering after matching were used to compare outcomes between study groups. **RESULTS:** Each group comprised 7,264 patients (14,528 total patients; mean age=66.5y; % females=61.8%). The groups were generally well-balanced on matching covariates: mean standardized difference calculated across 52 covariates=0.02. Compared to the conventional group, the SFX KTCD group had statistically significant: shorter LOS (2.7d vs. 2.9d, P=0.0059), lower probability of discharge to SNF/other vs. home/home healthcare (25.7% vs. 28.7%, P=0.0126), and shorter ORT (183min vs. 190min, P=0.0235). Total hospital costs and SSI rates were lower for the SFX KTCD vs. conventional group; however, these differences were not statistically significant. **CONCLUSIONS:** Among patients undergoing knee replacement for osteoarthritis in real world clinical practice, use of SFX KTCD vs. conventional sutures alone was associated with shorter LOS, shorter ORT, and less resource intensive discharge status.

PMD15

PHYSICIAN INSIGHT OF HEALTH ECONOMIC BENEFIT OF RHYTHMIA THREE – DIMENSIONAL MAPPING SYSTEM FOR RADIOFREQUENCY ABLATION PROCEDURES

Yang F[1], Chen G[2], Zhang M[2], Xu J[2], Xuan J[3]
[1]Shanghai Centennial Scientific Ltd, Shanghai, China, [2]Boston Scientific, Shanghai, China, [3]Sun Yat-Sen University, Guangzhou, China

OBJECTIVES: To explore and demonstrate the clinical/economic benefits associate with Rhythmia, a three–dimensional mapping system for radiofrequency ablation

procedures. **METHODS:** Rhythmia Mapping System was approved by China CFDA in 2015. Its clinical benefits include less mapping time, high precision and high degree of automation, however, no study has been conducted to explore and evaluate its potential health economic benefits. In this study, a KOL survey was conducted to explore such benefits. A questionnaire was designed to collect data associated with potential benefits of Rhythmia Mapping System such as the clinical advantages, the comparison with other mapping system, and the usage experience of Rhythmia system. Thirty-five clinicians who had Rhythmia experience from 11 cities (Shanghai, Beijing, Guangzhou, etc.) in China completed the questionnaire. This survey population accounted for 70% of the physicians who had experience with Rhythmia Mapping System in China. **RESULTS:** The survey demonstrated the following health economic benefits: 94.3% of physicians believe that the Rhythmia system can improve the ablation efficacy of patients with complex arrhythmia. Compared with other mapping systems, Rhythmia system can reduce the median operation time by 30 minutes. The Atrial Fibrillation (AF) recurrence ratio of Rhythmia system versus other systems were 5% and 20%; and recurrence frequency were 1.5 and 2 respectively. With current cost of radiofrequency ablation averaging 73,873.68 Chinese Yuan (CNY) and the number of patients requiring radiofrequency ablation in China being 31.36 million, the application of Rhythmia system (used only for 0.5% of all radiofrequency ablation operation) could result potential saving of 55 million CNY. Assuming the utilization of Rhythmia system comes up to 10%, the saving would be up to 1.1 billion CNY. **CONCLUSIONS:** Rhythmia three–dimensional Mapping System can improve the mapping accuracy and the efficacy of patients with complex arrhythmia. Substantial cost could be saved due to the application of Rhythmia system.

ASSOCIATION BETWEEN RECOMBINANT HUMAN BONE MORPHOGENETIC PROTEINS AND POST-OPERATIVE OPIOID USE IN LUMBAR FUSION PROCEDURE PATIENTS: A PROPENSITY-SCORE MATCHED ANALYSIS

Murimi IB[1], Ghambaran A[2], Decker R[3], Lu X[3], Segal R[3], Loyo-Berrios NI[2], Marinac-Dabic D[2], Hartzema A[3]
[1]*Johns Hopkins Bloomberg School of Public Health, Center for Drug Safety and Effectiveness, Baltimore, MD, USA,* [2]*United States Food and Drug Administration, Silver Spring, MD, USA,* [3]*University of Florida, Gainesville, FL, USA*

OBJECTIVES: To investigate the association between Recombinant human Bone Morphogenetic Protein-2 (rhBMP-2) use during lumbar fusion procedures and the demand for opioid analgesics in the first post-surgical year. **METHODS:** We conducted retrospective study using the Multi-Payer sClaims Database (MPCD) 2007-2010. Patients aged > 20, who received a Degenerative Disc Disease-indicated lumbar fusion procedure and had at least one opioid prescription filled in the three months prior to surgery, were identified. Propensity score matching (1:1) of rhBMP-exposed and unexposed patients was used to mitigate the effects of confounding. Outcomes of interest were opioid independence and decreases in opioid doses as measured in morphine equivalents assessed at 3-6 and 9-12 months post-procedure. Logistic regression and Analysis of Covariance models were used to examine the association between rhBMP-use and post-operative opioid use patterns. **RESULTS:** A total of 318 patients were included in the propensity score matched cohort; most were female (61%) and under 65 years old (68%). Few patients achieved opioid independence at either the 3-6 (n=71, 22.3%) or 9-12 months (n=115, 36.2%) post-surgical windows. During the 3-6 months window, patients who received rhBMPs reduced their opioid use rates (Estimated Mean Difference: -28.4 vs. -19.5, p value= 0.69) and achieved opioid independence (21.4% vs. 23.3%, OR=0.92, 95% CI, 0.54-1.56, pvalue = 0.74) at rates that were statistically comparable to their matched comparators. Similar patterns were observed during the 9-12 months window. **CONCLUSIONS:** We found no evidence to suggest that rhBMP use during spinal fusion procedures is associated with either the discontinuation or decrease of opioid analgesic therapy. Given the significant morbidity associated with prolonged opioid therapy, the high prevalence of continued opioid use after surgery warrants further study.

PMD18

SOCIOECONOMIC INEQUALITIES IN QUALITY-OF-CARE AND OUTCOMES AMONG PATIENTS UNDERGOING PERCUTANEOUS CORONARY INTERVENTION IN HONG KONG

Yan BP[1], Chan LL[1], Chan CK[1], To OT[1], Wong MC[1], Reid C[2], Lee VW[1]
[1]*The Chinese University of Hong Kong, Shatin, Hong Kong,* [2]*Monash University, Melbourne, Australia*

OBJECTIVES: Socioeconomic status has been associated with adverse cardiovascular outcomes. We aim to evaluate the impact of socioeconomic status on characteristics and outcomes of patients undergoing percutaneous coronary intervention (PCI) in Hong Kong. **METHODS:** We retrospectively analyzed 3300 patients undergoing PCIs between Sep 2009 and Dec 2013 at a tertiary academic institution. Low socioeconomic status (LSES) was defined by recipient of the Comprehensive Social Security Assistance (CSSA) Scheme which provides a safety net for those who cannot support themselves financially based on total household income and asset tests. Baseline characteristics and 12 month clinical outcomes including death, myocardial infarction (MI), target vessel revascularization (TVR) and composite major adverse cardiac events (MACE, composite of death, MI and TVR) were compared between LSES and non-LSES patients. Independent predictors of 12 month MACE were identified using multivariate analysis. **RESULTS:** Of 3,300 patients, 19.2% (n=635) were of LSES with mean age of 64±10.9 years and 75.6% male. LSES patients had high rates of co-morbidities including smoking, renal failure, history of MI, heart failure, previous PCI compared to non-LSES patients (all $p<0.01$). LSES patients had higher rates of death (5.1% vs. 3.2%), MI (2.2% vs. 0.6%), TVR (2.2% vs. 1.1%) and MACE (9.8% vs. 4.8%, all $p<0.01$) at 12 months. LSES was an independent predictor of 12-month MACE (Odds Ratio [OR] 1.45, 95% confidence interval [CI] 0.99-2.12, p=0.05). The use of drug-eluting stents (DES) was the only independent predictor of freedom-from-MACE at 12 month (OR 0.48, 95%CI 0.35-0.66, $p<0.01$). However, DES is only used in 20.6% of LSES patients compared to 80.7% of non-LSES patients ($p<0.01$). **CONCLUSIONS:** Among patients undergoing PCI, a low socioeconomic status is associated with a higher prevalence of cardiovascular risk factors and adverse outcomes but less effective therapy such as bare-metal stents.

PMD19

A GLOBAL EPIDEMIOLOGICAL FORECAST OF HOSPITAL-TREATED INFECTION EVENTS AND INFECTION TYPES

Kristo F, Dorfman K
Decision Resources Group, Burlington, MA, USA

OBJECTIVES: To estimate the global burden of Hospital-Treated Infection Events (HTIs) and HTI subtypes in 2016, and forecast the number of HTI events through 2026 using country-specific hospital discharge databases and literature review. **METHODS:** Hospital-treated infections are classified into community-acquired, healthcare-associated, and hospital-acquired infections. Six types of infections: urinary tract infections, respiratory, surgical site, bloodstream, intra-abdominal, and skin structure infections affect millions of patients every year placing a huge burden on low-and middle-income countries. We estimated the number of HTI events for each infection type by analyzing large hospital discharge databases and reviewing country-specific literature. We forecast changes in the number of events through 2026 based on economic development and changes in country-specific demographics. **RESULTS:** We estimate that pneumonias are the predominant infection types among European countries at 13 per 1,000 individuals, while urinary tract infections are predominant in the Americas at 16 per 1,000 individuals, a rate 3.6 times higher than urinary tract infections among European countries. Bloodstream event rates across Middle East and African countries are about 2.8 times higher than European countries, reflecting poor infection control measures. We predict a 34.8 % increase in surgical-site infection events in Middle Eastern and African countries over the forecast period. **CONCLUSIONS:** We observed heterogeneity in the rates of hospital-treated infection types among regions of the world. We predict increases in hospital-treated infection events across different regions due to demographic trends.

PMD20

FRAMINGHAM RISK SCORE PREDICTING MAJOR ADVERSE CARDIAC EVENTS IN POST CORONARY ANGIOPLASTY PATIENTS: A RIDDLE, MYSTERY AND ENIGMA

Shetty PN, Devasia T, Karkala YR, Kareem H
KASTURBA MEDICAL COLLEGE, UDUPI, India

OBJECTIVES: Framingham risk score (FRS) predicts the incidence of coronary atherosclerotic disease (CAD) but the same prediction in cardiovascular (CV) events after coronary angioplasty is questionable. **METHODS:** In this prospective study 1001 patients who underwent percutaneous transluminal coronary angioplasty (PTCA) from 1/6/2015 to 30/6/2016 were recruited and followed up for a period of 6 months. The clinical, anthropometric and other biochemical CVD risk factors of the study participants were done at the baseline. The univariate and multivariate cox proportional hazard regression analyses were performed to evaluate the relation between the cardiovascular risk factors and major adverse cardiac events (MACE) at one month **RESULTS:** At 6 Months, MACE was observed in 83 (8.3%) subjects who underwent PTCA, The area under the curve (Hazards Ratio/HR)for FRS and NT Pro

BNP in predicting MACE was found to be 0.81 (95% CI: 0·73-0·88) and 0.89 (95% CI 0.82-0.96) respectively.In type 2 diabetic patients, after adjustment for potential confounders baseline FRS > 20 and baseline NT ProBNP > 500 was significantly associated with MACE [adjusted hazard ratio (HR): 3.03, 95% CI:1.41-6.54, p = 0.005] .In nondiabetic patients, NT ProBNP(> 500) was significantly associated with MACE [adjusted hazard ratio (HR): 2.08, 95% CI: 1. 61-5.54, p = 0.002].FRS under predicted MACE in non-diabetic subjects. **CONCLUSIONS:** FRS and NT ProBNP > 500 predicted MACE in Diabetic subjects,But FRS underpredicts MACE in Non-diabetic, where other risk factors anticipated it.It appears that FRS beyond threshold appears to predict MACE in diabetic subjects.

BUDGET IMPACT ANALYSIS OF THE CELL CYCLE PROGRESSION TEST IN LOW AND INTERMEDIATE RISK, LOCALIZED PROSTATE CANCER

Li C, Schaink AK, Xie X, Holubowich C, Sikich N, Dhalla I, Ng V
Health Quality Ontario, Toronto, ON, Canada

OBJECTIVES: Clinical risk stratification of localized prostate cancer (PCa) guides treatment decisions. However, residual uncertainty and inaccurate classification could yield over- or under-treatment of patients considered for interventional treatment or active surveillance. The cell cycle progression (CCP) test, a genomic assay that estimates PCa aggressiveness, could improve accuracy of risk assessment and treatment choice for low- or intermediate-risk patients. This study estimated the five-year budget impact of CCP from an Ontario public payer perspective. **METHODS:** A budget impact analysis was conducted by comparing costs between a reference scenario without CCP and a new scenario with CCP. Since no studies have shown CCP's effect on clinical outcomes, we assumed that CCP would only change the distribution of initial treatments, not progression or survival. Each year an estimated 6,196 men are newly diagnosed with low- or intermediate-risk PCa. Treatment patterns for these groups of patients were obtained from the literature, and the expected uptake of CCP was estimated using expert opinion. The effect of CCP on treatment decisions was based on two clinical utility studies. **RESULTS:** We estimated the costs associated with the CCP test itself to be $47.9 million, the costs associated with additional physician visits required to interpret the test result to be $0.7 million, and the savings due to treatment change (increased use of active surveillance and decreased use of interventional treatment) to be −$7.3 million. As a result, publicly funding the CCP test would result in a net budget impact of $41.3 million in the first five years. Results were most sensitive to assumptions regarding the uptake and the extent that CCP altered current treatment. **CONCLUSIONS:** Publicly funding the CCP test would result in a large incremental cost to the provincial budget.

PMD22

ECONOMIC IMPACT ANALYSIS OF BRCA1 AND BRCA2 GENETIC TESTS IN WOMEN WITH ADVANCED STAGE OVARIAN CANCER IN THE COLOMBIAN CONTEXT

Romero Prada ME[1], Roa Cardenas NC[1], Vasquez Melo EC[2], Acosta JA[3]
[1]*Salutia Foundation - Research center in economy, management and health technologies., Bogota, Colombia,* [2]*Fundación Salutia, Bogotá, Colombia,* [3]*Marly, bogota, Colombia*

OBJECTIVES: To develop an economic impact of BRCA1 and BRCA2 genetic tests in women with advanced stage ovarian cancer in the Colombian context. **METHODS:** Using the decision tree model, in a lifetime horizon, we analyzed the application of BRCA1 and 2 genetic tests in a hypothetical cohort of 100 patients diagnosed with this disease, taking into account the probability of positive or negative result according to the scientific evidence. At the same time, the prevalence and incidence of this disease was taken in order to find the probability of development or non-development of ovarian cancer in the relatives of these patients, for each patient with this disease, a family member at risk of developing ovarian cancer was associated according to the national household survey of the National Administrative Department of Statistics in Colombia, given the indication of the tests (Adelaida criteria). Drug costs (per minimum unit of presentation) and procedures were taken from databases of the Colombian health system, according to the management in clinical practice guidelines, which were corroborated by clinical experts. The cost of the tests was provided by the funder. A sensitivity analysis was performed based on the size change of the hypothetical cohort of the relatives. **RESULTS:** For a cohort of 100 patients the cost of applying the tests is USD $4,536,728 and not to do so is USD $4,587,387, with savings of USD $50,659 (USD $ 507 per patient) for its implementation. As the hypothetical cohort of relatives increased in the sensitivity analysis to 2 and 3, the savings per patient are USD $3,636 and USD $6,765 respectively. **CONCLUSIONS:** Given the savings in costs showed, it is concluded that it is important to implement the use of genetic tests in order to save costs of treatment of ovarian cancer and to prevent the late diagnosis of the disease.

PMD23

BUDGET IMPACT OF NEXT GENERATION SEQUENCING FOR MOLECULAR ASSESSMENT OF ADVANCED NON-SMALL CELL LUNG CANCER

Yu TM[1], Morrison C[2], Gold EJ[3], Tradonsky AN[1], Arnold RJ[1]
[1]*Quorum Consulting, Inc, San Francisco, CA, USA,* [2]*OmniSeq, LLC, Buffalo, NY, USA,* [3]*HackensackUMC at Pascack Valley, Emerson, NJ, USA*

OBJECTIVES: Evaluate the budget impact of next-generation sequencing (NGS) instead of single-gene testing for tissue-based molecular assessment of non-squamous, advanced non-small cell lung cancer (aNSCLC) from the United States healthcare payer perspective. **METHODS:** A Markov model was developed to evaluate an annual cohort of newly-diagnosed, non-squamous aNSCLC patients in a hypothetical million-member plan followed for 5 years. aNSCLC epidemiology data were from published literature. Mutation prevalence and testing rates for activating mutations were considered for current and emerging gene targets (EGFR, ALK, ROS-1, BRAF, MET, HER2, RET), and sourced from literature. Rates of successful test completion were informed by literature and clinical expert opinion. Patients identified as EGFR+ and ALK+ were assumed to be treated with erlotinib and crizotinib, respectively; clinical trial enrollment was an option for patients with other mutations. Adverse events, progression, and survival rates with targeted therapy or chemotherapy were from randomized clinical trials. Costs of testing and first-line and maintenance therapies were based on Medicare 2016 reimbursement values; adverse event and post-progression costs were from literature. **RESULTS:** Of 1-million plan members, 312 patients were expected to be newly-diagnosed with non-squamous aNSCLC and 177 were tested. Of the 57 tested patients expected to have activating mutations, single-gene testing identified 39 patients and NGS identified 56. Testing-related costs decreased $45,326 with NGS instead of single-gene testing. First-line and maintenance treatment costs increased $264,185, offset by $79,612 of savings in post-progression-related costs. Total budget impact over 5 years for this cohort assessed with NGS instead of single-gene testing was $139,247 ($0.0023 per-member per-month). **CONCLUSIONS:** NGS is expected to improve identification of activating mutations and enable improved patient selection for targeted therapy and/or clinical trial enrollment. The impact to payer costs is expected to be breakeven or minimally cost-additive.

PMD24

BUDGET IMPACT ANALYSIS OF REMOTE MONITORING OF CRT/ICD THERAPY IN PATIENTS WITH HEART FAILURE IN BRAZIL: A PROBABILISTIC APPROACH

Riveros BS[1], Gonçalves VF[2], Pedro GO[3], Rosim MP[4], Lucchetta RC[1], Nita ME[5]
[1]*Federal University of Parana, Curitiba, Brazil,* [2]*BIOTRONIK Comercial Médica Ltda., Sao Paulo, Brazil,* [3]*SolVE, São Paulo, Brazil,* [4]*University of Sao Paulo, Sao Paulo, Brazil,* [5]*USP and FIPE/HAOC, Sao Paulo, Brazil*

OBJECTIVES: To estimate the budget impact of incorporating Remote Monitoring (Home MonitoringTM) of Cardiac Resyncronisation Therapy (CRT) and Implantable Cardioverter-Defibrillator (ICD) in Brazilian Public Healthcare System (SUS). **METHODS:** We undertake a budget impact analysis by means of cost calculator approach. Eligible population consisted of patients with CRT/ICD therapy in SUS diagnosed with heart failure (ICD-10 I50). Retrospective (2010-2016) number of patients with those characteristics was obtained through Health Informatics Department of the Brazilian Ministry of Health (DATASUS). Ordinary least square method was used to predict eligible population over the next five years. One scenario was built taking into account current and new intervention costs (BRL, Brazilian currency), whereas a second also included costs related to heart failure. Uptake of new intervention in SUS and its effect in current environment was estimated taking the private market and its differences with SUS in mind. Probabilistic sensitivity analysis was performed in order to explore parametric uncertainties. For the sake of clarity k means thousand. **RESULTS:** Deterministic results pointed out a budget impact of BRL 102k, BRL 427k, BRL 617k, BRL 879k and BRL 1,161k over the next five years. When opportunity costs are taken into account the budget impact drops to BRL 102k, BRL 1,2k, BRL 19k, BRL 72k and BRL 172k, respectively. Although uncertainties in BIA are not fully quantified, in view of our model, there is 95% of probability that budget impact will be less than BRL 155k, BRL 670k, BRL 1,200k, BRL 1,950k and BRL 2,950k over the next five years, respectively. **CONCLUSIONS:** Forecasting expenses with technology acquisition over the following five years lead to costs around BRL 102k to BRL 1,161k, favouring about 1,706 patients. Opportunity costs of new technology are capable to decrease dramatically budget impact, although meaningfully uncertainties may not be quantified in this model.

PMD25

BUDGET IMPACT ANALYSIS OF CAPSULE ENDOSCOPY FOR SCHEDULED MONITORING IN CROHN'S DISEASE

Saunders R[1], Torrejon Torres R[1], Williams MJ[2], Richardson K[3], Kosinski L[4]
[1]*Coreva Scientific, Freiburg im Breisgau, Germany,* [2]*Medtronic, Minneapolis, MN, USA,* [3]*Medtronic, Duluth, GA, USA,* [4]*3. Illinois Gastroenterology Group, Elgin, IL, USA*

OBJECTIVES: Crohn's disease, a chronic inflammatory condition of the gastrointestinal tract, is associated with substantial healthcare costs. Endoscopic inspection is considered essential for monitoring and optimizing treatment. Ileocolonoscopy visualizes the colon and terminal ileum but additional imaging is required to evaluate the entire bowel. Small bowel and colon capsule endoscopy (SBC-CE) evaluates the entire small bowel and colon in a single assessment. This analysis considers whether use of SBC-CE could reduce costs. **METHODS:** A patient-level, discrete-event simulation evaluated care and costs (in 2016 USD) in 1,000 patients (representing 140,184 patients in the health plan) over 5 years. During each cycle, patients were exposed to the risk of disease progression, adverse events, surgery, and death. Disease state changes used underlying Markov models for development of ulcers, stricturing, rectal disease, and anatomic involvement. Treatment decisions were reviewed every 3 months using patient-reported information and marker assessment or results from endoscopic monitoring. Monitoring was performed every 3, 6, or 12 months for patients starting treatment, presenting with symptoms, or in remission, respectively. **RESULTS:** SBC-CE resulted in a lower total cost of care (-1.1%, -$169.2 million). Monitoring costs (-8.3%), adverse events costs (-2.6%), and treatment costs (-0.4%) were reduced with SBC-CE compared with ileocolonoscopy. SBC-CE identified more patients with non-symptomatic disease, moving them to treatment more efficiently. Sensitivity analyses demonstrated that model results were robust to sampled changes in input parameters, with SBC-CE resulting in a reduced total cost of care in 84.6% of simulations and a median cost saving of $3,760 per patient **CONCLUSIONS:** Use of SBC-CE for monitoring of Crohn's disease can result in reduced healthcare costs. Savings are generally realized in the cost of monitoring and avoidance of adverse events associated with ileocolonoscopy.

PMD26

A BUDGET IMPACT ANALYSIS OF TOTAL DISC REPLACEMENT (TDR) FOR SINGLE-LEVEL LUMBAR DEGENERATIVE DISC DISEASE (LDDD): A U.S. PRIVATE HEALTH INSURER PERSPECTIVE

Ferko N[1], Sperber D[2], Banko D[3]
[1]Cornerstone Research Group Inc., Burlington, ON, Canada, [2]Cornerstone Research Group, Burlington, ON, Canada, [3]B. Braun Medical Inc., Bethlehem, PA, USA

OBJECTIVES: Concerns regarding the budget impact of lumbar total disc replacement (TDR) surgery for patients with lumbar degenerative disk disease (LDDD) may underlie delayed coverage by US Private health insurers, despite mounting evidence on the favorable efficacy, safety and cost-effectiveness of TDR relative to lumbar fusion (LF). The objective of this study was to estimate the budget impact of single-level lumbar TDR coverage for LDDD for a typical US private health plan. **METHODS:** An economic model (one-year time horizon) was developed for an insurance plan of one million privately insured patients, evaluating LDDD prevalence, failure rates to conservative care, current fusion adoption rates and probable TDR substitution patterns. Cost components include surgical costs (device costs, operating room time, hospitalization and surgeon's fees), reoperations and community-based care. Published U.S. epidemiological data underlies the prevalence of LDDD, conservative care failure rate and number of current lumbar fusions performed. Procedure costs of TDR and fusion were informed by Medicare 2016 DRG payment rates. **RESULTS:** In the absence of TDR coverage, the model predicts that the target insurance plan to incur annual costs of $18.56 million for LDDD patients who fail conservative care. If TDR is restricted to on-label use, and the patients who access TDR are those who would have fusion had TDR not been available, then the budget impact is predicted to fall to $18.39 million, leading to a cost savings of $170,000 with coverage of TDR. In a separate threshold analysis, TDR is predicted to remain budget neutral as long as 57% or more of TDR-treated patients are those who would have had a fusion surgery in the absence of TDR coverage. **CONCLUSIONS:** Based on the available evidence, TDR is expected to be less costly than surgical fusion and result in minimal to no budget impact when coverage is aligned with well-studied patient populations.

PMD27

ECONOMIC IMPACT OF THE USE OF THE PHARMACOGENETIC TEST OBTAINED FROM A SALIVA SAMPLE IN COLOMBIAN PATIENTS WITH MAJOR DEPRESSION

Romero Prada ME[1], Albanes Beltran JP[2], Roa Cardenas NC[1], Vasquez Melo EC[1]
[1]Salutia Foundation - Research center in economy, management and health technologies., Bogota, Colombia, [2]Universidad Nacional de Colombia, Bogotá, Colombia

OBJECTIVES: To determine the economic impact of the use of the pharmacogenetic test obtained from a saliva sample, compared with standard care, in patients diagnosed with major depression in the Colombian context. **METHODS:** The model is a decision tree to simulate the natural history of the disease in two study arms; the use of a pharmacogenetic test in the treatment, according to the genetic profile, versus the standard care, evaluating the stabilization or non-stabilization of the symptoms in response to the treatment, based on the probabilities taken from the scientific evidence, and from real data took from a Colombian over a 12 month period. **RESULTS:** The total cost of treatment of a patient with major depression using the pharmacogenetic test and the standard care is USD $ 3,224.75 and USD $ 2,990.89, respectively. The difference of USD $ 233.86, is mainly associated with the cost of implementing the genetic test. However, the analysis showed that the costs of drugs have a reduction of 47% and a saving in the cost of hospitalizations of USD $ 793.14 in patients who undergo the genetic test compared to those following the standard care. In addition, the use of pharmacogenetics generates a saving of USD $ 496.56 in costs derived from disabilities compared with those following standard care. **CONCLUSIONS:** The use of pharmacogenetic testing in the treatment of patients with major depression generates savings in the cost of disability, in addition to reducing drug costs and hospitalization compared to standard care.

PMD28

ECONOMIC ANALYSIS OF QUANTAFLO COMPARED WITH DOPPLER ABI, FOR DETECTION OF PERIPHERAL ARTERY DISEASE: A U.S. HOSPITAL PERSPECTIVE

Barclay B[1], Ferko N[2], Corral M[3]
[1]C.R. Bard Inc., Murray Hill, NJ, USA, [2]Cornerstone Research Group Inc., Burlington, ON, Canada, [3]C.R. Bard Inc., Murray Hill, ON, Canada

OBJECTIVES: The prevalence of peripheral artery disease (PAD) is high, however physician awareness and involvement in diagnosis can be low. An in-office, automated, and quick measurement system, Quantaflo, has been shown to help detect PAD in patients where it was previously unrecognized. An economic analysis was conducted to compare the Quantaflo PAD test with Doppler Ankle Brachial Index (ABI) from the U.S. provider perspective in patients with suspected PAD. **METHODS:** The analysis was based on 96 (Doppler) and 128 (Quantaflo) patients tested per month for PAD at a single healthcare facility. Testing time per patient was assumed to be 20 minutes with Doppler and 5 minutes with Quantaflo. Prospective, multi-center study results reported Device sensitivity/specificity values of: 54.7%/94.3% and 89.5%/90.0% for Doppler and Quantaflo respectively. Cost parameters included device rental (Quantaflo) or capital costs amortized over useful life (Doppler), maintenance or accessory costs, labor testing costs. Results were expressed over one month for the total population as well as per patient. One-way sensitivity analyses were completed on core model parameters. **RESULTS:** In the model simulation, Quantaflo was predicted to yield cost savings per test compared with Doppler (i.e., $5.15 vs. $6.16 per test). In total, the model predicted that Quantaflo would result in 32 additional patients being tested per month, and 6 additional potential PAD patients identified based on overall time savings. The average cost per test, as a proportion of reimbursement, was predicted to be 3.7% with Quantaflo and 4.4% with Doppler. Cost saving results remained robust across various sensitivity analyses. **CONCLUSIONS:** The Quantaflo PAD test was predicted to provide cost savings on a per test basis for U.S. providers primarily due to time saved on test administration, while potentially increasing the detection of PAD patients. Future study should involve further real-world analysis of potential cost-efficiencies with this product.

PMD30

INVESTIGATION OF THE COST-EFFECTIVENESS OF FENO MEASUREMENT AS A SCREENING TOOL TO DETECT OMALIZUMAB RESPONSIVENESS IN DIFFICULT-TO-TREAT ASTHMA PATIENTS

Massanari M[1], Brooks EA[2], Rickard KA[1], Roman AA[2]
[1]Circassia Pharmaceuticals, Morrisville, NC, USA, [2]Decision Driver Analytics, Inc., Asheville, NC, USA

OBJECTIVES: Describe the cost-effectiveness of fractional exhaled nitric oxide (FeNO) in identifying omalizumab responders in comparison to an alternative traditional strategy. INTRODUCTION: According to the CDC, in 2014 there were 17.7 million (7.4%) adults and 6.3 million (8.6%) children living with asthma in the US. Of all asthmatics, 5-10% have a difficult-to-treat form of the disease, and are responsible for almost 50% of the total costs of asthma therapy nationwide. When management of asthma with traditional therapies including inhaled corticosteroids fails, allergic asthmatics are often considered for treatment with omalizumab, a monoclonal anti-IgE antibody. However, since not all patients respond to omalizumab, healthcare payers often require an omalizumab trial to assess responsiveness before approving a longer-term prescription. **METHODS:** Using a decision analysis, cost-effectiveness for two alternatives for predicting omalizumab responsiveness was compared: utilization of FeNO measurement prior to initiation of omalizumab trial (FeNO + omalizumab trial) and the current standard of care, initiation of omalizumab trial only. Model assumptions were drawn from the most recent literature pertaining to the sensitivity and specificity of the alternative strategies in identifying omalizumab responders, the typical duration of payer-required omalizumab trials, and omalizumab treatment costs. To demonstrate the robustness of the results, one-way and multi-way sensitivity analyses were performed. **RESULTS:** Per-patient costs for omalizumab during the trial period and initial treatment period totaled $10,943 for the FeNO + omalizumab trial, and $13,703 for the omalizumab trial alone. The expected cost per omalizumab responder identified was $4,328 for those in the FeNO + omalizumab group, and $7,786 for those in the omalizumab trial only group. FeNO + omalizumab trial remained the more cost-effective alternative through all one-way and multi-way sensitivity analyses performed. **CONCLUSIONS:** The implementation of FeNO measurement prior to initiating an omalizumab trial is cost-effective and has widespread policy implications for healthcare payers.

PMD31

EVALUATION OF REAL WORLD CLINICAL AND PHARMACY BUDGET OUTCOMES WHEN SWITCHING TO A WEARABLE INSULIN DELIVERY DEVICE FOR INSULIN ADMINISTRATION IN PATIENTS WITH SUBOPTIMALLY CONTROLLED DIABETES- A RETROSPECTIVE STUDY

Lajara R[1], Nikkel C[2]
[1]Diabetes America, Plano, TX, USA, [2]Valeritas, Edmond, OK, USA

OBJECTIVES: To evaluate the clinical and budgetary impact of continuous use of a 24-hour wearable basal-bolus insulin delivery device (IDD) in patients with suboptimally controlled diabetes previously administering multiple daily injections (MDI) of insulin. **METHODS:** An electronic medical records database was queried to identify patients exceeding glycemic targets (A1C >7.0%) switched to V-Go IDD from MDI. Evaluated variables were extracted at baseline and up to 3 follow-up visits, post IDD initiation. Clinical and pharmacy budget comparisons to baseline were evaluated in patients with $\geq$ 5 months of continuous IDD use during the observation period. Impact to pharmacy budget per patient was derived by applying average unit pricing from market leaders for both basal and prandial insulins as well as pricing for insulin delivery via pen needles/syringes and V-Go IDD for prescribed insulin therapy. All costs were based on a normalized 30-day supply and published wholesale acquisition costs (WAC) in 2016 U.S. dollars as of December 31, 2016. **RESULTS:** Evaluated patients (N=86) had a mean baseline A1C of 9.2 ± 1.4%, duration of diabetes 15 ± 9 years, weight 98 ± 19 kg, and insulin total daily dose (TDD) 108 ± 48 units/day with an associated insulin therapy direct pharmacy cost of $924.80 ± $392.90 per patient/month. After a mean duration of 29 ± 5 weeks of administering insulin with an IDD, A1C was reduced by 1.2 ± 1.4%, $p<0.0001$, TDD decreased by 44% to 61 ± 19 units/day, $p<0.0001$ and direct insulin therapy costs were reduced to $778.80 ± $154.20, $p=0.001$ for a savings of $146.00 ± $378.60 per patient/month. Weight and patient reported hypoglycemia remained similar to baseline. **CONCLUSIONS:** Switching from MDI to basal-bolus therapy delivered with V-Go IDD was associated with significant reductions in A1C and insulin requirements and resulted in significant savings to the pharmacy budget.

PMD32

COST-EFFECTIVENESS OF USING FENO IN THE MANAGEMENT OF ASTHMA

Massanari M[1], Brooks EA[2], Rickard KA[1], Roman AA[2]
[1]Circassia Pharmaceuticals, Morrisville, NC, USA, [2]Decision Driver Analytics, Inc., Asheville, NC, USA

OBJECTIVES: Describe the cost-effectiveness of utilizing fractional exhaled nitric oxide (FeNO) to inform asthma management in comparison to the standard of care. INTRODUCTION: According to the CDC, in 2014 there were 17.7 million (7.4%) adults and 6.3 million (8.6%) children living with asthma in the US. Asthma guidelines recommend periodic assessment and management of symptoms to prevent exacerbations, the most severe of which can lead to hospitalization, increased healthcare utilization and cost. Some asthmatics have difficulty with achieving disease control, and despite treatment with effective controller agents including inhaled corticosteroids, and sometimes biologics for severe asthma patients, these patients experience an average of 2 exacerbations annually. In addition, according to recent data from Petsky et al. (Cochrane Reviews 2016), when FeNO is incorporated into asthma management, the risk of asthma exacerbations is reduced by 40-50%. **METHODS:** Using a decision analysis, the short-term

cost-effectiveness of two alternatives to asthma management was compared: FeNO measurement in addition to standard of care management and the current standard of care without FeNO measurement. Model assumptions were drawn from the most recent literature pertaining to exacerbation frequency and severity as well as to medication and other medical resource utilization associated with the two asthma management strategies. **RESULTS:** Annual expected per-patient asthma management costs totaled $2,013 for FeNO plus standard of care, and $2,637 for standard of care alone. The use of FeNO to guide asthma management is expected to result in 0.077 additional QALYs per patient per year, rendering FeNO measurement as an adjunct to standard of care the dominant asthma management strategy. **CONCLUSIONS:** This cost-effectiveness assessment suggests that widespread inclusion of FeNO measurement for guidance of asthma management would result in reduced risk for exacerbations and overall healthcare cost savings.

PMD33

BUDGET IMPACT MODEL APP ESTIMATING COST SAVINGS AND CLINICAL OUTCOMES OF THE HEART FAILURE PREVENTION PROGRAM. EXAMPLE FROM THE UK

Topachevskyi O[1], Volovyk A[2]
[1]Digital Health Outcomes, Brussels, Belgium, [2]Digital Health Outcomes, Kiev, Ukraine

OBJECTIVES: Develop a budget model app estimating financial impact of introduction of heart failure diagnostics program. Present economic model as communication app to inform regional healthcare budgeting and decision making for patients with heart failure disease. **METHODS:** The model was originally developed in MS Excel and transformed into HTML5 app format for delivery purposes. The model utilizes UK hospital episode statistics as a primary data source. Future healthcare budget projections and extent of savings from introduction of heart failure prevention program are estimated from a payer perspective. Model simulation time horizon is 5 years. Efficacy data was informed from published clinical study demonstrating high accuracy of early testing results of a diagnostic campaign. Sensitivity analysis was conducted to estimate parametric uncertainty around model outcomes. **RESULTS:** Direct medical cost savings following an introduction of a heart failure prevention program are estimated to be GBP 2,320 per patient. Cost savings in outpatient and inpatient settings were GBP 1,673 and 647 respectively. Sensitivity analyses indicated that efficacy and price of a prevention program had the strongest magnitude of impact on model base case results. **CONCLUSIONS:** Model estimated that diagnostic heart failure prevention program is a cost-saving intervention. A budget impact model app may effectively inform decision making and regional budget planning as it provides technical ability to modify model inputs during presentation to healthcare payers. An economic model powered with web capabilities and dedicated data visualization libraries provide effective means to convey detailed economic data to healthcare payers and providers.

LITERATURE REVIEW: HEALTH ECONOMIC MODELING OF COMPANION DIAGNOSTICS FOR TARGETED CANCER THERAPY

Wang Y, Stevens A
WG Group, New York, NY, USA

OBJECTIVES: Health economic (HE) modeling of companion diagnostics (CDx) shares certain principles with pharmacoeconomic modeling, however it does have underlying challenges. The aim of this study is to review methodologies used in the HE modeling of CDx for targeted cancer therapy. **METHODS:** A literature search was conducted in EMBASE® to identify HE studies on CDx for targeted cancer therapy. Full journal articles were selected following the PRISMA statement and the modeling methodologies were reviewed. **RESULTS:** A total of 367 abstracts were identified and 40 studies on CDx HE modeling were selected for review. The number of HE studies on CDx increased from 1 in 2003 to 8 in 2016, including lung cancer (21), breast cancer (8), colorectal cancer (7), melanoma (1), ovarian cancer (1), gastric cancer (1) and chronic myeloid leukemia (1). 36 studies were cost-effectiveness (or cost-utility) analysis and 4 other studies reported only economic outcomes. 29 of the 36 studies compared with vs. without CDx to guide the targeted therapy, and 16 compared different CDx strategies. Cost-effectiveness analysis was conducted with a time horizon ranging from 1 year to lifetime, and markov model or decision-tree was commonly used with 5 using both models. All studies included CDx and treatment costs from a payer or health system's perspective and 5 were conducted from a societal perspective. 7 studies specified the selection of CDx diagnostic performance, and only 2 considered impacts of false positive/negativer results. The majority of studies concluded that using CDx to guide targeted therapy could improve health outcomes with additional costs, and it was stated that cost-effectiveness of a CDx is sensitivity to treatment costs of a targeted therapy. **CONCLUSIONS:** With the increased adoption of targeted cancer therapy with CDx, best practice in HE modeling of CDx will be critical to assist the economic evaluation of both CDx and targeted therapies.

PMD35

COST-EFFECTIVENESS OF FIBERGLASS TOTAL CONTACT CASTING, IRREMOVABLE CAST WALKERS AND REMOVABLE CAST WALKERS IN THE TREATMENT OF PATIENTS WITH DIABETIC FOOT ULCERS IN ONTARIO, CANADA

Tu HA[1], Costa V[1], Xie X[1], Wijeysundera HC[2], Sikich N[1], Dhalla I[1], Ng V[1]
[1]Health Quality Ontario, Toronto, ON, Canada, [2]Sunnybrook Health Sciences Centre, Toronto, ON, Canada

OBJECTIVES: Diabetic foot ulcers (DFU) cause substantial morbidity and are a risk factor for lower limb amputation. We assessed economic implications of offloading devices including fiberglass total contact casting (TCC), irremovable cast walker (iTCC) and removable cast walker (RCW) in the treatment of DFU patients in Ontario, Canada. **METHODS:** We developed a decision analytic model to determine the cost-effectiveness of TCC, iTCC and RCW compared with each other and with therapeutic shoes (TS) from the Ontario public payer perspective. Clinical model parameters (effectiveness and safety) of offloading devices were obtained from our systematic clinical evidence review. Costs of offloading devices and adverse events were taken from literature and expert opinions. Main outcomes of the model were incremental cost per healed ulcer, quality-adjusted life-years (QALYs) and the incremental cost-effectiveness ratio (ICER). We conducted sensitivity analyses to explore the robustness of our findings. All costs were expressed in 2016 Canadian Dollars. **RESULTS:** RCW and TS were dominated by TCC and iTCC in both cost effectiveness and cost-utility analyses. In the cost-utility analysis, TCC was associated with 0.002 QALYs gained at an additional cost of $428 compared to iTCC over the 6-month time horizon. This translated into an ICER of $258,000 per QALY gained. The model was sensitive to time-to-healing using TCC, iTCC and healing probability of TCC and iTCC. Increased accessibility to an offloading device among DFU patients by 25% reduces the amputation cost by $16 million per year. **CONCLUSIONS:** RCW or TS was more expensive and less effective than TCC or iTCC in the treatment of DFU. iTCC is as effective as TCC in the treatment of patients with DFU and associated with fewer costs. iTCC should likely be the preferred option when acceptable to patients and clinicians. In situations where it cannot be used, TCC may be a reasonable alternative.

PMD36

THE ECONOMIC IMPACT FOR SELF-INSURED EMPLOYERS IN THE USA FROM EARLY DIAGNOSIS OF DIARRHEA DOMINATED OR MIXED IRRITABLE BOWEL SYNDROME (IBS-D/M) USING A NOVEL IBS DIAGNOSTIC BLOOD PANEL

Rinde H[1], Holtorf A[2], Riceberg LJ[1]
[1]BioBridge Strategies, Binningen, Switzerland, [2]GmbH, Basel, Switzerland

OBJECTIVES: The average time from first symptoms to diagnosis of IBS-D/M is 6.1 years. During the pre-treatment symptomatic period patients' work ability is reduced through increased absenteeism and presenteeism. This analysis assesses the economic impact of using a novel IBS diagnostic blood panel for the presence of two biomarkers associated with IBS-D as early diagnosis of IBS-D/M for self-insured employers in the USA. **METHODS:** Three integrated models were constructed: (1) Diagnostic cost-minimization (C-M) decision model comparing (a) exclusionary diagnostic pathway (standard of care) with (b) a diagnostic strategy using the IBS diagnostic blood panel. (2) The C-M model formed the basis for a diagnostic budget-impact analysis (BIA), which compared the annual cost of the two diagnostic strategies. (3) Work impact model to calculate the total diagnostic cost of the IBS-D diagnostic panel strategy, derived from the C-M model, the cost of treatment with rifaximin and the cost impact of reduced absenteeism and presenteeism for true positive IBS-D/M diagnosed and successfully treated patients. **RESULTS:** The C-M estimated the per patient total diagnostic cost was $4,303 for the exclusionary pathway and $2,555 for the IBS-D diagnostic panel strategy. The BIA estimated the annual potential diagnostic cost savings for a 10,000 employee organization would be $92,498 or $0.77 per member per month (PMPM). For the same organization the estimated number of work days gained from reduced absenteeism and presenteeism from true positive and successfully rifaximin treated IBS-D/M patients was 270 days. This translated into an annual net cost saving of $34,918, or a PMPM saving of $0.29. **CONCLUSIONS:** This economic evaluation, using the three integrated models, indicate that introducing a novel IBS diagnostic blood panel could lead to cost savings for self-insured corporations in the USA. Incorporating pro-active IBS diagnosis into corporate benefit or wellness programs could be an efficient strategy.

PMD38

COST EFFECTIVENESS OF VAB (VACUUM ASSISTED BIOPSY) VERSUS SURGERY IN THE REMOVAL OF FIBROADENOMAS

Barclay B[1], Corral M[2], Alsbrooks K[3], Zhang X[3], Meler J[1]
[1]C.R. Bard, Inc., Tempe, AZ, USA, [2]C.R. Bard Inc., Murray Hill, ON, Canada, [3]C.R. Bard Inc., Murray Hill, NJ, USA

OBJECTIVES: Fibroadenoma of the breast is most common in young women in their 20s and 30s, but can be found in women of any age. Fibroadenomas can cause physical deformity, discomfort and emotional distress, and as a result, are often removed. Two of the most common approaches to removing Fibroadenomas are surgical excision and percutaneous excision via Vacuum Assisted Biopsy (VAB). While open surgical excision is effective, it can be very costly due to operating room charges. Additionally, it can also lead to negative outcomes such as bruising, swelling, scarring and possibly infection. VAB has been shown to be safe and highly effective at removing Fibroadenomas. It offers significant advantages to the patient including minimal morbidity, scarring, reduced re-biopsy rates and cost. **METHODS:** A retrospective analysis of both Surgical Excision and VAB procedures from the Premier Hospital Database was conducted. The economic outcomes of patients whose discharge data included CPT codes for VABB procedures 19083 and surgical excision procedures 19101, 19120, 19125 were evaluated in the outpatient setting. Adult patients (>18) with a procedure between 1/2014-12/2014 were evaluated. Total costs for the procedure, re-operations and clinical complications were collected. **RESULTS:** The analysis produced cohorts of 24,479 for Surgical Excision and 30,067 for VAB. Average age for Surgical Excision was 51.50, SD 17.03 and for VAB was 54.44, SD 15.29. Cost of VAB was associated with a lower all-cause cost of $1,755.77 ($1,152, SD $4,102.01 VAB vs $2,908.66, SD $2,110.33 Surgery); readmission rates for Surgical Excision was 11-17% of cases while for VAB was 4-9%. **CONCLUSIONS:** Lower healthcare utilization and outpatient hospital cost was found to be associated with the use of VAB compared to Surgical Excision. The research shows that VAB can be cost saving and have better patient outcomes compared with Surgical Excision for Fibroadenomas of the breast.

PMD39

A PROSPECTIVE PRAGMATIC CLINICAL TRIAL TO COMPARE THE REAL-WORLD USE OF A WEARABLE INSULIN DELIVERY DEVICE TO STANDARD TREATMENT OPTIMIZATION IN TYPE 2 DIABETES PATIENTS WITH POOR GLYCEMIC CONTROL USING MULTIPLE DAILY INSULIN INJECTIONS

Abbott S[1], Strange P[2], Shi L[2], Nguyen M[3], Larholt KM[4], Wasser T[4], Cziraky MJ[4]
[1]Valeritas, Zionsville, IN, USA, [2]Integrated Medical Development, Princeton Junction, NJ, USA, [3]Valeritas, Bridgewater, NJ, USA, [4]HealthCore Inc., Wilmington, DE, USA

OBJECTIVES: This prospective pragmatic clinical trial (PCT) evaluated a wearable insulin delivery device (V-Go) compared to a standard treatment optimization control (STO) in a community-based practice setting. The primary outcome was the change in A1C from baseline to end of study (EOS). Treatment cost and effectiveness analyses in patients receiving multiple daily insulin injections (MDI) were conducted. **METHODS:** This cluster randomized trial, where study sites rather than individual patients, were randomized to initiate V-Go and stop other insulin therapy or to continue diabetes treatments. Patients taking insulin were enrolled in both groups and treated according to routine practice for up to 4 months. All treatments and medications were obtained by usual care utilizing patient health insurance. **RESULTS:** The analysis population included 52 sites in the United States with 246 STO and 169 V-Go patients. Baseline A1C ranged from 7.9 to 14.2% and was higher for V-Go vs. STO (9.88% vs. 9.34%; $p<0.001$) indicating a selection bias to initiate V-Go in more advanced diabetes patients. Significant A1C decreases from baseline to EOS with V-Go (-0.95%, $p<0.001$) and STO (-0.46%, $p<0.001$) and for V-Go vs. STO ($p<0.002$) were observed. To control for the baseline and treatment imbalance of the overall cohort, cost and efficacy analyses in patients utilizing comparable baseline diabetes treatment, basal bolus insulin injections, were performed. V-Go (n=95) had higher mean baseline A1C than STO (n=113), 9.895% vs 9.374%, and a larger change from baseline of -1.015% vs -0.377%; $p<0.01$. The mean per patient per day (PPPD) cost of diabetes treatment, using Wholesale Acquisition Cost (WAC) and including all concomitant diabetes medications and devices, was $32.60 for STO compared to $30.59 for V-Go patients. **CONCLUSIONS:** This PCT demonstrated improved diabetes treatment outcomes and total diabetes treatment cost in patients with poor diabetes control initiating a wearable insulin delivery device in a real-world setting.

PMD40

COST-EFFECTIVENESS OF NEXT GENERATION SEQUENCING FOR DETECTION OF LOWER RESPIRATORY TRACT INFECTIONS IN IMMUNOCOMPROMISED PATIENTS

Kim K[1], Hanson KE[2], Schlaberg R[2], Schmidt RL[1]
[1]University of Utah, Salt Lake city, UT, USA, [2]ARUP laboratories, Salt Lake City, UT, USA

OBJECTIVES: Lower respiratory tract infections (LRTIs) are a significant cause of mortality in immunocompromised patients. Next generation sequencing methods may improve diagnostic performance relative to a panel of targeted molecular diagnostic tests and cultures (PANEL) for detection of microorganisms from bronchoalveolar lavage (BAL); however, the relative cost-effectiveness is unknown. The objective of this study was to determine the cost effectiveness of NGS relative to PANEL for detection of respiratory infections in BAL specimens. **METHODS:** We built a decision tree to assess 30-day costs and mortality per patient tested in a population of hospitalized immunocompromised patients with suspected LRTI. Outcomes were compared in BAL specimens tested with NGS and PANEL. Inputs were identified from literature sources or expert opinion. Probabilistic sensitivity analysis was performed using the 20 variables that had greatest influence from a one-way sensitivity analysis. We tested two scenarios: 1) a base case in which we assumed the costs of the tests were the same 2) a test case in which we determined the cost difference at which NGS testing would be acceptable at a willingness-to-pay threshold of $50,000 per life saved. **RESULTS:** The base case analysis (assuming testing costs of NGS and PANEL were the same) showed that NGS had lower costs with no mortality difference compared to the PANEL over the 30 days ($19,460 and 88.99% survival vs. $19,551 and 88.86% survival per patient tested, respectively). The incremental cost-effectiveness ratio (ICER) for the NGS vs. PANEL reached $50,000 per life saved when the cost of the NGS test was $154 greater than PANEL, or if the specificity of NGS was 1% lower than PANEL. NGS achieved 66 and 75% likelihoods of being cost-effective at willingness to pay thresholds of $0 and 50,000, respectively. **CONCLUSIONS:** NGS-based testing is most likely cost-effective compared to PANEL for testing immunocompromised patients with symptoms of LRTI.

PMD41

COST-EFFECTIVENESS OF REVISION HIP ARTHROPLASTY IN TYPE IIIB ACETABULUM DEFECTS WITH USING A CUSTOM POROUS THREE-FLANGED ACETABULAR IMPLANT

Tack P[1], Annemans L[2]
[1]Ghent University, Ghent, Belgium, [2]Ghent University - Brussels University, Ghent, Belgium

OBJECTIVES: Total hip arthroplasty (THA) is a common, cost-effective operation for patients suffering from coxarthritis. Unfortunately, revisions are relatively frequent and their incidence is correlated to the size of the acetabular defect. The aim of this study is to analyse the cost-effectiveness of a new type of porous three-flanged implant (PTFI) targeting revision surgery of Paprosky type IIIB acetabular defects compared to the most common alternative for these serious acetabular defect, being a (non-porous) Custom Three-flanged Acetabular Component (CTAC). **METHODS:** CTAC were compared to the new PTFI by means of a Markov model with four states (successful, re-revision, resection and dead). The cycle length was set at 6 months with a 10 year time horizon. Implant survival, transition probabilities and quality of life measures were obtained through systematic literature search and data obtained from the manufacturers. Costs from the health care payer's perspective were calculated based on data from the literature, obtained from manufacturers and from social security agencies. Discount rates were used on cost (3%) and QALY (1.5%) estimates. **RESULTS:** Based on the outcomes of our model, the new PTFI provides good value for money. For the basecase of a 65 year old man, a QALY gain of 0.296 and cost reduction of 390€ is obtained. In all age and gender groups the use of the new PTFI is dominant. The price of the implant has the highest impact on cost side while the utility for successful surgery has the biggest influence on the QALY. Probabilistic analysis resulted in 33.4% of the cases being dominant. **CONCLUSIONS:** Based on the findings of this model, the new PTFI has the potential to provide excellent value for money when used in revision athroplasty of Paproski type 3B acetabular defects. This was mainly due to lower revision and complication rates.

PMD42

COST-EFFECTIVENESS OF ORBITAL COMPARED TO ROTATIONAL ATHERECTOMY OF SEVERELY CALCIFIED CORONARY ARTERY LESIONS IN JAPAN

Michishita I[1], Geisler BP[2], Ikeno F[3], Pietzsch JB[2]
[1]Yokohama Sakae Kyosai Hospital, Yokohama, Japan, [2]Wing Tech Inc., Irvine, CA, USA, [3]Stanford University, Stanford, CA, USA

OBJECTIVES: Percutaneous treatment of severely calcified coronary artery lesions is associated with lower procedural success and higher complication rates compared to non-calcified lesions, and continues to present a clinical and economic challenge. Compared to rotational atherectomy (RA), orbital atherectomy (OA) has been shown to decrease procedure failure and reintervention rates. Our objective was to explore the cost-effectiveness of OA compared to RA in the Japanese healthcare system. **METHODS:** A decision-analytic model calculated reintervention rates and consequent total one-year costs. Effectiveness inputs were therapy-specific target lesion revascularization (TLR) rates and all-cause mortality, pooled from identified clinical studies. Index and reintervention costs were determined via claims data analysis of n=33,628 subjects treated in Japan between April 2014 and March 2016. We computed incremental cost-effectiveness in ¥ per life year (LY) gained based on differences in one-year cost and projected long-term survival. In the absence of a final reimbursement amount, we assumed an OA device cost of ¥500,000, and tested a range of ¥350,000 to ¥650,000. **RESULTS:** Total one-year costs were ¥75,478 higher with OA compared to RA (¥2,765,239 vs. ¥2,689,761). Higher index procedure device and accessory costs for OA (¥567,800 vs. ¥365,850) were largely reclaimed at 1-year follow-up, because of lower 12-month target lesion revascularization rates (5.0 vs. 15.7%). Based on one-year mortalities of 5.5% and 6.8% for OA and RA, projected mean survival was 8.34 and 8.16 LYs respectively (+0.17), resulting in an ICER of ¥439,214. OA was the dominant strategy for device cost less than ¥465,000, and reached a maximum ICER of ¥1,079,314 at device cost of ¥650,000. Findings were robust across a wide range of clinical and utilization assumptions. **CONCLUSIONS:** Orbital atherectomy for the treatment of severely calcified coronary artery lesions is a cost-effective and potentially cost-saving treatment approach in the Japanese healthcare system. Future confirmatory analyses are warranted.

PMD43

DIRECT COST ANALYSIS OF PERIPHERALLY INSERTED CENTRAL LINE CATHETERS AND DEEP VEIN THROMBOSIS EPISODES

Kara R[1], Hogan A[2], Hollmann S[2]
[1]Bard Access Systems, Salt Lake City, UT, USA, [2]Cornerstone Research Group Inc., Burlington, ON, Canada

OBJECTIVES: Catheter-related thrombosis is associated with significant morbidity and economic burden. Recent studies have identified an association between the risk of deep vein thrombosis (DVT) and peripherally inserted central catheters (PICC) diameter size. One of the most commonly recommended strategies to minimize the risk of DVT is the use of the smallest PICC diameter appropriate for therapy. This economic analysis estimates a range of DVT-related costs that may be averted when shifting current utilization to smaller diameter PICCs where clinically indicated. **METHODS:** The model assumed an average number of 1,000 PICCs being inserted annually per hypothetical US hospital as the base case. The analysis compared annual DVT costs in a current treatment mix (i.e., 25% 4 Fr, 60% 5 Fr, and 15% 6 Fr PICCs) versus a future treatment mix (i.e., 65% 4 Fr, 30% 5 Fr, and 5% 6 Fr PICCs). The average cost to treat a DVT episode was $15,973 based on public literature for PICC-related DVT reported by Evans (2013). DVT rates were also derived from Evans (2013) (i.e., 0.77% 4 Fr, 2.78% 5 Fr, and 7.55% 6 Fr). Sensitivity analyses were conducted examining alternate PICC utilization, DVT rates, and DVT costs. **RESULTS:** The analysis predicted that increased use of smaller diameter PICCs in the future treatment mix may potentially avoid approximately $204,614 when compared with the current mix due to reduced DVT-related costs. Sensitivity analyses estimated cost savings with the future practice mix ranging from $12,362 to $849,920. **CONCLUSIONS:** Increasing the use of smaller diameter PICCs has the potential to provide cost savings due to potentially avoided DVT episodes. It is important to consider that the causes of DVTs are multifactorial, with PICC diameter only being one factor of several that may affect potential DVT episodes.

PMD44

UTILIZATION AND COSTS OF DIGITAL BREAST TOMOSYNTHESIS OR BREAST ULTRASOUND IN CONJUNCTION WITH FULL-FIELD DIGITAL MAMMOGRAPHY

Bonafede MM[1], Miller JD[1], Dabbous F[2], Pohlman SK[1], Troeger KA[3]
[1]Truven Health Analytics, an IBM Company, Cambridge, MA, USA, [2]Russell Institute for Research & Innovation, Park Ridge, IL, USA, [3]Hologic, Inc., Marlborough, MA, USA

OBJECTIVES: Digital breast tomosynthesis (DBT) and breast ultrasound (US) are increasingly used for breast cancer screening. The objective was to describe utilization trends and health plan costs of these tests compared to the use of traditional full-field digital mammography alone (FFDM). **METHODS:** The Truven Health MarketScan Commercial Database was used to identify women aged 40-64 years undergoing screening mammography in 2005-2015. Women were required to have 12 months

pre- and 6 months post-index continuous enrollment. For each screening scenario (FFDM alone, FFDM+DBT, and FFDM+US), an annual screening rate was estimated and the average annual cost was determined. Also, the rate of diagnostic mammography performed within 180 days for 2015 was estimated. **RESULTS:** Approximately 5,000,000 women met the inclusion criteria in each year for the trend analysis. Screening mammogram rates rose from 38.9% in 2005 to 45.8% in 2009, but have remained relatively stable recently (2011-2015 range: 42.8%-43.6%). The percentage of screened women who received US+FFDM on the same day increased from 0.7% in 2005 to 3.8% in 2015. In 2015, the year in which a DBT code became available, 9.5% of screened women received FFDM+DBT and 0.4% received FFDM, DBT and US on the same day. Diagnostic mammography rates following a screening exam were 8.9% for FFDM alone, 7.3% for FFDM+DBT, and 14.0% for FFDM+US. Average screening regimen costs were $178.93 for FFDM, $242.55 for FFDM+DBT and $420.20 for FFDM+US. **CONCLUSIONS:** While FFDM+US is less common than FFDM+DBT, utilization of FFDM+US is growing and average costs are higher for FFDM+US than FFDM+DBT. Diagnostic mammography is more commonly performed after FFDM+US than after FFDM+DBT or FFDM alone. Additional research should be conducted to understand factors contributing to this difference.

PMD45

DIRECT MEDICAL COSTS TO MEDICARE OF IMPLANTABLE CARDIOVERTER-DEFIBRILLATOR COMPLICATIONS THAT REQUIRED LEAD REOPERATION

Amorosi SL[1], Jacobsen CM[1], Stern K[2], Menzin JA[2], Griffiths RI[1]
[1]*Boston Scientific, Marlborough, MA, USA,* [2]*Boston Health Economics, Waltham, MA, USA*

OBJECTIVES: The epidemiology of complications associated with implantable cardioverter defibrillators (ICD) has been well-studied. However, economic data are needed to understand the overall impact of lead-related complications and the cost effectiveness of alternative treatment strategies. The objective of this study was to estimate the direct medical cost to Medicare of transvenous (TV) lead complications that required reoperation. **METHODS:** Using Medicare enrollment and claims data from 1/1/2010 through 12/31/2014, we identified 1,691 patients (cases), age $\geq$ 65, who underwent reoperation (repositioning, repair, or removal) of TV leads between 1/1/2011 and 12/31/2013. For comparison, we identified a pool of candidate controls who underwent initial ICD implantation between 1/1/2010 and 12/31/2010, but who did not undergo lead reoperation thereafter. From these, two controls were selected for each case (n=3,382) matched on age, sex, and geographic region. All patients were followed from six months before, to up to six months after, their index date, which was defined as the date of reoperation in cases and 1/1/2013 in controls. We calculated the cumulative direct medical cost to Medicare (Medicare allowed charges) of all services related to ICD complications during the observation period, and compared costs between cases and controls. **RESULTS:** The mean age was 78, 40% were female, 92% were white, and 72% had a Charlson Comorbidity score $\geq$ 2. Among cases, 63% were hospitalized for lead reoperation and 65% underwent removal. Overall, the average cumulative cost of TV lead complications requiring reoperation was $47,548 and $3,956 among controls (difference $43,592; 95% confidence interval $41,726-$45,459; p $<$0.001). The average cumulative cost of TV lead complications among those requiring lead reoperation in the presence of infection (21% of cases) was $86,745. **CONCLUSIONS:** The economic consequences of TV lead complications requiring reoperation are substantial. Effective approaches to reducing lead reoperations are likely to result in significant cost-offsets.

PMD46

SPINAL CORD STIMULATION INFECTION RATE AND INCREMENTAL ANNUAL EXPENDITURES: RESULTS FROM A US PAYER DATABASE

Provenzano DA[1], Falowski SM[2], Xia Y[3], Doth AH[3]
[1]*Pain Diagnostics and Interventional Care, Sewickley, PA, USA,* [2]*St. Luke's University Health Network, Bethlehem, PA, USA,* [3]*Medtronic Inc., Minneapolis, MN, USA*

OBJECTIVES: To estimate the infection rate and the annual health expenditures associated with spinal cord stimulation (SCS)-related infection. **METHODS:** Data from the Truven MarketScan® Commercial Claims and Medicare Supplemental databases were used to identify patients with a SCS neurostimulator generator implant during the calendar years 2009–2014. Patients were continuously enrolled for at least 12 months before and after implant. The patients were further divided into initial group or replacement group. Annual expenditures were estimated for patients who experienced a device-related infection versus those without infection since SCS generator implant. The generalized linear model was conducted to estimate annual expenditures, utilizing a gamma distribution and a log link function. All multivariable expenditure models were conducted separately for patients in the initial group and the replacement group. All models were controlled for presence of infection before generator implant, Charlson comorbidity index score, as well as patient demographics. **RESULTS:** The study included 6,615 patients: 5,563 patients were identified as the initial group, and 1,052 patients were identified as the replacement group. The overall SCS-related infection rate within 12-months post-implant was 3.11%. The infection rates for the initial group (3.09%) and replacement group (3.23%) were not significantly different (p=0.8104). The multivariable expenditure models revealed that patients with infection had higher annual expenditures than patients without infection in both initial implant and replacement implant groups. Estimated incremental annual healthcare expenditures for patients with an infection were $59,716 (95% CI: $48,965-$69,480) for initial implanted patients and $64,833 (95% CI: $37,377 - 86,519) for replacement patients. **CONCLUSIONS:** The approximate 3% infection rate within 12-months of SCS implant determined from a large administrative database further emphasizes the need for improvement in SCS infection control practices. The result shows the expenditure burden associated with SCS-related infection is substantial, and the management of SCS-related infection is important from both clinical and economic standpoints.

PMD47

IMPACT OF THE ADOPTION OF MICROPLEGIA DELIVERY SYSTEM: CLINICAL AND ECONOMIC ANALYSIS USING THE PREMIER DATABASE

Gerdisch MW[1], Robinson SB[2], David G[3], Makepeace S[4], Ryan MP[4], Gunnarsson C[4]
[1]*Franciscan St Francis Heart Center, Indianapolis, IN, USA,* [2]*Premier Research Services, Charlotte, NC, USA,* [3]*The Wharton School, University of Pennsylvania, Philadelphia, PA, USA,* [4]*CTI Clinical Trial and Consulting Services, Cincinnati, OH, USA*

OBJECTIVES: This study examined the clinical and economic impact of adoption of microplegia delivery system compared to traditional cardioplegia from the hospital perspective. **METHODS:** This retrospective cohort study used Premier Hospital data (January 2009 to March 2015) for patients undergoing one of the following primary procedures: coronary artery bypass graft (CABG), aortic valve replacement (AVR), or mitral valve replacement (MVR). The first three months of data after a hospital adopted the microplegia delivery system (MDS2) system was excluded. Outcomes for this analysis included: a composite adverse event endpoint, total visit cost, medication cost, length of stay (LOS) and ICU days. The composite adverse event included: major cardiac (acute myocardial infarction, angina, stent occlusion/thrombosis, stroke/TIA) or renal (acute kidney injury with and without dialysis) events, sepsis or other infection, wound, abdominal or pulmonary complications, cardiogenic shock, bleeding or death. A multivariable difference-in-differences (DID) analysis using fixed effects was performed for each outcome. All models were adjusted for patient demographics, surgical characteristics and comorbid conditions **RESULTS:** A total of 256,814 visits met the inclusion criteria. After controlling for within hospital variation and all covariates, there was a 2.25% absolute risk reduction in the composite of adverse events with MDS2 compared to traditional cardioplegia, which equates to a relative risk reduction of 5.25%. There were significant reductions in LOS and ICU days at the 0.1 alpha level. A per case reduction of $1,231 in total visit costs and a $192 in medication costs was found in MDS2 hospitals. This equates to a 2.5% reduction in total cost and a 5% reduction in medication costs. **CONCLUSIONS:** For hospitals performing CABG, AVR and MVR surgeries with second generation microplegia delivery systems, significant reductions were seen in adverse events, LOS, and ICU days, which lead to reductions in total visit costs and medication costs.

PMD48

COST ANALYSIS FOR MEDICAL DEVICES FOR RARE DISEASES IN BULGARIA – A CASE WITH EPIDERMOLYSIS BULLOSA

Kamusheva M, Doneva M, Dimitrova M, Savova A, Petrova G
Medical University-Sofia, Faculty of Pharmacy, Sofia, Bulgaria

OBJECTIVES: To define the financial burden of medical devices for rare disease epidermolysis for the Bulgarian healthcare system and to predict their budget impact in the next 3 years. **METHODS:** Prospective, observational study of the direct cost of reimbursed medical devices for health insured patients with epidermolysis bullosa during 2014 - 2016 was performed. Budget impact was extrapolated for the next 3 years applying linear function and considering the impact of the severity of the disease on the cost. **RESULTS:** The medical devices reimbursed for patients with epidermolysis bullosa are non-stick transferring or absorbent pads for disease' dystrophic, simplex and lethal forms (ICD codes Q81.0, Q81.1, Q81.2). Number of registered patients with lethal form of the disease is 1, 11 are with dystrophic form, and 3 with simplex. The total reimbursed cost for 2016 were 103 000 euros (0.3% of budget for medical devices) for patients with epidermolysis bullosa dystrophic (approximately 9 000 Euro per patient per year), followed by epidermolysis bullosa simplex - 16 000 euros (0.04% of budget for medical devices and approximately 5 000 Euro per patient per year). Cost per patient per year differs statistically significant with the increase in case of more severe form. The expected cost changes for the next 3 years follow a linear trend of increase with the severity of the disease and account for up to 300 000 Euro on total. **CONCLUSIONS:** The public funds reimbursed medical devices only for patients with epidermolysis bullosa. The direct costs are significantly low for the Bulgarian healthcare system and the expectations are for slightly increasing in the near future which logically depends on the number of cases and severity of the disease.

PMD49

ECONOMIC EVALUATION OF EMERGING DIAGNOSTIC TEST FOR CORONARY ARTERY DISEASE

Forrest B[1], Anderson NC[2]
[1]*HeartFlow, Redwood City, CA, USA,* [2]*Intermountain Healthcare, Salt Lake City, UT, USA*

OBJECTIVES: A number of diagnostic tests are available for patients with suspected coronary artery disease. It is widely known, however, that the poor accuracy of the existing tests results in poor diagnoses, unnecessary invasive procedures, and high healthcare costs. An emerging technology, the HeartFlow Analysis, utilizes data from Coronary CT Angiography to determine what patients need a cardiac intervention. Clinical studies have demonstrated that the test is safe and effective. Using clinical data, our objective is to evaluate the cost consequences of incorporating a HeartFlow analysis in the patient pathway. **METHODS:** Using data gathered from the Planned Invasive Cohort (n=380) in the PLATFORM (Prospective LongitudinAl Trial of FFRct: Outcome and Resource IMpacts) trial (Douglas 2015) we calculated the number of patients needed to treat (NNT) with a HeartFlow Analysis in order to avoid a negative outcome. In this analysis a negative outcome was defined as an invasive interventional coronary angiography (ICA) where the patient did not have obstructive disease. We then applied cost weights based on Medicare reimbursement rates (national average of technical and professional fees) and an assumed HeartFlow price of $1,500, to estimate the costs required to avoid an invasive angiography. **RESULTS:** It was determined that for this population 1.64 patients must have access to a diagnostic pathway with HeartFlow in order to avoid an unnecessary angiography. The average weighted cost of diagnosing a patient using this pathway was $1,210. With an NNT of 1.64, we see a cost of $,1984 to avoid the cost of an invasive angiography ($2,838). The cost savings of $834 represents a 30% reduction from the cost of sending a patient to angiography. **CONCLUSIONS:** Incorporating a HeartFlow Analysis into a patient's diagnostic pathway has the potential to significantly reduce the cost of care.

PMD51

COST-BENEFIT ANALYSIS OF DENTAL CROWNS IN UKRAINE: METALCERAMIC VS. ALL-CERAMIC CROWNS

Got S, Zaliskyy O, Zaliska O
Danylo Halytsky Lviv National Medical University, Lviv, Ukraine

OBJECTIVES: Metal ceramic (MC) crowns have been considered the gold standard for the repair of damaged teeth. However, the esthetic of MC crowns is limited by the metal framework and the layer of opaque porcelain needed for masking the underlying metal grayish shade. All-ceramic crowns have been used over the last four decades as an alternative for MC crowns to overcome their esthetic limitations. Although, the price of all-ceramic crowns is much higher. Policy makers require information on the relative benefits and costs associated with different types of crown materials in order to support reimbursement decisions. The objective of this study was to evaluate the cost-benefit ratio of dental metal ceramic and all-ceramic crowns. **METHODS:** three hundred ninety four patients participated in the study. They were included into two treatment groups and were followed up for two years and three months at Lviv National Medical University. People were selected among the patients who only needed crown restorations. Direct and indirect costs of the treatments were payed out of the pocket by patients. **RESULTS:** Total costs for the group (#1) with metal ceramic crowns were 21630$ and for the group (#2) with all-ceramic crowns were 26700$. The analyses yields a cost-benefit ratio of 291,8 for group #1 and 168,1 for the group #2. **CONCLUSIONS:** Metal ceramic crowns provide a positive cost-benefit ratio compared with the all-ceramic crowns. Metal ceramic dental restorations fulfill the treatment needs and continue to be the widely recommended treatment for the patients with extensively decayed teeth.

PMD53

EVALUATING THE COST-EFFECTIVENESS RESULTS OF DIAGNOSTIC STRATEGIES FOR HEPATOCELLULAR CARCINOMA IN JAPAN

Uchida-Nakakoji M[1], Nishie A[2], Ball G[3], Kruger E[4], Crawford B[3], Honda H[2]
[1]*Bayer Yakuhin Ltd., Tokyo, Japan,* [2]*Kyushu University Graduate School of Medical Sciences, Fukuoka, Japan,* [3]*QuintilesIMS, Tokyo, Japan,* [4]*QuintilesIMS, San Francisco, CA, USA*

OBJECTIVES: To evaluate cost-effectiveness estimates through model validation and characterization of uncertainty in a cost-effectiveness analysis comparing gadoxetic acid-enhanced magnetic resonance imaging (EOB-MRI) with extracellular contrast-media-enhanced MRI (ECCM-MRI) and contrast-media-enhanced computed tomography (CE-CT) for diagnosis of hepatocellular carcinoma (HCC) in Japan with a focus on local versus foreign inputs. **METHODS:** Nearly all input parameter values were from local Japanese sources. Model inputs and structure were validated by a Delphi panel of clinical experts. Uncertainty in model inputs was addressed using probabilistic sensitivity analysis. Scenario analyses were also conducted using values derived from previously conducted non-Japanese studies, including diagnostic sensitivity and specificity values reported according to tumor size and utility values used in previous economic evaluations. Probabilistic and sensitivity analyses were conducted based on a 6-stage Markov model constructed to estimate lifetime direct costs and clinical outcomes associated with HCC diagnosis using EOB–MRI, ECCM-MRI and CE-CT. **RESULTS:** For the per patient probabilistic results for a hypothetical cohort of 100,000 patients over a lifetime horizon, EOB-MRI was associated with lower direct costs (1,485,875JPY) and generated a greater number of QALYs (10.158) than either ECCM-MRI (1,750,167JPY, 9.865 QALYs) or CE-CT (1,907,129JPY, 9.724 QALYs). Under the scenario analysis by tumor size, EOB-MRI was found to be dominant, resulting in a larger incremental difference in costs than was found in the base case versus other diagnostic strategies. In the scenario analysis for the utility values, EOB-MRI remained dominant despite smaller incremental differences compared to the base case. **CONCLUSIONS:** Both probabilistic and scenario based results closely matched the base case results, providing preliminary validation of the model and supporting the finding that EOB-MRI is a cost-effective option over ECCM-MRI and CE-CT.

PMD54

A COST-EFFECTIVENESS ANALYSIS OF CONTINUOUS SUBCUTANEOUS INSULIN INFUSION VERSUS MULTIPLE DAILY INSULIN INJECTIONS IN INDIAN PATIENTS WITH TYPE 1 DIABETES

Pandey P, Pandey R, Shah V
SIRO Clinpharm Pvt Ltd, Maharashtra, India

OBJECTIVES: Incidence of type 1 diabetes mellitus (T1DM) is increasing at a rate of 3%-5% annually in India. Multiple Daily Insulin (MDI) injections and Continuous Subcutaneous Insulin Infusion (CSII) are effective modes of intensive therapy in patients with T1DM. CSII offers better glycemic control but incurs a higher cost as compared to MDI. This is the first-ever cost-effectiveness analysis to compare CSII against MDI in Indian healthcare setting. **METHODS:** India specific data were extracted from published literature (MEDLINE, Embase, Cochrane Library). If unavailable, data were adapted or assumed as per the standard guidelines. Analysis was conducted using a Markov simulation model with a time horizon of 8 years. Costs and quality-adjusted life years (QALYs) were discounted at a rate of 3.5% annually. Model outcomes were reported as incremental cost-effectiveness ratio (ICERs) and net benefit. Probabilistic sensitivity analysis was performed using Monte Carlo simulation. **RESULTS:** Cost and QALYs gained were higher with CSII (cost INR 9,34,430.89; QALY 2.498) versus MDI (cost INR 1,00,263.73; QALY 1.256) with a net benefit of INR 41,47,638.13. Compared to MDI, an additional cost of INR 6,71,534.69 was accrued with CSII for one year of perfect life gained. The ICER was greater than three times India's Gross Domestic Product (GDP) per capita (INR 1,10,368.91). **CONCLUSIONS:** Compared to MDI, CSII has higher cost but better outcome. Considering greater QALYs gained with CSII, patients can be offered with some measures to reduce the out-of-pocket expense on therapy.

PMD55

COST EFFECTIVENESS ANALYSIS OF A FLASH CONTINUOUS GLUCOSE MONITORING SYSTEM FOR TYPE 1 DIABETES (T1DM) PATIENTS RECEIVING INTENSIVE INSULIN TREATMENT IN THE UK

Bilir SP[1], Li H[2], Wehler EA[3], Hellmund R[4], Munakata J[5]
[1]*IMS Health, San Francisco, CA, USA,* [2]*IMS Health, Fairfax, VA, USA,* [3]*IMS Health, Plymouth Meeting, PA, USA,* [4]*Abbott Diabetes Care, Alameda, CA, USA,* [5]*QuintilesIMS, San Francisco, CA, USA*

OBJECTIVES: Regular glucose monitoring is important for T1DM patients receiving intensive insulin. A novel, factory-calibrated flash continuous glucose monitoring system (the FreeStyle Libre™ system) continuously measures glucose levels from interstitial fluid. Data transfers to a handheld reader from a wearable arm sensor without requiring routine self-monitoring of blood glucose (SMBG). The IMPACT RCT (Bolinder 2016) showed reduced time spent in hypoglycemia in T1DM for the flash monitoring system compared to SMBG, while decreasing the number of blood glucose tests by 91%. A time trade-off study demonstrated a utility benefit with the flash monitoring system compared with SMBG (Matza 2015). This analysis assesses the cost-effectiveness of the flash monitoring system versus SMBG in T1DM patients receiving intensive insulin from a UK NHS perspective. **METHODS:** The IMS Core Diabetes Model was run over a 50-year lifetime horizon, modelling a population reflecting the IMPACT study. Intervention effects included study-based reductions in hypoglycemic events (glucose <70mg/dL; 25.5% fewer daytime events, 33.2% fewer nocturnal events), and the utility benefit (0.03; Matza 2015). Costs are reported in 2015 GBP. Incremental cost-effectiveness ratios (ICERs) were calculated, with sensitivity analyses conducted for key inputs. **RESULTS:** The base case ICER was £25,045 and cost per hypoglycemia event averted was £27. For the scenario analyses, ICERs ranged from £7,643 to £30,811. **CONCLUSIONS:** Improved hypoglycemia and a health utility benefit translate to a base case ICER under the NICE threshold for cost-effectiveness for medical devices of up to £30,000 per QALY. This result was confirmed across a range of scenario analyses. The flash monitoring system may be considered cost effective for use in the UK NHS for T1DM patients receiving intensive insulin.

PMD56

ADAMTS13 TEST AND/OR PLASMIC CLINICAL SCORE IN MANAGEMENT OF ACQUIRED THROMBOTIC THROMBOCYTOPENIC PURPURA (TTP) - A COST-EFFECTIVE ANALYSIS (CEA)

Kim CH[1], Simmons SC[2], Williams III LA[2], Staley EM[2], Zheng XL[2], Pham HP[2]
[1]*University of Colorado Anschutz Medical Campus, Aurora, CO, USA,* [2]*University of Alabama at Birmingham, Birmingham, AL, USA*

OBJECTIVES: Reduced ADAMTS13 activity distinguishes potentially fatal TTP from other thrombotic microangiopathies (TMA). The PLASMIC score helps determine the pretest probability of severe ADAMTS13 deficiency. Due to potential adverse effects of therapeutic plasma exchange (TPE) while awaiting the activity level, we performed a CEA by investigating the benefits of incorporating in-hospital ADAMTS13 assays and/or PLASMIC scores into clinical practice. **METHODS:** A 3-day CEA model was created comparing 4 scenarios in a patient with TMA: 1) Send-out ADAMTS13 with 3-day TPE performed in the meantime; 2) In-hospital ADAMTS13 test with TPE initiated if ADAMTS13 activity was <10%; 3) Perform the first option if the PLASMIC score showed intermediate-high risk; 4) Utilize the second option if the PLASMIC score was at intermediate-high risk. Model parameters were based on medical literature (sensitivities/specificities, incidence of TTP in TMA, TTP and/or TMA mortality with or without TPE, TPE adverse events, and costs for TPE and adverse effects adjusted for inflation). ADAMTS13 assay-costs were derived institutionally. **RESULTS:** If only cost was considered, option 4 is the cheapest ($4,732/patient) followed by 2, 3, and 1. If only effectiveness was evaluated, option 1 has the highest life-year saving (LYS) at 0.98 LYS/patient followed by 3, 2, and 4. Therefore, for cost/LYS per patient, option 4 ($5,207/LYS) < 2 ($5,414/LYS) < 3 ($9,847/LYS) < 1 ($15,838/LYS). The incremental cost effectiveness ratios for option 2, 3, and 1 compared to 4 are $49,643, $97,444, and $152,127, respectively. **CONCLUSIONS:** In patients with clinical presentations of TMA, having an in-hospital ADAMTS13 test to establish the prompt diagnosis of TTP appears to be cost-effective. Utilizing the PLASMIC score increases the cost-effectiveness of the test. Initiating TPE on all TMA patients while waiting for send-out ADAMTS13 results is not cost-effective. Our findings support the need for establishing a rapid and reliable in-house ADAMTS13 test.

PMD57

COST-EFFECTIVENESS OF G5 MOBILE CONTINUOUS GLUCOSE MONITORING (CGM) COMPARED TO SELF MONITORING BLOOD GLUCOSE (SMBG) ALONE FOR TYPE 1 DIABETES (T1DM) IN THE US

Chaugule S[1], Graham C[2]
[1]*Dexcom, Inc, San Diego, CA, USA,* [2]*Dexcom, Inc., San Diego, CA, USA*

OBJECTIVES: To explore the cost-effectiveness of real-time G5 Mobile CGM compared to SMBG alone in Multiple Daily Injection (MDI) using T1DM patients in the US. **METHODS:** The IMS CORE Diabetes Model (CDM) (v. 9.0) was used to assess the long-term (50 year) cost-effectiveness of CGM (G5-Mobile) compared to SMBG alone for a T1DM cohort. Treatment effects and base-line characteristics of patients were sourced from the DIAMOND randomized controlled trial (RCT) while all other assumptions and costs were sourced from published research. The accuracy and clinical effectiveness of G5 Mobile CGM is the same as G4 Platinum CGM used in DIAMOND RCT. Base case (BC) assumptions included a) starting HbA1c 8.6%; b) change in HbA1c -1.1% for CGM group, -0.5% for SMBG alone; c) 50% reduction in severe hypoglycemic events (SHEs) and 26% conservative reduction in non-severe hypoglycemic events (NSHEs) for CGM

group; d) dis-utilities of -0.0142 for NSHEs and SHEs not requiring medical intervention, and -0.047 for SHEs requiring medical resources. Treatment costs and outcomes were discounted at 3%. **RESULTS:** The incremental cost-effectiveness ratio (ICER) for base-case G5 Mobile vs. SMBG was $25,435/QALY. Sensitivity analyses showed that base-case results were sensitive to changes in percent reduction in hypoglycemic events and to changes in disutilities associated with these events. A 50% reduction in non-severe hypoglycemic events for CGM resulted in an ICER of $14,469/QALY. The base-case results were minimally impacted by changes in starting HbA1c levels, incorporation of indirect costs and changes in discount rate. **CONCLUSIONS:** The results of this analyses show that G5 Mobile CGM is cost effective within the T1DM population using MDI, assuming a US willingness-to-pay threshold of $100,000 per Quality-Adjusted Life Year (QALY). Thus, CGM should be used "first" before more expensive treatments such as sensor augmented pumps are used in Type 1 diabetes patients on multiple daily injections.

PMD59

PROJECTED COST-EFFECTIVESS FOR TWO GENE-DRUG PAIRS USING A MULTI-GENE PANEL FOR PATIENTS UNDERGOING PERCUTANEOUS CORONARY INTERVENTION

Hart R[1], Garrison LP[1], Jarvik GP[2], Taraday JK[3], Watkins J[4], Devine B[1]
[1]*University of Washington, Seattle, WA, USA,* [2]*University of Washington Medical Center, Seattle, WA, USA,* [3]*Swedish Medical Center, Seattle, WA, USA,* [4]*Premera Blue Cross, Mountlake Terrace, WA, USA*

OBJECTIVES: For patients undergoing percutaneous coronary intervention (PCI), gene-drug associations exist relevant to first-line treatment options–antiplatelet agent, clopidogrel, and pain medication, tramadol. Knowledge of genotype information allows for avoidance of adverse drug events (ADEs) during critical clinical windows. This evaluation estimated cost-effectiveness associated with a multi-gene panel, providing CYP2C19 genotype-guided strategy for antiplatelet therapy, with CYP2D6 genotype-guided pain management, compared to single gene test for CYP2C19 with random assignment for pain treatment, and to standard treatment (no testing, clopidogrel with random assignment for pain treatment). **METHODS:** Decision analysis modeling was used to project costs from a US payer perspective and patient quality-adjusted life years (QALYs) for the three strategies over a 15-month time horizon. The model captured composite risks of major adverse cardiovascular events and pain therapy-related ADEs and associated utility estimates. Costs were expressed in 2016 US dollars and estimated using Medicare reimbursement rates when available. A 3% annual discount rate was applied to costs and QALYs. **RESULTS:** Over 15 months, multi-gene testing was least costly and yielded more QALYs compared to both single gene and no testing; total incremental costs were $2,265 lower with incremental gains of 0.0318 QALYs for multi-gene compared with single gene and $7,398 lower with 0.190 QALY gains compared to no test. Base case analyses revealed multi-gene was dominant compared to both single gene and no test. It demonstrated cost savings with increased QALYs. Net monetary benefit for multi-gene based on a $150,000/QALY willingness-to-pay threshold was $5,441 and $26,378 compared to single gene testing and no testing, respectively. **CONCLUSIONS:** For these patients, a multi-gene-guided strategy yields a favorable incremental cost-effectiveness ratio compared to the other two treatment strategies. Pre-emptively ascertaining additional gene-drug pair information can inform clinical and economic decision-making at point of care. Future work includes validating these preliminary results.

PMD60

COST EFFECTIVENESS ANALYSIS OF A FLASH CONTINUOUS GLUCOSE MONITORING SYSTEM FOR TYPE 2 DIABETES (T2DM) PATIENTS RECEIVING INTENSIVE INSULIN TREATMENT IN THE UK

Wehler EA[1], Li H[2], Bilir SP[3], Hellmund R[4], Munakata J[5]
[1]*IMS Health, Plymouth Meeting, PA, USA,* [2]*IMS Health, Fairfax, VA, USA,* [3]*IMS Health, San Francisco, CA, USA,* [4]*Abbott Diabetes Care, Alameda, CA, USA,* [5]*QuintilesIMS, San Francisco, CA, USA*

OBJECTIVES: Regular glucose monitoring is important for T2DM patients receiving intensive insulin. A novel, factory-calibrated flash continuous glucose monitoring system (the FreeStyle Libre™ system) continuously measures glucose levels from interstitial fluid. Data transfers to a handheld reader from a wearable arm sensor without requiring routine self-monitoring of blood glucose (SMBG). The REPLACE RCT showed a reduced time spent in hypoglycemia in T2DM patients receiving intensive insulin for the flash monitoring system compared to SMBG, while decreasing the number of blood glucose tests by 92%. A time trade-off study demonstrated a utility benefit with the flash monitoring system compared with SMBG (Matza 2015). This analysis assesses the cost-effectiveness of the flash monitoring system versus SMBG in T2DM patients receiving intensive insulin from a UK NHS perspective. **METHODS:** The IMS Core Diabetes Model was run over a 40-year lifetime horizon, modelling a population reflecting the REPLACE study. Intervention effects included study-based reductions in hypoglycemic events (27.7% reduction in glucose <70 mg/dL) and the utility benefit (0.03; Matza 2015). Costs were reported in 2015 GBP. Incremental cost-effectiveness ratios (ICERs) were calculated, with sensitivity analyses conducted for key inputs. **RESULTS:** The base case ICER was £23,842 and cost per hypoglycemia event averted was £93. For the scenario analyses, ICERs ranged from £6,555 to £29,517. **CONCLUSIONS:** Improved hypoglycemia and a health utility benefit translate to a base case ICER under the NICE threshold for cost-effectiveness for medical devices of up to £30,000 per QALY. This result was confirmed across a range of scenario analyses. The flash monitoring system may be considered cost effective for use in the UK NHS for T2DM patients receiving intensive insulin.

PMD61

ECONOMIC EVALUATION OF REMOTE MONITORING OF CRT/ICD THERAPY IN HEART FAILURE PATIENTS

Riveros BS[1], Smala A[2], Gonçalves VF[3], Pedro GO[4], Rosim MP[5], Lucchetta RC[1], Nita ME[6]
[1]*Federal University of Parana, Curitiba, Brazil,* [2]*Biotronik, Berlin, Germany,* [3]*BIOTRONIK Comercial Médica Ltda., Sao Paulo, Brazil,* [4]*SolVE, São Paulo, Brazil,* [5]*University of Sao Paulo, Sao Paulo, Brazil,* [6]*USP and FIPE/HAOC, Sao Paulo, Brazil*

OBJECTIVES: To estimate efficiency of Remote Monitoring (Home MonitoringTM, HM) of Cardiac Resyncronisation Therapy (CRT) and Implantable Cardioverter-Defibrillator (ICD) in Brazilian Public Healthcare System (SUS). **METHODS:** In patients with CRT/ICD therapy to treat heart failure (ICD-10 I50), continuous follow-up is based on outpatient visits (Conventional Follow-Up, CFU). HM is a new alternative which transmits real-time data to a central and then, to patient's cardiologists. By means of a health-state transition model, incremental costs (in Brazilian currency, BRL) and efficacy (in life-years gained, LYG) were estimated in a time horizon of 10 years. Costs related to SUS were retrieved through Health Informatics Department of the Brazilian Ministry of Health (DATASUS). From patient-level data of IN-TIME study, a survival analysis (Exponential distribution) was run in order to predict risk of death across the years between CFU and HM groups. Probabilistic sensitivity analysis (PSA) and alternative scenarios were carried out to assess parametric and structural uncertainties. **RESULTS:** Base-case showed an incremental cost-effectiveness ratio (ICER) of BRL 2,599 per incremental LYG when HM and CFU are compared. PSA pointed out similar central point and indicates that thresholds over BRL 2,450 favours HM as the technology most efficient. As an alternative scenario, mortality was assumed to be the same for both groups. In this case, HM promotes an incremental cost of BRL 3,839 on average. Other alternative scenarios brought similar results. **CONCLUSIONS:** Discussing threshold in Brazil remains a controversial subject. Irrespective of this issue, economic evaluations are still useful to bring about additional information. In this view, HM is likely to promote additional direct costs and LYG. Compared to drugs, the cost of each additional benefit is much cheaper. In addition, this model is not sensitive to opportunity costs as less demand for cardiology outpatient clinics.

PMD62

ECONOMIC EVALUATION OF THE THINPREP PAP TEST FOR THE DETECTION OF ABNORMAL CELLS, CERVICAL CANCER AND/OR PRECURSOR LESIONS

Soto Molina H[1], Alvarez A[2], Marquez-Cruz M[1], Rodriguez-Mendoza MM[3]
[1]*HS Estudios Farmacoeconómicos S.A. de C.V., Mexico City, Mexico,* [2]*SMH Innovación y Servicios en Equipos Médico, Mexico City, Mexico,* [3]*Independet consultant, Mexico, Mexico*

OBJECTIVES: Carry out an economic evaluation of the ThinPrep Pap test through the evaluation of sensitivity and specificity for the detection of abnormal cells, cervical cancer and/or precursor lesions. **METHODS:** A cost-effectiveness study was conducted, through a decision tree comparing ThinPrep Pap test vs conventional cytology for the detection of abnormal cells, cervical cancer and/or precursor lesions. The outcomes are expressed as number of detected cases, calculating the total and incremental effectiveness, the total and incremental costs and the Incremental Cost Effectiveness Ratio (ICER). The time horizon was instantaneous, i.e., the duration of a test. It was considered an institutional perspective. A deterministic and probabilistic sensitivity analysis was conducted, in order to analyze the uncertainty. **RESULTS:** ThinPrep Pap test in comparison with the conventional cytology demonstrated a major effectiveness expressed as number of detected cases. Assuming a 1,000 patient cohort, the additional detected cases using ThinPrep Pap test was of 26 cases. The use of ThinPrep Pap test generated an incremental cost of $18.20 USD per patient, the ICER was $701.50 USD. ThinPrep Pap test is a cost-effective option for the detection of abnormal cells, cervical cancer and/or precursor lesions. **CONCLUSIONS:** Based on the obtained results, ThinPrep Pap test is a diagnostic test that allows the detection of precursor lesions and inflammatory processes of the cervix, which allows an early diagnostic to prevent cervical cancer in the Mexican population. Furthermore, is was demonstrated that ThinPrep Pap test is a cost-effective option for the Mexico's National Healthcare System.

PMD63

ECONOMIC EVALUATION OF TOPICAL ADMINISTRATION OF GEL WITH PIRFENIDONE (KITOSCELL Q®) AS AN ADJUVANT IN THE TREATMENT OF PATIENTS WITH DIABETIC FOOT ULCERS

Peña P[1], Pineda R[1], Figueroa A[2], Lemus F[2], Orozco D[2], Flores B[2]
[1]*Grupo Medifarma, S.A. de C.V., Ciudad de México, Mexico,* [2]*Pharmamanagement EAS S de RL de CV, Cuidad de México, Mexico*

OBJECTIVES: To evaluate the cost-effectiveness of the gel with Pirfenidone treatment as an adjuvant in patients with diabetic foot ulcers (DFU), compared to the alternatives available in the National Formulary (NF). **METHODS:** A decision-tree model was implemented to compare the costs and effectiveness of Pirfenidone versus the alternatives available in the NF (gauze, hydrocolloids and antimicrobials dressings) for the treatment of DFU. The clinical outcome was defined as full epithelialization and the time horizon was 8-weeks. Local costs of the resources were obtained from those published by the Mexican Institute of Social Security (IMSS), and the price of the Pirfenidone was provided by Grupo Medifarma. Univariate and probabilistic sensitivity analysis were performed to confirm the robustness of the model findings. The time horizon was 8-week. The analysis was done from public perspective. **RESULTS:** The use of Pirfenidone as adjuvant in the treatment of patients with DFU in a cohort of 100 patients is a cost-saving alternative, demonstrating an increase of 38.1% completely re-epithelialized ulcers in contrast to other dressings, for $44,318.43. **CONCLUSIONS:** Pirfenidone, is an alternative that provides health benefits use ad adjuvant in the treatment of patients with DFU; and in addition, represents savings to the public health system.

PMD64

COST-EFFECTIVENESS ANALYSIS OF RADIOFREQUENCY CATHETER ABLATION WITH SMARTTOUCH® VERSUS FIRST-GENERATION CRYOBALLOON ABLATION ON THE TREATMENT OF PAROXYSMAL ATRIAL FIBRILLATION PATIENTS IN CHINA

Zhang L[1], Lin Z[2], Jia Y[3], Lyu R[3], Tao L[4], Xuan J[4]
[1]Shanghai Centennial Scientific Ltd., Shanghai, China, [2]Shanghai Centennial Scientific, Shanghai, China, [3]Johnson & Johnson Medical (China) Ltd., Shanghai, China, [4]Sun Yat-Sen University, Guangzhou, China

OBJECTIVES: Clinical guidelines recommend pulmonary-vein isolation by means of radiofrequency catheter ablation (RFCA) or cryoballoon ablation (CB) as treatment for paroxysmal atrial fibrillation (PAF). While RFCA with SmartTouch® Catheter (ST) and the first-generation CB (CB-1) are widely-used in China, studies examining the cost-effectiveness of the two technologies are rare. This study was to determine the cost-effectiveness of ST vs. CB-1 in Chinese PAF patients from a payer's perspective. **METHODS:** A two-part model was developed to estimate the cost-effectiveness of the two technologies. The short-term part was a decision-tree that included surgery-related complications within the first 18 months from discharge. The long-term (up to 20 years) part was a Markov chain including the health states of normal sinus rhythms, AF recurrence, stroke, post stroke, intracranial hemorrhages (ICH), post ICH, and gastrointestinal bleeding. Clinical and utility data were obtained from published literature. Cost data were collected from Chinese leading hospitals. The model calculated quality-adjusted life years (QALYs) and total costs per patient. Costs and QALYs were discounted by 3.5% annually. A one-way sensitivity analysis was conducted for all parameters. **RESULTS:** Captured by the 5-year, 10-year, and 20-year Markov model plus 18-month decision tree model, the total costs per patient for the ST vs. CB-1 groups were $14,717.17 vs. $16,662.94, $16,988.95 vs. $19,485.67 and $19,591.78 vs. $22,570.62, respectively; 5-year, 10-year, and 20-year QALYs for the ST vs. CB-1 groups were 4.23 vs. 4.22, 6.43 vs. 6.38 and 8.64 vs. 8.53, respectively. The result suggests dominant ICERs across all scenarios, indicating that ST, compared with CB-1, has better efficacy and lower overall costs. The one-way sensitivity analysis did not change the conclusion, indicating the robustness of the result. **CONCLUSIONS:** RFCA with ST is a dominant treatment of PAF in China compared to CB-1. This evidence supports the broad clinical application of RFCA with ST over CB-1.

PMD65

TREATMENT SEQUENCE IN INTERMEDIATE STAGE HEPATOCELLULAR CARCINOMA: A COST-EFFECTIVENESS ANALYSIS OF TWO APPROACHES WITH TRANS-ARTERIAL RADIOEMBOLIZATION

Rognoni C[1], Ciani O[1], Sommariva S[1], Tarricone R[2]
[1]Centre for Research on Health and Social Care Management (CERGAS), Bocconi University, Milan, Italy, [2]Bocconi University, Milan, Italy

OBJECTIVES: Hepatocellular carcinoma (HCC) is a major health problem worldwide. Trans-arterial radioembolization (TARE) is a relatively new option for the management of non-resectable HCC, although not explicitly recommended in clinical guidelines. Other approaches include systemic chemotherapy (i.e. sorafenib) or trans-arterial chemoembolization (TACE). Few studies have shown the favourable cost-effectiveness profile of TARE versus sorafenib, however scant evidence exists about which treatment sequence is best. In this study we evaluated two treatment sequences, TARE followed by TACE and eventually sorafenib (=TTS) and TARE followed by sorafenib alone (=TS) in intermediate stage patients, to identify the most cost-effective pathway from the Italian healthcare system perspective. **METHODS:** Starting from patient level data collected at three oncology centers in Italy, a Markov model was developed to project costs and health outcomes (life years and QALYs) associated with intermediate stage HCC patients for TTS and TS cohorts over a lifetime horizon (yearly discount rate 3.5%). Healthcare resource utilization was derived from standard management protocols for TARE, TACE and sorafenib. Costs were obtained from DRGs reimbursement rates and official tariffs. **RESULTS:** Considering 16 patients for TTS (47% with sorafenib administration) and 22 patients for TS treatments, the model estimated an average lifetime cost per patient of 36,509€ and 42,812€, respectively, and 3.494 years (1.385 QALYs) for TTS and 2.361 years (0.937 QALYs) for TS, in terms of health outcomes. TTS sequence resulted as dominant strategy. **CONCLUSIONS:** The cost-effectiveness of TARE versus sorafenib for the treatment of intermediate-advanced HCC has been previously stated. Our study, performed on a subset of patients with intermediate stage HCC, revealed that TARE followed by TACE plus eventually sorafenib may be a dominant strategy compared to TARE followed by sorafenib alone. Further RCTs and real world data are needed to better characterize the treatment pathways and confirm these conclusions in different settings and jurisdictions.

PMD66

COST-EFFECTIVENESS ANALYSIS OF EGFR MUTATION TEST FOR NON-SMALL CELL LUNG CANCER IN CHINA

Jin G, Yang L
Peking University, Beijing, China

OBJECTIVES: To examine the cost-effectiveness of EGFR mutation testing in China, and make recommendations on whether 'EGFR testing strategy' is more appropriate than 'no EGFR-testing strategy'. **METHODS:** A five-year Markov model was constructed to predict expected costs and outcomes for each strategy, in which three states including progression-free survival, progressive survival and death were taken into account. The percentages of patients with or without EGFR testing using traditional chemotherapy or molecular targeting therapy were based on Chinese literatures and expert interviews. Likely, the probabilities of transition from one state to another were also based on literatures and expert interviews, and the quality-adjusted life-years (QALYs) of different states were from literatures. We only included direct medical costs from the healthcare payer's perspective. The incremental cost-effectiveness ratio (ICER) was calculated using QALYs gained. Sensitivity analyses were conducted. **RESULTS:** The incremental cost and effectiveness of the 'EGFR testing strategy' compared to the 'no EGFR-testing strategy' was estimated to be approximately 32,383.83 yuan and 0.294 QALY per patient. The ICER was then calculated to be around 110,219.90 yuan per QALY gained. These results suggest that the 'EGFR testing strategy' is more cost-effective compared with the 'no EGFR-testing strategy' when 15,4098 yuan per QALY based on GDP in 2015 was considered an acceptable threshold. These results were supported by the sensitivity analyses. **CONCLUSIONS:** From the perspective of healthcare payer, the ICER of the 'EGFR-testing strategy' can be considered as a cost-effective therapy compared with the 'no EGFR-testing strategy' by the threshold of 154,098 yuan.

PMD67

ECONOMIC EVALUATION OF ULTRASONOGRAPHY AND MAMMOGRAPHY FOR BREAST CANCER SCREENING AMONG WOMEN IN CHINA

Sun L[1], Legood R[2], Yang L[1]
[1]Peking University, Beijing, China, [2]London School of Hygiene & Tropical Medicine, London, UK

OBJECTIVES: This study aimed to analyze the cost-effectiveness and cost-utility of annual ultrasonography screening, annual mammography screening and no screening for breast cancer among Chinese women, so as to provide evidence for the choice of breast cancer screening methods in China. **METHODS:** A Markov model was developed from a societal perspective among asymptomatic Chinese women over 40 years at risk for breast cancer over a lifetime horizon. The decision model was populated with data derived from China. According to the simulation results, we obtained the discounted lifetime costs, discounted quality-adjusted life years (QALYs) gained, and the number of detected breast cancer cases. Then we compared the incremental cost-effectiveness ratio. Parameter uncertainty was explored using one-way sensitivity analysis and probabilistic sensitivity analysis. Subgroup analysis was conducted based on different city levels and geographical areas in China. **RESULTS:** 54 breast cancer cases were estimated to occur among every 1000 women over their lifetime, with 27 detected by ultrasonography and 33 detected by mammography. Compared to no screening, the incremental cost-utility ratio (ICUR) of ultrasonography screening was ¥102653/QALY and the ICUR of mammography screening was ¥201309/QALY. In probabilistic sensitivity analyses, the probabilities of the ICUR being a threshold of ¥100000/QALY were 54.5% for annual ultrasonography and 26.2% for annual mammography. The sub-group analysis showed that compared to no screening, ultrasonography screening for breast cancer was cost-utility in all levels of cities and all geographic areas in China. The ICUR of mammography screening compared to no screening was very close to the threshold in eastern China. **CONCLUSIONS:** Compared to no screening, annual ultrasonography screening for women aged 40 was cost-utility and could be used as the primary method for breast cancer screening in China. Mammography screening was not cost-utility in central and western China, and could be used in eastern economically developed areas.

PMD68

COST-EFFECTIVENESS OF A BRONCHIAL GENOMIC CLASSIFIER FOR THE DIAGNOSTIC EVALUATION OF LUNG CANCER

Feller-Kopman D[1], Liu S[2], Geisler BP[2], DeCamp MM[3], Pietzsch JB[2]
[1]Johns Hopkins University, Baltimore, MD, USA, [2]Wing Tech Inc., Irvine, CA, USA, [3]Northwestern Memorial Hospital, Chicaog, IL, USA

OBJECTIVES: A bronchial genomic classifier had been prospectively validated to improve diagnostic accuracy of bronchoscopy for suspected lung cancer in order to identify patients at low probability who may be more suitable for active surveillance as opposed to a biopsy via an invasive procedure. Our objectives were to assess the frequency of invasive procedures and the cost-effectiveness of bronchoscopy plus genomic classifier versus bronchoscopy alone in diagnostic work-up of patients at intermediate risk for lung cancer in the United States. **METHODS:** A decision-analytic Markov model was developed to project the costs and effects of the two competing strategies, using test performance from the AEGIS-1 and AEGIS-2 studies. Diagnostic accuracy of non-invasive and invasive follow-up, as well as associated adverse event rates were derived from published literature. Procedure costs were based on claims data and 2016 inpatient and outpatient reimbursement amounts. The model projected the number of invasive follow-up procedures, two-year costs and quality-adjusted life years, by strategy, and the resulting incremental cost-effectiveness ratio (ICER), discounted at 3% per annum. **RESULTS:** Use of invasive procedures were reduced by 28% at one month and 18% at two years, respectively. Total costs and QALY gain were similar with classifier use ($27,221 vs. $27,183, and 1·512 vs. 1·509 QALYs, respectively), resulting in an ICER of $15,052 per QALY. **CONCLUSIONS:** The use of a genomic classifier for inconclusive bronchoscopies is associated with meaningful reductions in invasive follow-up procedures at about equal costs and is therefore a high-value strategy in the diagnostic work-up of patients at intermediate risk of lung cancer.

PMD69

COMPARISON OF MAGNETIC RESONANCE IMAGING FOLLOWED BY MAGNETIC RESONANCE-GUIDED TARGETED BIOPSY VERSUS SYSTEMATIC TRANSRECTAL ULTRASOUND-GUIDED BIOPSY IN DIAGNOSING PROSTATE CANCER: A COST-EFFECTIVENESS ANALYSIS IN THE US POPULATION

Wang Y, Mossanen M, Dunne R, Tempany C, Chang SL
Brigham and Women's Hospital; Harvard Medical School, Boston, MA, USA

OBJECTIVES: Systematic transrectal ultrasound-guided biopsy (TRUSGB) has raised concerns regarding the overdiagnosis of prostate cancer (PCa). Magnetic

resonance imaging followed by magnetic resonance-guided targeted biopsy (MRI-MRGB) is gaining more popularity. Evaluation that simultaneously considers cancer outcomes, healthcare costs and quality-of-life is needed to further inform decision making in the US population. **METHODS:** A decision-analytic Markov model with a lifetime horizon of 10 years was developed to evaluate diagnostic accuracy, long-term health outcomes, costs, and quality-of-life of the two strategies (i.e., MRI-MRGB versus TRUSGB) in men with elevated prostate-specific antigen ((>4 ng/ml). Probabilities of clinical events were obtained from published literature. Direct medical costs included diagnostic and treatment-related healthcare costs. Costs were inflated to 2015 US dollars and discounted at an annual rate of 3%. Quality-adjusted life years (QALYs) were derived from published literature and expert opinions. We calculated the incremental cost-effectiveness ratio (ICER), which was equal to the difference in costs of two interventions divided by the difference in QALYs. Sensitivity analyses were performed to assess uncertainty. **RESULTS:** The MRI-MRGB strategy yielded lower total costs (US 5,358 versus 6,372) and higher total QALYs (7.21 versus 7.19) than TRUSGB. Therefore, TRUSGB was dominated by the MRI-MRGB strategy. The results were robust with the sensitivity analyses. **CONCLUSIONS:** The MRI-MRGB strategy generated lower total costs but higher QALYs than the TRUSGB strategy. Therefore, MRI-MRGB was the optimal choice that provided the greatest health benefits for the diagnosis of men with suspected PCa in the US population.

PMD70

ECONOMIC EVALUATION OF AN ENDOSCOPIC SYSTEM (DA VINCI® ROBOTIC SURGICAL SYSTEM) FOR PATIENTS WITH LUNG CANCER

Soto Molina H[1], Martinez Samano E[1], Diaz-Alvarez O[1], Rodriguez-Mendoza MM[2]
[1]*HS Estudios Farmacoeconómicos S.A. de C.V., Mexico City, Mexico,* [2]*Independet consultant, Mexico, Mexico*

OBJECTIVES: To perform an economic evaluation study of the endoscopic system (Da Vinci®) as treatment for patients with lung cancer in Mexico. **METHODS:** Justified by the results from a systematic review of the clinical literature previously developed, that conclude that the health benefits in terms of decrease in mortality and surgical complications were similar, a cost minimization analysis was developed in comparison with Video-assisted thoracoscopic lobectomy (VATL). The analysis was performed from the National Health System perspective. This evaluation also considered only direct medical costs took from institutional sources. The temporal horizon was determined immediate, i.e., the duration of time of the surgical interventions in comparison, it was not included a social discount rate. The analysis also included the equivalent annual cost through the calculation of the annuity factor. With the purpose of analyze uncertainty, a univariate deterministic sensitivity analysis was done, it contemplated variation in the cost of the surgical system Da Vinci, cost of consumables used and the number of annual surgeries done by the public health services from Mexico. **RESULTS:** The use of Da Vinci surgical system in the treatment of lung cancer generates a cost per surgical intervention of $4,367.6642 USD, and $6,041.9646 USD in the case of VALT, the use of Da Vinci surgical system generates a save per intervention of $1,674.3004 USD. **CONCLUSIONS:** The use of Da Vinci surgical system in the treatment of lung cancer is an equally safe and efficacious strategy than the one available nowadays in the National Health System, but with less cost per surgical intervention. From an institutional perspective, the use of Da Vinci surgical system is a cost saving strategy.

PMD71

COST-EFFECTIVENESS OF PERCUTANEOUS VENTRICULAR ASSIST DEVICES FOR HIGH-RISK PCI PATIENTS IN ONTARIO, CANADA

Djalalov S[1], Xie X[1], Wijeysundera HC[2], Sikich N[1], Dhalla I[1], Ng V[1]
[1]*Health Quality Ontario, Toronto, ON, Canada,* [2]*Sunnybrook Health Sciences Centre, Toronto, ON, Canada*

OBJECTIVES: The newly introduced percutaneous Ventricular Assist Devices (pVAD) have been shown to provide better hemodynamic support but there is no evidence that they improve clinical outcomes in high-risk percutaneous coronary intervention (PCI) compared with the intra-aortic balloon pump (IABP), the current standard of care. We aim to evaluate the cost-effectiveness of pVAD compared with IABP in patients undergoing high-risk PCI in Ontario. **METHODS:** A cost-utility analysis was conducted from the Ontario public payer perspective using a 10-year time horizon. A Markov cohort model was developed to simulate the process of patients going through PCI treatment. Patients in the post-PCI state (no complication) may either stay in this health state or transition to death or develop Major Adverse Cardiac Events (MACE), specifically “acute myocardial infarction”, “stroke” and “repeat revascularization”. Transition probabilities and mortality rates were calculated using data from the PROTECT II study, a randomized controlled trial comparing pVAD and IABP. Costs were reported in 2016 Canadian dollars and obtained from the Ontario Case Costing Initiative, the CCN Cardiac Registry and the published literature. Utilities were obtained from various Quality of Life studies. Probabilistic sensitivity analyses were used to assess parameter uncertainties. **RESULTS:** High-risk PCI supported by pVAD resulted in a loss of 0.109 QALYs with an additional cost of $24,260 per patient, compared to IABP. As such, pVAD was dominated (more costly and less effective). Even in scenarios that favoured pVAD (such as setting the long-term MACE probabilities between treatments to be the same at 90 days and using the same mortality rate for both arms), it was still not cost-effective compared with IABP. **CONCLUSIONS:** Our economic evaluation showed that the pVAD was not an economically attractive alternative to IABP in high-risk PCI patients in Ontario. Further research will be needed to identify a population in which pVAD is clinically and economically attractive.

PMD72

COST-EFFECTIVENESS OF TRANSCATHETER AORTIC VALVE IMPLANTATION COMPARED WITH SURGICAL AORTIC VALVE IMPLANTATION IN HIGH SURGICAL RISK PATIENTS WITH SEVERE AORTIC STENOSIS IN ONTARIO, CANADA

Tu HA[1], Wijeysundera HC[2], Sehatzadeh S[1], Xie X[1], Sikich N[1], Dhalla I[1], Ng V[1]
[1]*Health Quality Ontario, Toronto, ON, Canada,* [2]*Sunnybrook Health Sciences Centre, Toronto, ON, Canada*

OBJECTIVES: Severe aortic stenosis (AS) refers to pathological, clinical and pathophysiological changes associated with decreased aortic valve area, as a consequence of calcification. Transcatheter aortic valve implantation (TAVI) is a treatment option for severe AS patients, who are at high risk or ineligible for surgical treatment. We assessed economic implications of TAVI compared with surgical aortic valve replacement (SAVR) for high-risk patients with severe AS in Ontario, Canada. **METHODS:** We developed a Markov model with monthly cycles to determine the cost-effectiveness of TAVI compared with SAVR from the Ontario public payer perspective. The model had a 5-year time horizon. Clinical model parameters (effectiveness and safety) of TAVI and SAVR were obtained from a systematic clinical evidence review. Costs of procedures, procedure-related adverse events were collected from an Ontarian costing study. The main outcomes of the model were costs, quality-adjusted life-years (QALYs) and the incremental cost-effectiveness ratio (ICER). We conducted univariate and probabilistic sensitivity analyses to explore the robustness of the findings. Costs were expressed in 2016 Canadian Dollars and discounted at 5% per annum. **RESULTS:** The base-case analysis showed that TAVI was associated with 0.181 QALYs gained at an additional cost of $9,412 compared to SAVR over the 5-year time horizon. This translated into an ICER of $51,988 per QALY gained. Univariate sensitivity analyses showed that the model was most sensitive to care costs of both TAVI and SAVR, and monthly follow-up costs of major stroke in the first and second years. Probabilistic sensitivity analyses showed that at the willingness-to-pay of $50,000 and $100,000 per QALY, the probability that TAVI would be cost-effective was 47% and 92%, respectively. **CONCLUSIONS:** The use of TAVI for patients at high surgical risk and severe aortic stenosis is cost-effective in Ontario. TAVI is a reasonable alternative for severe AS patients with high surgical risk.

PMD73

COST-EFFECTIVENESS OF ARGUS II RETINAL PROSTHESIS SYSTEM FOR ADVANCED RETINITIS PIGMENTOSA

Tu HA, Xie X, Sikich N, Dhalla I, Ng V
Health Quality Ontario, Toronto, ON, Canada

OBJECTIVES: Retinitis pigmentosa (RP) causes progressive retinal degeneration and blindness. The Argus II retinal prosthesis system can improve visual function in blind patients with advanced RP. We assessed economic implications of the Argus II system for advanced RP in Ontario, Canada. **METHODS:** We developed a Markov model to determine the cost-effectiveness of the Argus II system compared with standard care in RP patients from the Ontario public payer perspective. The main outcomes of the model were costs, quality-adjusted life-years (QALYs) and the incremental cost-effectiveness ratio (ICER). The model had a 10-year time horizon. Clinical model parameters (effectiveness and safety) of the Argus II system were obtained from the literature. Cost components (Argus II devices, surgery, maintenance of devices and treatment of adverse events were included). We conducted univariate and probabilistic sensitivity analyses to explore the robustness of the model. Costs were expressed in 2015 Canadian Dollars and discounted at 5% annually. **RESULTS:** In the base-case analysis, compared with standard care, Argus II system resulted in a gain of 1.13 QALYs (3.12 QALYs with Argus II versus 2.08 QALYs with standard care) with an additional cost of $234,606 (CDN) ($361,034 with Argus II versus $126,428 with standard care) over a 10-year time horizon. This translated into an ICER of $207,616 per QALY gained. Univariate sensitivity analyses showed that the model was most sensitive to health-related utility of RP patients, and the cost of implantation and device parameters. Probabilistic sensitivity analyses showed that at the willingness-to-pay amounts of $100,000 and $200,000 per QALY, the probability that Argus II would be cost-effective was 21% and 45%, respectively. **CONCLUSIONS:** The Argus II system improved the quality of life of RP patients but at a very high incremental cost. Its cost effectiveness would not typically be considered attractive given the incremental cost effectiveness ratio.

PMD74

COST-EFFECTIVENESS OF PET-CT VERSUS ADRENAL VEIN SAMPLING FOR THE DIAGNOSIS OF HYPERTENSION CAUSED BY PRIMARY ALDOSTERONISM

Lin Z[1], Kusel J[2], Ghosh W[3], Brown M[4]
[1]*University of Sheffield, Sheffield, UK,* [2]*Costello Medical Consulting Ltd, London, UK,* [3]*Costello Medical Consulting Ltd, Cambridge, UK,* [4]*William Harvey Research Institute, London, UK*

OBJECTIVES: Primary aldosteronism (PA) is caused by a benign adrenal gland tumour and leads to the development of hypertension (high blood pressure). PA is the cause of 11% of all hypertension cases. It can be cured by surgical removal of the affected gland (if unilateral), but is not always diagnosed as the current technique (adrenal vein sampling [AVS]) has a high failure rate and is unpleasant for patients. The aim was to compare the cost-effectiveness of PET-CT with AVS for the identification of PA patients suitable for surgery. **METHODS:** A discrete event simulation was developed. Anonymised individual patient data from Addenbrooke’s hospital (Cambridge, UK) were used to inform the patient characteristics of those screened. Sensitivity and specificity of the diagnostics were taken from the literature and the outcomes of surgery on hypertension were modelled. The model captured the impact of hypertension on the risk of cardiovascular events and death. The model used a UK NHS perspective, a lifetime time horizon and a 3.5% annual discount rate. NHS reference costs were

used and utilities were taken from the literature. **RESULTS:** PET-CT resulted in 0.04 additional QALYs (11.340 vs 11.299 for PET-CT vs AVS, respectively) and £64.43 fewer costs (£8,571.93 vs £8,636.36 for PET-CT vs AVS, respectively), meaning that PET-CT dominated AVS. PET-CT remained dominant across the majority of one-way sensitivity analyses, with positive ICERs under £10,000/QALY only for the upper bound of PET-CT cost (£6,997/QALY), upper bound of cost of laparoscopic adrenalectomy (£246/QALY) and lower bound of AVS cost (£7,702/QALY). **CONCLUSIONS:** Despite being a more costly procedure, PET-CT was overall a cost saving alternative to AVS for the diagnosis of unilateral PA, due to the greater number of successful surgeries and hence better long-term outcomes. This could change the way that PA is diagnosed in clinical practice, providing a less traumatic method for patients.

PMD75

COST UTILITY ANALYSIS OF DEEP BRAIN STIMULATION VS. BEST MEDICAL TREATMENT IN THE MANAGEMENT OF PARKINSON DISEASE WITH EARLY MOTOR COMPLICATIONS IN COLOMBIA

Rueda M[1], Orozco JJ[2]
[1]Clinica Soma, Medellin, Colombia, [2]Medtronic PLC, Medellín, Colombia

OBJECTIVES: Deep Brain Stimulation (DBS), has shown motor symptoms and quality of life improvement in advance Parkinson Disease (PD). There is evidence that DBS could also be effective in PD with early motor complications, which must be reflected in longer time horizon to offset the initial costs and better quality adjusted life years (QALYs). We did a cost-utility analysis of DBS vs. Best Medical Treatment (BMT) in the management of PD patients with early motor complications in Colombia. **METHODS:** After transferability analysis, adaptation of previously developed Markov model for cost-utility analysis was done. The Unified Parkinson's Disease Rating Scale measured "on_meds" was used to model disease progression and treatment effectiveness. Data was taken from the prospective EarlyStim-PD CT, including patient's characteristics, effectiveness and adverse events (AE). Data was used for fall probability, utility values, BMT withdrawal. The 15-years rechargeable DBS device was assumed. Resource use and costs were gathered from official prices and KOL. Colombian Mortality rates, a 15 years horizon, 3,5% discount rate and payer perspective was assumed. All costs were converted to USDollars to allow international comparison. Univariate and probabilistic sensitivity analysis were done. **RESULTS:** To 15 years, total discounted cost for DBS was estimated in USD$85.198 vs. USD$103.560 for BMT, (- USD $18.362). DBS yield 5,15 discounted QALYs compared to 4,10 for BMT, configuring dominance over BMT and not requiring to do incremental analysis. The main difference was obtained in medication costs, offsetting the DBS implantation costs. There were also savings in AE, follow up, falls, and other hospital costs. The univariate analysis showed the results were especially sensible to horizon. In the probabilistic analysis, 99,4% of iterations fall in the SE quadrant. **CONCLUSIONS:** Compared to BMT, DBS yielded a higher total Quality of life to a lower total cost, generating costs savings in a 15 years horizon.

PMD76

A COST-EFFECTIVENESS ANALYSIS BETWEEN RADIOFREQUENCY CATHETER ABLATION (RFCA) AND ANTI-ARRHYTHMIC DRUG IN THE TREATMENT OF CHINESE PATIENTS WITH ATRIAL FIBRILLATION (AF)

Du X[1], Guo L[1], He X[1], Jia Y[2], Wu J[1], Long D[1], Yu R[1], Sang C[1], Liu X[1], Yin H[3], Xuan JW[4], Dong J[1], Ma C[1]
[1]Anzhen Hospital, Beijing, China, [2]Johnson & Johnson Medical (China) Ltd., Shanghai, China, [3]Centennial Scientific Co., Ltd., Alpharetta, GA, USA, [4]Sun Yat-sen University, Guangzhou, China

OBJECTIVES: Catheter ablation (RFCA) procedure for AF has been widely applied in China, however, no published study has examined the cost effectiveness of catheter ablation in the Chinese setting. To determine the cost effectiveness of RFCA vs. anti-arrhythmic drugs in the treatment of Chinese AF patients from third-party payer perspective. **METHODS:** The cost effectiveness of RFCA was evaluated in comparison with anti-arrhythmic drugs (AADs). Outcomes in the model were captured as quality-adjusted life years (QALYs). A decision analytical model was constructed to evaluate the short-term and long-term cost effectiveness. The cost data were from a micro cost study based on real world Chinese hospital costs. Clinical effectiveness data were obtained from a prospective, non-randomized, single center study in China as well as literature review and the physician survey. **RESULTS:** In the short term and long term time horizons, the RFCA treatment arm incurred more costs than the AADs arm but also had more QALY improvement than the AADs arm. When compared RFCA with AADs, the ICERs were ¥66,763.91, ¥36,279.52 and ¥29,359.32 per QALY for 8, 15, and 20-year time horizons respectively. The sensitivity analyses demonstrated that the results were most sensitive to the changes in RFCA cost and CHADS2score among the variables tested. **CONCLUSIONS:** The present study provides the first cost-effectiveness analysis comparing these two most popular treatment strategies currently practiced in China. The study results support that RFCA is a cost effective therapy, when compared with anti-arrhythmic drugs, in the treatment of Chinese AF patients with ICERs lower than three times of per capita GDP in China. The results also demonstrated that the RFCA procedure is more cost effective in the longer time horizons.

PMD77

COST-UTILITY ANALYSIS OF THE PROLARIS TEST FOR PROSTATE CANCER IN PATIENTS WITH A POSITIVE BIOPSY

Dragomir A, Prevost N, Aprikian A, Vanhuyse M, Cury F, Kassouf W
McGill University Health Centre, Montreal, QC, Canada

OBJECTIVES: Improving the accuracy of risk stratification at diagnosis is an important goal in prostate cancer (PCa) research. This study aims to assess the cost-utility of Prolaris, a biopsy tissue-based cell cycle progression (CCP) assay, in the risk assessment of PCa patients with a positive biopsy, from the Canadian healthcare system perspective. **METHODS:** A Markov model was used to estimate the quality adjusted life years gained (QALYs) and costs for three strategies (standard 12-core TRUSGB, MRI-guided biopsy (MRGB) and standard TRUSGB plus Prolaris) over 5, 10, 15 and 20 years. The model takes into account the accuracy of diagnostic tests and the probability of assignment to various treatment options. We assumed that patients re-categorized with Prolaris to very low risk PCa will be placed on active surveillance. Direct medical costs based on the Quebec healthcare system's perspective were included. **RESULTS:** The difference in QALYs between TRUSGB + Prolaris and TRUSGB ranged from 0.01 to 0.11, with the highest difference observed over the 20-year time horizon. The corresponding values of the cost difference ranged from 1,900CAD and 1,000CAD. In addition, no benefit in QALY was observed between the TRUSGB + Prolaris strategy and the MRGB strategy. However, a higher cost was observed in the TRUSGB + Prolaris strategy (between 2,300CAD at 5 years and 4,300CAD at 20 years). The cost-utility analysis revealed an incremental cost-utility ratio (ICUR) as high as 190,000CAD/QALY at 5 years and as low as 9,200CAD/QALY at 20 years. **CONCLUSIONS:** Our preliminary results suggest that the incorporation of Prolaris in PCa diagnosis represents a cost-effective measure over a 10-, 15- and 20-year time horizon compared TRUSGB alone, with an ICUR below the threshold of 50,000CAD. However, the TRUSGB + Prolaris strategy was costlier and less effective than the MRTB strategy.

PMD78

ECONOMIC EVALUATION OF CONTINUOUS AMBULATORY PERITONEAL DIALYSIS (CAPD) AND HEMODIALYSIS (HD) FOR END-STAGE RENAL DISEASE (ESRD) PATIENTS IN INDONESIA

Nugraha RR[1], Thabrany H[2], Putri S[3], Pujiyanti E[4]
[1]Center for Health Economics and Policy Studies, Universitas Indonesia, Depok, Indonesia, [2]Center for Health Economic and Policy Studies, Universitas Indonesia, Depok, Indonesia, [3]Center for Health Economics and Policy Studies Faculty of Public Health Universitas Indonesia, Depok, Indonesia, [4]Universitas Indonesia, depok, Indonesia

OBJECTIVES: To determine costs of Continuous Ambulatory Peritoneal Dialysis (CAPD) and Hemodialysis (HD) treatment, as well as to assess cost-effectiveness between CAPD and HD modality in treating patients with End-Stage Renal Disease (ESRD) in Indonesia using societal perspective. **METHODS:** Patients with End-Stage Renal Diseases, aged >50 undergoing PD and HD were observed retrospectively. Clinical records were taken during the observation, as well as questionnaire used to gather cost during PD and HD procedures. A Cost Utility Analysis with Markov Model was developed applying 50 cycles, representing the switching between two modalities. Potential deterministic scenario and probabilistic sensitivity were performed. **RESULTS:** Using societal perspective, we calculated CAPD with incremental cost is CAPD is IDR 7,533,209 (US$ 562) lower than HD. The QALY of HD is 3.51 and CAPD is 3.66. After ICER estimation PD potentially cost saving IDR 48,850,332 (US$ 3,645) per QALY gained. We also conducted scenario with considering plausible values in parameters and explore the change in ICER and QALY values. **CONCLUSIONS:** Although the average direct medical costs of PD is higher than HD, in terms of cost-effectiveness, the results suggest that PD as an initial treatment is better in terms of cost and outcome rather than offering HD for ESRD patients.

PMD80

MEDICAL RESOURCE USE AND COST CONSEQUENCES OF HOSPITALIZATION FOR REPOSITIONING, REPAIR, OR REMOVAL OF IMPLANTABLE CARDIOVERTER DEFIBRILLATOR TRANSVENOUS LEADS

Griffiths RI[1], Jacobsen CM[2], Stern K[1], Menzin JA[1], Amorosi SL[2]
[1]Boston Health Economics, Waltham, MA, USA, [2]Boston Scientific, Marlborough, MA, USA

OBJECTIVES: Rates of implantable cardioverter-defibrillator (ICD) complications requiring transvenous (TV) lead reoperation have been documented. However, the resource use and costs of these complications are less understood. The objectives of this study were to estimate the Medicare costs and hospital length of stay (LOS) for ICD complications that required inpatient admission for repositioning, repair, or removal (reoperation) of TV leads. **METHODS:** Using Medicare administrative and claims data, we identified 1,068 patients, age ≥ 65, who were hospitalized for reoperation of ICD TV leads between 1/1/2011 and 12/31/2013. We calculated the total cost to Medicare of each admission, including inpatient facility and professional costs, and performed unadjusted and adjusted analyses to identify factors associated with variation in the total costs and LOS for these admissions. **RESULTS:** The mean age was 78, 61% were female, 92% were white, and 27% had a Charlson Comorbidity score ≥ 5. A majority of patients (70%) underwent lead removal, 26% underwent repositioning, and the remainder underwent repair. Mean LOS was statistically significantly longer for patients who underwent lead removal (12.3 days; 95% Confidence interval [CI]=11.4-13.2) than for those who underwent lead repair (6.4 days; 95% CI=2.8-10.0), or repositioning (7.0 days; 95% CI=5.5-8.5). Mean total cost also was significantly higher for patients who underwent lead removal ($45,838; 95% CI=$42,967-$48,708), than for repair ($32,767; 95% CI=$21,574-$43,960), or repositioning ($28,347 days; 95% CI=$23,614-$33,081). Among those who underwent removal, infection was associated with significantly longer LOS (+10.3 days; 95% CI 8.2-12.3) and higher total cost (+$11,690; 95%CI $5,143-$18,237). **CONCLUSIONS:** The economic consequences of ICD complications that require inpatient admission for reoperation of TV leads are substantial, especially in those who require lead removal in the presence of infection. Understanding the economic consequences of TV lead complications is essential to estimating the potential cost offsets associated with reducing these rates.

MEDICAL DEVICES/DIAGNOSTICS – Patient-Reported Outcomes & Patient Preference Studies

PEN NEEDLE REUSE IN CHINESE DIABETES PATIENTS: A LITERATURE REVIEW

Ren XX[1], Guan HJ[2], Wang YN[3], Liu SQ[1]
[1]Health Economics and Outcomes Research, Becton, Dickinson and Company, Beijing, China, [2]School of Pharmaceutical Sciences, Peking University, Beijing, China, [3]Peking University China Center for Health Economic Research, Beijing, China

OBJECTIVES: The purpose of this study is to analyze the current situation of pen needle (PN) reuse and replacement frequency in Chinese diabetes patients. **METHODS:** A systematic review of the literatures in Chinese and English was performed by using data from CNKI, VIP, WANFANG DATA, CBM, PUBMED, SCIENCE DIRECT, SCOUPSS, WEB OF SCIENCE, COCHRANE LIBRARY, EMBASE. The search terms used were "diabetes", "PN", "China", "Chinese". Systematic review were excluded. **RESULTS:** 79 articles were included, of which 4 were in English and 75 were in Chinese; 11 were multi-center study, 59 were single-center study, and 9 were unspecified. The collected sample were 18,063. About 88.02% patients reused PN. By ranking from highest to lowest, the reuse rate of PN in regions of China were, Northwest China (97.35%), Southern China (88.48%), Central China (88.27%), North China(87.95%), Southwest China (87.59%), Northeast China (78.39%), and East China (72.7%). 85.47% patients reused PN in areas with pen needle reimbursement (PNR) (Tianjin, Jiangsu, Zhejiang and Guangdong), lower than that without PNR (92.03%). One PN was used about 12.83 times on average. For replacement frequency, most patients reused the PN for more than 6 times, and some of them replaced PN when one insulin was used up, or when PN was broken. This phenomenon was more serious in rural areas: 22.5% patients replaced PN per week, 44.2% replaced PN half a month and 33.2% longer than half a month. Increases in PN's reuse frequency would lead to skin problems, injures, increased pain, inaccurate dose et al. However, only 49.87% patients knew it. **CONCLUSIONS:** PN reuse was common among diabetes patients in China. PN reuse rate is different by regions. PNR policy may have impact on PN reuse. The awareness of harm of PN reuse was relatively low. All the data from literatures, which may lead to bias.

PMD82

CAN A NEW FLASH CONTINUOUS GLUCOSE MONITORING SYSTEM IMPROVE PATIENT ADHERENCE TO GLUCOSE MONITORING AND GENERATE DATA TO SUPPORT THERAPEUTIC DECISION MAKING?

Varughese B
Abbott Diabetes Care, Alameda, CA, USA

OBJECTIVES: In a multi-center patient and physician survey conducted at 17 diabetes clinics in Germany, researchers identified that 20.6% of patients did not submit any blood glucose information during visits. Furthermore 29.3% of surveyed doctors rated available data as flawed or inappropriate for therapy adjustment. This lack of actionable glycemic information may prevent optimal therapeutic management. In a 2014 publication, Koster et al. reported in 2010, incremental medical costs attributed to diabetes were €2391 per patient in Germany. Of that amount, 26.5% was spent on managing hyperglycemia and 73.5% on complications. **METHODS:** Review of 2 recent RCTs in patients on intensive insulin, using a novel, sensor-based, factory-calibrated flash continuous glucose monitoring system (FreeStyle Libre™ system) to evaluate patients' monitoring behavior and to determine if the new system had any impact on this behavior. This review also looked at the amount and quality of data generated by subjects using the system. **RESULTS:** At the end of each 6 month study, patients were scanning their glucose sensor on average 8.3 times/day (T2DM) and 15.1 times/day (T1DM), compared to 3.8 finger sticks (T2DM) and 5.5 finger sticks (T1DM) at baseline. In both studies, the sensors collected over 88% of available glucose data. 95% or more of HCPs strongly agreed that data from the system will support them to make informed therapy decisions and help them to positively engage patients in the process. **CONCLUSIONS:** For patients with diabetes receiving intensive insulin, the flash continuous glucose monitoring system has been shown to improve adherence to glucose monitoring and to capture actionable data to guide appropriate therapy decisions. The major portion of costs associated with diabetes come from managing short and long term complications which result from inadequate management of the disease

PMD83

METHODS FOR DEVELOPING A PREFERENCE AND USABILITY SURVEY FOR DEVICES: A CASE STUDY IN DIABETES

Alemayehu B[1], Nguyen AM[1], Ganser R[2], Speiser J[1], Crutchlow M[1], DiBonaventura M[3]
[1]Merck, North Wales, PA, USA, [2]Ipsos Healthcare, Washington, DC, USA, [3]Ipsos Healthcare, New York, NY, USA

OBJECTIVES: Research has indicated that aligning prescribed treatments with patient preferences can maximize adherence and clinical outcomes. Herein we describe the development of a usability/preference survey for the purpose of evaluating insulin pens. **METHODS:** A multi-phased study was conducted in the United States, United Kingdom, and Canada. Adhering to ISPOR Good Research Practices, desk literature was reviewed and certified diabetes educators (CDEs) were interviewed by a trained moderator to develop a draft survey to assess preferences and usability of insulin pens. Two rounds of qualitative interviews were then conducted with CDEs and patients with diabetes. Each interview served a dual purpose of both concept elicitation and cognitive debriefing, with the survey being administered on a study-provided electronic tablet. No further feedback was given after these two rounds and the survey was then considered final. **RESULTS:** The structured interviews (N=3; 1 per country) with CDEs provided the initial language for the survey items (e.g., rating how "smooth", "easy to learn", "easy to inject" each pen was). Interviews with both CDEs and patients in the first round of cognitive debriefing (N=3 CDEs and N=6 patients, with representation from each country) introduced minor changes to the wording of the instructions and the addition of the item "ability to reach the injection button" based on patients who had finger dexterity limitations. The final round of cognitive debriefing (N=3 CDEs and N=6 patients) confirmed the acceptance of the changes and tablet presentation, with nearly all respondents reporting using the tablet was "very easy". **CONCLUSIONS:** The multi-phased approach helped to develop a preference and usability survey with content validity in the populations of interest. Future insulin pen studies can utilize this survey to comprehensively capture the patient/CDE perspective.

PMD84

DEVELOPMENT AND CONTENT VALIDITY OF THE PATIENT-REPORTED INTRAOCULAR LENS QUESTIONNAIRE (PR-ILQ)

Shields A[1], Galipeau N[2], Chacko J[3], Mazar I[1], Bowyer B[3]
[1]Adelphi Values, Boston, MA, USA, [2]Adelphi Values USA, Boston, MA, USA, [3]Lenstec, Inc, St. Petersburg, FL, USA

OBJECTIVES: The Food and Drug Administration's (FDA) Office of Device Evaluation and Center for Devices and Radiological Health and the American Academy of Ophthalmology (AAO) published recommendations on the development and use of patient-reported endpoints. The objective of this study was to develop a PRO instrument to assess outcomes associated with intraocular lens (IOL) surgery in ways consistent with FDA and AAO recommendations. **METHODS:** Concepts relevant to patients with cataracts and IOL surgery were identified via concept elicitation interviews (CEIs) with therapeutic experts (N=10) and with patients both pre- (n=10) and post-IOL implantation (n=34) of various lens types. Data saturation from the patient interviews was evaluated to ensure that the sample was large enough and that all relevant concepts had been elucidated. Following its construction, the questionnaire's content was evaluated via two rounds of cognitive debriefing interviews (CDIs) with post-cataract surgery patients (N=32). All interviews were audio-recorded, transcribed verbatim and analyzed using qualitative data software. **RESULTS:** The CEIs identified concepts of measurement related to physical symptoms, visual disturbances, vision quality and vision correction for near, intermediate, and far distances. This resulted in the creation of the Patient-Reported Intraocular Lens Questionnaire (PR-ILQ), with three distinct scales: the Spectacle Independence Scale (SIS), the Vision Disturbance Scale (VDS), and the IOL Replacement Satisfaction Scale (IOL RSS). Some modifications to the scales were made following the first round of CDIs in order to increase patient understanding. The final PR-ILQ was found to be well understood by patients and relevant to their condition and its treatment. **CONCLUSIONS:** The PR-ILQ is a novel questionnaire comprised of three scales to assess the pre- and post-IOL experience among patients with cataracts. This study supports the content validity of the PR-ILQ and its alignment with published recommendations by the FDA and AAO.

PMD85

A SYSTEMATIC REVIEW OF ACTIGRAPH USE TO MONITOR SLEEP IN PEDIATRIC CHILDREN

Patel M
University of Arizona, Tucson, AZ, USA

OBJECTIVES: To identify studies that use actigraphs, or similar devices, in monitoring sleep in pediatric children. **METHODS:** An electronic literature search was conducted on three databases (PubMed, EMBASE, PsycINFO) using the EBSCOhost platform, along with citation searches, from inception to October 2016. Key search terms included "actigraph", "children", and "insomnia" or "sleep". English, peer-reviewed studies that used actigraphs, or similar monitoring devices, for assessing sleep in a cohort of pediatric children (aged 4 to 12 years only) were included. **RESULTS:** A total of 927 articles resulted from the initial search. After title screening occurred, 102 articles remained for abstract review. Sixty articles were identified for full-text review, with 25 as the final number of studies included for this review. Studies were most commonly conducted in the United States (n=14). All studies used actigraphs or similar devices with placement on either the wrist (n=20), waist/hip, (n=5), or shoulder (n=1) to assess sleep quality. The most common actigraph brands were Actiwatch AW's (n=5) and Actigraph GT3X+ (n=4). Seven studies used a sleep diary/log that was completed by a parent as a secondary measure to monitor sleep in children. Outcomes that were most commonly measured in the studies included sleep start time/sleep onset (n=20), sleep duration period (n=25), sleep efficiency (n=17), and nighttime wake frequency/duration (n=17). **CONCLUSIONS:** Researchers should be aware of the considerations when using actigraphs in a population of children, including the use of a secondary measure (e.g., sleep diary) when collecting actigraphy data as studies in this review indicated the benefit of using such type of measure to support actigraphy data. But overall, the use of actigraphs is common and beneficial when needed to monitor sleep quality as an outcome in a pediatric population.

PMD86

ASSESSMENT OF HEALTH-RELATED QUALITY OF LIFE (HRQOL) AND EFFECT OF DEMOGRAPHICS ON HAEMODIALYSIS PATIENTS IN QUETTA, PAKISTAN

Hayat M[1], Haq N[2], Khan SL[3], Nasim A[2]
[1]university of balochistan, quetta, YT, Pakistan, [2]University of Balochistan, Quetta, Pakistan, [3]Bolan Medical College Quetta, Quetta, Pakistan

OBJECTIVES: This study aimed to assess health-related quality of life and effect of demographics on haemodialysis patients in Quetta, Pakistan. **METHODS:** Prospective observational study was conducted to assess HRQOL of haemodialysis patients. Study was conducted in the Sandeman provincial hospital Quetta (SPH) and

Baluchistan institute of nephrology and urology Quetta (BINUQ), data was collected from March - May 2016. A self-design questionnaire was used to measure demographics, disease condition and co morbidities of haemodialysis patients and EQ-5D EuroQol UK (English) questionnaire has been used in this study to measure HRQoL. The statistical analysis was performed by using SPSS v 20. **RESULTS:** One hundred eighty-five (185) patients were included in the study which was the total available patients at time of study. EQ-5D index score was 0.46 and visual analog scale (VAS) was 0.45 which reveals poor HRQOL in haemodialysis patients. Regression model reported Gender, Marital Status, Education, occupation and Monthly Income Locality were not significantly associated with HRQOL ($p>0.05$) except Age group. Keeping Age group 18-28 year as reference, only two sub age groups were significantly associated and Odd Ratio (OR) showed that 38% HRQOL decrease with increasing age. However, HRQOL among male is 4% better than female **CONCLUSIONS:** In present study, the respondents showed poor HRQOL it is concluded if we increase the haemodialysis sessions from two to three sessions per week it may improve the HRQOL of the patients.

PMD87

UNWISE CHOICE OF PATIENTS UNDERGOING PERCUTANEOUS CORONARY INTERVENTION IN HONG KONG WHERE STENT CHOICE IS BASED ON PATIENTS' WILLINGNESS-TO-PAY

Yan BP[1], Chan LL[1], Chan CK[1], To OT[1], Wong MC[1], Reid C[2], Lee VW[1]
[1]*The Chinese University of Hong Kong, Shatin, Hong Kong,* [2]*Monash University, Melbourne, Australia*

OBJECTIVES: Percutaneous coronary intervention (PCI) in Hong Kong is self-financed (SF) and the choice between drug-eluting (DES) and bare-metal stents (BMS) is dependent on patient's willingness-to-pay. We aimed to evaluate the outcomes and factors associated with patient's choice of stents. **METHODS:** We retrospectively analyzed 2330 consecutive patients who underwent PCI between Sep 2009 and Dec 2013 at a tertiary academic institution. Baseline characteristics and 12-month outcomes including death, myocardial infarction (MI), target-vessel revascularization (TVR) and composite major adverse cardiac events (MACE) were evaluated among 2 groups of patients who chose DES (SF-DES) and BMS (SF-BMS). Independent predictors of DES use and MACE were identified using multivariate analysis. **RESULTS:** DES were used in 1,835 (78.8%) of SF-PCI. Patients who chose DES were less likely to have a history of stroke, MI, renal failure, heart failure and present with acute coronary syndrome and cardiogenic shock (all $p<0.01$). There was no significant difference in income and education level between SF-DES and SF-BMS subgroups. Number of treated lesions (Odds Ratio [OR] 1.29, 95% confidence interval [CI] 1.10-1.51) was an independent predictor of DES use. Patients with a history of MI, stroke, acute ST-elevation MI, current smoker and renal failure were more likely to choose BMS. There were significantly higher 12-month mortality (5.1% vs 2.6%), TVR (2.4% vs 0.8%), and MACE (8.5% vs 3.8%) in SFI-BMS compared to SFI-DES patients (all $p<0.01$). The use of DES was the only independent predictor of freedom-from-MACE at 12 month (OR 0.50, 95%CI 0.33-0.76, $p<0.01$). **CONCLUSIONS:** In a healthcare system where choice of stents is largely dependent on the patient's willingness-to-pay instead of clinical criteria, the less expensive and effective bare-metal stents remained to be used in some high risk patients and was associated with worse outcomes.

MEDICAL DEVICES/DIAGNOSTICS – Health Care Use & Policy Studies

PMD88

F-CALPROTECTIN USE IN INFLAMMATORY BOWEL DISEASE (IBD) IS CHARACTERIZED BY IMPROVED DIAGNOSTIC ACCURACY, LESS PATIENT HARM AND DECREASED COSTS, COMPARED WITH CONVENTIONAL SEROLOGICAL MARKERS AND COLONOSCOPY – THE US PERSPECTIVE

Joy V[1], Vora AA[1], Mascialino B[2]
[1]*Thermo Fisher Scientific, Portage, MI, USA,* [2]*Thermo Fisher Scientific, Uppsala, Sweden*

OBJECTIVES: Gastrointestinal disorders may exhibit overlapping symptoms making diagnosis difficult in primary care. Inflammatory bowel disease (IBD - prevalence <0.5%) is a chronic inflammation of the gastrointestinal tract. Irritable bowel syndrome (IBS) is a functional disorder without gastrointestinal inflammation (prevalence of 10-20%). Endoscopy is the gold standard to diagnose IBD vs. IBS, but due to IBD's low prevalence is negative in most of cases. Furthermore, colonoscopy is invasive, expensive, and uncomfortable for the patient and not without risks. F-Calprotectin (FC) is a fecal marker of intestinal inflammation. IBD patients exhibit FC levels significantly higher than the general population whereas IBS patients have FC levels higher than healthy controls, but significantly lower than IBD patients. Therefore, FC can be used as a pre-endoscopic test to differentiate between IBD and IBS. The present study evaluates the cost-effectiveness of a) FC compared to b) CRP+ESR, and c) colonoscopy to distinguish IBD from IBS in the US. **METHODS:** A Markov model was developed for each diagnostic strategy; using data from the published literature, 1.6% of the colonoscopies brought about complications, resulting in Emergency Room visits/surgery. Inadequate colon preparation (23%) and consequent repeated colonoscopies (30.3%) were also considered.Outcomes include cost savings, cost-per-corrected-IBD diagnosed, and colonoscopy reduction. Uncertainty was addressed with sensitivity analysis. **RESULTS:** FC results in a lower price (average cost/patient: FC =$426.4; CRP+ESR=$579.4; Colonoscopy=$771.5), and it reduces the number of unnecessary endoscopies (FC=736 colonoscopies avoided; CRP+ESR=722) and reduces the associated complication costs (FC=$1558, CRP+ESR=$1787, Colonoscopy=$4975), increasing the number of correctly diagnosed IBD (N=63) and IBS (N=26) patients. **CONCLUSIONS:** Results show that the usage of FC as pre-endoscopic diagnostic tool is associated with fewer colonoscopies and correctly identifies more disease while decreasing costs compared to the alternatives. Consequently, FC demonstrates superior value both from patient and payer perspective, while simultaneously increasing diagnostic efficacy.

PMD89

PREVENTIVE CARE SCREENING PATTERNS AMONG WOMEN WITH MEDICAID OR COMMERCIAL INSURANCE, 2010-2015

Bonafede MM[1], Miller JD[1], Winer I[1], Pohlman SK[2], Troeger KA[2], Herschorn SD[3]
[1]*Truven Health Analytics, an IBM Company, Cambridge, MA, USA,* [2]*Hologic, Inc., Marlborough, MA, USA,* [3]*Robert Larner College of Medicine at University of Vermont, Burlington, VT, USA*

OBJECTIVES: To describe the prevalence of breast, cervical and colorectal cancer screening among women with Medicaid or Commercial insurance from 2010-2015. **METHODS:** The Truven Health Analytics MarketScan Commercial and Medicaid Multi-State Databases were used to identify women aged 30-59 with continuous enrolment in either database from 2010 through 2015. The primary analysis outcome was the prevalence and frequency of mammography (age 40+), Pap (age 30+), HPV, and colonoscopy (age 50+); results were reported overall and by 5-year age strata. **RESULTS:** A total of 2,042,752 women with commercial insurance and 127,076 women with Medicaid were included in the analysis. Most commercially-insured women (82.0%) received at least one mammogram during the 6-year study period and 54.7% received at least three. One-third (35.3%) of commercially-insured women had a gap between mammograms of at least three years. The majority (78.8%) of commercially-insured women had a Pap test during the study period, though 42.1% had a gap of more than three years between Pap tests. Approximately one-half (45.1%) of commercially-insured women received at least one HPV co-test during the study period. Colorectal screening was more common among commercially-insured women ages 55-59 (63.6%) than 50-54 (28.5%). Two-thirds (61.7%) of Medicaid-insured women received at least one mammogram and one-fourth (23.7%) received at least three. Two-thirds (69.8%) of Medicaid-insured women had a gap between mammograms of at least three years. The majority (58.3%) of Medicaid-insured women had a Pap test during the study period, though 69.8% had a gap of more than three years between Pap tests. Approximately one-quarter (25.9%) of Medicaid-insured women received at least one HPV co-test. Approximately one-half (47.2%) of Medicaid-insured women ages 50-59 underwent colorectal screening during the study period. **CONCLUSIONS:** Patterns of preventive screening utilization vary by type of insurance coverage. Many women fail to access any screening services while others experience large gaps between exams.

PMD90

USE OF SCREENING TOOLS AND PATTERNS OF HEALTHCARE UTILIZATION AMONG PREGNANT WOMEN DIAGNOSED WITH PRETERM LABOR IN THE U.S. EMERGENCY DEPARTMENT SETTING

Sullivan E[1], Shen X[1], Petrilla A[1], Troeger KA[2], Byrne J[3]
[1]*Avalere Health LLC, Washington, DC, USA,* [2]*Hologic, Inc., Marlborough, MA, USA,* [3]*Santa Clara Valley Medical Center, San Jose, CA, USA*

OBJECTIVES: Fetal fibronectin (fFN) testing and transvaginal ultrasound (TVUS) are tools used to assess risk of preterm delivery among women with symptoms of preterm labor (PTL). Objectives were to assess patterns of care and timing of delivery among a cohort of pregnant women with symptomatic PTL; evaluate use of fFN testing and TVUS during the 5-months prior to delivery; and identify patient characteristics associated with utilization of fFN testing. **METHODS:** Retrospective cohort study using the MORE2Registry®, a nationwide multi-payer claims database covering 139 million lives. Study cohort included women who presented at the emergency department (ED) and were diagnosed with PTL from 6/1/2012–11/30/2015. Exclusion criteria: premature rupture of membranes, pre-eclampsia, viral infection, no record of infant delivery, and <5 months insurance coverage. Patient characteristics associated with use of fFN testing were identified using logistic regression modeling. **RESULTS:** 23,062 patients were included in study, of which 17,512 (75.9%) were discharged home following the ED encounter (20.1% delivered ≤3 days); the remaining 5,550 (24.1%) women were admitted to the hospital (91.3% delivered within that stay). Among those discharged home, 9.2% received fFN testing only, 16.4% received TVUS only and 5.0% received both tests during the 5 months prior to delivery. Among women who received fFN testing alone and were discharged home, 6.6% delivered within 3 days versus 21.6% of women who received only TVUS. Further, among women who were discharged home from the ED and had both fFN testing and TVUS during the five months prior to delivery, 4.7% delivered within 3 days. Key predictors of fFN testing included more frequent physician office visits and receipt of TVUS. **CONCLUSIONS:** Utilization of either TVUS or fFN for patients at risk of preterm delivery was low. Clinicians may consider fFN testing alone or in conjunction with TVUS to assist with evaluation and management of PTL patients.

PMD91

THE DETERMINANTS OF ADOPTION AND DIFFUSION OF INNOVATIVE NON-PHARMACEUTICAL TECHNOLOGIES ACROSS LIFE CYCLE: A SYSTEMATIC REVIEW OF QUANTITATIVE STUDIES

Callea G[1], Gautier L[2], Armeni P[3], Tarricone R[1]
[1]*Bocconi University, Milan, Italy,* [2]*University of Montreal, Montreal, QC, Canada,* [3]*CERGAS and SDA Bocconi, Milan, Italy*

OBJECTIVES: The proliferation and uneven diffusion of new medical technologies in recent years has been raising concerns on affordability and equity of care, inspiring the publication of scientific papers on the determinants of their adoption. The knowledge of the determinants spurring adoption and diffusion of innovative medical technologies is relevant for policymakers because it helps them implementing evidence-based health policies aimed at influencing the adoption of innovation, thus reducing inequities in uptake rates across areas and populations. We identified the empirical literature investigating the determinants of adoption and diffusion of innovative health technologies. Our goal is to discuss the existence of consensus on the direction and significance of the factors that influence their

adoption in each phase of technologies life cycle (i.e., early adoption, adoption, diffusion). **METHODS:** We performed a systematic review of quantitative empirical literature. **RESULTS:** We identified a total of 33 studies, published between 1977 and 2014. We conclude that early adoption of innovative technologies is positively affected by physicians' characteristics (e.g., experience with new technology by himself or by other physicians in the same hospital) and fee-for-service reimbursement scheme. The probability of adoption is mainly driven by provider's characteristics (e.g., size, importance of being perceived as technology leaders, previous adoption of similar/substitute technologies, strong medical staff involvement in acquisition decisions), by physicians' experience with the technology and by the new technology's expected impact on hospitals and physicians revenues. Socio-economic determinants (e.g., health expenditure), hospitals and physicians reimbursement schemes, market structure (e.g., number of providers, number of substitute procedures), providers' features (e.g., size, quality of care, reputation), and physicians' characteristics (e.g., experience with technology, innovator status of the team) significantly increase the extent of diffusion. **CONCLUSIONS:** Our results can be used as a guide by policymakers who wish to influence the adoption of new medical technologies with evidence-based decisions.

PMD92

NEW EUROPEAN MEDICAL DEVICE DIRECTIVE AND THE POTENTIAL CONSEQUENCES FOR US AND EUROPEAN MANUFACTURERS

Ehreth J[1], Mueller E[2], Neeser K[2]
[1]*LASER Analytica, Paris, France,* [2]*LASER ANALYTICA, Loerrach, Germany*

OBJECTIVES: Medical devices (MDs) must comply with the EU directives and be CE marked before entering the European market. Despite these high requirements, several serious health risks have been observed during the past years, which were initiated by implanted MDs. These incidents have caused the European Commission to revise the Medical Device Directives (MDD). The implementation of the new MDD will affect the stakeholders like manufacturers, regulatory bodies, physicians, and patients in Europe as well as in the US. Aim of this work was to assess the consequences of the new MDD with regard to the stakeholders and to estimate their potential occurrence rate. **METHODS:** A SWOT analysis has been performed to identify the strengths, weaknesses, opportunities and threats of the new MDD followed by a risk analysis. **RESULTS:** The SWOT analysis revealed two types of consequences of the new MDD: Immediate consequences that are associated with a high probability of occurrence like an increased workload and higher product development costs for manufactures, improved product safety for patients, enhanced pool of medical evidence for regulatory bodies and physicians. Potential indirect consequences of the new MDD, which are less likely or even unlikely, are consequences regarding a delayed market access of new products, a higher co-payment for patients using MDs, a discrimination of diseases with a low prevalence as well as a negative impact on the development of innovative products. **CONCLUSIONS:** For US and European stakeholders the implementation of the new MDD will result in a benefit, especially for patients and regulatory bodies. Nevertheless, an extended regulation may also cause unfavorable consequences. Therefore, and even though the implementation of the new rule will take a few years, it is important that manufacturer anticipate hidden consequences as early as possible. Therefore, the findings of the SWOT analysis are the basis for the development of strategic scenarios.

PMD93

ASSESSMENT OF NEW MEDICAL DEVICES WITH ADMINISTRATIVE DATABASES: THE NEED FOR TRACEABILITY

Callea G[1], Cavallo MC[2], Tarricone R[1]
[1]*Bocconi University, Milan, Italy,* [2]*Bocconi University, Milano, Italy*

OBJECTIVES: Administrative data (e.g., hospital discharge databases HDDs) can be used as a real world source of clinical and economic evidence for assessing new medical devices (MDs), providing that their use can be identified in the data. In absence of updated classification systems for procedures and diagnoses, which allow to identify the use of new technologies in the data, traceability can still be achieved thanks to authorities' coding guidelines (i.e., indication on how to combine the existing codes for procedures and/or diagnoses when new technologies are used). In 2009 Italy adopted version 2007 of the ICD-9-CM classification system and version 24 of DRGs, which are still in use. The rapid pace of innovation characterizing MDs poses a serious problem of traceability of their use in administrative data. The aim of this work was to investigate the capacity of the classification system currently used in Italy to identify innovative MDs. **METHODS:** We searched all the national and regional coding guidelines published from 2009 (i.e., the year of introduction of the new classification systems) to 2015. We extracted from each document the list of technologies for which the Ministry of Health and/or the Regional Authorities provided with coding indications. **RESULTS:** Our results show that only few recent technological innovations can be identified in the Italian HDDs. This reduces the possibility for Decision Makers to measure new technologies' outcomes and costs in the real world clinical practice. **CONCLUSIONS:** A better traceability of new MDs would provide a valuable support to the new Italian Health Technology Assessment Programme. Indeed, having the possibility to identify their use in HDDs would real-world assessment and re-assessment of MDs 2-3 years after their introduction.

PMD94

CHARACTERISTICS ASSOCIATED WITH HAVING A BREAST CANCER SCREENING TEST AMONG WOMEN 50 TO 74 YEARS OLD IN THE UNITED STATES

Zhang S, Thomas III J
Purdue University, West Lafayette, IN, USA

OBJECTIVES: The U.S. Preventive Services Task Force recommends that women 50 to 74 years old with average risk for breast cancer have a mammogram every 2 years. This study assessed characteristics associated with having a mammogram. **METHODS:** A sample was drawn from 2014 Medical Expenditure Panel Survey (MEPS) data. Inclusion criteria were being female and 50 to 74 years of age. Exclusion criteria were a self-reported diagnosis of breast cancer or missing data on any study variables. Receipt of a mammogram was captured in the MEPS through a question that asked respondents how long it had been since their last mammogram. A binary variable was created to indicate whether each respondent had a mammogram within the past 2 years, it was the response variable in analysis. Association with having a mammogram in the past 2 years was assessed for the variables age, race, educational level, marital status, and insurance coverage. Multivariate logistic regression was used to assess association between selected characteristics and having a mammogram. The MEPS sampling weights adjusted for the complex survey design. **RESULTS:** A sample of 4,070 women met study criteria. Mean ($\pm$ standard deviation) age was 59.9 $\pm$ 6.7 years. The sample was predominately white (66.8%). The prevalence of having a mammogram within the past 2 years was 77.4 percent (95% CI=76.1 to 78.7 percent). Women with a college degree (Odds Ratio=1.57, $p<0.001$), married women (Odds Ratio=1.47, $p<0.001$), and those with insurance coverage (Odds Ratio=3.82, $p<0.001$) had higher likelihood of having a mammogram in the past 2 years. No significant association was found between age, race, and use of mammogram. **CONCLUSIONS:** Over three-quarters of women met the breast cancer screening recommendation for mammograms. Having a college degree, being married, and having insurance coverage were associated with higher likelihood of using the mammogram test.

PMD95

U.S. PAYER ASSESSMENT OF LATE STAGE CLINICAL TRIALS INVOLVING DIGITAL HEALTH TECHNOLOGIES AND PHARMACEUTICAL MANUFACTURERS

Parcher BW[1], Shamseddine N[1], Polston M[2], Gaiser A[3], Walters T[1], Campbell CM[1]
[1]*Xcenda, Palm Harbor, FL, USA,* [2]*Butler University, Indianapolis, IN, USA,* [3]*Duquesne University School of Pharmacy, Pittsburgh, PA, USA*

OBJECTIVES: We investigated US payer perceptions of collaborations between digital health technologies (DHTs) and pharmaceutical manufacturers (PMs) currently undergoing late-stage FDA trials. Our aim was to determine reimbursement implications based on an assessment of trial design and stated health outcomes. **METHODS:** A 5-part analysis was administered to members of Xcenda's Managed Care Network. Respondents were asked to evaluate 4 clinical trials, each including a DHT/PM intervention, across 4 disease categories: age-related macular degeneration, type 1 diabetes, atrial fibrillation, and human immunodeficiency virus. For each study, respondents were given a summary trial report and asked to assess study parameters using a 5-point Likert scale. Responses were tallied for each parameter, and scores were assessed based on ratings of $\geq$4 on the Likert scale (top-2-box method). Respondents were also asked to rate research activities that would add value to payer appraisals for each technology. Finally, a willingness-to-pay score was derived based on the technologies meeting their stated clinical endpoints. **RESULTS:** 43 respondents completed the assessment, representing 168 million covered lives in the US. All participants were active members of their organization's pharmacy & therapeutics committee. The atrial fibrillation, mobile monitoring study was rated the highest top-box score in terms of "willingness-to-pay" (44%) and "overall study quality assessment" (37%). While "appropriateness of study population" was rated highly across all studies (65% average), "demonstration of improved patient outcomes" was rated as the lowest parameter in quality (32%). The top 3 supplemental research activities recommended overall were the addition of a claims-based analysis (49%), long-term follow-up (47%), and development of a cost-effectiveness model (41%). **CONCLUSIONS:** This study has yielded insight for how DHT/PM partnerships can best convey the value of their technologies to US payers. Obtaining additional evidence generation via real-world analysis and demonstrating improvements in patient outcomes may represent viable opportunities for technologies to obtain favorable coverage decisions.

PMD96

SURGICAL AORTIC VALVE REPLACEMENT 90-DAY EPISODE OF CARE ANALYSIS

Reifenberger M, Moore M
Edwards Lifescience, irvine, CA, USA

OBJECTIVES: The CMS Innovation Center (CMMI) has a growing number of models that test payment and service delivery to achieve better care for patients at lower cost. Among these are episode-based payment models (i.e. bundled models) where participants are accountable for the cost and quality of care provided to Medicare fee-for-service beneficiaries during the inpatient stay and 90-days after discharge. The objective of this analysis was to determine average Medicare expenditures from index hospitalization through 90 days for surgical aortic valve replacements (SAVR) compared to existing mandatory orthopedic and cardiovascular episode of care models from CMMI. **METHODS:** Utilizing the 100% SAF Medicare file we identified index hospitalizations anchored by MS-DRGs that align with the episodes of interest. Medicare expenditures for the index hospitalization, readmissions, post-acute care, outpatient care, and physician services occurring within 90 days of discharge were analyzed. Descriptive statistics were used to compare and contrast the spending across each episodes of care **RESULTS:** 90-day episode of care average spending for SAVR [$62,912] was higher than current CMMI orthopedic and cardiovascular [CABG $46,510, AMI PCI $25,976, AMI Medical $27,536] episodes of care. Considerable variation across procedures existed with the most striking difference occurring in the index hospitalization. For SAVR procedures, 78% of spending is concentrated in the index hospitalization versus current CMMI cardiovascular and orthopedic models [range from 45% to 75%] where the distribution of spending is more evenly dispersed across other settings-of-care. For SAVR, post-acute care represented 6% while readmissions accounted

for 7% of the 90-day expenditures. **CONCLUSIONS:** The high percentage of spending on SAVR in the inpatient setting (78%) may create a challenge for a bundled payment model. Conditions with high post-acute care and readmission rates could be better targets for testing bundled payments and offer providers more opportunities to improve care and lower Medicare spending.

PMD97

BUDGET IMPACT ANALYSIS OF P4HB VS PERMANENT SYNTHETIC MESHES IN COMPLEX ABDOMINAL WALL REPAIR IN AUSTRIA, GERMANY, UK, SPAIN AND SWITZERLAND IN THE HOSPITAL SETTING

Busutil R[1], Tripodi D[2], Heitmann T[3], Pswarayi C[4], Dawson D[4], Corral M[5]
[1]*Bard España SA, Barcelona, Spain,* [2]*C.R. Bard Inc, Warwick, RI, USA,* [3]*C.R. Bard GmbH, Karlsruhe, Germany,* [4]*CR Bard Inc., Crawley, Sussex, UK,* [5]*C.R. Bard Inc., Murray Hill, ON, Canada*

OBJECTIVES: Despite advances in surgical technique and prosthetic technologies, the risks for recurrence and infection are high following the repair of incisional ventral hernias. The current standard for reinforced hernia repair is synthetic mesh, which may reduce the risk for recurrence in many patients. Patients with comorbidities, contaminated wounds or previous wound infections experience higher rates of surgical site occurrences/infections (SSO/SSI). Mesh choice in Complex Abdominal Wall Repair (CAWR) may have an impact on short and long-term patient outcomes. The aim of this study was to analyze the economic consequences of P4HB Mesh use versus Permanent Synthetic Meshes in CAWR, under the perspective of the Austrian, German, UK, Spanish and Swiss National Health Systems. **METHODS:** A dynamic excel-based decision-analytic model was developed to assess the Budget Impact of P4HB Mesh in Complex Abdominal Wall Repair. For each Synthetic Mesh comparator, variables on efficiency were set as Hernia Recurrence, Infected Mesh Explantation, Wound Infection and Seroma. The analysis covered an 18 month time horizon and assumed 100% use for each technology. Public databases, as well as published and grey literature were used to estimate model input data. In the base case, a price difference of +1,700€ for P4HB mesh was considered. A tornado analysis was conducted for verification. **RESULTS:** Compared to Permanent Synthetic meshes, use of P4HB mesh in CAWR resulted in cost savings of 1,596€/1,514€/1,476£/1,376€/2,408€ per procedure in Austria/Germany/UK/Spain/Switzerland, respectively. The sensitivity analysis showed robust results for P4HB mesh, even in the most complex scenarios. **CONCLUSIONS:** Compared to Permanent Synthetic meshes, use of P4HB mesh may lead to potential cost savings in CAWR. Further research is needed in order to better assess rates of clinical complications, as well as the appropriate patient groups where P4HB technology would be most beneficial for patients and health systems

PMD98

COST SAVING ANALYSIS FOR A BIPOLAR SEALER (BS) DEVICE DURING HEPATIC AND SPINE SURGERY COMPARED TO STANDARD MONOPOLAR ELECTROSURGERY IN COLOMBIA

Rodriguez A[1], Orozco JJ[2], Lopez A[3]
[1]*Fundacion Santa Fe de Bogota, Bogota, Colombia,* [2]*Medtronic PLC, Medellín, Colombia,* [3]*Medtronic PLC, Bogota, Colombia*

OBJECTIVES: Perioperative blood loss and transfusion are important concerns in complex surgeries. Blood loss is associated with higher incidence of complications, transfusion rates, longer Length of Stay (LOS) and operating room time. The BS claims reduced intraoperative bleeding, lower transfusion rates and faster recovery times. This work estimates cost savings in spine fusion and hepatic surgeries using a low temperature RF Bipolar sealer versus standard monopolar electrosurgery (SME) from a Colombian provider perspective. **METHODS:** An Excel cost-saving model was developed to assess the differential cost of using BS during spine fusion and hepatic surgeries, compared to SME. Variables included were transfusion rate, transfusion rate LOS, comparators related LOS, operating room time, direct costs of technologies, opportunity costs for operating room, hospital bed, and blood units. Clinical inputs were populated via a systematic literature search. Opportunity costs were estimated with hospital administrator, KOL input and the official Colombian tariff manual. **RESULTS:** One partial hepatectomy and four spine surgery reference clinical publications were reviewed for this analysis. Spine procedures included Lumbar posterolateral, posterior spinal-fusion for degenerative lumbar scoliosis, posterior spinal-fusion for adolescent idiopathic scoliosis, and multilevel spinal-fusion surgery. For hepatectomy cases, there were cost savings in all cost categories, cost technology difference, blood bank, operating room and LOS, with USD$ 2.138 total saving per procedure. For spine-fusion surgeries, costs were higher (USD$ 255,2) for BS in cost technology difference, however they were offset by the lower costs in the blood bank, operating room and LOS. Dependent upon the type of spine surgery, total savings ranged from USD$ 78 to USD$ 2.327 per procedure. In all reviewed clinical works, lower blood loss was reported (-19% to -55%), compared to SME. **CONCLUSIONS:** The use of BS during Hepatectomy and fusion-spine surgeries could represent important savings from the Hospital perspective compared to SME.

PMD99

OVERSUPPLY OF CT AND MRI EQUIPMENT, BUT UNDERSUPPLY OF MAMMOGRAPHY EQUIPMENT IN JAPAN

Hamashima C
National Cancer Center, Tokyo, Japan

OBJECTIVES: The OECD has reported an oversupply of CT and MRI equipment in Japan compared with other developed countries. We investigated current situation of CT and MRI equipment compared with that of mammography equipment in Japan. **METHODS:** We compared the 1) trend in the total numbers of CT and MRI equipment and examinations with the total numbers of mammography equipment and examinations using data from the Medical Institution Survey in Japan, and 2) the total numbers of CT, MRI, and mammography examinations per 100,000 individuals (women for mammography). **RESULTS:** The total numbers of CT and MRI equipment and examinations have increased over the last decade. Compared with the total numbers in 1996, the numbers of CT and MRI equipment have increased 1.4 and 2.5 times, respectively. The total numbers of examinations was 5.8 times for CT and 10.3 times for MRI. From 2008 to 2011, the total numbers of mammography equipment and examinations increased by 10% (the national data before 2005 could not be obtained). The national average number of equipment per 100,000 individuals was 6.2 for mammography, 10.2 for CT, and 4.7 for MRI. The national average number of examinations per 100,000 individuals was 7,983 for mammography, 22,464 for CT, and 10,627 for MRI. In all the 46 prefectures (excluding Fukushima), the numbers of equipment and examinations per 100,000 individuals were always higher for CT than for mammography. The number of MRI equipment per 100,000 individuals was higher than that of mammography equipment in 9 prefectures. The number of MRI examinations per 100,000 individuals was lower in 9 prefectures than that of mammography examinations. **CONCLUSIONS:** CT and MRI examinations have increasingly been performed in Japan compared with mammography examinations. Notably, the supply of mammography equipment has not markedly increased compared with the supply of CT and MRI equipment.

PMD100

A U.S. HOSPITAL BUDGET IMPACT ANALYSIS OF A SKIN CLOSURE SYSTEM COMPARED WITH STANDARD OF CARE IN HIP AND KNEE ARTHROPLASTY

Sadik K[1], Flener J[2], Gargiulo J[3], Graves M[4], Nunley RM[5], Post Z[6], Wurzelbacher SJ[7], Sutton N[1], Hogan A[8], Hollmann S[8], Ferko N[8]
[1]*Ethicon Inc., Somerville, NJ, USA,* [2]*Proliance Orthopedic Associates, Renton, WA, USA,* [3]*Anderson Orthopedic Clinic, Arlington, VA, USA,* [4]*St. Louis Home Health, Inc, St. Louis, MO, USA,* [5]*Washington University in St. Louis, St. Louis, MO, USA,* [6]*Sidney Kimmel Medical College at Thomas Jefferson University, Philadelphia, PA, USA,* [7]*Trihealth Orthopaedic and Sports Institute, Cincinnati, OH, USA,* [8]*Cornerstone Research Group Inc., Burlington, ON, Canada*

OBJECTIVES: CMS' mandatory bundle for hip and knee arthroplasty necessitates provider accountability for quality and cost of care to 90-days. Wound closure is a key area to consider within hip and knee arthroplasty. The DERMABOND® PRINEO® Skin Closure System combines a topical skin adhesive with a self-adhering mesh without the need for dressing changes or suture or staple removal. This study estimated the budget impact of DERMABOND PRINEO System compared to other wound closure methods for hip and knee arthroplasty. **METHODS:** A 90-day economic model was developed assuming 500 annual hip/knee arthroplasties for a typical U.S. hospital setting. In current practice, wound closure methods for the final skin layer was set to 50% sutures and 50% staples. In future practice, this distribution shifted to 20% sutures, 20% staples, and 60% DERMABOND PRINEO System. Healthcare resources included materials (eg, staplers, steri-strips, and traditional/barbed sutures), standard or premium dressings, outpatient visits, and home care visits. An Expert Panel, comprised of 3 orthopedic physician assistants, two orthopedic surgeons, and a home health representative, was used to inform several model parameters. Other inputs were informed by national data or literature. Unit costs were based on list prices in 2016 USD. **RESULTS:** The analysis predicted that use of DERMABOND PRINEO System could achieve cost savings of $56.70 to $79.62 per patient, when standard or premium wound dressings are used, respectively, with sutures or staples. This translated to an annual hospital budgetary savings ranging from $28,349 to $39,809 when assuming 500 arthroplasties. Dressing materials and post-operative healthcare visits were key drivers of the results. **CONCLUSIONS:** Based on the results of this analysis, it is anticipated that the DERMABOND PRINEO System may provide cost savings within hip and knee arthroplasties due to decreases in resource utilization in the post-acute care setting.

PMD101

COST-EFFECTIVENESS ANALYSIS OF THE DIAGNOSIS OF MUCOSAL LEISHMANIASIS IN COLOMBIA

Castillo-Rodríguez L[1], Ovalle-Bracho C[2], Díaz-Jiménez D[1], Sánchez-Vanegas G[2], Muvdi-Arenas S[2], Castañeda-Orjuela C[1], De la Hoz Restrepo F[3]
[1]*Instituto Nacional de Salud, Bogotá, D.C., Colombia,* [2]*Hospital Universitario Dermatológico Federico Lleras Acosta, Bogotá, D.C., Colombia,* [3]*Universidad Nacional de Colombia, Bogotá, D.C., Colombia*

OBJECTIVES: To estimate the cost-effectiveness of available diagnosis alternatives for Mucosal Leishmaniasis (ML) in suspected patients. **METHODS:** A simulation model of the disease's natural history was built with a decision tree and Markov Model. The model's parameters were identified by systematic review and validated by expert consensus. A bottom-up costing analysis to estimate the costs of diagnostic strategies was performed reviewing 48 clinical records of patients diagnosed with ML. The diagnostic strategies compared were: 1) no diagnose; 2) Parasite culture, biopsy, indirect immunofluorescence (IFI) and Montenegro in parallel; 3) Parasite culture, biopsy, IFI in parallel; 4) PCR-miniexon and 5) PCR-kDNA. Three scenarios were modeled in people with clinical suspicion, according of ML prevalence: high, medium and low. For each alternative, the costs and results were estimated. The time horizon was the life expectancy, taking as average age of diagnosis 31 years. Incremental cost-effectiveness ratio (ICER) was calculated per DALY avoided, and sensitivity analyzes were performed. It was considered a threshold of three GDP per capita and all costs were reported in American dollars of 2015 **RESULTS:** The PCR-miniexon was the most cost-effective alternative in the level low clinical suspicion, with an ICER of US$ 3,380.88. At medium and high clinical suspicion levels, the most cost-effective strategy per additional DALY was the PCR-kDNA with ICERs of US$ 2,915.04 and US$ 3,210.28, respectively. **CONCLUSIONS:** Diagnostic tests for ML based on PCR are cost-effective strategies at a willingness to pay of three GDP per capita for DALY avoided, regardless level of

clinical suspicion. The PCR-kDNA was the most cost-effective strategy in the competitive scenario, with the parameters included in the present model.

PMD102

FACTORS INFLUENCING ATTITUDES TO BREST CANCER SCREENING

Horváthné Kívés Z, Ribarics I, Endrei D, Boncz I
University of Pécs, Pécs, Hungary

OBJECTIVES: The purpose of our research was to reveal the motivational and restraining factors that prevail on screening participation and to examine the knowledge of the respondents on breast cancer, breast cancer screening among women attending screenings. **METHODS:** Quantitative cross-sectional study was carried out in 2016 at the Breast Centre of the Radiology Clinic, University of Pécs, among women between 45-65 years, who attended on mammography with an invitation letter or medical referral Patients with a diagnosis of breast cancer or other malignant diseases were excluded (n=333). The question groups of the questionnaire were: sociodemographic data, reasons for examination, attitude, knowledge about breast cancer and breast screening. Besides descriptive statistical analysis χ2-test, ANOVA, Kruskall Wallis, Mann-Withney test, logistic regression were applied ($p<0.05$) with SPSS 20.0 program. **RESULTS:** Most respondents (73%) were influenced by their environment to participate on breast screening. However, they are more afraid of finding some kind of lesion compared to other patients without complaints (p=0.002). Those living in a relationship are more likely to participate on mammography within two years (ß=0.649, p=0.041; OR=1.91, 95%CI [1.02; 3.57]. The unpleasantness of the test was considered as the most important among the restraining factors. 283 women (85%) failed to recognize the symptoms of breast cancer. The knowledge of breast cancer symptoms is a protective factor for screening regarding absence (ß =1,225, p=0.029; OR=0.29, 95%CI [0.09, 0.88.] Risk factors of breast cancer were completely listed only by a few patients from the sample, 6.3%. The main source of information was the gynecologist (33.7%). **CONCLUSIONS:** The current value of breast cancer screening appearance is around 50%, still below the expected level (70%). The expansion of population knowledge, efforts to decrease the negative experience about the examination, the organization of fast and flexible screening service can support the achievement of this goal.

PMD103

STUDY ON THE EFFECT OF COMBINED USE OF A REMOTE MONITORING PILLBOX, MULTI-DOSE BLISTER PACKAGING, AND AUTOMATED REMINDERS ON MEDICATION ADHERENCE IN PATIENTS ON LIPID LOWERING, ANTIHYPERTENSIVE, OR ORAL DIABETES THERAPIES

Gooneratne N[1], Smith-McLallen A[2], Brooks R[2], Valilis N[3], Jain R[3], Cerciello E[3]
[1]*University of Pennsylvania, Philadelphia, PA, USA,* [2]*Independence Blue Cross, Philadelphia, PA, USA,* [3]*TowerView Health, Philadelphia, PA, USA*

OBJECTIVES: To assess the efficacy of a multi-modal, remote monitoring intervention on medication adherence of patients previously nonadherent to therapy (proportion of days covered (PDC) <80%) according to Independence Blue Cross claims data. **METHODS:** Patients with ongoing care at Penn Medicine, taking 4+ chronic oral medications, and established nonadherence to lipid lowering, antihypertensive, or oral diabetes therapies were invited to participate in the randomized controlled trial. Consenting patients were randomized to treatment or control arms and observed for 6 months. Patients in the treatment group received a commercially available service that includes 1) aligning the patient's medication regimen into weekly multi-dose blister packages that insert into 2) a remote monitoring pillbox that alerts the patient with lights, sounds, phone, or text message reminders when a dose is missed and 3) relays adherence information to study staff for outreach if <80% of doses are taken for three consecutive days. Patients in the control group received usual care without reminders or outreach. **RESULTS:** Treatment (N=17) and control (N=33) groups were well-matched for demographics and adherence prior to randomization. In the 12 months prior to index date, the treatment group had an average PDC of 70.4% vs. 69.5% for the control group. All patients in the treatment group moved from non-adherent (PDC<80%) in the prior period to adherent in the treatment period across all drug classes of interest with number of on-time refills moving to 98%. At 6 months, treatment patients had higher rates of therapy persistence at 91.3% remaining persistent at 6 months vs 61.8% for control (Log-rank $p<0.05$). Potential covariates age, gender, education level, and race were not statistically significant in predicting early therapy termination. **CONCLUSIONS:** Patients on the intervention demonstrated significant and sustained improvements in medication adherence. Further testing should be done to determine the effectiveness of the approach on clinical outcomes and cost related measures.

PMD104

TOPICAL HEMOSTAT TRENDS AND FACTORS ASSOCIATED WITH UTILIZATION IN KNEE AND HIP ARTHROPLASTY

Etter K[1], Danker III W[2], Kocharian R[2], Yoo A[1]
[1]*Medical Device - Epidemiology, Johnson and Johnson, New Brunswick, NJ, USA,* [2]*Ethicon, Inc., Somerville, NJ, USA*

OBJECTIVES: Examine trends in topical hemostat utilization and factors associated with use in knee and hip arthroplasty. **METHODS:** The Premier Perspective® Database containing billing data from over 700 hospitals in the U.S. was analyzed. Patients age 21 or older who underwent an inpatient total knee or hip (total or partial) arthroplasty or revision surgery, from 2009 to 2014 were identified. Topical hemostat utilization was identified searching the free text fields of the hospital billing record. Categories of hemostats included: fibrin sealant, flowable, synthetic sealant, thrombin, Oxidized Regenerated Cellulose (ORC), gelatin or plant based, and patients with a combination of hemostats. Patient, provider, and procedure factors associated with use of any topical hemostat were explored in a multivariable model. All statistical analysis accounted for clustering of patients within hospital; p-values <0.05 were considered significant. **RESULTS:** 932,243 patients were identified. A majority were knee procedures (60.1%), almost a fifth of hip procedures were partials (19.5%), and revision procedures account for a similar percent in both groups (knees 8.2%, hips 9.7%). The majority of patients were female (60.9%), had an elective procedure (86.1%), and were seen at an urban hospital (90.0%). Ten percent of patients received a topical hemostat, with the top three being thrombin (52.8%), fibrin sealant (19.5%), and flowable (18.8%). Usage of topical hemostats was relatively stable over the study period. Factors associated with hemostat usage included: diagnosis of a bleeding disorder (OR=1.3[95% CI(1.1-1.6)]), having a transfusion prior to surgery (OR=1.3 [1.2-1.4], undergoing an elective surgery (OR=1.2[1.1-1.2]), ischemic heart disease (OR=1.2[1.0-1.3]), peripheral vascular disorders (OR=1.2[1.1-1.2)], and arthritis (OR=1.1[1.0-1.1]). **CONCLUSIONS:** Topical hemostat usage has been stable between 2009 and 2014. Elective surgeries, transfusions prior to surgery, ischemic heart disease, peripheral vascular disorders, and arthritis where associated with receiving a topical hemostat. Further research is warranted on the impact of topical hemostats in these procedures.

PMD105

THE EFFECTS OF VARIOUS BLOOD SAMPLING TECHNIQUES AND EQUIPMENTS ON BLOOD TEST

Csonti R[1], Müller Á[1], Pakai A[2], Szabó L[1], Stromájer-Rácz T[1], Knisz J[1], Boncz I[1], Oláh A[1]
[1]*University of Pécs, Pécs, Hungary,* [2]*University of Pécs, Zalaegerszeg, Hungary*

OBJECTIVES: In laboratory diagnostics, 70% of errors occur in the preanalytical phase. Our purpose was to identify factors that increase hemolysis in blood samples collected from intravenous catheters and to examine whether incorrect order of draw results in biased test results. **METHODS:** This quantitative, cross-sectional study was carried out in Karolina Hospital, Mosonmagyaróvár, Hungary between September 1. and November 30, 2016. Volunteers were selected by non-randomized purposive sampling. Blood was collected from 120 volunteers using intravenous catheters of various sizes (18, 20, 22 and 24G). During phlebotomy the following parameters were recorded: catheter size, tourniquet time, difficulty of phlebotomy, blood flow through the cannula, site of cannula insertion. Data were analyzed using descriptive (absolute and relative frequency, median, interquartile range – IQR) and mathematical (χ2-test, Mann- Whitney U tests, linear and logistic regressions) statistical analyses ($p<0.05$). **RESULTS:** The rate of hemolyzed samples was 13.3% (16/120). Hemolysis was significantly increased by the use of intravenous cannula 22-24G (OR: 3.638, 95% CI: 1.101-12.027, $p<0.05$), tourniquet time over one minute (OR: 4.256, 95% CI: 1.286-14.087, $p<0.05$) and site of blood draw distal to the antecubital fossa (OR: 6.143, 95% CI: 2.023-18.653, p<0,05). Increased tourniquet time resulted in increased LDH (r=0.226, p=0.013) and CK (r=0.248, p=0.006) levels. **CONCLUSIONS:** Using cannula >20G, tourniquet time longer than 1 minute and drawing blood from sites other than the antecubital fossa result in increased risk of hemolysis. Increased toniquet time also resulted in the increase of certain analytes.

PMD106

DIAGNOSTIC DELAY IN PATIENTS DIAGNOSED WITH COLORECTAL CANCER

Horváthné Kívés Z[1], Farkas A[2], Vajda R[1], Endrei D[1], Boncz I[1]
[1]*University of Pécs, Pécs, Hungary,* [2]*Kaposvár University, Kaposvár, Hungary*

OBJECTIVES: In developed countries, colorectal cancer is the second most common cause of cancer death involving both genders. The research aims to reveal that at which stage, with which symptoms patients with colon tumors are detected, and to estimate the duration of patient delay and its role in the prognosis of the disease. **METHODS:** A quantitative, rerospective document analysis was carried out, where patients diagnosed with colorectal cancer were analysed beween 2012 and 2016 in Komárom-Esztergom County (n=518). Collected data were: gender, age, histological type, stage, metastasis, symptoms, patient delay. Data were processed by SPSS 20.0 programme, applying descriptive statistical analysis, χ2-test, Mann-Whitney and Kruskal-Wallis test ($p<0.05$). **RESULTS:** 89% of tha patients are treated because of the malignant tumor of the rectum (adenocarcinoma). 63,9% of the patients are male (p=0,016). The average age is 64,8 years. 53.7% of the patients are diagnosed at stage III, when lymph node involvement also exists, and this rate is significantly higher in the 60-70 age group (p=0.016). The most frequent symptoms are blood in the stool (65.5%), weight loss (29.5%), diarrhea (19.7%) and pain (17.8%). In case of patients at stage III. the occurence of bloody stool (p=0.006), weight loss ($p<0.001$), and pain (p=0.015) is significantly higher. 36.1% of the patients visit the doctor with their symptoms after 3-6 months. 13,5% after more than a year. Regarding patients with stage IV. delay significantly (p=0.004) was longer. The delay was significantly longer in case of weight loss ($p<0.001$) and diarrhea ($p<0.001$), while the blood in the stool ($p<0.001$) the delay was shorter. **CONCLUSIONS:** The majority of patients are diagnosed with advanced tumors, which is clearly linked to the patient delay. Knowledge development of lifestyle influencing factors, awareness raising symptoms, and general medical oncology alertness may be an important moment of delay reduction.

PMD107

MHEALTH: HOW TO IMPROVE EFFECTIVENESS AND EFFICIENCY OF CANCER MANAGEMENT

Tarricone R[1], Cucciniello M[1], Armeni P[2], Petracca F[2]
[1]*Bocconi University, Milan, Italy,* [2]*CERGAS and SDA Bocconi, Milan, Italy*

OBJECTIVES: The continuous booming of mHealth allows the development of new models of care, and might revolutionize the overall delivery of care. However, evidence on the potential effects of mHealth is still scant and current literature

mostly focuses on chronic diseases. To address this research gap, we researched mHealth current utilization in cancer care and aimed at assessing the perceived impact of mHealth on clinicians and patients by comparing the opinions of those who use it with those of individuals that still do not use mHealth. **METHODS:** We carried out a survey on 1,033 cancer patients and 1,116 oncologists in 5 European countries (France, Germany, Italy, Spain and the UK) and the United States.The objective of the questionnaire was to assess the current State of the Art of mHealth in cancer care (how many use it and for which purposes) and the perceived mHealth performance with respect to several different dimensions: efficiency,clinical effectiveness, and quality of life. **RESULTS:** The proportion of Users among clinicians is higher than the one observed in the patient group (77% vs 28%).This gap takes place in all geographic areas. As to the impact of mHealth on clinicians'activities and on patients'overall quality of life, Users express a higher degree of agreement with the mHealth potential. Among Users, those who use mHealth more frequently and for symptom management and compliance enhancement express higher levels of perceived improvement. **CONCLUSIONS:** mHealth can provide a more accurate way of managing cancer care. Although evidence is not definitive on actual benefits, Users perceive higher levels of satisfaction with respect to efficiency, effectiveness and impact on overall quality of life. However, the actual spread of such technologies is still scarce, especially among patients, with very limited utilization for activities related to treatment and follow-up and with several barriers to be tackled,ranging from financial management to privacy concerns.

PMD108

DO HIGH-VOLUME ORTHOPEDIC SURGEONS HAVE LOWER REVISION RATE THAN LOW-VOLUME SURGEONS? A MEDICARE DATABASE ANALYSIS

Holy CE[1], Chitnis A[1], Wei D[2], Lerner J[3]
[1]*Johnson & Johnson, New Brunswick, NJ, USA,* [2]*Johnson & Johnson Co., New Brunswick, NJ, USA,* [3]*DePuy Synthes, Inc., Raynham, MA, USA*

OBJECTIVES: Surgical outcomes are thought to be superior for high- versus low-volume surgeons. This study was designed to evaluate whether an association exists between a surgeon's own surgical volume and revision rate. **METHODS:** Patients within Medicare's Standard Analytic File (SAF) Limited Data Sets who underwent total hip arthroplasty (THA) or total knee arthroplasty (TKA) from 2012 to 2014 were identified using Diagnosis-related Groups (DRGs) 469-470 and International Classification of Disease 9th edition procedure codes (ICD-9-PCS) 81.51 or 81.52 for THA and 81.54 for TKA. Patients who died within 12 months of index were excluded. Revisions within the 12-month follow-up were identified (THA revision: ICD-9-PC 81.53, 00.70, 00.71, 00.72, 00.73, and TKA procedure: 00.80, 00.81, 00.83, 00.84, 81.55). Two-year surgery volume and average revision rate per surgeon were calculated. Surgeons with < 10 procedures were excluded. Surgeons were grouped based on revision rates and volume of surgery (surgical volume decile: D_SV, revision rate decile: D_RR). Logistic regression was used to calculate odds of having a High_RR surgeon (top decile RR) as a function of procedure volume. **RESULTS:** A total of 9,446 and 9,507 TKA and THA surgeons were included. The one-year incidence of revision was 2.51% and 1.77% after THA and TKA, respectively. High_RR surgeons had revision rates $\geq$ 5.00% and 4.61% for THA and TKA, respectively. The proportion of High_RR in each D_SV decreased significantly as D_SV increased. From the lowest to the highest D_SV, the proportion of High_RR surgeons decreased from 25.3% to 1.81% for hips, and 20.72% to 0.11% for knees. The OR of having a High_RR surgeon in the lowest D_SV versus the highest was 5.50 (95%CI: 4.04-7.63) for hips and 40.92 (95%CI: 18.07-92.67) for knees. **CONCLUSIONS:** The proportion of surgeons with high revision rates was significantly greater in the lower surgery volume decile vs higher decile.

PMD109

PARTICIPATION ON ORGANIZED BREAST CANCER SCREENING PROGRAM AT THE MAMMOGRAPHY CENTER OF THE CLINICAL CENTER IN PÉCS (2011-2015)

Horváthné Kívés Z, Ribarics I, Vajda R, Endrei D, Boncz I
University of Pécs, Pécs, Hungary

OBJECTIVES: Our research aims to examine the participation rates of the invitees for breast screening and to reveal changes in the rate of participants on breast imaging tests in a five years (2011-2015) interval by data review, and to analyze ratio and changes in breast imaging examinations. **METHODS:** A quantitative retrospective research was carried out at the Mammography Center at the Clinical Center at the University of Pécs between 01.01.2011-31.12.2015 based on the documents of patient performance data reported monthly to the National Health Fund. We recorded the screening-, and other diagnostic imaging tests (ultrasound, invasive), the total of 177 575 investigations were analyzed. Descriptive statistical analyzes (absolute and relative frequency, distribution ratios) with Excel programme. **RESULTS:** During the five years a total of 84 474 persons appeared in radiological imaging examinations, the average age was 55.1 years. Participation rate of women who received invitation on mammographic screening was 23.7% in 2011, 17.7% in 2012, and 20.4% in 2013, in the year of the invitation or within two years. In 2015 performance relative to the patient population increased, as a result of the introduction of an extra shift per week. Under 34 years of age ultrasonography, over 66 years mostly diagnostic mammographic images are applied. The breast screening code reported cases in 2015 showed a decrease of 0.45%, diagnostic breast examination shows 4.72% increase compared to the previous quarter. Within the five-year average 45.09% of the examinations were reported as diagnostic tests, mammography screening represent 54.91%. **CONCLUSIONS:** The participation rates are below the known international screening programs and reference values. The target group following the invitation will appear in the test mainly for diagnostic purposes. More than 40% of women did not participate in mammography screening following the invitation.

PMD110

THE NEED FOR PAYER COVERAGE OF LARGE NEXT GENERATION SEQUENCING PANEL TESTING IN EPILEPSY: POTENTIAL FOR MISSED DIAGNOSES USING A SMALL GENE PANEL APPROACH

Spinner DS[1], Cardeiro D[1], Stanley CM[1], Le NM[1], Head HA[1], Scacheri CA[1], Schuette JL[1], Pineda-Alvarez DE[1], Zare AS[1], Smith D[1], Faulkner EC[2]
[1]*Courtagen Life Sciences, Inc., Woburn, MA, USA,* [2]*Evidera, Raleigh, NC, USA*

OBJECTIVES: Clinical guidelines and expert consensus agree on the importance of a molecular diagnosis that identifies the underlying genetic etiology of epilepsy. While close to 1000 genes have been linked to epilepsy (Wang et al. Seizure. 2016), payer coverage policies support testing only a small number of epilepsy genes. To evaluate the potential for missing the underlying molecular diagnosis in patients affected with epilepsy, we reviewed positive results from patients tested with large next generation sequencing (NGS) panels. Our goal was to identify diagnoses that would have been missed if only epilepsy genes supported by payer coverage policies had been tested. **METHODS:** We evaluated pathogenic variants in genes identified in 714 epilepsy patients tested in our lab with consent using comprehensive epilepsy gene panels ranging from 471 to 1000 genes. Pathogenic variants were classified according to ACMG guidelines (Richards et al., 2015). The cohort included patients with phenotypes ranging from simple epilepsy to complex epilepsy syndromes. We compared pathogenic genes identified in the cohort against a set of 35 epilepsy genes identified as covered in a review of published US payer policies. Deletion and duplication variants were not analyzed in this study. **RESULTS:** Eighty-eight patients who tested positive using comprehensive panels had variants identified in 41 different genes. Fifty-five percent (48 of 88) had variants in genes with established drug and dietary treatments, or avoidance (Hani and Mikati, 2016; Pearl, 2016; Balestrini and Sisodiya, 2017). When compared with the set of payer-covered epilepsy genes, diagnoses would have been missed in 35% of patients (31 of 88). Furthermore, 6% of these patients (2 of 31) had variants in genes with established treatments options. **CONCLUSIONS:** Our data suggest clinical utility associated with testing epilepsy patients using a large gene panel approach, and support the extension of payer coverage to many more epilepsy-associated genes.

PMD111

IDENTIFYING ATTRIBUTES OF PROSTHETIC DEVICES FOR USE IN A BENEFIT-RISK STUDY

Janssen EM[1], Benz H[2], Bridges JF[1]
[1]*Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, USA,* [2]*US Food and Drug Administration, Silver Spring, MD, USA*

OBJECTIVES: Through significant investment in novel technologies, upper-limb prostheses are rapidly increasing in functionality. These more advanced prostheses are expected to be submitted to the Unites States Food and Drug Administration (FDA) for regulatory review soon. Given recent guidance released by FDA, the benefit and risk tradeoffs patients are willing to make might be considered in regulatory review. We aim to demonstrate an approach for the identification of patient preference attributes for upper-limb prosthetic devices. **METHODS:** We engaged in evidence synthesis, expert consultation, and community engagement. To identify attributes, we conducted a targeted literature review and interviews with experts (n=10), and reviewed interviews with upper-limb amputees (n=7). We conducted a prioritization exercise through two focus groups with upper-limb amputees, end-users, and regulators and through a paper-based survey administered during a public meeting. Results from the exercise were analyzed using Best-Worst Scoring and rescaled on a 100 point scale. **RESULTS:** We identified 62 unique benefits, risks, and convenience attributes of upper-limb prosthetic devices. Based on expert input, we selected 16 risk items to be included in the prioritization exercise. 13 people participated in the focus groups and 34 people completed the prioritization survey. The four most influential risks were reliability (BWS score: 67.38, SE: 1.78), pain (65.78, SE: 1.62), infection (62.58, SE 1.55), and malfunction (62.41, SE: 1.70). The four least influential risks were MRI compatibility (32.09, SE: 1.68), time until use (31.38, SE: 1.80), training (30.85, SE 3.79), and outdated device (BWS: 29.96, SE: 1.78). **CONCLUSIONS:** This study documents rigorous development work for a stated-preference study in accordance with FDA's patient preference information guidance. It provides an approach that can be used by FDA reviewers to evaluate preference study design. Future studies will identify upper-limb amputees' willingness to trade between the benefit, risks, and practical aspects of prosthetic devices.

PMD112

TECHNOLOGICAL INNOVATION AND THE RATE OF CONCOMITANT CARDIAC PROCEDURES: THE CASE OF SURGICAL AORTIC VALVE REPLACMENTS (SAVRS)

Janczyk P[1], Moore M[1], Mumtaz M[2]
[1]*Edwards Lifesciences, Inc., Irvine, CA, USA,* [2]*PinnacleHealth Harrisburg Hospital, Harrisburg, PA, USA*

OBJECTIVES: Technological advancement in diagnosis and therapy has led to an increase in number of patients undergoing surgery for valvular heart disease. This has also increased the number of concomitant procedures. Patients commonly undergo coronary artery bypass grafting, mitral repair or replacement, tricuspid repair and arrhythmia ablation as part of their cardiac surgery. The purpose of this research is to use real world evidence from hospitals across the United States to summarize the procedural mix, patient demographics and comorbid conditions for patients having SAVR. **METHODS:** Hospital visits from the MedAssets database from 2010-2014 with a record of SAVR were included in this analysis. Differentiation between isolated SAVR versus concomitant procedures were determined via ICD-9 coding. Rates of isolated versus concomitant procedures were calculated across hospitals. Descriptive statistics for patient demographics and comorbid

conditions were generated for patients having isolated SAVRs versus concomitant procedures. **RESULTS:** A total of 42,049 SAVRs across 199 hospitals met the inclusion criteria. Over half 23,367 [56%] of all SAVRs were performed as a concomitant procedure. Average age for concomitant procedures were slightly higher than isolated [67.5 versus 66.9] with the majority [67%] of concomitant SAVR patients being 65 years of age or older. When examining the procedure mix within each age group, a slightly lower percentage of concomitant SAVRs are being performed in patients under the age of 65 vs. patients ages 65+ [53% versus 57%]. Patients with concomitant procedures are sicker with an average Charlson comorbidity index of 2.18 versus isolated SAVR patients' average score of 1.95. **CONCLUSIONS:** The majority of SAVRs being performed are concomitant procedures for both patients <65 and 65+ years of age, and concomitant patients are sicker than those having isolated SAVR. As surgical technological advancements continue, the fact that SAVR patients across ages are typically not having these procedures in isolation should be considered.

PMD113

THE CHOICE BETWEEN HIP PROSTHETIC BEARING SURFACES IN TOTAL HIP REPLACEMENT: COST-EFFECTIVENESS ANALYSES USING UK AND SWEDISH HIP JOINT REGISTRIES DATA

Fawsitt CG[1], Thom H[1], Nemes S[2], Hunt LP[1], Lopez-Lopez JA[3], Beswick AD[1], Burston A[3], Higgins J[1], Hollingworth W[1], Welton NJ[3], Rolfson O[4], Garellick G[4], Blom A[1], Marques EM[1]
[1]*University of Bristol, Bristol, UK,* [2]*Sahlgrenska University Hospital, Gothenburg, Sweden,* [3]*University of Bristol, Bristol, Sweden,* [4]*University of Gothenburg, Gothenburg, Sweden*

OBJECTIVES: Hip prosthetic implants used in primary total hip replacements (THR) have a range of bearing surface combinations (metal-on-polyethylene, ceramic-on-polyethylene, ceramic-on-ceramic, metal-on-metal); head sizes (small <36mm, large 36mm+); and fixation techniques (cemented, uncemented, hybrid, reverse hybrid), which influence prosthesis survival, quality of life, and healthcare costs. This study compares the lifetime cost-effectiveness of prosthetic implants to determine the optimal choice for patients of different age and gender profiles. **METHODS:** We developed a tunnel-state Markov model to compare implant combinations. Hip joint registries in the UK and Sweden were used to estimate the probability that patients require revision surgeries after primary THR across three time periods (0-2, 2-10, and 10+ years), for males and females aged <55, 55-64, 65-74, 75-84, and 85+ years. Implant, revision, and follow-up care costs were estimated from hospital procurement prices, national tariffs, and published studies. Quality-adjusted life years (QALYs) were calculated using utility estimates, taken from published studies. We calculated incremental net monetary benefits and generated cost-effectiveness acceptability curves. **RESULTS:** QALY benefits were similar between implants; rates of revision drove differences in cost and overall findings. Optimal choices varied mainly between traditionally used cemented metal-on-polyethylene and hybrid ceramic-on-polyethylene implants. Small head cemented metal-on-polyethylene implants were optimal for males 85+ and females 65 through to 84 years; large head cemented metal-on-polyethylene implants for females 85+; all with over 75% probability of being most cost-effective. Hybrid ceramic-on-polyethylene large implants were optimal for under 55s, with 54 and 25% probability of being most cost-effective for males and females, respectively. **CONCLUSIONS:** Our findings suggest that traditional implants are optimal for patients above 55, but the choice is considerably more uncertain for younger adults. Implant failure is a key cost driver. Further research into implant revision risks is recommended to reduce decision uncertainty.

PMD114

TRENDS IN DIAPYSIS MODALITY FOR PATIENTS WITH END-STAGE RENAL DISASE (ESRD) IN KOREA: 2003~2015

Son SK, Lee NR, Kim J, Sul AR, Kim YJ
National Evidence-based Collaborating Agency, Seoul, South Korea

OBJECTIVES: To assess trends in peritoneal dialysis (PD) and hemodialysis (HD) for patients with end-stage renal disease in Korea for the past thirteen years. **METHODS:** National administrative healthcare database in Korea from January 1, 2003 to December 31, 2015 was used. Patients who received dialysis for at least three months at that year were included as prevalence cases. Incidence cases were defined as patients who maintained the same modality for at least three months after starting PD or HD at that year. Trends in the number of patients, and medical cost in each year were assessed by dialysis modality. Age-adjusted rate per 100,000 of patients with PD or HD per year were also calculated based on 2015 Korea standard population. **RESULTS:** Regarding prevalence, while the number of HD was highly increased from 12,415 in 2003 to 46,233 in 2015, PD was slightly increased from 6,519 in 2003 to 8,962 in 2015; the rate of increase was 280.4% versus 37.5%. The rate of increase in total cost of HD in 2015 compared with 2003 was approximately four times higher than that of PD (426.7% versus 114.6%). In incidence cases, the number of HD increased by 84.3% in 2015 compared to 2003, but PD decreased by 27.1%. While total cost of HD increased by 270.6% in 2015 compared to 2003, those who received PD decreased by 4.0%. **CONCLUSIONS:** For the latest decade, HD was highly increased compared with PD in Korea, and medical cost of HD also increased dramatically. Therefore, further research is needed in order to investigate effective allocation of national healthcare resources on ESRD patients received dialysis.

PMD115

TECHNOLOGY ASSESSMENT OF THE EFFECTIVENESS AND CONVENIENCE OF SMART PUMPS IN NON CRITICAL HOSPITALARY SETTINGS

Ariza JG[1], Villamizar L[2], Varon M[1]
[1]*BAXTER, BOGOTA, Colombia,* [2]*Fundación Universitaria de Ciencias de la Salud, Bogota, Colombia*

OBJECTIVES: To assess the effectiveness and staff convenience of Smart Pumps in comparison with Standard Pumps for intravenous drug administration in non-critical hospitalary settings. **METHODS:** A systematic literature search was conducted following IETS recommendations, by using Medline, Cochrane Database of Systematic Reviews, Database of Abstracts of Reviews of Effects and LILACS. The search was restricted for Spanish, English or Portuguese, including indexed journal, humans, and preference for original studies. Titles and abstract were reviewed for first screening by one reviewer. Pre-selected full text articles had a second level screening by two additional reviewers. Relevant information was gathered in a predefined template. Because heterogeneity and qualitative nature of the information, results were presented in a narrative form. **RESULTS:** Six observational studies were found to fully met inclusion criteria and research question. Smart Pumps showed heterogeneous and different degrees of benefits in terms of the following outcomes: medication error avoidance, reduction in adverse events, improvements in medication adherence and better convenience for nursing staff. **CONCLUSIONS:** This technology assessment suggests that the usage of Smart Pumps, for intravenous drug administration in non-critical settings, could be an effective technology to improve medication errors, adverse events and adherence, while enhancing nursing staff convenience.

PMD116

STUDYING THE STATUS OF LUNG FUNCTION OF CARPENTERS IN QUETTA DISTRICT, PAKISTAN

Ahmed T[1], Rauf A[1], Iqbal Q[1], Waqas M[2], Minhas M[1], Jaffar F[1]
[1]*University of Balochistan, Quetta, Pakistan,* [2]*Hanyang University, Gyeonggi-do, Ansan, South Korea*

OBJECTIVES: The study was designed to assess the effect of wood dust on pulmonary system of carpenters. **METHODS:** The total number of 100 male carpenters age ranging from 18-50 years, more than one year work experience selected randomly from the wood industries in Quetta district, Pakistan. Data was collected by using self-questionnaire based on interview and Spirometric tests were carried out. Forced vital capacity (FVC), Forced expiratory volume over the first second (FVE1) and FEV1/ FCV ratio were observed and analyzed. To find statistically significant difference between the mean of groups by ANOVA test ($P < 0.05$) was observed on post hoc analysis (Tukey's multiple comparison analysis) by using SPSS 22. **RESULTS:** The total 100 carpenters were selected and divided in to four categories of age groups; out of which age group 18-27 years were 55 (55.0%), followed by age group 28-37 years 19 (19.0%), age group 38-47 years 15 (15%) and age group 48 years > 11 (11.0%). The mean of percentage predicted for (FVC) the group exposed to wood dust for less than 5 years was 57.8, exposure group 5-15 years the value was 63.63 and in exposure group 15 years & > 59.12. The mean of percentage predicted for (FEV1) in less than 5 years exposure group was 58.77, in exposure group 5-15 years was 67.29 and in exposure group 15 years & > was 67.15. The mean of percentage predicted for FEV1/FVC in exposure group < 5 years was 94.04, in exposure group 5-15 years was 94.23 and in the exposure group 15 years & > was 89.74 %. **CONCLUSIONS:** The finding of this study determined that the wood dust adversely affect the Pulmonary System and this damage is linked with the duration of exposure to wood dust. The study population related to the wood industries workers affected with the restrictive lung disease.

PMD117

EXAMINING UNCERTAINTY AROUND THE AMERICAN COLLEGE OF MEDICAL GENETICS (ACMG) RECOMMENDATIONS FOR NEWBORN SCREENING (NBS) FOR MEDIUM/SHORT CHAIN L-3-OH ACYL-COA DH DEFICIENCY (M/SCHAD)

Moon J, Rittenhouse B
MCPHS UNIVERSITY, Boston, MA, USA

OBJECTIVES: In 2006, ACMG published NBS recommendations. This research examines its reliance on expert survey scores about disease attributes. Scores determined an entry point to an algorithm (EPA) leading to recommendations; different EPAs led to different algorithm questions. **METHODS:** ACMG did not acknowledge uncertainty RE: scoring. We examine sampling uncertainty and uncertainty associated with missing responses, individually and jointly. We examine one condition, M/SCHAD (score, 1223), recommended as a Secondary Target. We use two questions with reported data: sensitivity/specificity of the test (SCREEN) and need for specialists in confirming diagnosis (CONF_DIAG). Missing data uncertainty uses boundary estimates based on potential scores for missing values; sampling uncertainty uses bootstrapping. Total scores < 1200 imply a new EPA and potentially a different recommendation. **RESULTS:** For CONF_DIAG alone, the EPA did not change due to any of the uncertainty assessments. When bootstrapping around the mean of the original data for SCREEN and around the lower boundary estimate, the EPA changes for 12.3% and 42.7% of the bootstrap cases, respectively. Because of the unique importance of SCREEN in the algorithm, the same percentages of cases implied that the recommendation would change to "not recommended". Combining both questions, resulted in similar percentages leading to a new EPA with potential changes in recommendations. **CONCLUSIONS:** The ACMG algorithm advantaged conditions with multiplex screening, so a new EPA generally did not matter - regardless of the total score, M/SCHAD would always be a secondary target recommendation. The notable exception is when the SCREEN score was < 100 where M/SCHAD would then be "not recommended." This result casts doubt on the recommendation for M/SCHAD but also on the entire ACMG process, highly insensitive to its survey results for all other questions.

PMD118

SMALL AND MEDIUM-SIZED ENTERPRISES: HOW DO THEY FARE IN THE UK MEDICAL TECHNOLOGIES EVALUATION PROGRAMME (MTEP)?

Ridley CJ, Marsh W
Costello Medical Consulting Ltd, Cambridge, UK

OBJECTIVES: Health technology assessment (HTA) of medical devices is rarer than pharmaceuticals, due to limited clinical evidence, shorter lifespan and variable

pricing. In contrast to pharmaceuticals, the majority of medical device manufacturers (MDMs) are small and medium-sized enterprises (SMEs). The Medical Technologies Evaluation Programme (MTEP), developed in 2010 by the UK National Institute for Health and Care Excellence (NICE), promotes development and market access of new medical technologies. However, barriers for SMEs include costs and high clinical evidence requirements. In this study, we assess how well the MTEP provides a route to market for SMEs. **METHODS:** We extracted data from the 36 published/draft medical technology guidances (MTGs), identified the size of manufacturers and analysed how SMEs (defined as MDMs with <500 employees) compare to larger MDMs in terms of guidance output, recommendation status and time to publication. **RESULTS:** Whilst 98% of UK MDMs are SMEs, we show that only 63% of MTG sponsors are SMEs. The annual number of MTGs fluctuates, but overall presents a cumulative annual increase of 0.2 MTGs. However, there is an annual decrease of 0.1 MTGs for SMEs. For large MDMs, 100% of MTGs published were positive, compared to 71% for SMEs. Finally, SMEs experience a longer mean time to publication (15.9 vs. 12.8 months, p=0.27) and a much wider range in publication time (23 vs. 8 months), driven by a considerably higher maximum time to publication. **CONCLUSIONS:** The MTEP is an important step towards improving HTA for medical devices. However, much remains to be done to improve participation by SMEs. SMEs appear less likely to submit applications, and receive fewer positive recommendations. A lack of clinical evidence was cited in every case of non-recommendation; suggesting SME's struggle to meet NICE's evidence requirements. Therefore, we present considerations for NICE to improve SME participation in the MTEP.

PMD119

ECONOMIC EVALUATION OF LUNG CANCER SCREENING WITH LOW-DOSE COMPUTERIZED TOMOGRAPHY (LDCT) FOR SMOKING GROUPS IN TAIWAN

Hsieh H
Kaohsiung Medical University, Kaohsiung City, Taiwan

OBJECTIVES: Lung cancer is the leading cause of death worldwide. Patients with lung cancer were often diagnosed at late stage. If patients can be diagnosed and treated earlier, the survival rate is above 60%. One large trial by the National Lung Screening Trial (NLST) in the United States found that compared to chest X-ray, low-dose computed tomography (LDCT) screening can reduce 20% death due to lung cancer. However, there were lack of localized clinical or economical evidences regarding the implementation of population-based LDCT lung cancer screening among high-risk smoking groups, in particular for those countries without trial-based evidences. This study used Taiwanese epidemiological local data to conduct an economic evaluation of implementing LDCT screening among high-risk groups. **METHODS:** This study conducted 1st order Markov simulation models to analyze the life-time cost-effectiveness of LDCT screening. Quality-adjusted life years (QALYs) and costs were calculated among high-risk groups between screening and no screening population. Through literature review, database analysis and expert opinions, base parameters were generated. 10,000 hypothetical individuals were simulated. **RESULTS:** Compared to those without receiving LDCT screening, our results suggested that screening group tended to have better QALYs. The incremental QALYs was 0.16 and ICERs was NT$303,748 per QALY gained. Regarding the results from one-way sensitivity analyses, the ICER between male and female was only slightly different; the trend of ICER value started to be lower when the starting screening age 55 to 75 was the lowest point and then went up. Compared to no smoke group, smoke group tended to have higher incremental QALYs. Former smoker (quick smoke<15 years or current smoker with 20-30, >=30 pack year tended to have higher QALYs and ICERs. **CONCLUSIONS:** Consistently with existing studies, this study provided evidences that LDCT screening policy might be cost-effectiveness for providing to age 55 to 75 and heavy smokers.

PMD120

INCORPORATING ECONOMIC EVIDENCE INTO COCHRANE REVIEWS: AN UPDATED METHODS FRAMEWORK AND A WORKED EXAMPLE IN A REVIEW OF INTERVENTIONS FOR INCREASING UPTAKE OF DIABETIC RETINOPATHY SCREENING

Aluko PO[1], Vale L[1], Shemilt I[2], On behalf of the Campbell and Cochrane Economic methods Group -[1]
[1]*Newcastle University, Newcastle upon Tyne, UK,* [2]*University College London, London, UK*

OBJECTIVES: Health care decisions are made in the context of constrained budgets. Thus, evidence on the health effects of interventions is often not sufficient for decision-making as it also requires evidence on resource use, costs, and their cost-effectiveness. Extending the scope of Cochrane Intervention Reviews (CIRs) to incorporate economic evidence can increase their usefulness in decision-making. We developed a methods framework for conducting a full systematic review of economic evidence which was piloted in a new Cochrane review of interventions for increasing the uptake of Diabetic Retinopathy Screening (DRS). The framework focused on helping end-users help understand key economic trade-offs between alternatives. **METHODS:** Following the framework, searches were conducted to identify full economic evaluations, cost analyses, or comparative resource utilization studies conducted alongside eligible randomised controlled trials (RCTs). These studies were next classified according to the type of economic evaluation and analytic framework used. Characteristics of included studies and their results were extracted. Risk of bias and overall methodological quality were assessed using the Cochrane Risk of Bias Tool v.1.0 and the CHEERS statement plus CHEC criteria. **RESULTS:** 76% of included economic studies were conducted in the USA and the remainder in Europe. Two of the thirteen included economic studies were full economic evaluations. Proximity to screening venue, reminders through personal telephone and diabetic self-education management with the use of non-physicians (personally trained on diabetes management) were evaluated in individual studies, reporting increasing screening attendance by 14-18% (similar to the range seen in the whole CIR) at additional costs which varied depending on the intervention. Higher cost interventions were not obviously more effective. Applicability to harder to reach groups is limited. **CONCLUSIONS:** The economic perspective raises questions about the value of more costly interventions but more full economic evaluations focusing on hard to reach populations are needed.

PMD121

HTA OF INTENSIVE CARE VENTILATORS FOR PEDIATRIC PATIENTS

Faggiano F, Andellini M, Sabusco F, Derrico P, Ritrovato M
Bambino Gesù Children's Hospital, Rome, Italy

OBJECTIVES: The purpose of the study was to evaluate different type and manufacturers of intensive care ventilators in order to support the health care decision-making process about the choice to adopt the best available technology for ventilation of pediatric patient in intensive care units at Bambino Gesù Children's Hospital **METHODS:** The technology assessment process was developed by using a new methodology, the Decision-oriented HTA (DoHTA), a new implementation of the EUnetHTA CoreModel, integrating the Analytic Hierarchy Process. A literature review was carried out to gather evidence on safety and overall effectiveness of different kind of intensive care ventilators, with several ventilation modalities and strategies. The synthesis of scientific evidences, and results of the specific context analysis resulted in the definition of components of the decisional hierarchy structure, consisting in detailed characteristics of the technology's performances covering the aspects on feasibility, safety, efficacy, costs, and organizational and technical characteristics of the technology. A subgroup of these indicators has been included in a checklist form for the evaluation of different type and manufacturers of intensive care ventilators, each of which was tested in three independent runs performed in three different department. In addition, an economic evaluation was also carried out. **RESULTS:** Preliminary DoHTA results showed that the domains with the highest impacts within the evaluation are safety and clinical effectiveness (34.77% and 25.69%, respectively) followed by organizational aspects, technical characteristics of technology and costs and economic evaluation. The final objective is to define the alternatives' ranking through a comparison between alternative technologies' performances. **CONCLUSIONS:** The technology assessment project allowed to identify strengths and limits of the most recent intensive care ventilator' models in the specific contexts of use by involving all health professionals interested, and eventually identify the best option for the hospital.

PMD122

MACHINE LEARNING AS A DIAGNOSTIC TOOL FOR VALIDATION OF SENSITIVITY

Katsipis I
University of Maryland College Park, College Park, MD, USA

OBJECTIVES: Using Machine-Learning, this research identifies key diagnostic reading levels that lead to prediction of diabetes among readmited patients, and provides analysis as to why this is the case. **METHODS:** Gathered by researchers at the University of California Irvine, the dataset encompasses 10 years (1999-2008) of clinical care at 130 US hospitals and integrated delivery networks. It includes over 50 features representing patient and hospital outcomes. The dataset includes information concerning demographics, diagnostics, prescriptions, existence of diabetes and readmission. I used the Complex Tree method for analysis, using readmission as the independent variable, with the theresholds of diagnostic readinigs from A1C test selected for their sensitiivity and specificity. **RESULTS:** Roc curve with Area Under Curve 67.8% and False positive class 64% True positive Rate (TPR) of current classifier and positive class 83.3%. Positive class determined >8 and negative classes >7 and normal readings of A1C diagnostic test. **CONCLUSIONS:** A1C test and more specific the higher threshold is more prominent to show high sensitivity and true positive between the predicitive and the true value. Given te indipendent variables readmission rate.

PMD123

QUALITY OF MANDATORY REPORTING OF ADVERSE EVENTS ASSOCIATED WITH INTRAVENOUS PATIENT-CONTROLLED ANALGESIA DEVICES

Mohanty M, Lawal O, Lanier R, Katz N
Analgesic Solutions, LLC, Natick, MA, USA

OBJECTIVES: To assess the quality of mandatory reporting of adverse events associated with intravenous (IV) patient-controlled analgesia (PCA) devices in the Food and Drug Administration (FDA) Manufacturer and User Facility Device Experience (MAUDE) database. **METHODS:** We analyzed IV PCA device-related events, occurring in inpatient settings, reported to the MAUDE database from January 1st, 2011 through September 12th, 2016. The FDA requires all medical device manufacturers and user facilities to report any device-related adverse events that may have caused or contributed to death or serious injury within 30 calendar days and 10 calendar days to manufacturers respectively. We assessed timeliness of mandatory reporting (difference between date of report and date of event) using a 40-day and 10-day maximum reporting time criteria for manufacturers and user facilities, respectively. **RESULTS:** Of the 1430 IV PCA device-related events submitted to MAUDE, a total of 92 AEs including deaths (n=13) were present in structured AE data fields. Upon qualitative review of the text narratives, 7 additional cases of death absent in the structured AE field were identified. Several reports had missing information on location of event, personnel involved with event, and specific opioid involved. The average reporting time for AEs was 42 days (n: 92, S.D: 108 days, range: 0-801 days). The mean reporting time for a manufacturer-submitted event was 48 days (n: 65, SD: 116 days, range: 0-801 days); 22% of these events were submitted outside the 40-day maximum reporting

time. Similarly, the mean reporting time by user facilities was 9 days (n:5, SD:2 days, range: 5-11 days). However, 3 of these events were reported outside the 10-day maximum reporting time. **CONCLUSIONS:** Despite regulatory requirements, our findings suggest variance in the reporting of mandatory IV PCA device-related events. Additional training and outreach programs are needed to improve the current quality of reporting of AEs associated with IV PCA devices.

PMD124

EXAMINING UNCERTAINTY AROUND AMERICAN COLLEGE OF MEDICAL GENETICS (ACMG) RECOMMENDATIONS FOR NEWBORN SCREENING (NBS) FOR CYSTIC FIBROSIS (CF)

Hariharan D, Rittenhouse B
MCPHS University, Boston, MA, USA

OBJECTIVES: CF was recommended by the ACMG for NBS, based on an algorithm whereby survey scores determined an entry point to an algorithm (EPA) with EPA-specific follow up questions, determining final recommendations. No uncertainty RE: survey scoring was acknowledged by ACMG. The objective of this research is to identify, from unreported survey responses, potential numbers of missing responses (M) to certain questions and estimate the influence of uncertainty due to missing data and sampling variation on the confidence in the total score reported and recommendation made. In CF a loss in score of > 1 point will result in a change in EPA and final recommendation. **METHODS:** Estimates of missing responses consistent with question total scores were made. The influence of missing data was estimated through boundary estimates (Manski, 1989); bootstrapping estimated the influence of sampling variation. Their joint influence was also examined. **RESULTS:** The score (48) for one question implied a range of possible missing observations (2, 3, 6 or 7 of 65 expected responses). Using the conservative M=2, a lower bound (LB) of 46.15 (1.85 points below the original mean) implied a possible influence of missing data on the EPA and recommendation. Bootstrapping around the LB indicated 56.4% of means to be lower than the critical value for an EPA and recommendation change. **CONCLUSIONS:** Even with a conservative estimate of missing responses (2) to this one question, missing data could influence the EPA and final recommendations. Adding the influence of sampling variation implies even less confidence around the scoring and recommendation since any decrease > 1 point in the scoring changes the recommendation to "not recommended".

PMD125

NATIONAL TRENDS OF LAPAROSCOPIC SURGERY IN KOREA: RESULTS FROM THE HEALTH INSURANCE REVIEW AND ASSESSMENT SERVICE-NATIONAL INPATIENT SAMPLE

Park H[1], Cho Y[2], Sung K[2]
[1]Johnson and Johnson Medical, Seoul, South Korea, [2]LINEWALKS Inc., Seoul, South Korea

OBJECTIVES: Over the past decade, laparoscopy has gained wide acceptance as a curative surgical procedure in various body organs. However, it is not known whether laparoscopic surgery is increasingly being adopted in Korea. The purpose of this study was to evaluate national trends regarding the utilization of laparoscopy for the surgical treatment in Korea. **METHODS:** All laparoscopic surgeries are recorded nationwide by HIRA using the related procecure code and the code for laparoscopic devices. Using the Health Insurance Review and Assessment Service–National Inpatients Sample (HIRA-NIS), which was a stratified sampling from the entire population under the Korea national health insurance system (Year 2010, 2011, 2012, 2013, 2014), descriptive statistics for the patterns of laparoscopic surgery in various organs were performed. To identify laparoscopic surgery, we selected medical device codes of all Trocar (Blade, Bladeless, Blunt, Ballon type, etc.). The procedure codes were grouped as colorectal, esophagus, hepato-pancreatic-biliary, stomach, thoracic based on the target organs. **RESULTS:** The number of laparoscopic surgery increased more than 30% over the study period, from 12,312 to 17,694. The most of cases were performed in colorectal and stomach cancer. In colorectal cancer, 4726 cases in 2010, 4960 cases in 2011, 5306 cases in 2012, 5071 cases in 2013, 5985 cases in 2014. In stomach cancer, 4004 cases in 2010, 4822 cases in 2011, 4783 cases in 2012, 4540 cases in 2013, 5457 cases in 2014. Furthermore, laparoscopy was increasing utilized in colorectal or stomach cancer related procedures; Subtotal Gastrectomy-Distal(code Q0252), Rectal and Sigmoid Resection-Anterior resection(code QA921), Rectal and Sigmoid Resection-Low anterior resection(code QA922). **CONCLUSIONS:** The present study shows a significant increase in the number of laparoscopy performed in various organs as the surgical treatment in Korea from 2010 to 2014, which is in-line with recent findings of increased utilization with the rest of the world.

CARDIOVASCULAR DISORDERS – Clinical Outcomes Studies

PCV1

A CROSS SECTION STUDY ON PHARMACOVIGILANCE IN POST STROKE PATIENTS

Sadanandan K[1], Valliot B[2], Susmitha G[1], Saritha M[3]
[1]ACADEMY OF PHARMACEUTICAL SCIENCES, KANNUR, India, [2]ACADEMY OF MEDICAL SCIENCES, KANNUR, India, [3]crescent college of pharmacy, kannur, India

OBJECTIVES: To determine the prevalence of neuropsychiatric disorders and to assess the adverse reactions and cost effects in stroke management. **METHODS:** The patients diagnosed as stroke and wished to participate were identified from Neurology Department of Tertiary care teaching hospital and consent was obtained. Cross-sectional study for six-month duration after getting clearance from the Human Ethical Committee (order no: IEC no.07/22/2011/MCT). All the subjects were evaluated for adverse drug reactions through telephonic or face to face interview. Data processing tabulation of descriptive statistics did on statistical software. **RESULTS:** Out of 52 patients 71.15% were males and 28.84% females. The mean age of the patients was 63.21 (±10.19) years and the median was 65. 85% stroke patients were non-vegetarian. 61% patients had Blood Pressure, followed by 55% Dyslipidymia, 42% Diabetes Mellitus. Depression (46.15%) was observed high in percentage of domain present, subsequently Aggregation (30.77%), Anxiety (26.92%). A total of 38 incidences of ADRs were observed, The highest reported ADR was GI bleeding (17.3%). According to Naranjos algorithm majority of ADRs found to have probable 74%, possible 23.6% and definite 2.6% and no doubtful categories. Medical cost for drug varies from Rs.300 to 800. The medicines were supplied by Govt. according to the availability had great relief for poor socio economic groups. **CONCLUSIONS:** The incidence of ADRs were more for males compared to females. Majority of the patients seems to have mistaken the symptoms of ADR to be due to the disease being treated and old age.

PCV2

REGIONAL DIFFERENCES IN THE ECONOMIC BURDEN OF HEART FAILURE: EVIDENCE FROM THE HEALTHCARE COST AND UTILIZATION PROJECT (HCUP) DATABASE

Coleman A, O'Toole E
Xavier University, Cincinnati, OH, USA

OBJECTIVES: The aim of this study is to examine regional differences in hospital cost, healthcare utilization, and mortality for Medicare patients with heart failure (HF). **METHODS:** The study is a retrospective observational design using visit-level de-identified hospital records from the Healthcare Cost and Utilization Project database for the year 2013. Visits with a primary diagnosis of HF, Medicare insurance, age of 18 or older, and with the hospital region recorded were eligible for inclusion. Descriptive statistics were generated for patient demographics, comorbidities, and hospital characteristics by region (Northeast, Midwest, South, West). Primary outcomes included cost, length of stay, and mortality. **RESULTS:** A total of 143,732 visits met the inclusion criteria, 2.02% of the annual visits. The distribution of visits by region was: South (40%), Midwest (24%), Northeast (21%), and West (15%). Across all regions, HF patients had high rates of hypertension (>70%), renal failure (>45%), atrial fibrillation (>40%), and chronic pulmonary disease (>35%); with the South having the highest percentage of people with diabetes (47.28%). Across all regions, most patients were Caucasian, while Black patients had the most visits among minorities in all regions except the West where Hispanics (13%) had the most visits and were emergently admitted. The West was the only region with a percent of coronary artery disease below 50% (48.14%) and had the lowest average length of stay (4.72 ± 5.46 days) but the highest average cost per visit ($13,878 ± 28,381). The Northeast had the highest mortality rate (3.68%), with the Midwest having the lowest (2.97%). **CONCLUSIONS:** This study found differences in cost, healthcare utilization, and mortality between regions with the most significant differences occurring in the West, with the highest average cost per visit and a high mortality rate, yet the shortest average length of stay.

PCV3

ASSESSMENT OF TREATMENT & OUTCOMES OF ST SEGMENT ELEVATION MYOCARDIAL INFARCTION (STEMI) IN SANDEMAN PROVINCIAL HOSPITAL QUETTA, PAKISTAN

Haq N, Sehar S, Nasim A
University of Balochistan, Quetta, Pakistan

OBJECTIVES: Study aimed to assess treatment & outcomes of STEMI in Sandeman Provincial Hospital Quetta. **METHODS:** A cross-sectional descriptive study was conducted in cardiac patients of STEMI as the principal diagnosis registered in Sandeman provincial hospital Quetta. Data obtained from 194 STEMI patients' during May to August 2016 by using self-designed proforma which consist of vital signs, prescribed drugs, positive and negative outcomes. Statistical analysis was done by using SPSS version 20. Descriptive and inferential statistics used where applicable **RESULTS:** Result showed that majority of STEMI patients (n=145 (74.7%) were male. Most of the patients (n=64 (33.0%) having age ranges between 59-68 years. Majority of the patients (n=71 (36.6%) were diagnosed with Anterior wall MI. Ninety-three patients (47.9%) were prescribed with four drugs for STEMI and most of patients (n=120 (61.9%) were using Streptokinase. In majority of patients (n=139 (71.6%) recovery is achieved, (n=163 (84.0%) patients Cure is partially achieved, BP maintenance is achieved in (n=101(52.1%) patients. Normal heart rate was achieved in (n=127 (65.5%) patients. One-hundred and ten (56.7%) achieved normal ECG, Maximum Patients (n=139 (69.6%) achieved stability. In-hospital mortality was occurred in (n=18 (9.3%) patients. ADRs and Drug interactions were not reported in majority of the patients. **CONCLUSIONS:** Study concluded that majority patients were male diagnosed with STEMI therefore, consideration of healthcare providers should be driven towards this alarming condition to reduce its occurrence to improve health facility in order to improve health of such patients.

PCV4

THE EFFECT OF SHORT-ACTING Β2-AGONISTS ON ARRHYTHMIA FOR PEDIATRIC PATIENTS WITH BRONCHOPULMONARY DYSPLASIA AND CONGENITAL HEART DISEASE USING TEXAS MEDICAID DATABASE

Heo JH, Vohra Y, Ghosh S, Rascati KL
The University of Texas at Austin, Austin, TX, USA

OBJECTIVES: Congenital heart disease (CHD) is known to be associated with congenital and acquired airway disorders such as bronchopulmonary dysplasia (BPD). Short-acting β2-agonists (SABA) are highly effective in the treatment of BPD. However, β-adrenoceptor agonists have inotropic and chronotropic effects that can increase arrhythmias or tachycardia. To our knowledge, among pediatric patients with CHD, the association of SABAs therapy with arrhythmia in pediatric patients with BPD have not been evaluated before. The focus of this study was to compare the occurrence of arrhythmia between SABA users and non-users among

pediatric patients with BPD and CHD. **METHODS:** Texas Medicaid database from 2008-2014 was used to conduct the retrospective cohort study. Patients aged ≤12 years who had a diagnosis of CHD (ICD-9-CM 745-747.xx, V151) and BPD (ICD-9-CM 770.7) were included in this study. SABAs included albuterol, ipratropium, levalbuterol, and tiotropium. Covariates adjusted for were demographic factors (age, gender, and race) and clinical factors (respiratory distress syndrome, asthma, cardiovascular condition, and use of anti-arrhythmia drugs). Propensity score matching, logistic regression, Cox proportional hazard regression model, and Kaplan–Meier plots were used to compare the occurrence of arrhythmia between the control and the test groups. **RESULTS:** After 1:1 matching, 2,882 patients were identified. Logistic regression showed that SABA users were more likely to have arrhythmia compared to non-users (OR=2.17 (95% CI: 1.56-3.02), p<.0001). For individuals on SABA therapy, the number of supply days of SABA was significantly associated with the occurrence of arrhythmia (p<.001). A Cox proportional hazard model showed that the risk of arrhythmia for SABA users were significantly higher than non-users (HR=2.10 (95% CI: 1.53-2.90), p<.0001). **CONCLUSIONS:** Our analysis showed that SABA use in pediatrics patients with BPD and CHD may be associated with higher risk of arrhythmia. Phycisians should monitor patients for long-term SABA therapy to avoid potential risk of arrhythmia.

PCV5

PATTERNS AND PREDICTORS OF DEPRESSION TREATMENT AMONG STROKE SURVIVORS WITH DEPRESSION IN AMBULATORY SETTINGS IN THE UNITED STATES

Bhattacharjee S[1], Axon DR[2], Goldstone L[1], Lee JK[3]
[1]*The University of Arizona, Tucson, AZ, USA,* [2]*University of Arizona, Tucson, AZ, USA,* [3]*University of Arizona, tucson, AZ, USA*

OBJECTIVES: Objectives of this study were to examine the depression treatment patterns and predictors among stroke survivors with comorbid depression seeking care in ambulatory settings in the United States (US). **METHODS:** Weused a cross-sectional study design by pooling multiple-year data (2005-2011) from the National Ambulatory Medical Care Survey and the outpatient department of the National Hospital Ambulatory Medical Care Survey. Older adults (age ≥ 50 years) with stroke and depression comprised the final study sample. Ambulatory visits that involved stroke diagnosis were identified by using International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM) of 430.xx-438.xx. Depression was identified in visits where the answer to the question "Regardless of the diagnoses written…..does the patient now have: depression?" was "yes." Depression treatment defined as antidepressant use with or without psychotherapy comprised the dependent variable in this study. Multivariate logistic regression analysis was conducted to ascertain the predictors of depression treatment. All analyses were adjusted for the complex survey design of the datasets to obtain nationally representative estimates. **RESULTS:** During 2005-2011 timeframe, approximately 3.96 million ambulatory care visits recorded a stroke and depression diagnosis. Overall depression treatment was observed in 47.32% of the study sample, mainly driven by antidepressant use alone. An overwhelming majority used selective serotonin reuptake inhibitors (77% of overall antidepressant use), and sertraline was the most prescribed antidepressant (30.5% of overall antidepressant use). Sex, race/ethnicity, region of residence, number of medications recorded at the sampled visit, and number of chronic conditions were significantly associated with depression treatment. For example, men were approximately three-times more likely (Odds Ratio=2.772; 95% CI, 1.127-6.819, P=0.027) than women to receive depression treatment. **CONCLUSIONS:** According to this nationally representative sample, depression treatment is low among stroke survivors in ambulatory care settings in the US. Appropriate interventions should be developed to optimize post-stroke depression treatment.

PCV6

PATTERNS AND PREDICTORS OF DEPRESSION TREATMENT AMONG COMMUNITY-DWELLING OLDER ADULTS WITH STROKE AND DEPRESSION IN THE UNITED STATES

Bhattacharjee S[1], Yami MA[1], Kurdi S[1], Axon DR[2]
[1]*The University of Arizona, Tucson, AZ, USA,* [2]*University of Arizona, Tucson, AZ, USA*

OBJECTIVES: The objectives of this study were to examine national-level patterns and predictors of depression treatment among community-dwelling stroke survivors with comorbid depression **METHODS:** This study adopted a retrospective, cross-sectional study design using multiple alternate years of Medical Expenditure Panel Survey (MEPS) [2002, 2004, 2006, 2008, 2010, 2012] data. The study sample consisted of older adults (age ≥ 50 years) who were stroke (ICD-9-CM codes of 430.xx-438.xx) survivors with comorbid depression (ICD-9-CM code of 296.xx, or 311.xx) and did not die during the calendar year. Depression treatment, identified by antidepressant medication use with or without psychotherapy, was the dependent variable of this study. Multinomial logistic regression analysis was conducted to examine the association of factors with depression treatment in the study sample. Depression treatment categories included antidepressant use only; combination therapy of antidepressant and psychotherapy; and no depression treatment. **RESULTS:** An overwhelming majority (87.6%) of the study sample (unweighted N=370) reported some form of depression treatment. Antidepressants only and combination therapy were reported by 74.8% and 12.8% of study sample respectively. Selective serotonin reuptake inhibitor (61%) was the most commonly reported antidepressant class, while sertraline (15.8%) was the highest reported individual antidepressant. Depression treatment was associated with age, education, poverty status, perceived mental health status, functional disability, presence of other chronic conditions, body mass index, smoking, metro status, and region. For example, among stroke survivors with comorbid depression, those who were 65 years and older were nearly six times more likely (Odds Ratio=5.80, 95% CI 2.48-13.5) to report use of antidepressants only compared to those who were 50-64 years old. **CONCLUSIONS:** The majority of the study sample received some form of depression treatment and several individual-level factors were associated with the receipt of depression treatment. Future studies should assess outcomes associated with depression treatment in this vulnerable population.

PCV7

A LITERATURE REVIEW OF CRITICAL LIMB ISCHEMIA IN JAPAN REVEALS AN AMPUTATION PREVENTION STANDARD OF CARE, BUT NEED FOR IMPROVED ENDOVASCULAR TECHNOLOGIES

Igyarto Z, Martinsen B
Cardiovascular Systems, Inc., St Paul, MN, USA

OBJECTIVES: To review the current epidemiology, treatment patterns, and outcomes of critical limb ischemia (CLI) in Japan. **METHODS:** Clinical literature review of Japanese CLI (2007-2017; English; PubMed) was completed to identify the risk factors and the current clinical outcomes of treating CLI with revascularization and/or primary amputation. **RESULTS:** The incidence of CLI in Japan is 100 to 200/million/year and the main risk factors identified are older age, diabetes, kidney disease, and smoking—similar to what is seen worldwide. Japanese citizens with these risk factors; however, is steadily increasing. Japan has the highest proportion of elderly citizens in the world (38% will be >65 by 2050), a rapidly increasing prevalence of diabetes (13.5%), a higher proportion of hemodialysis patients, and a high number of smokers (19.7%). Patients that progress to CLI in Japan; however, experience very low rates of primary amputation—5% (2006-2011), 2% (2013) and 1% (2014). There is also a high utilization of revascularization procedures in Japan (43% surgical and 51% endovascular or hybrid) to treat CLI patients. The amputation and mortality rates are similar between the two treatment modalities, but endovascular treatments in Japan result in higher revascularization rates than surgical treatment. **CONCLUSIONS:** The changing Japanese lifestyle is increasing the number of people suffering from diabetes, kidney disease, hypertension, and dyslipidemia—thus, CLI is expected to rise and impact the Japanese healthcare system. The extremely low rate of primary amputation in Japan to treat CLI; however, suggests a Japanese standard of care with an emphasis on amputation prevention which has been shown in other studies to reduce costs and improve quality of life. One area of improvement revealed by this review is the need for better endovascular treatment technologies that lead to lower revascularization rates—another way to contain medical costs in a society with a growing prevalence of CLI.

PCV8

CHARACTERISTICS OF EARLY SACUBITRIL/VALSARTAN USERS IN A MANAGED CARE POPULATION WITH HEART FAILURE TO INFORM FUTURE OUTCOMES STUDIES

Xie Y, Sylwestrzak G, Barron J
HealthCore Inc., Wilmington, DE, USA

OBJECTIVES: Sacubitril/valsartan was approved by the FDA in July 2015 for treating heart failure (HF). We aimed to examine the baseline characteristics of patients who started sacubitril/valsartan from July 2015 to September 2016. **METHODS:** This was an observational study using medical and pharmacy administrative claims from the HealthCore Integrated Research Database®. Patients with any pharmacy claim for sacubitril/valsartan between 7/1/2015 and 09/30/2016 were identified. The first claim date for sacubitril/valsartan was assigned as the index date. Patients included in the analysis were ≥18 years and with continuous health plan enrollment during the 12 months pre-index (n=874). **RESULTS:** Cardiologists represented the majority of prescribers (84%) for sacubitril/valsartan index prescriptions. Commercial coverage was predominant in our sample (65%), followed by Medicare Advantage (19%) and Medicare Supplemental (16%). Most of the patients were male (74%) and above 60 years (62%), with an average age of 62 years. Common comorbidities included hypertension (85%), peripheral vascular disease (54%), atrial fibrillation (43%), and diabetes (41%). The most commonly used pre-index HF medications were beta-blockers (93%), ACE inhibitors/ARBs (86%), loop diuretics (72%), and mineralocorticoid receptor antagonists (MRA) (51%). Of these drug classes, the majority of patients received three (36%) or all four classes (37%) before initiating sacubitril/valsartan, with 5% on only one or none of these. Approximately half (52%) of patients had a hospitalization in the 12 months pre-index, with an average length of stay of 8.9 days. Of patients with any hospitalization, 23% had re-admission within 30 days of discharge. The majority of the hospitalizations were for HF (87%; mean length of stay: 8.9 days). **CONCLUSIONS:** The results help to characterize the complexity of the patient population receiving sacubitril/valsartan for treating heart failure. Future studies that evaluate real world outcomes should understand the characteristics of the sacubitril/valsartan users to determine the most appropriate comparator population.

PCV9

THE COST-EFFECTIVENESS OF STATINS FOR SECONDARY PREVENTION OF CARDIOVASCULAR DISEASE: OBSERVATIONAL STUDY USING DATA FROM ROUTINE ELECTRONIC MEDICAL RECORDS

Mujica-Mota RE, Hughes P
University of Exeter, Exeter, UK

OBJECTIVES: To evaluate the cost-effectiveness of statins for secondary prevention of cardiovascular disease in routine practice from the perspective of the English NHS. **METHODS:** Electronic English NHS health records of 6,078 previously untreated patients of age 60+ receiving statins following the occurrence of a myocardial infarction (MI) and a one-to-one propensity score matched control of untreated patients after a MI, resulted in n=12,156 patients. Costs of primary care service use and referrals were calculated from CPRD data and inpatient hospitalisations from HES and HRG codes. QALYs were calculated from ONS mortality records and utilities from the literature applied to MI or ischemic stroke events recorded in HES. Inverse probability of censoring weights (IPCW) were used to estimate counterfactual outcomes in the absence of treatment cross-over in the

control arm. **RESULTS:** The distribution of baseline characteristics was balanced across the two treatment groups, and 43% initially untreated patients crossed-over to statins treatment. For 60-74 year olds, we found an increase in QALY with statins of 0.66 (95% CI: 0.44-0.87) and, in the 75+ group, a gain of 0.81 (95% CI: 0.72-0.88) per patient. Excluding the CV-unrelated costs of inpatient hospitalisations, the total incremental costs were respectively £1,616 (95% CI: 1347-2095) and £2,644 (95% CI: 2034-2963) per patient. Statins had an ICER of £2456 (95% CI: 1814, 2759) in the younger patient group and of £3250 (95% CI: 2843, 3531) in the older group. In contrast, when inpatient hospitalisation costs ICD-10 codes for non-CV events were included, statins resulted in cost savings (95% CI: -1165, 2782), and was consequently dominant, in the younger group, and had incremental costs of £5562 (95% CI: 4356, 6436) for an ICER of £7200 (6221, 8587) in patients aged 75+. **CONCLUSIONS:** Quasi-experimental evaluation using data from electronic medical records of patients treated in routine practice is feasible. CEA based on decision models may underestimate the cost-effectiveness of statins, due to their omission of hospitalisation costs associated with non-CVD outcomes.

PCV10

HEALTHCARE UTILIZATION AND COSTS IN PULMONARY ARTERIAL HYPERTENSION (PAH) PATIENTS TREATED WITH ENDOTHELIN RECEPTOR ANTAGONISTS (ERAS) OR PHOSPHODIESTERASE TYPE 5 INHIBITORS (PDE5IS)

Hill J[1], Lickert C[2], Cole M[2], McGuiness K[1], Wade RL[1], Drake W[2]
[1]*QuintilesIMS, Plymouth Meeting, PA, USA,* [2]*Actelion Pharmaceuticals, Inc., South San Francisco, CA, USA*

OBJECTIVES: Pulmonary arterial hypertension (PAH) is a rare, progressive disease characterized by increasing pulmonary vascular resistance and pressure. There are 13 approved PAH-specific medications in the USA targeting three distinct pathways. Without head- to-head comparative effectiveness trials, stakeholders may assume that ERAs and PDE5is produce similar health outcomes. The study evaluated all-cause healthcare utilization, all-cause hospitalization, costs and adherence in PAH patients treated with ERAs or PDE5is. **METHODS:** Using the PharMetrics Plus claims database, the most recent PAH therapy for all patients was identified between 1/1/2009-6/30/2015 (first Rx claim = index date). Therapies included the ERAs: ambrisentan, bosentan, and macitentan and the PDE5is: sildenafil and tadalafil (PDE5i erectile dysfunction drugs were excluded). Patients had continuous healthplan enrollment ≥3 months pre- and ≥6 months post-index. All-cause healthcare utilization, costs and proportion of days covered (PDC) were compared between ERA and PDE5i. Multivariable generalized linear models were used to assess all-cause hospitalization costs. **RESULTS:** A total of 805 ERA and 1,818 PDE5i patients were analyzed over 6 months post index. The mean age of the ERA cohort was lower (51.9 vs. 53.0, p=0.011) and included more females (74.5% vs. 61.5%, p<.0001). Post-index, ERA patients had more PAH prescriptions (mean 6.6 vs. 5.0, p<.0001), had fewer outpatient visits (mean 12.6 vs. 16.0, p<.0001) and fewer hospitalizations (29.4% vs. 36.5%, p<0.001). PDC was higher in ERA patients (mean 0.85 vs. 0.78, p<0.0001). Mean unadjusted hospitalization costs for all patients were lower in the ERA cohort ($20,017 vs. $37,570, p=0.007). Adjusted hospitalization costs for patients with a hospitalization were 19% lower in ERA patients (p=0.048) **CONCLUSIONS:** PAH patients treated with ERA were younger, with higher adherence to therapy, lower resource use, fewer hospitalizations, and lower hospitalization costs than PDE5i treated patients. These results provide real-world evidence suggesting PAH therapies with different treatment pathways produce different clinical and economic outcomes.

PCV11

COMPARISON OF AMLODIPINE VERSUS OTHER CALCIUM CHANNEL BLOCKERS ON BLOOD PRESSURE VARIABILITY IN HYPERTENSIVE PATIENTS IN CHINA: A RETROSPECTIVE PROPENSITY SCORE-MATCHED ANALYSIS

Zhang L[1], Yang J[1], Li L[2], Liu D[3], Xie X[3], Dong P[3], Lin Y[2]
[1]*Beijing TongRen Hospital, Capital Medical University, Beijing, China,* [2]*PalanDataRx, Shanghai, China,* [3]*Pfizer Investment Co., Ltd., Beijing, China*

OBJECTIVES: Calcium channel blockers (CCBs) was associated with lower blood pressure variability (BPV) than other classes of antihypertensive drugs. Nonetheless, the correlation within CCBs group is unclear. This study aimed to assess the effect of Amlodipine versus other CCBs on BPV. **METHODS:** A retrospective propensity score-matched analysis was conducted, which retrieved 6,995 hypertensive inpatients encounter data (with median age at 69 years old, 52% was female, diastolic blood pressure (DBP) ≥40 mmHg and <150 mmHg; systolic blood pressure (SBP) ≥70 mmHg and <260 mmHg), who took at least one antihypertensive agent and completed at least three SBP measurements during the visit. International Classification of Diseases (ICD-10) was used to identify the hypertensive patients. BPV was calculated with standard deviation of SBP during a single inpatient visit. The Propensity Score Matching (PSM) was used to balance the cohort of patients prescribed Amlodipine or other CCBs. Series of appropriate statistical tests were applied to the propensity score-matched sample to examine the different effects on BPV. Additionally, the hypertensive patients with comorbidity i.e. Coronary Artery Disease (CAD), Diabetes Mellitus (DM), Myocardial Infarction (MI), Heart Failure (HF) and Chronic Kidney Disease (CKD) were analysed. **RESULTS:** For the hypertensive patients (n=2004, for each cohort), patients prescribed Amlodipine had lower BPV than patients prescribed other CCBs (12.7 mm Hg vs. 13.6 mm Hg, p<0.05). For the hypertensive patients with comorbidity (n=1242, for each cohort), patients prescribed Amlodipine had lower BPV than patients prescribed other CCBs as well (13 mm Hg vs. 13.7 mmHg, p<0.05). **CONCLUSIONS:** Amlodipine was associated with lower BPV than other CCBs for both hypertensive patients and hypertensive patients with comorbidity.

PCV12

THE READMISSIONS, HEMORRHAGIC EVENTS AND ANNUAL MEDICAL COSTS OF THREE ANTI-PLATELET STRATEGIES IN SECONDARY PREVENTION AMONG NON-CARDIOEMBOLIC ISCHEMIC STROKE PATIENTS: A REAL WORLD STUDY

Feng L[1], Wu J[2], Yang L[1]
[1]*Peking University, Beijing, China,* [2]*Bayer Healthcare Company Ltd, Beijing, China*

OBJECTIVES: The objective of this research was to compare effects, adverse drug events, economic burden of Aspirin, Clopidogrel, combined Aspirin and Clopidogrel in secondary prevention of non-cardioembolic ischemic stroke. **METHODS:** New onset IS patients with hospitalizations during Jan, 2012 to Dec, 2012 were identified by their diagnosis from Beijing medical insurance database, then followed up their records until Sep,2013. Prescription records of patients were separated into three groups, patients with Aspirin records only, patients with Clopidogrel records only, and patients with both Aspirin and Clopidogrel simultaneously for some time. Recurrence and incidence of hemorrhagic events were calculated in each group and compared with others. Logistic regression was used to control relevant factors of recurrence. Generalized linear model (GLM) was performed to identify factors which affected annual medical costs. **RESULTS:** The readmissions of aspirin group, clopidogrel group and combined group were 42.5%、71.1%、47.2% separately and the incidence of hemorrhagic events were 4.0%、2.2%、4.2% separately. Different antiplatelet strategies showed significant difference in recurrence by logistic regression. Medical coats of patients in aspirin group was the lowest among three groups and readmission, age, index hospitalization stays, levels of index hospitalization had significant effects on annual medical costs. **CONCLUSIONS:** Aspirin is the most effective and cost-effective anti-platelet strategy to prevent recurrence in non-cardioembolic ischemic stroke patients. But limitations of Beijing medical insurance database and relevant bias should be taken into account when interpret the results.

PCV13

EFFECTIVENESS OF A COMMUNITY-BASED HYPERTENSION SELF-MANAGEMENT EDUCATION (HSME) PROGRAMME IN THE STATE OF PENANG, MALAYSIA

Mohd Yatim H[1], Wong YY[2], Neoh CF[1], Lim SH[2], Hassali MA[3]
[1]*Universiti Teknologi MARA, Puncak Alam, Malaysia,* [2]*Universiti Teknologi MARA, Penang, Malaysia,* [3]*Universiti Sains Malaysia, Penang, Malaysia*

OBJECTIVES: To evaluate the impact of a structured, group-based Hypertension Self-management Education (HSME) programme on participant's clinical and psychosocial outcomes. **METHODS:** A pre-post study design was employed. With the help of community leaders from non-governmental organisations in the state of Penang, adults diagnosed with hypertension and treated with anti-hypertensive(s) were recruited to participate in the study. Participants attended a total of 4-weekly (2-hour each session) of HSME programme. The programme was developed locally based on Bandura's self-efficacy theory. Participant's clinical (i.e. blood pressure, lipids, weight, body mass index, waist circumference, percentage body fat and percentage skeletal muscle) and psychosocial (medication adherence, hypertension self-care behaviour, self-care motivation, self-efficacy and quality-of-life) outcomes were assessed at baseline, post 1-week and post 2-month of HSME programme. **RESULTS:** A total of 45 participants consented to join the programme, with 36 (80.0%) attended two or more sessions. Most participants (68.9%) were female with a mean age 60±7.72 years old. Post 1-week of intervention, participants were found to have significant improvement in high-density lipoprotein (HDL) cholesterol (p = 0.001), day spent on vigorous physical activity (p = 0.007), self-care motivation (p = 0.001) and self-efficacy (p = 0.005). At 2-month, participants sustained some of the aforementioned positive outcomes include HDL cholesterol, self-care motivation and self-efficacy with other significant improvement reported in medication adherence (p = 0.005) and hypertension self-care behaviour (p = 0.002). However, a significant decrease in percentage skeletal muscle (p = 0.002) was found between post-1 week and post-2 month. No significant differences were found in other outcomes between baseline, post 1-week and post 2-month of HSME programme. **CONCLUSIONS:** This short term HSME though had limited impact on participants' blood pressure but was found to improve other clinical and psychosocial outcomes. Therefore, a well-structured educational programme should be in place to support hypertensive patient in sustaining daily self-care activities.

PCV14

SYSTEMATIC LITERATURE REVIEW (SLR) OF EFFICACY OF STATIN AND NONSTATIN LIPID LOWERING THERAPIES FOR CARDIOVASCULAR EVENT REDUCTION

Sattar N[1], Toth PP[2], Worthy G[3], Worth G[4], Qian Y[5], Bray S[6], Forbes CA[3], Kleijnen J[3], Deshpande S[3], Stroes E[7]
[1]*Institute of Cardiovascular and Medical Sciences, University of Glasgow, Glasgow, UK,* [2]*CGH Medical Center, Sterling, IL, USA,* [3]*Kleijnen Systematic Reviews Ltd., York, UK,* [4]*Amgen Ltd, Zug, Switzerland,* [5]*Amgen Inc., Thousand Oaks, CA, USA,* [6]*Amgen Ltd, Cambridge, UK,* [7]*Academic Medical Center, Department of Vascular Medicine, Amsterdam, The Netherlands*

OBJECTIVES: The objective of this SLR was to characterize the evidence supporting the efficacy of pharmacologic LDL-C–lowering therapies for reducing the incidence of major cardiovascular events and mortality. A network meta-analysis (NMA) is planned to compare the efficacy of agents added to statins (PCSK9 inhibitors [e.g. evolocumab], CETP inhibitors, ezetimibe). **METHODS:** A broad SLR using standard methods (eg, Cochrane) was conducted using databases, clinical trial registries, and congress abstracts (through 01/2016). Studies reporting time to a major vascular events or incidence of major vascular events were selected. Possible networks of trial evidence were formed for each outcome to explore the feasibility of performing NMA. **RESULTS:** There were 42,502 records. 390 full papers were screened, of which 208 were relevant. Overall, 66 completed

or ongoing trials were identified: 43 trials focused on statin therapy, 7 trials on monotherapy of nonstatin agents and 16 trials on addition of agents to statins (e.g. PCSK9 inhibitors, CETP inhibitors, ezetimibe, fibrate). There were 8 trials reporting cardiovascular outcomes and evaluating agents added to statins (evolocumab N=3; alirocumab N=2; ezetimibe N=1; anacetrapib N=2) that could inform a NMA, 3 of which were ongoing. Of the 8 trials, 5 were secondary prevention, of which 4 were cardiovascular outcomes trials; 3 were in mixed/primary prevention populations with exploratory cardiovascular outcomes. Secondary prevention trials differed in inclusion criteria regarding type and timing of prior events. Primary endpoints were most often composites generally including death, myocardial infarction, stroke, and hospitalization for unstable angina. Four studies also include revascularization within the composite endpoint. **CONCLUSIONS:** This SLR summarizes the current state of evidence for reduction of cardiovascular events with lipid-lowering therapies. In the absence of head-to-head trials, the SLR will support an NMA that will assess the relative effectiveness of therapies that are added to statins (initially evolocumab vs ezetimibe).

PCV15

COMPARISON OF CALCIUM CHANNEL BLOCKERS VERSUS OTHER CLASSES OF ANTIHYPERTENSIVE DRUGS ON BLOOD PRESSURE VARIABILITY IN HYPERTENSIVE PATIENTS IN CHINA: A RETROSPECTIVE PROPENSITY SCORE-MATCHED ANALYSIS

Zhang L[1], Yang J[1], Li L[2], Liu D[3], Xie X[3], Dong P[3], Lin Y[2]
[1]*Beijing TongRen Hospital, Capital Medical University, Beijing, China,* [2]*PalanDataRx, Shanghai, China,* [3]*Pfizer Investment Co., Ltd., Beijing, China*

OBJECTIVES: Previous studies suggested that blood pressure variability (BPV) was an important risk factor for stroke, coronary heart disease and all-cause mortality. This study aimed to assess the effect of calcium channel blockers (CCBs) versus other classes of antihypertensive drugs on BPV, including angiotensin-I receptor blockers (ARBs), angiotensin-converting-enzyme inhibitors (ACEIs), beta blockers (BB) and diuretic (DI). **METHODS:** A retrospective propensity score-matched (PSM) analysis was conducted, which retrieved 5,627 hypertensive inpatients encounter data (with median age at 69 years old, 51% was female, diastolic blood pressure (DBP) $\geq$40 mmHg and $<$150 mmHg, systolic blood pressure (SBP) $\geq$70 mmHg and $<$260 mmHg), who took at least one antihypertensive agent and completed at least three SBP measurements during the visit. International Classification of Diseases (ICD-10) was used to identify the hypertensive patients. BPV was calculated with standard deviation of SBP during a single inpatient visit. The PSM was used to balance the cohort of patients prescribed CCBs or other classes of antihypertensive drugs. Series of appropriate statistical tests were applied to the PSM sample to examine the different effects on BPV. Additionally, the hypertensive patients with comorbidity i.e. Coronary Artery Disease (CAD), Diabetes Mellitus (DM), Myocardial Infarction (MI), Heart Failure (HF) and Chronic Kidney Disease (CKD) were analysed. **RESULTS:** For the hypertensive patients (n=1889, for each cohort), patients prescribed CCBs had lower BPV than patients prescribed other classes of antihypertensive drugs (12.3 mm Hg vs. 12.8 mm Hg, $p<0.05$). For the hypertensive patients with comorbidity (n=737, for each cohort), patients prescribed CCBs had even lower BPV than patients prescribed other classes of antihypertensive drugs (11.9 mm Hg vs. 12.9 mmHg, $p<0.05$). **CONCLUSIONS:** CCBs was associated with lower BPV than other classes of antihypertensive drugs for the hypertensive patients, and much lower BPV was associated for the hypertensive patients with comorbidity.

PCV16

FONDAPARINUX SODIUM COMPARED WITH LOW MOLECULAR WEIGHT HEPARINS FOR THROMBOPROPHYLAXIS AMONG PATIENTS AT RISK AS PER VIRCHOW'S TRIAD: A SYSTEMATIC REVIEW AND META ANALYSIS

Kumar A, Talwar A, Wu W
College of Pharmacy and Health Sciences, St. John's University, New York, NY, USA

OBJECTIVES: The objective of this meta-analysis was to systematically review the randomized clinical trials (RCTs) of Fondaparinux sodium 2.5 mg once daily versus low molecular weight heparins (LMWH) at the titrated dose for the prophylaxis of venous thromboembolism (VTE) among the patients who are at risk as per Virchow's triad. **METHODS:** Systematic search in the database e.g. EMBASE, MEDLINE, Cochrane Library, ProQuest, Science Direct, Google Scholar and clinicaltrials.gov was done to identify RCTs evaluating both treatments for the prophylaxis of VTE among patients at risk published in English language from the year 2000 to 2016. A web-based systematic review tool "Covidence" was used to systematically screen the studies of interest. Analysis in "RevMan" was performed with the relative odds based on the random effect model. Results were presented as odds ratios (OR) with their 95% confidence intervals. The assessment of study quality and risk of bias among the included studies was performed as per Cochrane collaboration. **RESULTS:** After screening 10, 506 articles, 4,676 were selected for review. Thirteen RCTs were included in the final analysis after reviewing these 4,676 articles. Pooled analyses showed a significant 54% reduction for VTE (OR=0.46 [0.36, 0.60]) and 11% reduction in mortality (OR=0.89 [0.63, 1.25]) with Fondaparinux compared to LMWH. Contrarily, there was a significant 47% increase in the risk for the major bleeding (OR=1.47 [1.14, 1.89]) and 16% increase in minor bleeding (OR=1.16 [0.90, 1.49]) with Fondaparinux compared to LMWH. Quality assessment results identified four studies with high risk in the "blinding of participants and personnel" domain. **CONCLUSIONS:** This meta analysis concluded that Fondaparinux showed a superior efficacy in terms of reduction of VTE and mortality. However, it also increased the risk for major bleeding. Thus, observation is warranted to prevent the adverse effects post Fondaparinux administration.

PCV17

NET BENEFIT OF ANTICOAGULATION IN ATRIAL FIBRILLATION CHANGES MARKEDLY WITH VARIATION IN POPULATION STROKE RATES

Shah SJ[1], Eckman MH[2], Go AS[3], Singer DE[4]
[1]*Harvard University, Boston, MA, USA,* [2]*University of Cincinnati College of Medicine, Cincinnati, OH, USA,* [3]*The Permanente Medical Group, Oakland, CA, USA,* [4]*Massachusetts General Hospital and Harvard Medical School, Boston, MA, USA*

OBJECTIVES: U.S. guidelines recommend anticoagulating patients with atrial fibrillation (AF) and CHA2DS2-VASc score of 2 or greater. This recommendation relies on stoke risk from the SPORTIF trials; a score of 2 represents 2.2% annual incidence of stroke. New evidence from multiple AF cohorts indicates the risk of stroke off anticoagulants may vary considerably. This variation in stroke risk may substantially impact the net benefit of anticoagulation. We used stroke rates from SPORTIF and the larger U.S. community-based ATRIA cohort to address this question. For given CHA2DS2-VASc scores, stroke rates in ATRIA are, on average, 2% lower than in SPORTIF. **METHODS:** We conducted a simulation study of 33,436 patients with incident AF within the ATRIA-CVRN Kaiser California cohort. We determined the gain in quality-adjusted life years (QALYs) associated with anticoagulation compared with no thromboprophylaxis, using a previously published Markov state transition decision model incorporating patient-specific stroke and hemorrhage risk factors. We performed two simulations using stoke rates reported in (1) SPORTIF and (2) ATRIA. We report the number of patients expected to benefit from anticoagulation (gain $\geq$ 0.1 QALYs). We also determined population and mean gain in QALYs/patient through guideline-based anticoagulation. **RESULTS:** Simulations using SPORTIF rates lead to expected net benefit for 74.6% (24,960) of the cohort while simulations using ATRIA rates lead to expected net benefit for 26.4% (8,817). Using SPORTIF rates, guideline-based anticoagulation (i.e., CHA2DS2-VASc 2+), would lead to a gain of 12,716 QALYs (mean, 0.47/per patient receiving anticoagulation therapy). By contrast, using ATRIA rates, guideline-based anticoagulation would lead to a gain of 966 QALYs (mean, 0.04/patient receiving anticoagulant therapy). **CONCLUSIONS:** The net benefit of anticoagulation for AF is highly sensitive to variation in baseline stroke rates. Future work is needed to reconcile the observed variation in baseline stroke risk so that the benefit of anticoagulation can be accurately determined.

PCV18

INCIDENCE OF CARDIOVASCULAR EVENTS AMONG SECONDARY PREVENTION PATIENTS TREATED WITH STATINS OR EZETIMIBE IN JAPAN

Nagar SP[1], Fox KM[2], Rane PP[3], Beaubrun A[3], Qian Y[3], Inomata H[4], Davis KL[1], Meyers J[1], Kajinami K[5]
[1]*RTI Health Solutions, Research Triangle Park, NC, USA,* [2]*Strategic Healthcare Solutions, LLC, Aiken, SC, USA,* [3]*Amgen Inc., Thousand Oaks, CA, USA,* [4]*Amgen Astellas BioPharma K.K., Tokyo, Japan,* [5]*Kanazawa Medical University, Uchinada, Japan*

OBJECTIVES: To estimate the incidence of cardiovascular events (CVE) among secondary prevention patients in Japan **METHODS:** A retrospective cohort study examined adults initiating either a statin or ezetimibe from 1/1/2006-5/31/2014 in the Japan Medical Data Center database (2005-2015). The first observed statin or ezetimibe prescription defined the index date. Patients had $\geq$12 months of pre- and post-index date plan enrollment. Patients with atherosclerotic cardiovascular disease (ASCVD) during the pre-index period were identified, including the subgroup of patients with $\geq$25% statin up-titration in the follow-up period. Incidence of CVE, defined as a new inpatient claim for myocardial infarction (MI), unstable angina, stroke, coronary revascularization procedure, heart failure (HF), transient ischemic attack, or peripheral artery disease was reported. **RESULTS:** 5,302 patients with previous ASCVD were included (mean [SD] age: 55.7 [9.5] years, 63.8% males). Diabetes (59.6%) and hypertension (59.5%) were the most prevalent comorbidities, pre-index. 69.8% of patients received moderate intensity statins and 0.8% received both statins and ezetimibe. Post-index date, 8.1% had any new CVE over a mean follow-up of 2.8 years; stroke (2.4%), MI (2.2%) and HF (1.5%) were the most common events; incident rates of these events per 1000 person-years of follow-up were 8.6 (stroke), 7.9 (MI) and 5.5 (HF). Among ASCVD patients who up titrated statin (N=385), 8.6% had a new CVE after statin up titration over a mean follow-up of 2.7 years; MI (2.9%), stroke (2.3%) and HF (1.6%) were the most common CVEs. Incidence rates of these events per 1000 person-years in patients with ASCVD and statin up-titration were 10.6 (MI), 8.7 (stroke) and 5.8 (HF). **CONCLUSIONS:** In a real world Japanese cohort with ASCVD, many patients still had recurrent CVEs despite receiving statins and/or ezetimibe. These findings highlight a continued unmet medical need in the area of secondary CVE prevention in Japanese patients.

PCV19

IMPACT OF RENAL FUNCTION ON CLINICAL OUTCOMES AMONG NONVALVULAR ATRIAL FIBRILLATION PATIENTS TREATED WITH WARFARIN OR RIVAROXABAN

Weir MR[1], Haskell L[2], Berger JS[3], Ashton V[2], Laliberté F[4], Crivera C[2], Brown K[4], Lefebvre P[4], Schein JR[2]
[1]*University of Maryland School of Medicine, Baltimore, MD, USA,* [2]*Janssen Scientific Affairs, LLC, Raritan, NJ, USA,* [3]*New York University School of Medicine, New York, NY, USA,* [4]*Groupe d'analyse, Ltée, Montreal, QC, Canada*

OBJECTIVES: Renal functional impairment is linked to increased risk of thromboembolic and bleeding events in patients with nonvalvular atrial fibrillation (NVAF) treated with warfarin or rivaroxaban. This cohort study assesses the impact of renal function on ischemic stroke and major bleeding rates in NVAF patients in the real-world setting. **METHODS:** Patients with first dispensing of warfarin or rivaroxaban after 11/2011 from the IMS Health Real-World Data Adjudicated Claims and Optum's Integrated Claims-Clinical de-identified data were included. Outcomes were stratified by estimated creatinine clearance (eCrCl from Cockcroft-Gault formula) for ischemic stroke, major bleeding, and a composite measure

(ischemic stroke, myocardial infarction (MI) or venous thromboembolism (VTE)) and analyzed using hazard ratios. Patients were stratified by those with eCrCl < 60 mL/min and eCrCl ≥ 60 mL/min. Confounding adjustments were made with inverse probability of treatment weights. **RESULTS:** Analyses included 874 rivaroxaban and 1,069 warfarin users in IMS data and 1,269 rivaroxaban and 2,256 warfarin users in Optum data. Baseline characteristics for weighted cohorts were similar. In Optum data, the risk of ischemic stroke was significantly lower for patients treated with rivaroxaban (HR = 0.31 [0.17-0.59], p=0.0003) as well as for patients with eCrCl < 60 mL/min (HR = 0.19 [0.05-0.68], p=0.0105). In IMS data, the risk of ischemic stroke was not statistically different between cohorts overall or between subgroups. In both databases, the risk of major bleeding events was not statistically different between study groups and the risk for the composite measure was significantly lower for rivaroxaban-treated NVAF patients with eCrCl ≥ 60 mL/min. **CONCLUSIONS:** Across IMS and Optum databases, ischemic stroke rates were either significantly lower for rivaroxaban-treated NVAF patients (overall and for patients with eCrCl < 60 mL/min) or not statistically different between cohorts. The risk of bleeding was not statistically different between cohorts for any subgroups across databases.

PCV20

THE IMPACT OF LOW-DENSITY LIPOPROTEIN CHOLESTEROL GOAL ATTAINMENTS ON CARDIOVASCULAR OUTCOMES: A RETROSPECTIVE COHORT STUDY IN CHINESE ACUTE CORONARY SYNDROME PATIENTS

Lee VW[1], Wang Y[1], Wu J[2], Yan BP[1], Nichol MB[2], Tomlinson B[1]
[1]*The Chinese University of Hong Kong, Shatin, Hong Kong,* [2]*University of Southern California, Los Angeles, CA, USA*

OBJECTIVES: This study aimed to assess the effect of low-density lipoprotein cholesterol (LDL-C) goal attainments (of <2.6mmol/L, <1.8mmol/L, and ≥50% reduction) on first major adverse cardiovascular events (MACEs) for acute coronary syndrome (ACS) patients who underwent percutaneous coronary intervention (PCI). **METHODS:** A retrospective cohort study was conducted using case reviews of post-PCI ACS patients at an acute public hospital in Hong Kong between January 2009 and August 2015. Patients were followed from the date of PCI procedure until the first event of MACE (including all-cause death, myocardial infarction, heart failure, documented unstable angina, revascularization, and stroke) or to the end of the first year. Kaplan-Meier estimates were used to evaluate the impact of LDL-C goal attainment prior to the event on event-free time (time from the latest lipid goal attainment to the first occurrence of MACE). **RESULTS:** A total of 1684 patients were identified. Mean age was 68.7 years (78.8% males). At one-year endpoint, 658 (39.1%) attained the LDL-C goal of <1.8mmol/L, 727 (43.2%) had LDL-C between 1.8 mmol/L and 2.6mmol/L, and 299 (17.8 %) had LDL-C ≥2.6mmol/L. About 10% experienced a MACE within one year. The attainment of LDL-C level<2.6mmol/L was significantly associated with lower rates of MACEs during the one-year follow-up, and a further lowering of LDL-C level to 1.8 mmol/L did not lead to any incremental clinical benefits. Statin therapy was highly associated with LDL-C goal attainments but high-intensity statin therapy itself was not associated with a reduced rate of MACEs. Obtaining a ≥50% reduction in LDL-C was associated with a significant reduction in MACEs. **CONCLUSIONS:** The clinical benefits of achieving an LDL-C goal of <2.6mmol/L or obtaining a ≥50% reduction were reconfirmed, whereas achieving a <1.8mmol/L goal was not.

PCV21

LIPID TARGET ACHIEVEMENTS AMONG HIGH AND VERY HIGH RISK PATIENTS IN OMAN: FINDINGS FROM THE CEPHEUS STUDY

Al-Zakwani I[1], Al-Hinai AT[2], Al-Sabti H[3], Al-Waili K[4], Al-Hashmi K[1], Al-Rasadi K[4]
[1]*Sultan Qaboos University, Muscat, Oman,* [2]*Ministry of Health, Muscat, Oman,* [3]*Oman Medical Specialty Board, Muscat, Oman,* [4]*Sultan Qaboos University Hospital, Muscat, Oman*

OBJECTIVES: To determine lipid target achievements among Omanis with high and very high risk status from the Centralized Pan-Middle East Survey on the undertreatment of hypercholesterolemia (CEPHEUS) according to the recent recommendations from the National Lipid Association. **METHODS:** The Omani CEPHEUS study included 399 high and very high atherosclerotic cardiovascular disease (ASCVD) risk patients (≥18 years) on lipid lowering drugs (LLDs). The lipid fractions included high-density lipoprotein cholesterol (HDL-C), low-density lipoprotein cholesterol (LDL-C), non-high density lipoprotein cholesterol (non-HDL-C) and apolipoprotein B (Apo B). **RESULTS:** The overall mean age of the cohort was 58 ± 12 years, 48% (n=192) were female and 79% (n=316) had very high ASCVD risk status. Lipid target attainments for HDL-C, LDL-C, non HDL-C and Apo B were 41%, 26%, 35% and 35%, respectively. Very high ASCVD risk patients were less likely to attain lipid goal attainments compared to those with high ASCVD risk status (LDL-C (21 vs. 45%; p<0.001), non-HDL-C (30 vs. 55%; p<0.001) and Apo B (33 vs. 45%; p=0.048)). Lipid goal attainment was significantly lower in those with higher triglyceride levels (p<0.001 for HDL-C, non-HDL-C and Apo B goal achievements). Females were also less likely to make lipid goals (p<0.001 for HDL-C, LDL-C and Apo B goal achievements). **CONCLUSIONS:** Despite being on LLDs, a large proportion of patients in Oman, especially those with very high ASCVD risk status, those with high triglyceride levels as well as females, are not at recommended lipid targets and remain at a substantial residual risk for cardiovascular diseases.

PCV22

EXAMINATION OF CARDIO-VASCULAR RISK FACTORS IN THE PRIORITY OF ATRIAL FIBRILLATION

Meng Z[1], Pakai A[2], Oláh A[1], Szunomár S[1], Szabó L[1], Boncz I[1], Betlehem J[1], Váradyné Horváth Á[1]
[1]*University of Pécs, Pécs, Hungary,* [2]*University of Pécs, Zalaegerszeg, Hungary*

OBJECTIVES: Stroke-prophylaxis is the most massive subject of interest of atrial fibrillation, which is highly influenced by presence of risk factors toward for arrhytmia. Our goal was to examine risk factors, successfulness of frequency control, effectiveness of anticoagulant therapy. **METHODS:** The study was a retrospective, quantitative cross-sectional study with non-randomized sampling method. Target group was patients treated with anticoagulant therapy. Enrollment criteria: atrial fibrillation, age 20-90 years, NYHA II. stage. Excursion criteria: patients having elective intervention that influence INR rates. The study was carried o tat the University of Pécs Clinical Centre, Cardiology Clinic in 01.01.2012-31.12.2012. Data collecting was done by patients records analysis. Statistical analysis included linear regression, T-test, Chi square test, variance analysis (ANOVA) withy SPSS 20.0. **RESULTS:** We found significant correlation between BMI values-, systolic blood pressure-, modified medication and its effect on frequency control-, correct anticoagulant therapy- and the INR parameters, and the increased risk of thrombo-embolia in patients with atrial fibrillation. (p<0.05) **CONCLUSIONS:** International publications prove increasing incidence of atrial fibrillation. (Schnabel, 2012) Based upon clinical protocols and our study we emphasize importance of stratification of risk factors, individual optimalization of the anticoagulant therapy in the interest of effective stroke prevention (Járai, 2008) and increased chance of survival (Matos, 2009).

PCV23

INCIDENT CANCER AND ADHERENCE TO STATINS AND ANTIHYPERTENSIVE MEDICATIONS FOR CORONARY ARTERY DISEASE AMONG ELDERLY MEDICARE BENEFICIARIES

Chopra I[1], Tan X[1], Dwibedi N[2], Findley P[3], Mattes M[1], Sambamoorthi U[2]
[1]*West Virginia University, Morgantown, WV, USA,* [2]*West Virginia University, School of Pharmacy, Morgantown, WV, USA,* [3]*Rutgers University, New Brunswick, NJ, USA*

OBJECTIVES: To examine the relationship between incident cancer and adherence to statins and angiotensin-converting enzyme inhibitors (ACEIs), angiotensin II receptor blockers (ARBs), or beta-blockers among elderly individuals with CAD. **METHODS:** A retrospective observational longitudinal study assessing elderly Medicare fee-for-service beneficiaries with pre-existing CAD and incident breast (BC), colorectal (CC), or prostate (PC) cancer (N=12,096) and those with no cancer (NC) (N=34,257). Adherence to pharmacotherapy was measured during one-year pre- and post-index period at 120-day intervals. Key independent variable was grouped by cancer type and sex. Medication adherence was categorized into mutually exclusive groups. The adjusted relationship between incident cancer and medication adherence was analyzed using the generalized estimating equation. Inverse probability treatment weights were used to account for observed group differences between cancer and non-cancer groups. **RESULTS:** Only 29.1% of the elderly with CAD were adherent to both statins and ACEIs/ARBs/beta-blockers. In adjusted analyses, women [AOR=0.70; 95%CI=0.58,0.81; P<0.0001] and men [AOR=0.62; 95%CI=0.49,0.74; P<0.0001] with CC and men with PC [AOR=0.90; 95%CI=0.83,0.98; P=0.022] were significantly less likely to be adherent to both medication classes compared to their NC counterparts. No significant differences in adherence were observed for BC compared to those with NC. Even among those using single medication class, women [AOR=0.65; 95% CI=0.51,0.80; P<0.0001] and men with CC [AOR=0.59; 95%CI=0.42,0.76; P<0.0001] were significantly less likely to be adherent to that medication class compared to women and men with NC. **CONCLUSIONS:** Adherence to evidence-based medications for CAD varied by cancer types. Elderly Medicare beneficiaries with CC or PC were less likely to be adherent to evidence-based medications for CAD. Future research needs to explore the effect of non-adherence to concomitant medications on health outcomes such as survival among patients with incident CC and PC.

PCV24

HYPERLIPIDEMIA DRUG UTILISATION PATTERN IN PATIENTS WITH HYPERLIPIDEMIA BASED ON CLAIMS DATABASE OF HOSPITALS IN JAPAN

Wake M[1], Onishi Y[2], Hiroi S[1], Uda A[3], Shimasaki Y[3], Teramoto T[4]
[1]*Takeda Pharmaceutical Company Limited, Chuo-ku, Japan,* [2]*Creativ-Ceutical, Tokyo, Japan,* [3]*Takeda Pharmaceutical Company Ltd., Tokyo, Japan,* [4]*Teikyo Academic Research Center, Tokyo, Japan*

OBJECTIVES: The aim of this study was to describe real-world prescription patterns, adherence and persistence of hyperlipidaemia (HLD) drugs for patients with HLD in Japan. **METHODS:** This study was a retrospective analysis using a hospital-based claims database provided by Medical Data Vision (MDV). Adult patients with HLD (ICD10: E78) initiating an HLD drug class between 01 January 2014 and 31 December 2014 were evaluated. Individuals were categorized as previously untreated (UT) or previously treated (PT), depending on the prescription of HLD drugs within the 12-month look-back period, and they were followed for at least 12 months. Adherence was measured using the medication possession ratio (MPR) and patients were defined as adherent when MPR≥80%. Persistence was defined as no discontinuation of initial HLD drugs during 12 months after the drug initiation. Standard descriptive and survival analysis methods were used to evaluate persistence and adherence. **RESULTS:** The analysis included 19,589 patients (UT: 13,185, PT: 6,404). Mean age was 66.6 years (UT: 67.1, PT: 65.7). The proportion of patients treated with one single drug class varied between the UT (98.3%) and PT cohorts (48.9%). The most frequently prescribed drug class was moderate statin. Among patients treated with several concomitant HLD drug classes, the most frequently prescribed combinations were moderate statin plus polyunsaturated fatty acids. Mean MPRs of single drug class therapy were over 95% across all HLD classes in UT and PT cohorts. The 12 months persistence rate of moderate statin was 62.1% and 68.4% in UT and PT cohorts, respectively. **CONCLUSIONS:** Moderate statin was the most frequent choice when initiating a first HLD drug therapy and a combination treatment was preferred for more experienced patients. The study showed patients with HLD are mostly adherence to drug therapies.

PCV25

BASELINE CHARACTERISTICS OF A RETROSPECTIVE CLAIMS ANALYSIS OF CARDIOVASCULAR OUTCOMES AND HEALTH CARE RESOURCE UTILIZATION AND COSTS IN HIGH-RISK STATIN-TREATED PATIENTS WITH HYPERTRIGLYCERIDEMIA

Hull M[1], Philip S[2], Granowitz C[3], Liassou D[1], Anderson A[1], Toth PP[4]
[1]Optum, Eden Prairie, MN, USA, [2]Amarin Pharma, Inc., Bedminster, NJ, USA, [3]Amarin Pharma, Inc, Bedminster, NJ, USA, [4]CGH Medical Center, Sterling, IL, USA

OBJECTIVES: The ongoing REDUCE-IT study is investigating the effects of the prescription omega-3 fatty acid icosapent ethyl as add-on therapy to statins on long-term cardiovascular (CV) events in high-risk patients with hyperlipidemia. The objective of this study was to examine real-world evidence on CV outcomes and health care resource utilization and costs in a patient population similar to REDUCE-IT. **METHODS:** This was a retrospective administrative claims analysis using the Optum Research Database of medical and pharmacy claims data, enrollment information, laboratory results, and mortality data. Patients ≥45 years with documented diabetes and/or atherosclerotic CV disease (ASCVD), baseline statin usage, baseline triglycerides ≥150 mg/dL, and up to 5 years of available data for follow-up were included. Patients had continuous enrollment with medical and pharmacy coverage for 6 months of baseline and ≥6 months of follow-up. Evaluation parameters included use of fibrates and prescription omega-3 fatty acid products, statin titration patterns, rates of occurrence of first and subsequent major CV events, new chronic heart failure, transient ischemic attack, coronary revascularization, and quantification of health care costs and resource utilization. **RESULTS:** This report describes the baseline characteristics of the study population: 27,471 patients were included and had these characteristics: mean (SD) age, 61.6 (9.6) years; 46.7% female; 41.2 months mean follow-up; 69.3% commercial insurance enrollees, 30.7% Medicare; 83.7% on statins only, 13.4% on statin+fibrate, 1.9% on statin+omega-3, 1.0% on statin+fibrate+omega-3. Most (85.0%) patients had diabetes, 29.1% had ASCVD, 2.1% had prior myocardial infarction, and 3.1% had prior stroke. **CONCLUSIONS:** This real-world evidence study of patients with characteristics similar to those in REDUCE-IT identified more than 27,000 patients for an analysis that is well positioned to provide robust insight into medication patterns, CV events, health care costs and resource utilization, and the potential impact of icosapent ethyl therapy, based on the forthcoming REDUCE-IT results.

PCV26

FREQUENCY, PROGNOSIS AND RISK FACTORS AMONG CONGESTIVE HEART FAILURE IN DIALYSIS PATIENTS ATTENDING PUBLIC HOSPITALS OF QUETTA CITY, PAKISTAN

Khilji F[1], Baloch M[1], Iqbal J[2], Iqbal Q[1], Saleem F[3]
[1]University of Balochistan, Quetta, Pakistan, [2]University of Bolochistan, Quetta, Pakistan, [3]University of Baluchistan, Quetta, Pakistan

OBJECTIVES: The current research was conducted to evaluate Congestive Heart Failure (CHF) in dialysis patients; it`s frequency, prognosis, and risk factors among patients attending public healthcare institutes of Quetta city, Pakistan. **METHODS:** This is a multicenter cohort study conducted at two public healthcare institutes of Quetta city, Pakistan. Data of 117 patients for one year was screened from the official records and evaluated retrospectively to identify variables of interest. Data was collected through a validated information sheet. SPSS v.20 was used for data analysis and data was described descriptively. **RESULTS:** All patients had End-Stage Renal Disease (ESRD) and were on regular maintenance hemodialysis therapy. Out of all selected patients, 7.7 % patients had Non-Insulin Dependent Diabetes Mellitus, 4.3% patients had Ischemic Heart Disease, 78.6% had Left Ventricular Hypertrophy and 80.34% had Cardiomyopathy. Forty five patients (38.46%) were confirmed with CHF. Thirty seven (31.6%) of those had systolic dysfunction, 8 (6.8%) had diastolic dysfunction and 4 (3.4%) had both systolic and diastolic dysfunction. In the subjects with systolic dysfunction, 2.6% measured ejection fraction (E.F) of ≤ 20%, 13.7% measured 21-30% and 15.4% measured 3-40%. Additionally, 13 (28.9%) patients developed de novo CHF. Recurrence of CHF was observed in 26 patients (57.7%) whereas among the CHF group, ten patients died during the study period presenting a mortality rate of 24% in CHF group. **CONCLUSIONS:** The incidence of CHF was relatively high in our study population of ESRD. It was also observed that risk factors of both the disease conditions collaboratively exacerbated each other, resulting in worsening of patients' condition. Frequent recurrence of the disease, re-hospitalization and enhanced mortality in our study population is evident of adverse prognosis of CHF in ESRD population.

PCV27

BLEEDING-RELATED HOSPITAL ADMISSIONS AND 30-DAY RE-ADMISSIONS WITH DABIGATRAN VERSUS WARFARIN IN PATIENTS WITH NONVALVULAR ATRIAL FIBRILLATION

Lau WC[1], Li X[1], Wong IC[2], Chan EW[1]
[1]University of Hong Kong, Hong Kong, Hong Kong, [2]UCL School of Pharmacy, London, UK

OBJECTIVES: To compare the incidence of bleeding-related hospital admissions and 30-day re-admissions with dabigatran versus warfarin in patients with nonvalvular atrial fibrillation (NVAF). **METHODS:** Retrospective cohort study using a population-wide database managed by the Hong Kong Hospital Authority. Patients newly diagnosed with NVAF from 2010 through 2014 and prescribed dabigatran or warfarin were 1:1 matched by propensity score. The incidence rate of hospital admission with bleeding (a composite of gastrointestinal bleeding, intracranial hemorrhage, and bleeding at other sites) was assessed by zero-inflated negative binomial regression. Among patients who were continuously prescribed with their initial anticoagulants upon discharge, we assessed the risk of 30-day re-admission with bleeding using a Cox proportional hazard regression model, with adjustment for length of stay and type of bleeding in the initial bleeding episode. **RESULTS:** Preliminary results indicated that among the 51946 patients with NVAF, 8309 users of dabigatran or warfarin were identified, with 5160 patients matched by propensity score. Of these, 151 (5.9%) dabigatran users and 172 (6.7%) warfarin users were hospitalized with bleeding during follow-up. The incidence of first hospitalized bleeding did not differ significantly between groups (incidence rate ratio[IRR]: 0.92; 95% confidence interval[CI]: 0.66-1.28). Cox regression analysis indicated that dabigatran use was associated with a higher risk of 30-day re-admission with bleeding over warfarin (adjusted hazard ratio [HR]: 2.87; 95%CI: 1.10-7.43). The difference became statistically non-significant when the observation period was extended to 60 days of discharge (HR: 1.89; 95%CI: 0.89-4.04). **CONCLUSIONS:** When compared to warfarin, dabigatran was associated with a comparable incidence of hospital admission but a higher risk of 30-day re-admission with respect to bleeding. Given that dabigatran achieves full anticoagulation more quickly than warfarin, close early monitoring of patients initiated on dabigatran following hospital discharge for bleeding is warranted.

PCV28

PREVALENCE AND INCIDENCE OF CLINICAL ATHEROSCLEROTIC CARDIOVASCULAR DISEASE (ASCVD) IN TAIWAN

Chen W[1], Wen Y[2], Hsiao F[3], Fox KM[4], Shen L[3], Qian Y[5], Zhao Z[5], Rane PP[5]
[1]National Taiwan University Medical College and Hospital, Taipei, Taiwan, [2]Health Data Research Center, National Taiwan University, Taipei, Taiwan, [3]Graduate Institute of Clinical Pharmacy, College of Medicine, National Taiwan University, Taipei, Taiwan, [4]Strategic Healthcare Solutions, LLC, Aiken, SC, USA, [5]Amgen Inc., Thousand Oaks, CA, USA

OBJECTIVES: To estimate the annual prevalence and incidence of clinical atherosclerotic cardiovascular disease (ASCVD) in Taiwan. **METHODS:** We conducted a cross-sectional study using Taiwan's 2005-2013 National Health Insurance Research Database (NHIRD). Patients with clinical ASCVD, defined as patients with coronary artery disease (acute coronary syndrome, coronary revascularization, myocardial infarction and stable or unstable angina), ischemic stroke or transient ischemic attack (TIA), peripheral arterial disease or peripheral artery revascularization according to ACC/AHA 2013 guidelines, were identified. Annual prevalence and incidence were reported per 100,000 individuals and further stratified by age and gender. **RESULTS:** Among Taiwanese adults aged more than 20 years, the overall prevalence of clinical ASCVD per 100,000 persons was 2,318 in 2006 and increased to 3,305 in 2013. Incidence of clinical ASCVD (1,263 in 2006 and 1,126 in 2013 per 100,000 persons) remained constant during the study period. The overall prevalence/incidence trends among patients with clinical ASCVD was similar between men and women. The prevalence and incidence increased with age until 84 years of age. **CONCLUSIONS:** The prevalence of ASCVD increased over time during 2006 to 2013 among Taiwanese population. Stable incidence of clinical ASCVD was observed during the study period.

PCV29

PROTECTING THE GAINS: WHAT CHANGES ARE NEEDED TO PREVENT A REVERSAL OF THE DOWNWARD CVD MORTALITY TREND?

Ortendahl JD, Cherepanov D, Harmon AL, Broder MS
Partnership for Health Analytic Research, LLC, Beverly Hills, CA, USA

OBJECTIVES: Cardiovascular disease (CVD) mortality has decreased by >60% over the past 50 years, partially due to development of preventive therapeutics (e.g., statins, antihypertensive agents) and acute interventions, however progress is slowing. With an aging US population, an expected rise in obesity and diabetes, and competing needs for limited resources, future patterns of CVD are uncertain. **METHODS:** We developed a Microsoft® Excel-based model to project trends in CVD mortality. National Health and Nutrition Examination Survey (NHANES) data was used to estimate population-level trends in CVD-related risk factors (e.g., smoking, diabetes, cholesterol, blood pressure). Cohorts of 1,000,000 individuals were generated and assigned characteristics based on risk factor projections. Microsimulations were performed to estimate the 10-year CVD risk for individuals using the Framingham Risk Score. Risk scores, calculated separately for men and women, were used to predict future CVD prevalence and mortality. Scenarios, differing by uptake of current therapies, pharmaceutical innovations with efficacy exceeding available alternatives, and risk factor prevalence, were assessed to estimate the annual mortality rate from 2017-2040 given uncertainty. **RESULTS:** When incorporating a demographic shift, but assuming constant risk factors, current treatment utilization, and no major innovations, we predicted the CVD mortality rate would increase by 12% by 2040. In order to decrease CVD mortality by 15% given projected changes in risk factors, innovative therapies that can provide incremental benefits equal to or greater than the those associated with the introduction of statins will need to be identified and widely utilized. **CONCLUSIONS:** Although CVD is the leading area of direct healthcare costs with <$230 billion spent in 2013, further investment is necessary to continue reducing the CVD burden. Increasing access and adherence to current preventative therapeutics could slow the increase in mortality, but innovative therapies may be needed to maintain the downward trend in CVD deaths.

PCV30

EVALUATION OF PATIENTS' KNOWLEDGE ON WARFARIN AND INR GOAL ATTAINMENT IN AN OUTPATIENT CLINIC OF A TERITARY HOSPITAL IN NIGERIA

Ogunbameru AA, Dadogo D, Baderinwa A
University of Lagos, Lagos, Nigeria

OBJECTIVES: To assess the knowledge of patients receiving warfarin therapy in outpatient cardiology clinic using a validated and adapted Anticoagulation

Knowledge Assessment (AKA) questionnaire and examine the relationship between patients' anticoagulation knowledge and INR control. **METHODS:** The study was a cross-sectional survey. Patients (n= 70) on warfarin who visited the outpatient clinic of the cardiology unit from July 2016- September 2016 were enrolled and asked to complete the AKA questionnaire upon voluntary consent. Demographic and clinical data such as INR goal range, and 5 INR values preceding the date of consent were manually extracted from patients' record data. Passing score was defined as at least 12 correct responses out of 23- INR relevant AKA questions (52%). INR control was defined by 3 outcome measures: number of INR values within goal range, time in therapeutic range (TTR), and standard deviation (SD) of INR values. **RESULTS:** Of the 70 patients enrolled, 60 patients consented to participate (85.7%; females 45%; mean age± SD 60.07±7.75; % with post-secondary education 28.3%). Most patients (n=52) had goal INR ranges of 2.0 to 3.0 (86.6%). Of the 60 patients who completed the questionnaire, 26 (43.3%) achieved the passing score (52%). There was no significant relationship between number of correct INR-relevant responses and INR control as defined by any of the 3 measures (count of INR values within range rho = 0.070, P = 0.595; TTR rho = 0.092, P = 0.595; and SD rho = 0.118, P = 0.371). **CONCLUSIONS:** Although 43.3% (n= 26) achieved the passing score of 52%, there was no significant relationship between patients' knowledge of warfarin and INR control. Establishment of educational programs for patients on anticoagulation drugs are recommended for future studies.

PREVALENCE AND INCIDENCE OF ATHEROSCLEROTIC CARDIOVASCULAR DISEASE AND CARDIOVASCULAR RISK FACTORS IN SOUTH KOREA: A POPULATION-BASED STUDY

Suh HS[1], Rane PP[2], Fox KM[3], Kim HT[1], Han S[1], Kim S[1], Zhao Z[2], Qian Y[2]
[1]*Pusan National University, Busan, South Korea,* [2]*Amgen Inc., Thousand Oaks, CA, USA,* [3]*Strategic Healthcare Solutions, LLC, Aiken, SC, USA*

OBJECTIVES: To estimate the prevalence and incidence of patients with atherosclerotic cardiovascular disease (ASCVD) or at high risk for ASCVD in Korea using national claims data. **METHODS:** We identified patients aged ≥18 years with ASCVD or with risk factors for ASCVD during 2013-2015 using the national claims data of Health Insurance Review and Assessment Service. ASCVD was defined as myocardial infarction (MI), angina (stable and unstable), coronary revascularization, peripheral artery disease (PAD), ischemic stroke, and transient ischemic attack (TIA). Cardiovascular risk factors, namely hypertension and diabetes mellitus, were also examined. Prevalence and cumulative incidence of ASCVD were reported per 1000 persons and further stratified by age and gender. Incident patients were those without history of or risk factors for ASCVD in the year prior to the first occurrence of ASCVD or any risk factor. **RESULTS:** Among South Korean adult patients, the overall prevalence of ASCVD per 1000 persons was 98 in 2014 and 101 in 2015. The prevalence of diabetes mellitus and hypertension was 113 and 206 per 1000 persons in 2015, respectively. Cumulative incidence of ASCVD per 1000 persons was 55 in 2014 and 60 in 2015. Cumulative incidence of diabetes mellitus and hypertension in 2015 was 34 and 27 per 1000 persons, respectively. Overall prevalence and cumulative incidence of ASCVD per 1000 persons was higher in women than in men (105.62 and 64.58 in women v. 96.52 and 56.41 in men, respectively). The prevalence and incidence of ASCVD increased with age until the age of 79 years. **CONCLUSIONS:** This national population-based study confirmed a high prevalence and incidence of ASCVD and cardiovascular risk factors in the adult population of South Korea.

PCV32

PREDICTORS OF STATIN UTILIZATION IN US PATIENTS WITH NON-FATAL MAJOR ADVERSE CARDIOVASCULAR EVENTS

Williams AO[1], Fan W[2], Armstrong S[2], Demissie K[1]
[1]*Rutgers, The State University of New Jersey, Piscataway, NJ, USA,* [2]*The Medicines Company, Parsippany, NJ, USA*

OBJECTIVES: To estimate the prevalence of statin utilization, as well as identify the predictors of statin use in US patients with non-fatal major adverse cardiovascular disease (MACE). **METHODS:** The study was a retrospective analysis using data from Premier hospital database. Patients aged 18 to 89 diagnosed in 2010 with primary non-fatal MACE were identified and followed for 5 years. Two groups of participants were studied: Statin users and non-statin users at index hospitalization and by each year after the index event. Statistical modeling was used to examine the associations between cardiovascular risk factors and statin utilization, as well as the prevalence of statin utilization. Statistical analysis was performed using SAS 9.3 software. **RESULTS:** 420,866 patients met the inclusion criteria (44%) coronary artery disease, ischemic stroke (21%), myocardial infarction (18%), peripheral artery disease (13%), and unstable angina (4%). The mean age was 66.8 years (SD=12.6), 61.3% and 71.1% were men and white, respectively. The prevalence of statin utilization ranged from 43% during the index event and increased from 71.2% to 72% from 2011 to 2015. After adjusting for baseline, clinical, and hospital characteristics, female gender was associated with an 18.4% increase (OR=1.18, 95% CI: 1.15-1.25) in the odds of statin utilization compared to males one year after the index event. The model predicted a lower probability of statin use one year after the index event at 0.76 (95% CI: 0.72-0.79) for individuals with diabetes compared to those without diabetes, after adjusting for other covariates. **CONCLUSIONS:** Findings provide insights on the prevalence and predictors of statin utilization. Gender and diabetes are significant factors that had consistent impact on statin use during the five years. These factors may be useful guides for targeting interventions to increase statin use in patients with cardiovascular events.

PCV33

LEVERAGING OPEN DATA TO CREATE NEW INSIGHTS IN CARDIOVASCULAR EPIDEMIOLOGY

Pencina M[1], Navar AM[1], Wojdyla D[1], Peterson ED[1], Gee D[2]
[1]*Duke University Medical Center, Durham, NC, USA,* [2]*Duke Clinical Research Institute, Durham, NC, USA*

OBJECTIVES: The study sought to pool and harmonize patient-level data from open source databases to evaluate: 1) how associations between modifiable risk factors and coronary heart disease (CHD) changed over time; and 2) if the population attributable fractions (PAF) of CHD due to modifiable risk factors changed post year 2000. **METHODS:** The study pooled individual patient-level data (n=28,081) from 5 observational cohort studies available in the NHLBI Biological Specimen and Data Repository Information Coordinating Center (BioLINCC). Data were harmonized to allow for examination of four modifiable risk factors: 1) systolic blood pressure (SBP), 2) diabetes, 3) smoking, and 4) total to high-density lipoprotein cholesterol ratio (total:HDL-C) in an older (1983–2000, "pre-2000") and more contemporary (1998–2010, "post-2000") era. Matched pairs of participants free from cardiovascular disease (n=14,009) were selected and followed for up to 12 years for new-onset CHD. **RESULTS:** Pooling data from multiple studies afforded sample size sufficient for necessary precision and generalizability of estimates that could not have been achieved with a single cohort. The rate of CHD declined from pre-2000 to post-2000 by 17% (p-value<0.001). Reductions in PAFs between periods were not statistically significant for SBP and total:HDL-C and exceeded 25% and 15%, respectively, post-2000. Compared with pre-2000, PAF of diabetes post-2000 declined from 10% to 5% (p-value=0.004). **CONCLUSIONS:** Open source cohort data from multiple government funded registries proved to be a vital resource in studying the time course of risk factors and CHD. Analysis of pooled data revealed that although CHD risk declined with time, the proportion of CHD still attributable to modifiable risk factors remained high. After considerable effort to pool and harmonize data, the scientific value of these cohort studies can be exploited further through subsequent analyses to address other pressing questions in cardiovascular epidemiology.

PCV34

PATIENT ADHERENCE TO NOVEL ORAL ANTICOAGULANTS (NOACS) FOR THE TREATMENT OF ATRIAL FIBRILLATION AND OCCURRENCE OF ASSOCIATED BLEEDING EVENTS: A SYSTEMATIC REVIEW AND META-ANALYSIS

Bhagavathula AS[1], Shehab A[2], Abegaz TM[3], Befekadu T[3]
[1]*University of Gondar - College of Medicine and Health Sciences, Gondar, Ethiopia,* [2]*United Arab Emirates, UAE University, UAE, United Arab Emirates,* [3]*University of Gondar, Gondar, Ethiopia*

OBJECTIVES: We sought to review the available published literature on adherence to NOACs and associated bleeding events, among patients with AF **METHODS:** Observational studies assessing patient adherence to NOACs conducted on AF patients between September 2010 and June 2016 were identified by systematic searching of PubMed, Scopus and Google Scholar, using MeSH keywords to locate eligible studies, in accordance with Cochrane guidelines. Papers from included studies were quality assessed in duplicate, and data extracted according to a range of pre-defined criteria and outcomes. Meta-analysis was performed using a Random effects model with DerSimonian-Laird weighting to obtain pooled effect sizes. **RESULTS:** From 185 potentially relevant citations, six studies, comprising 1.6 million AF patients, met the eligibility criteria and were included in the review and meta-analysis. Among these, successful adherence to NOACs occurred in some 75.6%. Adherence levels were higher in patients treated with dabigatran (72.7%) compared with those treated with apixaban (59.9%) or rivoraxaban (59.3%). However, the level of adherence was still suboptimal than expected 80% rate. Bleeding events in non-adherent patients were found to be 7.5%. **CONCLUSIONS:** Suboptimal adherence to NOACs among AF patients was highlighted as a significant risk factor that may affect clinical outcomes, with a higher percentage of non-adherent patients having bleeding events. There is an urgent need for research on the effects of specific interventions to improve patient adherence to NOACs and to assess the related outcome factors that may be associated with adherence.

PCV35

REDUCTION OF TOTAL MORTALITY AND CARDIOVASCULAR MORBIDITY WITH FIXED-DOSED COMBINATIONS OF ANGIOTENSIN RECEPTOR BLOCKERS COMPARED TO EXTEMPORANEOUS COMBINATIONS

Rodilla E[1], Muñoz C[2], Maroto R[2], Pascual J[3], Lobo F[2]
[1]*Universidad CEU Cardenal Herrera / Hospital de Sagunto, Moncada (Valencia) / Sagunto (Valencia), Spain,* [2]*Universidad Carlos III, Getafe (Madrid), Spain,* [3]*Hospital de Sagunto, Sagunto (Valencia), Spain*

OBJECTIVES: Control of hypertension (HTN) remains unsatisfactory in the majority of cases. The improvement of HTN control is the target of introducing multidrug, fixed-dosed combinations (FDC) of complementary drugs. The aim of this study is to compare the efficacy of FDC versus extemporaneous combinations (EXT) on total mortality and cardiovascular morbidity in a real-life setting. **METHODS:** Longitudinal, retrospective, post-observational study in a Primary Care setting of the Comunidad Valenciana in Spain, that included 116,937 hypertensive patients treated with angiotensin 2 receptor blockers (ARB) and at least calcium channel blockers (CCB) or one diuretic (D), either on EXT or FDC, during the years 2012 and 2013. **RESULTS:** The proportion of female gender was 53,2 %, mean age was 66,3 ± 13,2 years. 35% of patients kept FDC throughout the study, 34% maintained EXT, 4% added, 3% switched to FDC, 7% switched to EXT, 4% added EXT, 13% kept both. Both strategies reduced BP, but systolic and diastolic reductions were significantly larger in the FDC group (4,3 vs. 3,5 mmHg y 2,2 vs. 1,8 mmHg, p<0.0001), respectively, as was the proportion of controlled patients at follow-up (55,7 % vs. 55,3 %, p<0.001).

Treatment with FDC was associated with a reduced total mortality (5,3 % vs. 8,4 %, OR: 0,88; CI 0,87/0,89; p<0.0001), a reduced incidence of stroke (3,8 % vs. 4,5 %, OR: 0,83; CI 0,79/0,87; p<0.0001) and of ischemic heart disease (4,9 % vs. 7,9 %, OR: 0,60; CI 0,58/0,63; p<0.0001) compared to extemporaneous treatment, not only in patients maintaining FDC during the whole study, but also in those who switched to or added FDC. **CONCLUSIONS:** Higher reductions of BP, a higher proportion of controlled patients and a lower total mortality and cardiovascular morbidity are achieved with ARB in fixed-dosed combination with diuretics or calcium channel blockers in comparison with extemporaneous combinations.

PCV36

DEVELOPMENT AND VALIDATION OF A PREDICTION MODEL FOR RECURRENT CARDIOVASCULAR EVENTS AMONG PATIENTS WITH ASCVD IN THE US

Wang X[1], Bratton E[2], Wirtz H[2], Walton S[2], Monda KL[2]
[1]*University of Florida, Gainesville, FL, USA,* [2]*Amgen Inc, Thousand Oaks, CA, USA*

OBJECTIVES: Survival of patients with atherosclerotic cardiovascular disease (ASCVD) has increased; understanding the burden of subsequent events is important. Research is lacking regarding predictors of recurrent coronary risk. Our objective was to develop and validate a prediction model for recurrent CV events among patients with established ASCVD. **METHODS:** We conducted a retrospective cohort study using data from Truven Health MarketScan® Commercial Claims and Encounters. Adults (≥18 years) diagnosed with ASCVD in 2012 (index date) with at least one LDL-C measurement in the 12 months prior to the index date were included. Patients were followed for the occurrence of a subsequent CV event (myocardial infarction, stroke, hospitalization for unstable angina, stroke, or coronary revascularization), the end of enrollment, or the end of 12-months follow up. We used Cox proportional hazards regression to evaluate the predictive ability of clinical and laboratory risk factors and selected the model with the highest discriminatory ability. Temporal validation was performed using two cohorts of patients in 2011 and 2013. We assessed discrimination and calibration in all three cohorts. **RESULTS:** A total of 49,651 patients met our inclusion criteria. Strong predictors of a subsequent CV events included older age (≥66 years), male gender, geographical location, LDL-C above 100 mg/dL, history of cancer, chronic kidney disease, and a major cardiovascular event. High potency statin treatment (HR 0.75; 95% CI 0.67-0.84) and moderate potency statin treatment (HR 0.85; 95% CI 0.77-0.94) were significantly associated with reduced risk of recurrent CV events. The prediction model showed a reasonable C-statistic (0.70, 95% CI 0.66-0.74) and had an acceptable discrimination in the two validation cohorts (0.58, 95% CI 0.53-0.52; and 0.53, 95% CI 0.49-0.57, respectively). **CONCLUSIONS:** This risk prediction model of recurrent CV events may be informative in evaluating short-term prognosis and treatment decisions among patients with ASCVD in real-world clinical settings.

CARDIOVASCULAR DISORDERS – Cost Studies

PCV37

BUDGET IMPACT ANALYSIS OF DUAL ANTIPLATELET THERAPY WITH COMBINATION OF TICAGRELOR AND ACETYLSALICILIC ACID IN COMPARISON WITH COMBINATION OF CLOPIDOGREL AND ACETYLSALICILIC ACID IN PATIENTS WITH ACUTE CORONORY SYNDROM MANAGED WITH CORONARY ARTERY BYPASS GRAFTING IN CONDITIONS OF RUSSIAN HEALTH CARE SYSTEM

Zyryanov S
RUDN University, Moscow, Russian Federation

OBJECTIVES: To assess the budget impact of the use of ticagrelor combined with acetylsalicylic acid (ASA) in comparison withclopidogrel plus ASA in patients with acute coronary syndrome (ACS) managed with coronary artery bypass grafting (CABG) from societal perspective in Russia. **METHODS:** Clinical effectiveness of the therapeutic alternatives under evaluation was comparedby subanalysis,which includes ACS patients, managed with CABG, from randomized controlled trial PLATO. Direct medical expenses on antiplatelet therapy with ticagrelor plus ASA and original clopidogrel plus ASA during one year and management of patients dying from cardiovascular and other causes, as well as indirect expenses due to gross domestic product loss in case of premature death were included in the analysis. In budget impact model only for indirect cost discount rate 3% was applied. **RESULTS:** Both cost of one-year antiplatelet therapy (39 145 rubles per patient for ticagrelor plus ASA vs. 29 193 rubles for clopidogrel plus ASA) and direct medical expenses (40 624 rubles per patient for ticagrelor plus ASA vs. 32 088 rubles for clopidogrel plus ASA) were higher in case of therapy with ticagrelor plus ASA. Meantime, due to markedly lower total mortality (5.1% for ticagrelor plus ASA vs. 9.9% for clopidogrel plus ASA) indirect expenses (100 810 rubles per patient for ticagrelor plus ASA vs. 208 584 rubles for clopidogrel plus ASA) and total expenses (141 434 rubles per patient for ticagrelor plus ASA vs. 240 672 rubles for clopidogrel plus ASA) were lower for therapy with ticagrelor plus ASA. **CONCLUSIONS:** Despite higher medical expenses total cost of care for ACS patient managed with CABG in conditions of Russian health care system is lower in case of therapy with ticagrelor combined with ASA as compared to clopidogrel combined with ASA.

PCV38

BUDGET IMPACT ANALYSIS OF RIVAROXABAN IN CHINA

Fan CS[1], Wu J[2], Wu J[3]
[1]*Beijing Medical and Health Economic Research Association, Beijing, China,* [2]*Bayer Healthcare Company Ltd, Beijing, China,* [3]*306 hospital of PLA, Beijing, China*

OBJECTIVES: Rivaroxaban is the only new oral anticoagulant with three indications approved in China to reduce the risk of stroke among people with non-valvular atrial fibrillation (NVAF), treat deep vein thrombosis (DVT), and prevent Venous thromboembolism (VTE) after total knee or hip replacement surgery (TKR &THR). The objective of this study was to evaluate the budget impact of introducing rivaroxaban in the management of AF, DVT, TKR and THR patients from payers' perspective. **METHODS:** An Excel-based budget impact model was developed. Model inputs included the prevalence of AF patients, the incidence of DVT, TKR and THR patients, the proportion of target patients receiving rivaroxaban, the efficacy and safety of treatment choices, cost data, and resultant health care utilization. Most of the variables were from literature, including the epidemiology data, efficacy, safety and costs. Two different scenarios were applied according to the setting of the threshold of willingness to pay, i.e.2-3 times GDP per capita in the top 100 cities in China. Costs and cost savings were reported as year-2016 CNY. **RESULTS:** The largest cost savings associated was observed in TKR and THR patients to prevent DVT and PE (CNY 163.7 million and CNY 221.4 million in two scenarios). In DVT populations, the cost savings were also observed with CNY 47.9 million and CNY 63.7 million in two scenarios. While for AF populations, the budget would increase due to the pharmacy costs with additional CNY 74.0 million to CNY 149.0 million. The main drivers for cost saving include the avoided event costs, administration costs in AF and DVT population and the overall costs in TKR and THR patients. **CONCLUSIONS:** The introduction of rivaroxaban as a treatment option for patients with AF, DVT, TKR, and THR could achieve substantial cost savings for payers. The total combined savings ranged from CNY 62.7 million to CNY 211.1 million.

PCV39

BUDGET IMPACT ANALYSIS OF ACETYLSALICYLIC ACID 100MG, SIMVASTATIN 40 MG AND RAMIPRIL 5-10 MG (SINCRONIUM®) FOR THE SECONDARY PREVENTION OF CARDIOVASCULAR EVENTS IN MEXICO

Sinta Cortes G[1], Rodriguez-Mendoza MM[2], Escobar Juárez Y[1], Soto Molina H[1], Mendoza Medrano G[3]
[1]*HS Estudios Farmacoeconómicos S.A. de C.V., Mexico City, Mexico,* [2]*Independet consultant, Mexico, Mexico,* [3]*Ferrer Mexico, México City, Mexico*

OBJECTIVES: To assess the financial impact of the introduction of AAS 100 mg, simvastatin 40 mg and ramipril 5-10 mg (Sincronium®) in the secondary prevention of cardiovascular events in adult patients with a recent or not recent history of acute myocardial infarction (MI), from the perspective of the Mexican Healthcare System. **METHODS:** Two scenarios were used, the current one, a reference scenario with the single-components (AAS 100 mg, simvastatin 40 mg and ramipril 5-10 mg) was compared against future scenario, using polypill (Sincronium®), assuming an initial penetration rate of 5% and annual increases of 10%, considering a time horizon of 5 years (2016 to 2020). Direct medical costs, as they are drugs administration, acute event and chronic events were considered. The target population was calculated based on the incidence of acute myocardial infarction in persons 40 years old and over, as well as the mortality of this event. The costs and results are presented in United States Dollar (USD, 2016) the epidemiological data and unit costs were obtained from country's institutional sources (Mexico) and the literature. **RESULTS:** The average annual cost per patient was $845.84 USD for treatment with the single-component and treatment with the polypill (Sincronium®) was $851.00 USD. Based on the penetration rate, the time horizon and the estimated population (101,347 in 2016, 180,220 in 2017, 242,212 in 2018, 291,509 in 2019 and 331,237 in 2020) there is an additional average consumption of $355,172.95 USD which represents 0.0107% of the total budget allocated to medicines. **CONCLUSIONS:** The introduction of the polypill in the public health sector does not represent a significant financial impact on the Mexican healthcare system's budget.

PCV40

BUDGET IMPACT ANALYSIS OF THE USE OF CONTACT FORCE CATHETER IN ATRIAL FIBRILLATION ABLATIONS IN THE BRAZILIAN HEALTH CARE SYSTEM

Oliveira D[1], Junqueira Junior SM[1], Oliveira FM[1], Luque A[2], Cabra HA[3]
[1]*Johnson & Johnson Medical Brazil, São Paulo, Brazil,* [2]*Johnson&Johnson Medical Brazil, Sao Paulo, Brazil,* [3]*Johnson & Johnson Medical, Miami, FL, USA*

OBJECTIVES: Cardiac ablation has been increasingly used to treat complex arrhythmias, once the success rate of the procedure reaches 86% while drug treatment reaches only 22% success rate. Studies demonstrate that, by using the Contact Force catheter it is possible to increase the success rate of the procedure, reduce complications and reduce the need of additional ablation procedures. It is estimated that in Brazil there are 940,000 people with Atrial Fibrillation and 44,000 would be eligible for ablation treatment in the private health care system(HCS). Our main objective in this study was to evaluate whether or not the adoption of Contact Force Cathether in a radiofrequency ablation can reduce costs in the Brazilian private HCS. **METHODS:** A budget impact model of the use of the contact force catheter technology was elaborated comparting it to catheter without contact force for AF ablation. One-year follow-up was considered. The success rates found in the literature were :92% for ablation using a contact force catheter; and 74% for non-contact force catheter ablation. Also there were developed two scenarios for the contact force technology adoption (70% and 100% adoption). Data were collected from a database that has 18 million lives. Total number and average reimbursement of procedures were included. **RESULTS:** The initial investment in catheter adoption in the private HCS would be USD$ 685,358 and USD$1.4 million, considering 70% and 100% conversion scenario, respectively. However, considering the total cost of treatment in one year, the HCS would have a cost reduction of USD$ 2.3 million and USD$ 4.8 million, considering the scenarios of 70% and 100% of conversion, respectively. **CONCLUSIONS:** The adoption of the Contact Force Catheter in ablations by the Brazilian private HCS could improve patients' clinical outcomes, and potentially reduces the total costs of treatment, bringing economic and financial sustainability to HCS.

PCV41

COSTS AND CONSEQUENCES OF LACK OF ADHERENCE TO PRESCRIBING GUIDELINES FOR STATINS IN THE UK: A VALUE OF IMPLEMENTATION ANALYSIS

Hodgson R, Biswas M, Morgan P
University of York, York, UK

OBJECTIVES: To assess the health consequences and costs of lack of adherence to National Institute for Health and Care Excellence (NICE) guidelines on the prescribing of statins for the primary prevention of cardiovascular disease in the United Kingdom. **METHODS:** Value of implementation methods are applied to consider Quality adjusted life years (QALYs) lost and net monetary benefit lost due to the lack of adherence to NICE guidelines using data on current prescribing patterns of statins in the UK and data on the size of the total population currently recommended to receive statins by NICE guidelines. The study considers the value of improving implementation of statins in patients recommended to receive statins and the costs of over prescribing statins to patients currently not recommended to receive statins by current guidelines. **RESULTS:** The under prescribing of statins in patients recommended to receive statins is substantial with substantial consequences in terms of QALYs. The net momentary value of these lost QALYs is in excess of 1 billion per year. Equally there is currently wide scale overprescribing of statins in patients who are not currently recommended to receive by statins. The total costs to the NHS of this over prescribing are between £101 million and £128 million per annum, with uncertain benefits in terms of cardiovascular events prevented and uncertain cost-effectiveness. **CONCLUSIONS:** Lack of adherence to NICE guidelines on the prescribing of statins for the primary prevention of cardiovascular disease has significant consequences both in terms of health and NHS budgets. There is considerable value to be had from programs aimed at encouraging greater adherence to NICE guidelines on the prescribing of statins.

PCV42

THE HOSPITAL BURDEN OF MAJOR AMPUTATION DUE TO PERIPHERAL ARTERY DISEASE IN THE UNITED STATES

Gunnarsson C[1], Adams GL[2], Ryan MP[1], Kotlarz H[3], Martinsen BJ[3]
[1]*CTI Clinical Trial and Consulting Services, Cincinnati, OH, USA,* [2]*UNC Rex Healthcare, Raleigh, NC, USA,* [3]*Cardiovascular Systems, Inc., St. Paul, MN, USA*

OBJECTIVES: This study uses data from hospitals across the United States to estimate the prevalence of peripheral artery disease (PAD) among inpatient hospitalizations and to explore the clinical and economic burden to the hospital when treating patients with advanced PAD with either revascularization or amputation. **METHODS:** Data was derived from the MedAssets health system database of more than 400 hospitals across 42 states for the years 2010-2014. To be eligible for inclusion, inpatient hospitalizations required a diagnosis of PAD and a record of an intervention (revascularization or major/minor amputation). Adverse event rates, length of stay (LOS), and average reimbursement per diem were calculated by intervention for all PAD patients and a subset of patients with a primary PAD diagnosis. **RESULTS:** Of the over 17 million inpatient hospitalizations in the database, 616,401 (3.5%) have a diagnosis of PAD, with 95,561 (15.5%) having a record of an intervention. Of these visits, 48,072 (50.3%) had a primary diagnosis of PAD with 35,220 (73.3%) having a revascularization alone, 8,955 (18.6%) having a major/minor amputation alone and 3,897 (8.1%) having both. Rates of sepsis or other infection (5.8% vs 1.6%) and pulmonary complications (10.6% vs 5.3%) are higher for patients having a major amputation alone versus revascularization alone. Average hospital reimbursement per diem estimates were significantly lower for the major amputation cohort versus the revascularization cohort ($2,383 vs $4,399). This is driven by LOS which is almost 2X higher for major amputation versus revascularization (11.0 vs 5.9 days). **CONCLUSIONS:** PAD affects a significant number of inpatient admissions with a substantial hospital burden due to complications and long lengths of stays. Hospital limb salvage programs that include revascularization procedures/algorithms may reduce this burden while providing cost savings to the hospital.

PCV43

RISK OF MAJOR AMPUTATION OR DEATH AMONG PERIPHERAL ARTERY DISEASE PATIENTS WITH CRITICAL LIMB ISCHEMIA ACROSS TREATMENT PATHWAYS

Gunnarsson C[1], Ryan MP[1], Boyes CW[2], Bolden PL[2], Baker ER[1], Kotlarz H[3], Martinsen BJ[3], Mustapha JA[4]
[1]*CTI Clinical Trial and Consulting Services, Cincinnati, OH, USA,* [2]*Sanger Heart & Vascular Institute, Charlotte, NC, USA,* [3]*Cardiovascular Systems, Inc., St. Paul, MN, USA,* [4]*Metro Health Hospital, Wyoming, MI, USA*

OBJECTIVES: The most advanced form of peripheral artery disease (PAD) is critical limb ischemia (CLI), defined as chronic ischemic rest pain, ulcers, or gangrene attributable to arterial occlusive disease. This research estimates the risk of major amputation or inpatient death by treatment pathway for patients with CLI. For those patients having a major amputation the incremental expenditures per member per month (PMPM) were estimated. **METHODS:** Data from MarketScan Commercial and Medicare Supplemental Databases from January 2006-December 2014 was utilized. Eligible patients required at least 2 visits—one with an ICD-9 diagnosis of PAD and another of CLI, as well as 6 months of continuous enrollment prior to diagnosis of CLI. Cohorts were developed based on patients' treatment pathway: endovascular revascularization (EVAS), surgical revascularization (SVAS), minor amputation without revascularization (MinAMP), or no intervention (NONE). The odds of major amputation or inpatient death for each cohort were estimated using the Cox proportional hazards model. Total expenditures PMPM (inpatient and outpatient) were estimated using a gamma log-link model. All models were adjusted for patient demographics and comorbidities. **RESULTS:** Patients who met inclusion criteria (N=52,527), were subset into treatment pathway cohorts: EVAS (N=29,798), SVAS (N=10,683), MinAMP (N=5,126), NONE (N=6,920). Patients without an intervention had significantly higher odds of major amputation or inpatient death compared to patients who had MinAMP (1.59 times), EVAS (2.08 times), or SVAS (2.12 times). Patients having a minor amputation had higher odds of major amputation or inpatient death compared to EVAS (1.31 times) and SVAS (1.33 times). The estimated incremental expenditures PMPM for patients with a major amputation was $5,165. **CONCLUSIONS:** This study of a national payer database found that revascularization reduces the risk of a major amputation or inpatient death for patients with CLI. Also, expenditures are higher when a major amputation occurs, costing the payer approximately $5,000 per member per month.

PCV44

EVALUATION OF HEALTHCARE COSTS OF ELDERLY NONVALVULAR ATRIAL FIBRILLATION PATIENTS TREATED WITH APIXABAN VS. RIVAROXABAN AND DABIGATRAN

Deitelzweig S[1], Luo X[2], Gupta K[3], Trocio J[2], Mardekian J[4], Curtice T[2], Lingohr-Smith M[5], Menges BL[5], Lin J[5]
[1]*Ochsner Medical Center, New Orleans, LA, USA,* [2]*Pfizer, New York, NY, USA,* [3]*Bristol-Myers Squibb, Plainsboro, NJ, USA,* [4]*Pfizer Inc, New York, NY, USA,* [5]*Novosys Health, Green Brook, NJ, USA*

OBJECTIVES: The burden of nonvalvular atrial fibrillation (NVAF) is expected to double in the near future, with significant increases in hospitalizations and healthcare costs. We evaluated healthcare costs among elderly NVAF patients after initiating treatment with apixaban vs. rivaroxaban and dabigatran. **METHODS:** Patients with Medicare coverage initiating apixaban, rivaroxaban or dabigatran (index event) were identified from the Humana database (1/1/2013-9/30/2015). Patients were required to be $\geq$65 years and have an NVAF diagnosis and 12 months of continuous health plan enrollment prior to the index event date. NVAF patients were grouped into cohorts depending on the drug initiated. Patient characteristics were evaluated during the baseline period. Propensity score matching (PSM) was conducted to control for differences in patient characteristics of study cohorts. All-cause and major bleeding (MB)-related healthcare costs during the follow-up periods were evaluated and compared between cohorts. **RESULTS:** After PSM, 13,620 patients treated with apixaban and rivaroxaban were matched with 6,810 in each cohort. During the follow-up, apixaban vs. rivaroxaban treatment was associated with lower all-cause total healthcare costs (inpatient+oupatient+prescription: $22,146 vs. $26,803 per-patient-per-year (PPPY), $p<0.001$), total medical costs (inpatient+outpatient: $17,021 vs. $22,145 PPPY, $p<0.001$), and MB-related total medical costs ($2,030 vs. $3,422 PPPY, $p<0.001$). After PSM, 4,654 patients treated with apixaban and dabigatran were matched with 2,327 in each cohort. During the follow-up, among patients treated with apixaban vs. dabigatran all-cause total healthcare costs ($21,616 vs. $23,758, $p=0.12$) were not significantly different, but all-cause total medical costs ($16,413 vs. $19,218 PPPY, $p=0.04$) were significantly lower for patients treated with apixaban vs. dabigatran. **CONCLUSIONS:** In the real-world setting after initiating treatment, healthcare costs for all causes and those that are MB-related were lower for elderly NVAF patients who received apixaban vs. rivaroxaban. Medical costs for all causes were also lower for patients who received apixaban vs. dabigatran.

PCV45

AN INCREMENTAL COST ANALYSIS OF ORBITAL ATHERECTOMY PLUS ANGIOPLASTY COMPARED TO ANGIOPLASTY ALONE FOR THE TREATMENT OF CRITICAL LIMB ISCHEMIA

Palli SR[1], Rizzo JA[2], Martinsen BJ[3], Kotlarz H[3]
[1]*CTI Clinical Trial and Consulting Services, Cincinnati, OH, USA,* [2]*Stony Brook University, Stony Brook, NC, USA,* [3]*Cardiovascular Systems, Inc., St. Paul, MN, USA*

OBJECTIVES: To perform an incremental cost analysis of Diamondback 360 peripheral orbital atherectomy system (OAS) in conjunction with balloon angioplasty (BA) compared to BA alone for the treatment of critical limb ischemia (CLI) in peripheral artery disease (PAD) patients from a US hospital perspective. **METHODS:** A deterministic decision tree simulation model was constructed for a hypothetical cohort of 100 PAD-CLI patients with moderate-to-severely calcified below-the-knee lesions undergoing an endovascular revascularization. Clinical (peri-operative and one-year complications) and healthcare utilization (OAS device, balloon(s), and bailout bare metal stenting) data were obtained primarily from the CALCIUM 360° trial and supplemented with a best evidence review of the published literature (BA arm only). Eligible studies were pooled and parameters weighted by sample size. Cost data (2016 dollars) were obtained from 2014 HCUP and published evidence. Incremental cost to the hospital for performing OAS+BA vs. BA was computed by summing cost differences corresponding to differential utilization during the procedure and treating peri- and post-operative complications. One-way, scenario (a composite one-year major adverse event) and probabilistic sensitivity analyses (SA) were performed to gauge the model robustness. **RESULTS:** For every 100 revascularizations, the incremental costs to the hospital at one-year were $467,355 lower with OAS+BA compared to BA alone. These savings reflected a reduced need for revascularization in the target lesion (TLR) and/or vessel (TVR) and, amputation, and lower end-of-life care costs, despite higher technology costs upfront. One-way SA demonstrated that the model was most sensitive to: amputation rates and its costs, OAS device cost, TLR/TVR frequency and its costs, and one-year mortality and end-of-life care cost. **CONCLUSIONS:** Compared to stand-alone BA, OAS+BA appears to be associated with cost savings of $4,674 per-patient-per-year to a hospital/health system. SA determined that the superior economic value of OAS+BA was robust to the specified parameter value ranges.

PCV46

COMPARISON OF ALL-CAUSE HEALTHCARE RESOURCE UTILIZATION (HCRU) AND COSTS AMONG PATIENTS WITH NON-VALVULAR ATRIAL FIBRILLATION (NVAF), NEWLY TREATED WITH NEW ORAL ANTI-COAGULANTS (NOACS)

Gilligan AM[1], Franchino-Elder J[2], Song X[3], Wang C[4], Henriques C[1], Sainski-Nguyen A[1], Wilson K[5], Smith DM[6], Sander S[2]
[1]Truvan Health Analytics, Ann Arbor, MI, USA, [2]Boehringer Ingelheim, Ridgefield, CT, USA, [3]Truven Health Analytics, Shrewsbury, MA, USA, [4]Boehringer Ingelheim Pharmaceuticals, Inc., Ridgefield, CT, USA, [5]Truven Health Analytics, Bethesda, MD, USA, [6]Truven Health Analytics, Ann Arbor, MI, USA

OBJECTIVES: Among NVAF patients, compare all-cause cost and healthcare resource utilization (HCRU) between dabigatran and apixaban, and dabigatran and rivaroxaban. **METHODS:** Adult NVAF patients newly diagnosed and treated with dabigatran, apixaban or rivaroxaban during 10/01/2010-12/31/2014 were identified using MarketScan claims databases. Patients were continuously enrolled for 12-months prior to index date (first NOAC claim) and were followed from index until medication switch, discontinuation, inpatient death or end of continuous enrollment or study period. Dabigatran patients were matched to apixaban and rivaroxaban patients and two 1:1 propensity score matched groups were created. Per-patient-per-month (pppm) HCRU and costs were reported. Generalized linear models compared total, inpatient, outpatient, and pharmacy costs within each group. **RESULTS:** A total of 26,646 and 8,857 dabigatran patients were matched to rivaroxaban and apixaban patients, respectively (mean age 68 years; 37% female in each matched group). Compared with rivaroxaban, dabigatran patients had significantly lower mean all-cause, pppm total healthcare, inpatient, and pharmacy costs ($4,147 vs. $4,559; $1,484 vs. $1,812; and $630 vs. $644, respectively, all $P<0.05$) and significantly fewer hospitalizations (0.06 vs. 0.07), outpatient visits (4.81 vs. 4.95), and pharmacy claims (4.77 vs. 4.91) (all $P<0.01$). Compared with apixaban, dabigatran patients had similar mean, all-cause, pppm total healthcare, inpatient, outpatient, and pharmacy costs ($3,849 vs. $3,807; $1,225 vs. $1,198; $1,953 vs. $1,930 and $671 vs. $678, respectively, all $P>0.05$) and, similar hospitalizations (0.05 vs. 0.05, $p=0.097$) but significantly higher outpatient visits (4.68 vs. 4.24) and pharmacy claims (4.79 vs. 4.57), (both $P<0.01$). Multivariate analyses demonstrated dabigatran had significantly lower total, inpatient, and outpatient costs than rivaroxaban and similar costs (across all categories) as apixaban patients. **CONCLUSIONS:** Dabigatran had significantly lower total costs and HCRU than rivaroxaban patients. Total costs were similar between dabigatran and apixaban. Dabigatran had more outpatient and pharmacy HCRU than apixaban but similar hospitalizations, the main driver of costs.

PCV47

PREVALENCE OF PATIENTS WITH PERIPHERAL AND CORONARY ARTERY DISEASE

Gunnarsson C[1], Lee MS[2], Ryan MP[1], Kotlarz H[3], Martinsen BJ[3]
[1]CTI Clinical Trial and Consulting Services, Cincinnati, OH, USA, [2]UCLA Medical Center, Los Angeles, CA, USA, [3]Cardiovascular Systems, Inc., St. Paul, MN, USA

OBJECTIVES: Peripheral artery disease (PAD) is similar to coronary artery disease (CAD) in that they are both caused by atherosclerosis that narrows and blocks arteries in various critical regions of the body. An advanced form of PAD and CAD is the development of calcified lesions which are typically seen in the critical limb ischemia (CLI) and in complex CAD. This research uses real-world payer data to understand the prevalence of CLI and coronary artery calcification (CAC) in both the PAD and CAD populations. **METHODS:** Data for this study were derived from the MarketScan Commercial Database and the Medicare Supplemental and Coordination of Benefits Database from January 2006 - December 2014. Patients were eligible if they had a diagnosis of either PAD or CAD. Patients were categorized into the following cohorts based on their treatment pathway: [1] PAD only (with and without CLI), [2] CAD only (with and without CAC), or [3] PAD and CAD (with CLI only, with CAC only, with both, with none). **RESULTS:** A total of 6,981,758 patients met the inclusion criteria: 1,375,601 (20%) had PAD only, 4,429,217 (63%) had CAD only, and 1,176,940 (17%) had both PAD and CAD. Of the PAD only patients, 130,938 (10%) had a diagnosis of CLI. Of the CAD only patients, 180,740 (4%) had a diagnosis of CAC. For patients with both PAD and CAD, 881,626 (75%) had no record of calcification, 134,585 (11%) had CLI only, 126,716 (11%) had CAC only, and 34,013 (3%) had both CLI and CAC. **CONCLUSIONS:** This study found that a significant number of patients have PAD and CAD. Calcification in these patients is also a significant occurrence; therefore, testing for CLI and CAC should be performed.

PCV48

ATHERECTOMY UTILIZATION SHOWS LOWER ODDS OF ADVERSE EVENTS DURING OUTPATIENT PERCUTANEOUS CORONARY INTERVENTIONS COMPARED TO ANGIOPLASTY ALONE

Gunnarsson C[1], Chambers JW[2], Ryan MP[1], Baker ER[1], Kotlarz H[3], Martinsen BJ[3]
[1]CTI Clinical Trial and Consulting Services, Cincinnati, OH, USA, [2]Metropolitan Heart and Vascular Institute, The Heart Center, Mercy Hospital, Minneapolis, MN, USA, [3]Cardiovascular Systems, Inc., St. Paul, MN, USA

OBJECTIVES: An indicator of advanced coronary artery disease (CAD) is the presence of coronary artery calcification (CAC). Current treatment for CAC is revascularization via percutaneous coronary intervention (PCI). However, PCI in severely calcified lesions is associated with higher angiographic complications and major adverse cardiac event (MACE) rates, as well as lower procedural success in placing a stent when compared to non-calcified lesions. **METHODS:** Data were derived from the MarketScan Commercial and Medicare Supplemental Databases from October 2011 - December 2014. Eligible patients had a record of an outpatient PCI and at least one claim with an ICD-9 diagnosis of CAC or a record of the following three risk factors [Diabetes, Renal insufficiency or Failure, and ≥70 of age] along with their diagnosis code of CAD. Patients with evidence of multiple PCI procedures were excluded. Comparisons were made between patients having outpatient angioplasty compared to atherectomy alone. Patients were followed for 90-days with adverse events and total expenditures tracked. Multivariable models were adjusted for differences in patient demographics and comorbid conditions. **RESULTS:** 1,358 patients met all inclusion criteria [angioplasty alone (N=1,009) and atherectomy (N=349)]. Patients treated with outpatient angioplasty alone had a 1.69 [CI: 1.26, 2.27] higher odds of having an adverse event within 90-days compared to patients treated with atherectomy for vessel preparation. After model adjustments, no statistically significant differences in 'all cause' expenditures at 90 days were found. **CONCLUSIONS:** This study of a national payer database found that CAC patients treated with angioplasty alone have a higher risk for an adverse event during outpatient PCI compared to those with atherectomy treatment prior to angioplasty and stent placement. Furthermore, despite the additional added device for vessel preparation, expenditures were no different at 90 days post procedure.

PCV49

ECONOMIC BURDEN OF HOSPITALIZATION FOR CONGESTIVE HEART FAILURE AMONG ADULTS AGED > 19 YEARS OLD IN THE PHILIPPINES

Tumanan-Mendoza BA[1], Mendoza VL[2], Punzalan FE[3], Pestano NS[4], Bermudez-De los Santos AA[4], Natividad RB[4], Macabeo R[4], Shiu LA[4]
[1]Manila Doctors Hospital; University of the Philippines College of Medicine, Manila, Philippines, [2]De La Salle Health Sciences Institute, Dasmarinas, Cavite, Philippines, [3]Manila Doctors Hospital; University of the Philippines College of Medicine & Philippine General Hospital, Manila, Philippines, [4]Manila Doctors Hospital, Manila, Philippines

OBJECTIVES: 1) To determine the hospitalization costs (healthcare and non-healthcare costs) for congestive heart failure (CHF) using the societal perspective; 2) To compare the healthcare-related hospitalization cost using the societal perspective with the payer's perspective – PhilHealth's case rate payment for CHF; 3) To determine the total economic burden of CHF hospitalization in the Philippines in 2014. **METHODS:** This is a cost of illness study. The hospitalization cost (usually incurred through out-of-pocket expenses in the Philippines) included cost of diagnostic procedures, treatment, professional fees and hospital charges. The non-healthcare costs included production losses as well as transportation and food expenses incurred by the patient or his caretaker during confinement or both. **RESULTS:** The overall mean healthcare-related cost for CHF hospitalization in government hospitals in the Philippines in 2014 was PHP19,340 – 28,220 (US$436 - 636). In private hospitals, the cost ranged from PHP28,370 – 41,800 (US$639 – 941). In comparison, PhilHealth's case rate payment for CHF is PHP15,700 (US$354). The mean non-healthcare cost, on the other hand, was PHP10,700 - PHP14,600 (US$241 - 329). Using PhilHealth's case rate payment and the total number of CHF cases in 2014, the total economic burden was PHP691,522,200 (US$15,574,824). In contrast, calculation using the study results on healthcare-related cost only showed that the total economic burden for CHF hospitalization would be PHP851,850,000 – 1,841,563,000 (US$19,185,811 – 41,476,644). **CONCLUSIONS:** Using the societal perspective, the mean healthcare-related hospitalization cost for CHF in the Philippines in 2014 was about 23% - 80% more than the PhilHealth's case rate payment if one was confined in a government hospital. However, this cost was underestimated since government hospitals defray some of the hospitalization cost, exemplified by the low charges (or nil) for room/ward accommodations. Confinement in a private hospital resulted to 1.8 - 2.7 times higher hospitalization cost than the case rate payment.

PCV50

COMPARISON OF THE REVENUE AND HEALTH OUTCOME BENEFITS OF TWO TYPES OF HEARTWORM PREVENTATIVES IN DOGS: LONG-LASTING MOXIDECTIN INJECTABLE VERSUS MONTHLY ORAL PREVENTION

Mwacalimba KK[1], Amodie D[2], Pavlock AM[3]
[1]Zoetis, Indianapolis, IN, USA, [2]Zoetis, Greeley, CO, USA, [3]AMP Research Solutions, Parker Ford, PA, USA

OBJECTIVES: The objective of this study was to compare revenue and health outcome benefits associated with two canine heartworm prevention (HWP) modalities: long-acting moxidectin (LAM) injection and oral monthly HWP. LAM is given in the veterinary clinic every 6 months, while oral monthly HWP is purchased by the pet owner from the clinic and given at home each month. **METHODS:** In 2014, a retrospective 5 year (2009-2014) records analysis was conducted at 18 veterinary practices to determine the health and revenue benefits of the second LAM injection (which occurs 5-7 months after the annual wellness visit). One thousand six hundred twenty-six invoices for 918 dogs met the study review criteria. In 2016, we conducted a similar analysis at 9 of the 18 practices for dogs on oral monthly HWP. In this study, 1,177 invoices for 396 dogs met the review criteria. **RESULTS:** The second LAM visit allowed the veterinarian to evaluate dog health for a second time in a single year. This resulted in identification of more health issues (22%) than those diagnosed at the annual wellness visit (10%) or the monthly HWP return visit (4%) 5-7 months later. Practice revenue was higher for the second LAM visit than for monthly HWP, with an average invoice of $121.13 for LAM compared with $56.41 for monthly HWP. Finally, the average cost of LAM ($45.96) was less than the average cost of 6 months' worth of monthly HWP ($54.06). **CONCLUSIONS:** The second LAM visit identified more health issues than the comparable return visit for dogs on monthly HWP and delivered nearly $65

more clinic revenue. Economic projections for an average veterinary clinic with 3,000 - 5,000 dogs showed that if 25% received LAM for HWP, the clinic would generate $48,750 - $81,250 additional revenue per year.

PCV51

EFFECTIVENESS AND ECONOMIC EFFICIENCY OF THE TREATMENT OF CORONARY HEART DISEASE WITH SALVIANOLATE INJECTION: A RETROSPECTIVE COHORT STUDY

Dong P[1], Fan D[2], Wang Z[3], Yu S[4], Han S[5]
[1]School of Pharmaceutical Science, Shandong University, Jinan, China, [2]International Research Center of Medical Administration, Peking University, Beijing, China, [3]Cardiovascular Department, Anyang People's Hospital, Anyang, China, [4]Shandong University affiliated Jinan Central Hospital, Jinan, China, [5]School of Pharmaceutical Sciences, Peking University, Beijing, China

OBJECTIVES: To examine the effectiveness and economic efficiency of the treatment of coronary heart disease with salvianolate injection. **METHODS:** We retrospectively studied hospitalized patients with coronary heart disease from August 2011 to December 2015 by using electronic medical record database. Patients who received salvianolate injection combined with conventional treatment were selected as exposed group, while those who received conventional treatment alone were selected as unexposed group. Propensity score matching (PSM) analysis was used to balance the characteristics of patients. Then we evaluated hospital stay, nitrates use, total medical costs and subcategories costs of both groups. **RESULTS:** In all, 2250 patients were included. And 401 patients in each group were analyzed after PSM. A significant decrease was found in hospital stay ($P < 0.05$) and nitrates use ($P < 0.05$) in exposed group. Total medical costs per patient had no significant difference between two groups. Subcategories costs comparison showed that the Chinese patent medicine costs of exposed group were significantly higher, and other subcategories costs of exposed group were lower or not significantly different from unexposed group. **CONCLUSIONS:** Patients who receive salvianolate injection combined with conventional treatment have shorter hospital stay and less nitrates use than who receive conventional treatment alone. But there is no significant difference between two groups in total medical costs.

PCV52

COMPARISON OF COSTS AND HEALTHCARE UTILIZATION BETWEEN PATIENTS USING NOVEL ORAL ANTICOAGULANTS (DABIGATRAN & RIVAROXABAN) VERSUS WARFARIN

Deshpande CG, Willey Temkin C, Kogut S, Laforge R
University of Rhode Island, Kingston, RI, USA

OBJECTIVES: Dabigatran and Rivaroxaban are Novel Oral Anticoagulants (NOACs) which have shown better or similar efficacy compared to warfarin in clinical trials. The objective of the study was to compare annual all-cause costs for NOACs vs warfarin and to identify the major cost drivers based on the clinical subgroups. **METHODS:** A retrospective cohort study utilized de-identified data from Optum® Clinformatics™ Data Mart (Optum Insight, Eden Prairie, MN) (Jan 1, 2010 and Dec 31, 2012). Adult patients with $\geq$ 1 diagnosis of atrial fibrillation or flutter (ICD-9 427.31/32), >1 prescription of NOACs or warfarin, 6-months pre-index continuous enrollment and CHA2DS2VASC score >1 were included. Post-index costs and Healthcare Resource Utilization (HCRU) was calculated using GLM model with gamma distribution. The total cost, sum of medical (inpatient + outpatient) and drug cost was adjusted for inflation to 2016. Unadjusted costs were analyzed by subgroups (Gender, Region, Age, Insurance Type, CHA2DS2-VASC Score, and Charlson's Co-morbidity Index [CCI]). **RESULTS:** A total of 3287 and 1770 patients were included for warfarin and NOAC cohort respectively. The NOAC users were slightly older (66 vs 65 years) and more severe based on the CHA2DS2VASC and CCI. The annual drug cost for NOAC was greater ($4998 vs $331, $P < 0.05$), but was offset by lower medical cost ($22,134 vs $31,400, $P < 0.05$). The total annual cost for NOACs ($26,803 vs $32,157) was significantly lower than warfarin ($P > 0.05$). The frequency of ER visits was similar (14 vs 13) but office visits (76 vs 49) were significantly higher for warfarin vs NOACs ($P < 0.05$). Based on subgroup analysis, CCI and age < 65 were major cost drivers of medical cost while Northeast region and CHA2DS2VASC score > 2 were major drivers of the drug costs. **CONCLUSIONS:** Annual total cost and HCRU for patients prescribed the NOACs was lower compared to warfarin.

PCV53

THE INPATIENT BURDEN OF MEDICARE PATIENTS WITH HEART FAILURE, CHRONIC KIDNEY DISEASE AND A HISTORY OF STROKE: A RETROSPECTIVE DATABASE ANALYSIS

Imhoff RJ, Thomas JT
Xavier University, Cincnnati, OH, USA

OBJECTIVES: The aim of this study is to evaluate the effect of having chronic kidney disease (CKD) and a history of stroke along with heart failure (HF) on hospital cost, healthcare utilization, and mortality for hospitalized Medicare patients. **METHODS:** A retrospective observational study utilizing 2013 data from the Healthcare Cost and Utilization Project (HCUP) database. Inpatient visits were eligible for inclusion if there was a primary diagnosis of HF, primary payer of Medicare and age 18+. Descriptive statistics were produced for patient characteristics and comorbidities by cohort – those with and without CKD and a history of stroke. Outcomes included cost, length of stay (LOS), and mortality. **RESULTS:** A total of 61,719 inpatient visits met inclusion criteria: 56,209 with HF only and 5,510 with HF, CKD and a history of stoke. Mean age was similar for both cohorts (76.3 vs 76.9). Inpatient visits with HF, CKD and a history of stroke had a higher proportion of males (50.7 vs 43.4%) with more minority representation (33.1 vs 26.1%). These patients also had more chronic conditions (4.53 $\pm$ 1.57 vs 2.89 $\pm$ 1.55) with higher rates of both uncomplicated (38 vs 33.1%) and complicated diabetes (16.1 vs 5.3%), hypertension (81.3 vs 68.2%), deficiency anemias (44.1 vs 22%) and peripheral vascular disorders (20 vs 10.5%). Both cohorts experienced the same average LOS (4.43 days) with average costs ($8,727 vs $$9,488) and mortality rates (1.9% vs. 2.1%) being slightly lower for those patients with HF, CKD, and history of stroke. **CONCLUSIONS:** Inpatient admissions for HF patients with CKD and history of stroke have higher rates of comorbidities and more chronic conditions than those with HF only; however, despite this LOS is the same and mortality/costs appear lower. This data will be further explored with multivariable analysis.

PCV54

INDIRECT, DIRECT NON-MEDICAL COST AND QOL BY NEW YORK HEART ASSOCIATION (NYHA) CLASSIFICATION IN CHINESE HEART FAILURE PATIENTS

Zhu S[1], Zhang ML[2], Ni Q[3], Sun Q[4], Xuan J[4]
[1]Shanghai Centennial Scientific Co.,Ltd, Shanghai, China, [2]Novartis Pharmaceuticals (China), Beijing, China, [3]Beijing Novartis Pharmaceutical Co., Ltd., Beijing, China, [4]Sun Yat-Sen University, Guangzhou, China

OBJECTIVES: Heart failure (HF) is a disease with high morbidity and mortality that leads to loss of productivity, caregiver burden and negative impact on patients' quality of life. There is very limited data to examine the burden other than direct medical cost of HF in China. This study aims to evaluate the indirect cost, direct non-medical cost and quality of life by NYHA classification in Chinese HF population by with real-world data from societal perspective. **METHODS:** This study was conducted via patient surveys collected from the cardiology/cardiac surgery departments of 8 tier III hospitals in four major cities in China. Adult patients diagnosed with heart failure more than one year and had NYHA classification information were selected to interview. Indirect cost examines the patients and their caregivers' salary loss due to work absence and cessation, and reduced productivity due to HF; direct non-medical cost examines transportation, accommodation and meals associated with HF treatment. Patient quality of life was examined using health utility value measured by EQ-5D-5L. **RESULTS:** A total of 150 HF patients were interviewed. The mean$\pm$SD age was 66.60$\pm$14.14 years. The annual mean indirect cost and annual direct non-medical cost was at 24,783CNY and 2,454CNY respectively, with no significant difference between NYHA classes (ANOVA test: $P > 0.05$). The mean health utility value for Chinese HF patients was estimated at 0.725 by EQ-5D-5L, and significant difference were observed by NYHA classification of I, II, II-III, III, III-IV and IV at 0.732, 0.78, 0.78, 0.715, 0.636, 0.66 (ANOVA test: $P > 0.05$), respectively. **CONCLUSIONS:** Both Indirect cost and direct non-medical cost impose extra economic burden on top of significant direct medical costs in Chinese HF patients. HF patients' quality of life is significantly lower than that of elder Chinese population over 60 years with a minimum health utility 0.79 and a maximum health utility 0.89 by EQ-5D-5L.

PCV55

COMORBIDITY STATUS AND MEDICAL EXPENDITURES IN U.S. HYPERTENSIVE ADULTS

Park C, Fang J, Hawkins N, Wang G
The Centers for Disease Control and Prevention (CDC), Atlanta, GA, USA

OBJECTIVES: To investigate comorbidity status and its impact on medical expenditures in U.S. hypertensive adults. **METHODS:** We pooled the 2011-2014 Medical Expenditure Panel Survey data for this analysis. Patients were included if they: 1) had a diagnosis code for hypertension; 2) were aged $\geq$ 18 years; and 3) were not pregnant during the study period (N=26,049). We modified the Elixhauser Comorbidity Index (EI) to better analyze the impact of hypertension-related comorbidities on medical expenditures. The dependent variable was total annual medical expenditures paid by all payers. Generalized linear model with a log link and gamma distribution were used for the estimations. All costs were adjusted to the 2014 U.S. dollars. **RESULTS:** Based on the modified EI, 14.7% of patients did not have any comorbid condition, 24.2% had 1 comorbid condition, 24.5% had 2 conditions, and 36.6% had $\geq$3 conditions. The 10 most frequent comorbidities were hyperlipidemia (55.9%), diabetes (27.3%), rheumatoid arthritis (26.8%), depression (24.9%), chronic pulmonary disease (CPD) (16.9%), coronary heart disease (CHD) (16.7%), hypothyroidism (12.5%), solid tumor (6.1%), heart rhythm disorders (6.0%), and stroke (4.7%). Medical expenditures were $4,236 (95% confidence interval, $3,788-$4,684) for those without any comorbid condition, $6,361 ($5,927-$6,794) for those with 1, $8,815 ($8,276-$9,355) for those with 2, and $14,601 ($13,781-$15,420) for those with $\geq$3. Of the 10 most frequent comorbidities, the condition with the largest impact on medical expenditures was stroke ($6,474), while rheumatoid arthritis ($4,079) had the smallest impact. Hyperlipidemia, diabetes, depression, CPD, CHD, and heart rhythm disorders increased expenditures by $5,079, $5,288, $5,175, $6,461, and $5,447, respectively. **CONCLUSIONS:** Comorbidities were highly prevalent among hypertensive adults and each successive comorbidity significantly increased the medical expenditures. These findings illustrate the importance of looking at the impact of comorbid conditions and can be used to help develop and evaluate interventions for hypertension prevention and control.

PCV56

FACTORS IMPACTING HOSPITALIZATION EXPENDITURE OF MYOCARDIAL INFARCTION PATIENTS IN BEIJING, CHINA

Liu Y[1], Yang L[2], Wen L[3], Wu J[4]
[1]The University of Missouri – Kansas City, Kansas City, MO, USA, [2]Peking University, Beijing, China, [3]Health and Family Planning Commission of Yunnan Province, Kunming, China, [4]Bayer, Beijing, China

OBJECTIVES: To identify factors impacting the hospitalization expenditure of myocardial infarction (MI) patients in Beijing, China from January 2012 to September 2013. **METHODS:** The Beijing Medical Insurance Database has

maintained reimbursement activities of about 13.5 million urban residents in Beijing. Using patient medical records from the database, 10% of the MI patients were randomly selected as study subjects. Variables such as hospitalization expenditure, patients' demographic characteristics, length of stay at first hospital admission, whether having rehospitalization due to MI (yes/no), comorbidities, and hospital type at first hospital admission (tertiary vs. non-tertiary hospitals) were collected. An ordinary least squares regression analysis was conducted, in which the dependent variable was the logarithm of annualized hospitalization expenditure and independent variables were the other variables. **RESULTS:** A total of 1,235 MI patients (mean age 65.78 ± 15.36 years) were randomly selected from the database. The incidence of MI-associated hospitalization was dominant among males (n=935, 75.31%). The regression model was significant ($P<0.05$, R square = 13%). The significant positive predictors of hospitalization expenditures were male patients, age (≥45 years old), length of stay at first hospital admission, rehospitalization due to MI, comorbidity (heart failure and diabetes), and being admitted by tertiary hospitals at first hospital admission. **CONCLUSIONS:** Male MI patients 45 years old or greater, with heart failure and diabetes, are likely to incur higher hospitalization expenditure. To lower hospitalization expenditure of MI patients in Beijing, effective measures could include reducing the length of hospital stay and controlling spending at tertiary hospitals.

PCV57

COST OF HEART FAILURE IN ARGENTINA: A CROSS SECTIONAL STUDY

Insua J
Hospital Universitario Austral, Argentina, Argentina

OBJECTIVES: Costs of a large series of HF patients of a hospital utilization and cost study(Value in Health 2013;16:A70), were analyzed, stratified by age, sex, multimorbidity (MM), and for inflation and monetary units conversions (2015). Inflation and monetary units distort cost and transferability in Argentina. **METHODS:** In a multicentric 3 hospital Health Care Cost and Utilization Study, a cross sectional (1 year output), selected HF patients with Clinical Classification Software adaptation for Argentina (CCS #108) in 2008, in first (1Dx) or secondary (2Dx) diagnosis. HF prevalence, stratified by age, sex, multimorbidity (MM), measured with the Chronic Condition Indicator (CCI), mortality, HF in 2Dx, and <30 day readmissions (<30 d ReH) .Total costs (TC$), per discharge costs (mean, median), were analyzed. Current monetary values used ACECRA/CEDIM, SHIDP, 2015 medical costs study (up to 2015). International Dollar (I$) conversion PPP, used QUANDL I$ PPP (conversion rate to I$ PPP is 6,604, year 2015). Mean 95% CI were estimated with boothrapping. **RESULTS:** 1187 HF CCS #108 in 1Dx discharges is a TC$ of $38 272 825 I$ (1,57% of TC$), 69,05 % ocurrs among pts. age >65 yrs old (and 24,56 % >85yrs old). Mean cost per discharge was 32 243 I$ PPP (95%CI 27 524, 37 347) and median cost 7 829 I$PPP for HF in 1Dx (6,60 times 2008 value). Mean cost decreases with increased age strata (p trend<0,01) (stratified data not presented here). 969 HF CCS 108 in 2Dx a TC$ 61 410 345 I$ PPP. While 213 discharges with <30 d ReH among HF 1 Dx represent TC$ 8 459 432 I$ PPP (22% of HF TC$). **CONCLUSIONS:** Total HF costs increase with age and male sex, while per discharge cost is reduced by age strata. ADECRA/CEDIM,SHIDP cost study permitted to obtain costs with inflation adjustment and monetary conversion to I$ PPP.

MEASURING INDIRECT COSTS (PRODUCTIVITY AND CAREGIVER BURDEN) IN THE ACC/AHA GUIDELINE STATIN BENEFIT GROUPS

Mulligan K[1], Ton T[1], Yoon L[2], Boklage S[3], Kuznik A[3], Sullivan J[4], Kabiri M[2], Panaccio M[5], Higuchi K[6], Lakdawalla D[7]
[1]Precision Health Economics, Oakland, CA, USA, [2]Precision Health Economics, Los Angeles, CA, USA, [3]Regeneron Pharmaceuticals, Inc., Tarrytown, NY, USA, [4]Precision Health Economics, Boston, MA, USA, [5]Sanofi US, Inc., Bridgewater, NJ, USA, [6]Sanofi, Bridgewater, NJ, USA, [7]University of Southern California, Los Angeles, CA, USA

OBJECTIVES: Productivity loss associated with morbidity and mortality from heart disease and stroke totaled $99 billion in 2010 in the US. We estimated the annual costs of productivity loss and caregiver burden (CB) for three statin benefit groups (SBG) defined by ACC/AHA guidelines, including patients with atherosclerotic cardiovascular disease (ASCVD) (SBG1), patients with LDL-C>190 mg/dL (SBG2), and patients with diabetes and LDL-C 70-189mg/dL (SBG3). **METHODS:** We used the 2011–2012 National Health and Nutrition Examination Survey to classify individuals into SBGs and derive employment status, hours worked, and work limitations. Among those employed, productivity loss was estimated as the difference in hours worked between individuals with and without work limitations. Having any condition (not heart disease specific) that limits ability to work proxied for caregiving need. For CB, we combined the proportion requiring caregiving with time spent providing care, caregiver employment status, and reduction in hours worked for caregivers, from data from Caregiving, 2015 survey. We stratified by age and monetized productivity and CB using median annual US salary ($48,320). **RESULTS:** Annual productivity losses among those employed were $12,727 for SBG1, $0 for SBG2, and $11,226 for SBG3. The proportion requiring caregiving was highest for SBG1 (32% for <65 years; 35% for ≥65), with up to $13,234 in CB. Proportion requiring caregiving for SBG2 and SBG3 increased with age (9% (28%) for <65 years vs. 22% (45%) for ≥65 for SBG2 (SBG3), with up to $8,992 and $15,874 in CB, respectively. Approximately 13.8 million patients in SBG1, 2, and 3 have work limitations, amounting to $150 billion in productivity losses; CB is $465 billion. **CONCLUSIONS:** Productivity losses and CB are substantial in the top three SBG when compared to direct medical costs associated with heart disease and stroke ($63 billion), and highlight the importance of indirect costs in economic modeling.

PCV59

THE ECONOMIC IMPACT OF MYOCARDIAL REVASCULARIZATION: TREATMENT COSTS FROM THE PERSPECTIVE OF THE PUBLIC HEALTH SYSTEM

Soares LC[1], Greiffo RH[2], Azinari FE[3], Wosch MC[1], Rosa VC[3], Rozin L[3], Cordeiro EA[3], Martins LV[3], Matia Gd[3], Tanaka E[4]
[1]Curitba's Govern Health Care, Curitiba, Brazil, [2]APOIO A SAUDE , CURITIBA, Curitiba, Brazil, [3]Faculdades Pequeno Principe, Curitiba, Brazil, [4]Curitiba'S Health Institute, Curitiba, Brazil

OBJECTIVES: The objective of the study is to describe the economic impact analysis of the procedure' s costs for myocardial revascularization and their variations among CURITIBA'S CITY hospitals accredited by Brazilian Government Health Care System (BGHS). Currently in Brazil there are no studies comparing the costs of different types of treatment for ACS in BGHS. Background: Prevalence data in Brazil estimate that 5% to 8% of adults older than 40 years old have acute coronary syndrome (ACS). The disease is the leading cause of mortality in Brazil. Thus, coronary heart disease is the leading cause of death worldwide, making it one of the diseases with the highest clinical and financial impact. **METHODS:** From January to December 2015, the frequency, length of stay, number of deaths and total cost of the procedure were evaluated through data registered on DATASUS/TABWIN from BGHS were collected. Days in hospital and angiographic and revascularization procedures were counted in the groups of patients and total cost of care for 12 months was calculated using current billing levels. **RESULTS:** A total amount of R$ 4.778.548,39 (USD 1.592.849,46 at rate 1:3) were spend for 368 procedures divided by 5 hospitals. A 3.733 inpatients days were counted during all time procedures (ICU care = 1.744 days). 26 deaths were noticed (17,96%) during the same period. Differences in total and daily costs of ICU, in the rates of permanence and mortality were detected among the five stakeholders health care providers. **CONCLUSIONS:** The difference in hospitalization costs for the Myocardial Revascularization procedures, within the Public Unified System of Curitiba, was shown to be a cost-effectiveness variable that may affect the managers' decisions regarding use and allocation.

PCSK9 INHIBITORS SHOW VALUE FOR PATIENTS AND THE U.S. HEALTHCARE SYSTEM

Cheng W, Gaudette É, Goldman D
University of Southern California, Los Angeles, CA, USA

OBJECTIVES: Proprotein convertase subtilisin/kexin type 9 (PCSK9) inhibitors were approved by the U.S. Food and Drug Administration (FDA) as cholesterol-lowering therapies for persons with familial hypercholesterolemia or atherosclerotic cardiovascular disease. However, the long-term cost-effectiveness of PCSK9 inhibitors is not clear. This study was designed to estimate the long-term health impact and economic value of PCSK9 inhibitors for older Americans (aged 51 and older). **METHODS:** We conducted simulations using the Future Elderly Model (FEM), an established dynamic microsimulation model, to project the lifetime outcomes for the population aged 51+ in the United States. Health effects estimates and confidence intervals from published meta-analysis studies were used to project changes in life expectancy, quality-adjusted life-years, incidence of heart disease and lifetime medical spending resulting from use of PCSK9 inhibitors. We consider two treatment-eligibility criteria: 1) current FDA eligibility; and 2) an extended eligibility criterion that considers PCSK9 inhibitor use for persons with no pre-existing cardiovascular disease (CVD) but with high-CVD risks. **RESULTS:** Utilization of PCSK9 inhibitors by individuals covered by the current FDA approval would extend life-expectancy at age 51 by an estimated 1.2 years and would yield a lifetime net value of $11,100 per capita. We also estimate that PCSK9 inhibitors would generate a lifetime net benefit of $21,000 per capita if utilization were extended to those with high-CVD risk. Looking only at the population covered by current FDA approval over the next 20 years, PCSK9 inhibitors would generate cumulative net value of $0.96 trillion. **CONCLUSIONS:** Our study suggests that PCSK9 inhibitors would offer positive long-term net value for patients and the U.S. healthcare system. In addition to current FDA-approved indications, our study also suggests greater value if more people gain access to this new class of drugs.

PCV61

COST-EFFECTIVENESS ANALYSIS OF DABIGATRAN VERSUS RIVAROXABAN FOR NON-VALVULAR ATRIAL FIBRILLATION USING REAL-WORLD EVIDENCE IN MEDICARE BENEFICIARIES

Peng S[1], Deger K[1], Ustyugova AV[2], Gandhi P[3], Qiao N[1], Wang C[3], Kansal A[1]
[1]Evidera, Bethesda, MD, USA, [2]Boehringer Ingelheim GmbH, Ingelheim am Rhein, Germany, [3]Boehringer Ingelheim Pharmaceuticals, Inc, Ridgefield, CT, USA

OBJECTIVES: To assess the cost-effectiveness of dabigatran 150 mg twice-daily versus rivaroxaban 20 mg once-daily for the treatment of patients with non-valvular atrial fibrillation (NVAF) based on real-world evidence in the United States Medicare population. **METHODS:** A previously published Markov model, which followed patients with NVAF at risk of thromboembolic stroke, intracranial hemorrhage, major extracranial bleeding, and acute myocardial infarction through the natural course of the disease, was adapted to enable cost-effectiveness evaluation of dabigatran versus rivaroxaban from a US payer perspective. Risks of events were estimated based on a study in Medicare beneficiaries which demonstrated significantly fewer bleeding events associated with dabigatran compared to rivaroxaban. In the base-case, treatment persistence was based on a published US study in a population with commercial insurance. Given differences in the populations considered, a scenario analysis examined effects of equal persistence. Utility and cost inputs were extracted from published literature or estimated from nationally representative data (REDBOOK, CMS

costing files, and AHRQ-MEPS). All costs were adjusted to 2016 US dollars. Outcomes were discounted at 3%. Scenario and probabilistic sensitivity analyses (PSA) were conducted to test the robustness of the results. **RESULTS:** Over a five-year time horizon, dabigatran incurred $18,848 in total costs and 3.343 quality-adjusted life-years (QALYs)/patient compared to rivaroxaban with $22,382 total costs and 3.339 QALYs/patient; dabigatran dominated rivaroxaban (less costly and more effective). PSA demonstrated that at a threshold of $50,000/QALY, dabigatran was dominant in 98% of cases. The results remained robust in the scenario analyses assuming same treatment persistence, demonstrating dabigatran was the dominant option with $1,642 cost savings and 0.07 incremental QALYs. **CONCLUSIONS:** Over a five-year time horizon, the analyses demonstrated that dabigatran in Medicare patients with NVAF was a dominant option compared to rivaroxaban and was likely to remain cost-effective relative to rivaroxaban in PSA and scenario analyses.

PCV62

COST-EFFECTIVENESS OF THROMBOPROPHYLAXIS WITH ENOXAPARIN FOR GENERAL SURGERY PATIENTS IN CHINA

Zhao G[1], Gu XH[2], Bu J[3], Lin HW[4], Wu B[4]
[1]*Department of General surgery, Renji Hospital, School of Medicine, Shanghai Jiaotong University, Shanghai, China,* [2]*Department of Respiratory, Shanghai Jiao Tong University Affiliated Sixth People's Hospital, Shanghai, China,* [3]*Department of Cardiology, Renji Hospital, School of Medicine, Shanghai Jiaotong University, Shanghai, China,* [4]*Medical Decision and Economic Group, Department of Pharmacy, Renji Hospital, School of Medicine, Shanghai Jiaotong University, Shanghai, China*

OBJECTIVES: Premature death due to pulmonary embolism is a short-term complication of venous thromboembolism (VTE). The long-term clinical course after VTE can be further complicated by excess mortality, recurrent VTE, Chronic thromboembolic pulmonary hypertension (CTEPH) and the post-thrombotic syndrome (PTS), all of which may produce sizable long-term economic burdens. The cost-effectiveness of thromboprophylaxis with enoxaparin versus no prophylaxis has been established in other countries. The aim of this study was to evaluate the cost-effectiveness of enoxaparin in Chinese patients after general surgery with comparison of no prophylaxis. **METHODS:** A decision model, which included both the acute VTE (represented as a decision tree) and the long-term complications (represented as a Markov model), was developed to assess economic outcomes of the two strategies for Chinese patients after general surgery. Transition probabilities related to VTE, categorized by Caprini score (the VTE risk assessment model which is well accepted by international and Chinese clinical guideline), were derived from published literature. Costs and utilities were derived from published literature and local healthcare settings. One-way and probabilistic sensitivity analyses were performed to test the uncertainty concerning the model parameters. Quality-adjusted life year (QALY) and direct medical costs were measured over a five-year horizon. Incremental cost-effectiveness ratios (ICERs) were calculated. **RESULTS:** Comparing with no prophylaxis, thromboprophylaxis with enoxaparin gained additional 0.010, 0.014, 0.030 and 0.072 QALYs in patients with Caprini score 3-4, 5-6, 7-8 and $\geq$9, respectively. In Caprini score 3-4 and 5-6, the ICER of enoxaparin versus no prophylaxis was ¥9,834 and ¥2,190 per QALY gained when enoxaparin used for 7 days. In Caprini score 7-8 and $\geq$9, thromboprophylaxis with enoxaparin was dominant. Sensitivity analyses confirmed the results. **CONCLUSIONS:** The study suggests that thromboprophylaxis with enoxaparin is a cost-effective intervention for all VTE risk levels in patients undergoing general surgery in China.

PCV63

COST-EFFECTIVENESS OF EVOLOCUMAB IN TREATMENT OF HETEROZYGOUS FAMILIAL HYPERCHOLESTEROLAEMIA IN BULGARIA: MEASURING HEALTH BENEFIT BY EFFECTIVELY TREATED PATIENT-YEARS (ETPY)

Borissov B[1], Urbich M[2], Georgieva B[3], Tsenov S[3], Villa G[2]
[1]*Prescriptia EOOD, Sofia, Bulgaria,* [2]*Amgen (Europe) GmbH, Zug, Switzerland,* [3]*Amgen Bulgaria EOOD, Sofia, Bulgaria*

OBJECTIVES: An elevated level of low-density lipoprotein cholesterol (LDL-C) constitutes an important modifiable risk factor for cardiovascular disease (CVD). Individuals with heterozygous familial hypercholesterolaemia (HeFH) are particularly vulnerable to CVD events and often do not achieve adequate reduction of LDL-C with standard of care (SoC). The objective of this analysis was to demonstrate the clinical and economic value of LDL-C lowering with evolocumab in HeFH patients from the Bulgarian public health care perspective. **METHODS:** A disease-specific measure of health benefit was devised: Effectively treated patient-years (ETPYs) combine length of life with the likelihood of attaining best-practice recommendations on LDL-C lowering aimed at reducing CVD events. 'Effective treatment' was defined as a reduction in LDL-C levels of $\geq$50%. Considering a life-long treatment duration, a Markov model was adapted to compare the addition of evolocumab to SoC (high-intensity statins) versus SoC alone. Demographics, baseline characteristics and efficacy were taken from pertinent trial data. The model uses the relationship between LDL-C lowering and reduced CVD event rates observed in the Cholesterol Treatment Trialists' Collaboration (CTTC) meta-analyses. **RESULTS:** The total incremental costs of evolocumab added to SoC versus SoC alone are BGN120,111 while adding 9.35 ETPYs over lifetime. These results imply an incremental cost per ETPY of BGN12,846 (US$7,258; €6,559). The use of evolocumab is associated with a relative reduction in the CVD event rate by 46% (22% per 1 mmol/L), consistent with CTTC. **CONCLUSIONS:** The addition of evolocumab to SoC may be considered cost-effective in light of an additional expense per patient-year gained in which individuals with HeFH receive effective treatment under the terms of international prevention guidelines. ETPYs are an intuitive and clinically meaningful measure of patient benefit that, in relation to costs, can support healthcare decision-making not subject to the cost-per-QALY paradigm, and that recognises and considers process-oriented factors of value, specifically quality of care.

PCV64

MODELING THE IMPACT OF ALIROCUMAB TREATMENT DELAY ON 3-YEAR CARDIOVASCULAR EVENT RISK

Klimchak A[1], Joulain F[2], Higuchi K[3], Kuznik A[4], Shaya F[5]
[1]*Axtria, Berkley Heights, NJ, USA,* [2]*Sanofi, Chilly-Mazarin, France,* [3]*Sanofi, Bridgewater, NJ, USA,* [4]*Regeneron Pharmaceuticals, Inc., Tarrytown, NY, USA,* [5]*PHSR University of Maryland School of Pharmacy, Baltimore, MD, USA*

OBJECTIVES: Patients with atherosclerotic cardiovascular disease (ASCVD) or heterozygous familial hypercholesterolemia (HeFH) on statin remain at high risk for cardiovascular (CV) events and may benefit from additional lipid-lowering therapy (LLT), such as PCSK9 inhibitors (PCSK9i). Yet patients and physicians are required to fulfill several steps before reimbursement, with up to 75% prescription denials. This analysis modeled the effects of delaying treatment with alirocumab (a PCSK9i) on CV event risk. **METHODS:** A Markov cohort model with annual cycles was developed to estimate the long-term rate of CV events for patients with clinical ASCVD or HeFH on statins and high low-density lipoprotein cholesterol (LDL-C). CV events included acute coronary syndrome (ACS), revascularization, ischemic stroke, and CV death. The model estimated 3-year CV event risk when patients received add-on alirocumab at the start of the simulation or after 1- or 2-year delays. Baseline characteristics, annual CV risk and transition probabilities among ASCVD patients were estimated using real world data (with published literature for HeFH patients). CV risk reduction was based on Cholesterol Treatment Trialists' (CTT) meta-analysis. Four high CV risk cohorts were modeled: 1) HeFH with ASCVD and LDL-C $>$130 mg/dL; 2) recent ACS (0-1 year) with LDL-C $>$70 mg/dL; 3) ASCVD with LDL-C $>$100 mg/dL; and 4) ASCVD with LDL-C $>$70 mg/dL. **RESULTS:** For each aforementioned cohort, the model analyzed the 3-year CV risks when patients received add-on alirocumab at the simulation start or after 1- and 2-year delays: 1) 18.7%, 23.2%, and 27.5%; 2) 20.7%, 24.4%, and 26.2%; 3) 13.9%, 15.9%, and 17.7%; and 4) 13.5%, 15.0%, and 16.4%. Overall, 3-year CV event risk increased by an absolute +1.5% to +8.8%, or a relative increase of 11% to 47%. **CONCLUSIONS:** Delaying treatment access to alirocumab was associated with a proportional increase in CV events of 11% to 47%.

PCV65

UTILIZING CLINICAL DECISION SUPPORT SYSTEMS TO ALIGN CLINICAL AND VALUE-BASED REIMBURSEMENT INITIATIVES

Thompson SM[1], Joyce AR[2], Sasinowska HD[3], Sasinowski M[2], Zedler BK[2], Murrelle L[2]
[1]*University of Richmond, Richmond, VA, USA,* [2]*Venebio Group, LLC, Richmond, VA, USA,* [3]*INCOGEN, Inc., Williamsburg, VA, USA*

OBJECTIVES: To estimate the potential impact of personalized clinical decision support (CDS) of statin therapy on achieving goal LDL-cholesterol (LDL-C) levels and the effect on atherosclerotic cardiovascular events (CVEs) and healthcare costs. **METHODS:** A retrospective analysis of EHR data for 2.673 million commercially insured patients with elevated LDL-C who met AHA/ACC criteria for and were treated with statins. Evidence-based CDS recommended most effective/least effective statin drug-dose combinations to reach goal LDL-C for each individual. Likelihood of subsequent CVE for patients receiving recommended most effective/least effective drug-dose combinations were based on observed LDL-C and published medical research. Agent-based and Monte Carlo simulation were used to extrapolate CVEs and subsequent cost of care over a ten-year period for 20,000 treated patients. For 10,000 simulation runs, costs were calculated for payers and patients based on national averages for provider reimbursement and patient copayments and deductibles. **RESULTS:** Wide variance in the efficacy of statin therapy strategies was observed. The proportion of patients achieving goal LDL-C levels ranged from 14% to 42%, median 31%, across 26 typical statin therapy drug-dose combinations. The reduction of LDL-C ranged from 59mg/dL (37%) to 12mg/dL (9%), median 23mg/dL (17%). Simulations of the most effective/least effective statin drug-dose combinations showed significant differences in ten year expected (a) number of CVEs (509 vs. 813), (b) total cost of care ($83 M vs. $99 M), and (c) patient out-of-pocket expenses ($26 M vs. $33 M). **CONCLUSIONS:** Approaches to statin therapy are highly variable and associated with significant differences in outcomes and cost of care. Cardiovascular disease remains the single most common cause of morbidity and mortality in the U.S., and lower LDL-C levels are associated with reduced numbers of CVEs. Personalized, evidence-based clinical support guidelines can help practitioners identify the most clinically- and cost-effective pharmacological interventions.

PHARMACOECONOMIC STUDY OF ROSUVASTATIN AGAINST ATORVASTATIN IN CARDIOVASCULAR DISEASES AND STROKE IN TELANGANA REGION OF INDIA: A COST EFFECTIVENESS ANALYSIS

Varun raja A[1], Deepthy B[1], Shalini P[1], Suresh B[1], Buchi Reddy K[2]
[1]*St.Peter's institute of pharmaceutical sciences, warangal, India,* [2]*Rohini Superspeciality Hospitals, warangal, India*

OBJECTIVES: The main objective of the current study is to assess the costeffectiveness of Rosuvastatin and Atorvastatin in cardiovascular diseases and stroke conditions. Statins being dyslipidemic agents are successfully used as a standard therapy for both primary and secondary prevention of cardiovascular diseases and stroke. **METHODS:** This pharmacoeconomic study is a cross sectional ambispective study. A total of 300 patients were screened from which 150 are eligeble for primary prevention group and 108 for secondary prevention group. Drug costs, number of events avoided and lipid profiles were recorded, cost

effectiveness ratios were determined. Decision tree model was used and statistical comparisions are done using microsoft excel 2007. **RESULTS:** This study revealed that Rosuvastatin was more effective in preventing reccurence of events i.e., events avoided by Rosuvastatin was 86.37% when compared to Atorvastatin of 64.07%. Rosuvastatin costs an incremental cost of Rs136.5 per lipid profile maintenance and Rs82.82 per event avoided in primary and secondary prevention groups respectively. When calculated in terms of lipid level maintenance Rosuvastatin showed a significant reductions like serum cholesterol(Sr.Ch) of 182.97±30.4mg/dl, High density lipoprotiens(HDL) of 42±2.8mg/dl, Triglycerides (TG) of 148.5±79mg/dl, Low density lipoprotiens (LDL) of 108.9±29mg/dl were as Atorvastatin showed Sr.Ch of 180.26±35.4mg/dl,HDL of 40±15.4mg/dl, TG of 155.8±93.8mg/dl, LDL of 115.4±30mg/dl. **CONCLUSIONS:** The above results revealed that Rosuvastatin is more cost effective drug inspite of its high unit cost when compared with Atorvastatin. The additional effectiveness gained by Rosuvastatin is worth its additional cost.

PCV67

LIFETIME BENEFITS OF IMPROVED HEART FAILURE TREATMENT AMONG OLDER AMERICANS

Xie Z, Van Nuys K, Tysinger B
University of Southern California, Los Angeles, CA, USA

OBJECTIVES: Lifetime Benefits of Improved Heart Failure Treatment Among Older Americans **METHODS:** We adapted an established economic-demographic microsimulation to estimate scenarios in which a hypothetical "cure" eliminates the incidence of CHF and, separately, six other diseases in patients aged 50 in 2016. We followed this cohort until death and estimated the total life years and disability-free life years with and without a cure, for the population as a whole and for race- and gender-defined subpopulations. **RESULTS:** We estimate an increase in CHF prevalence from 4.29% in 2012 to 8.08% in 2030, generally higher than previous estimates. Diagnosis with CHF coincides with significant increase in disability and medical expenditures, particularly among blacks compared with whites. A CHF "cure" among those aged 50 in 2016 would generate nearly 2.7 million additional life years, and over 1.1 million disability-free life years, worth $200 to $400 billion. These gains are generally greater among blacks than whites, thereby reducing disparities. **CONCLUSIONS:** Improved treatment for CHF could generate significant social value, and reduce existing health disparities.

PCV68

A PHARMACEOECONOMICS ANALYSIS OF A GOVERNMENT INITIATIVE OF DYSLIPIDEMIA IN CHINA DEVELOPED COMMUNITY CLINICAL PRACTICE

Xu J[1], Ni W[1], Zhuo Z[1], Yu W[1], Liu Y[2], Shi R[2], Yu W[2]
[1]*Shenzhen Center for Chronic Disease Control, Guangdong, China,* [2]*Pfizer, Beijing, China*

OBJECTIVES: China Adult Dyslipidemia Management Program (CADMP) is a government initiative aiming to provide practical evidence of comprehensive management of cardiovascular disease for China national basic public health service policy by integrating lipid management with the existing hypertension and diabetes management. Shenzhen pilot is one of the three pilots among 5 subprojects of CADMP. The study is intended to assess the cost effectiveness of lipid management in CADMP Shenzhen. **METHODS:** 15738 participants with high risk of cardiovascular disease were recruited from 6 districts 52 primary care practices (17.6% were simple dyslipidemia, 57.2% with both dyslipidemia and hypertension, and 14.33% were dyslipidemia with hypertension and diabetes) We conducted a randomized, controlled trial to examine the effects of CADMP interventions in 404 participants from 26 community practices. 204 participants were randomly selected receiving a set of interventions, including integrating dyslipidemia into performance assessment policy, physician trainings, and patient education, while 200 participants received regular treatment. **RESULTS:** CADMP was cost-effective (defined as <$24,112 per QALY, KEEP's ICER was $9484 per QALY) for adults older than age 20. For every 1% reduction in control rate of LDL-C, the intervention group even saves $ 9.53 than the control group and the institutional cost is $7.07. The mean concentrations of LDL-c in interventional group before and after therapy decreased significantly from 3.26 to 3.02 (mmol/, $P<0.05$), and rate of treatment increased from 29.94% to 33.37% ($P<0.05$). The reduction of LDL-c and TC in intervention group were significantly higher than the control group (TC -0.43 vs -0.1; LDL-c -0.42 vs 0.06 mmol/, $P<0.05$). **CONCLUSIONS:** Dyslipidemia management in community hospitals with a multilevel approach that integrates policy actions, physician trainings, and health education is cost effective. The study provides scientific evidence for future policy of dyslipidemia in China contributing to prevent increasing cardiovascular disease mortality.

PCV69

ASSESSING THE COST-EFFECTIVENESS OF PATIROMER PLUS SPIRONOLACTONE THERAPY IN HEART FAILURE PATIENTS WITH HYPERKALEMIA

Bounthavong M[1], Butler J[2], Dolan CM[3], Dunn JD[4], Fisher KA[3], Oestreicher N[5], Pitt B[6], Hauptman PJ[7], Veenstra DL[1]
[1]*University of Washington, Seattle, WA, USA,* [2]*SUNY at Stony Brook, Stony Brook, NY, USA,* [3]*CMD Consulting, Inc., Sandy, UT, USA,* [4]*VRx Pharmacy Services, Salt Lake City, UT, USA,* [5]*Relypsa, Inc., a Vifor Pharma Company, Redwood City, CA, USA,* [6]*University of Michigan School of Medicine, Ann Arbor, MI, USA,* [7]*Saint Louis University School of Medicine, Saint Louis, MO, USA*

OBJECTIVES: Although spironolactone therapy has been shown to significantly improve survival in heart failure (HF), many patients are unable to tolerate spironolactone due to hyperkalemia. Our objective was to estimate the cost-effectiveness of patiromer, a newly approved drug for the treatment of hyperkalemia, plus spironolactone (PS) in patients with NYHA III-IV HF receiving a renin-angiotensin-aldosterone system inhibitor (RAASi, ACE inhibitor or angiotensin receptor blocker) and otherwise unable to tolerate spironolactone due to hyperkalemia. **METHODS:** We conducted a cost-utility analysis using a Markov model to evaluate the incremental cost-effectiveness ratio (ICER) for PS with RAASi versus RAASi only in patients with HF and hyperkalemia from the US payer perspective. We enhanced a previous version of the model by considering treatment discontinuation. Clinical parameters were derived primarily from the RALES spironolactone RCT, the OPAL patiromer study, and recent cohort studies of patients with HF. Wholesale acquisition costs were used for drugs and hospitalization costs were derived from HCUP data. Quality of life estimates were based on a prospective study on patients with HF using the EQ-5D. Total direct healthcare costs, quality-adjusted life years (QALYs), and ICER were estimated using a 10-year time horizon and a 3% discount rate. One-way sensitivity analyses were conducted to assess model uncertainty. **RESULTS:** The average increase in QALYs with addition of patiromer plus spironolactone was 0.27, accompanied by an increase in cost of $15,600, giving an ICER of approximately $57,800/QALY. These findings were driven by the decreased risk of mortality and hospitalization with spironolactone therapy. A limitation is our assumption that the RALES study findings apply to the modeled population, but study findings were robust to sensitivity analyses. **CONCLUSIONS:** Based on our modeling analysis, use of patiromer to enable spironolactone therapy in NYHA III-IV HF patients may provide a clinical benefit and good economic value.

PCV70

COST-UTILITY ANALYSIS OF THREE NEW ORAL ANTICOAGULANTS IN THE PREVENTION OF THROMBO-EMBOLIC EVENTS VERSUS WARFARIN IN PATIENTS WITH ATRIAL FIBRILLATION IN THE COLOMBIAN CONTEXT

Romero Prada ME[1], Herran SE[2], Meneses E[2], Marrugo RD[2]
[1]*Fundación Salutia, Bogotá, Colombia,* [2]*Bayer andina, Bogota, Colombia*

OBJECTIVES: To estimate the cost-effectiveness ratios of the use of rivaroxaban, dabigatran and apixaban versus warfarin for the prevention of thrombo-embolic events in patients with non-valvular atrial fibrillation in Colombia. **METHODS:** Development of Markov chain model with quarterly cycles and lifetime horizon. Cerebral vascular accidents, bleeding and myocardial infarctions are estimated, with the main outcomes being the years of life saved (LYS) and quality-adjusted life years QALYs from the perspective of the third payer. In base case, the risk of patient was 0% low risk, 13% moderate risk and 87% high risk under CHA2Ds classification. Costs are source Local data base for technologies and insurance costs for events. **RESULTS:** The mean QALYs and total health care cost with lifetime horizon, of patients treated with warfarin was 6.75 QALYs/ USD 6,208, with rivaroxaban was 7.07 QALYs/ USD 7,597, with dabigatran was 7.02 QALYs/ USD 8,207, and with apixaban was 6.80 QALYS / USD 8,525.Thus, an incremental cost-effectiveness ratio compared to warfarine was estimated in USD $4,340 for rivaroxaban, USD $7,410 for dabigatran and USD $46,348 for apixaban. **CONCLUSIONS:** Oral anticoagulants in general, shows results superior to those estimated for warfarin in the analyzed patients, highlighting decrease in stroke and bleeding. While rivaroxaban is estimated to be a cost-effective technology for Colombia, dabigatran is identified as potentially cost effective, while apixaban would not be cost effective for being above Colombia's cost-effectiveness threshold. Among the oral anticoagulants, rivaroxaban is estimated as a cost-saving technology versus dabigatran and apixaban, mainly due to the reduction of events, stroke and better patient adherence.

PCV71

MEDICARE PATIENTS WITH CONGESTIVE HEART FAILURE: A COMPARATIVE ANALYSIS OF RESOURCE UTILIZATION BY REASON FOR ADMISSION (CARDIAC, PULMONARY, OR VASCULAR)

Uhlenbrock MM, Rees LE, Quinn KL
Xavier University, Cincinnati, OH, USA

OBJECTIVES: To estimate the differences in the cost of care to the hospital, length of stay, and mortality rates for Medicare patients with congestive heart failure having an inpatient admission for one of the following three reasons: cardiac, pulmonary or vascular. **METHODS:** This study was a retrospective observational analysis, conducted using the 2013 HCUP NIS database. Inpatient admissions (n=230,868) were included in this analysis if Medicare was the primary payer and if the patient had a ICD-9 diagnosis code of congestive heart failure. Hospitalizations meeting the inclusion criteria were categorized and subsequently analyzed by the congestive heart failure patient's primary diagnosis or reason for admission as follows: cardiac (n=185,619), pulmonary (n=40,844), and vascular (n=4,365). **RESULTS:** There were significant differences across the three groups (cardiac, pulmonary, vascular) with inpatient vascular admissions having the highest rate of diagnoses on record. Patients with vascular admissions were more likely to be male, African American, and coming from teaching hospitals located in urban areas. Vascular inpatient admissions had significantly higher total costs (mean of $25,927, SD $27,499) than cardiac (mean of $14,674, SD $20,581) and pulmonary (mean of $9,837, SD $20,980). Length of stay was significantly longer as well: vascular group (mean of 7.74 days, SD 8.84) compared to either cardiac (mean of 5.53 days, SD 5.33) or pulmonary (mean of 5.11 days, SD 4.33). Mortality rates were higher for vascular 5.18% versus 3.58% for cardiac and 2.44% for pulmonary. **CONCLUSIONS:** Whether a congestive heart failure patient is admitted to the hospital for cardiac, pulmonary, or vascular reasons can significantly impact the burden of illness to the hospital for their inpatient stay.

CARDIOVASCULAR DISORDERS – Patient-Reported Outcomes & Patient Preference Studies

PCV72

THE EFFECT OF GAPS IN ADHERENCE TO ANTIHYPERTENSIVE MEDICATION ON FALLS RISK IN OLDER ADULTS

Dillon P, Smith S, Gallagher P, Cousins G
Royal College of Surgeons in Ireland, Dublin, Ireland

OBJECTIVES: There is an on-going debate as to whether antihypertensive medications are associated with an increased falls risk in older adults. Patients initiating antihypertensive medication have been observed to have an increased falls risk attributed to initial hypotensive effects. In contrast studies of long-term users of antihypertensive medication have reported conflicting findings. However few studies examining this association have assessed medication adherence - non-adherent patients may experience hypotensive symptoms due to blood pressure fluctuations. Our objective was to investigate the relationship between poor adherence to antihypertensive medication and falls in older (>65 years) long-term antihypertensive users. **METHODS:** We recruited community dwelling older adults (N=1592) from 106 community pharmacies in the Republic of Ireland between March and May 2014 and administered a baseline structured telephone interview. A follow-up structured telephone interview was conducted at 12 months. Each interview was linked to dispensing records for the previous 12 months. To assess the longitudinal association between adherence to antihypertensive medication and falls, adherence was estimated as the number of five day gaps in medication supply from linked dispensing records for the 12 months prior to the baseline interview. Falls were assessed via questionnaire at 12 month follow-up interview. For our binary outcomes, any fall and any injurious fall during follow-up, relative risks were estimated using modified Poisson regression models with robust standard errors. **RESULTS:** Adjusting for fall risk factors, increasing number of five day gaps in adherence to antihypertensive medication was associated with an increased risk of falls (aRR 1.11, 95% CI 1.03-1.19, p=0.005) and injurious falls (aRR 1.19, 95% CI 1.06-1.33, p=0.003) during follow-up (n=1084). **CONCLUSIONS:** Poor adherence to antihypertensive medication was observed to increase falls risk in older adults which may relate to fluctuations in blood pressure secondary to non-adherence. However further studies examining the timing of the falls in relation to non-adherence are required.

PCV73

TREATMENT PATTERNS AND MEDICATION ADHERENCE AND PERSISTENCE AMONG PATIENTS WITH PULMONARY ARTERIAL HYPERTENSION IN REAL-WORLD DATABASE REPRESENTING A LARGE US HEALTH PLAN

Hull M[1], Pruett J[2], Koep E[1], Tsang Y[2], Drake W[2]
[1]*Optum, Eden Prairie, MN, USA,* [2]*Actelion Pharmaceuticals, Inc., South San Francisco, CA, USA*

OBJECTIVES: Pulmonary arterial hypertension (PAH) is a chronic and progressive disease characterized by high pressure in the pulmonary arterioles, with increased pulmonary vascular resistance that can result in right heart failure and premature mortality. With several new PAH medications available since 2013, more information is needed regarding treatment patterns, persistence, and adherence. **METHODS:** Patients with a diagnosis code for pulmonary hypertension and treated with an approved medication for PAH (ERAs, PDE-5is, prostacyclins, sGCs) identified by pharmacy claims between January 2010 and March 2015 were included. Patients were ≥18 years old with continuous enrollment in a large US health plan with medical and pharmacy coverage for 6 months before (with no PAH medication claim) and ≥1 year after initiating a PAH-related medication. Patients were followed until disenrollment from the plan or end of study (March 2016). Initial and subsequent treatment regimens were examined. Persistence was measured as months to discontinuation or modification, and adherence was measured as proportion of days covered (PDC). **RESULTS:** The study included 1637 patients. Most patients initiated treatment with a monotherapy (93.8%). PDE-5is and ERAs were used in 70.0% and 26.8%, respectively, of initial treatment regimens. Of patients who discontinued (n=443) or modified (n=581) their initial regimen, 78.9% did so within one year (mean±SD 7.6±9.0 months, median 4.0). Combination therapies comprised 42.7% (248/581) of second regimens. Patients initiating combination therapy usually did so within six months (55.4%). ERAs were associated with higher PDC (0.8±0.4 vs. 0.6±0.4, p<0.001) and persistence (9.5±10.8 vs. 7.5±8.6 months, p<0.01) than PDE-5is. Combination therapies were associated with greater persistence than monotherapies (11.7±11.1 vs. 7.4±8.8 months, p<0.01). **CONCLUSIONS:** Patients with PAH most often initiated treatment with monotherapies, commonly PDE-5is in spite of lower adherence and persistence than ERAs. Most patients remained treated with monotherapies. Therapy adjustments to initial regimens occurred early and in the majority of patients.

PCV74

PRESCRIPTION TREND AND DRUG ADHERENCE OF NON-VITAMIN K ANTAGONIST ORAL ANTICOAGULANTS IN ELDERLY PATIENTS WITH ATRIAL FIBRILLATION

Han S, Jeong HS, Kim HT, Suh HS
Pusan National University, Busan, South Korea

OBJECTIVES: To examine monthly prescription trend and drug adherence of non-vitamin K antagonist oral anticoagulants (NOACs) including apixaban, dabigatran, and rivaroxaban in elderly patients with atrial fibrillation (AF). **METHODS:** We used nationally representative data named Health Insurance Review and Assessment Service-Aged Patient Sample 2014 that contained medical and pharmacy claims of approximately 1 million elderly patients aged 65 or older. We included patients who had at least one diagnosis of AF (ICD-10 code I48.0) and at least one prescription of NOAC between January 1, 2014 and December 31, 2014 to assess monthly prescription trend. To assess adherence, we included patients who had at least one diagnosis of AF and at least two prescriptions of NOACs. The adherence to NOACs was assessed by calculating the medication possession ratio (MPR). If calculated MPR was ≥0.80, it was considered as adherent case. **RESULTS:** Among 40,473 elderly patients with AF, 1,234 patients were eligible for prescription trend analysis and 921 patients were eligible for adherence analysis. In 2014, Dabigatran was the most prescribed NOAC in Korea (47.2-61.7%). The number of patients prescribed rivaroxaban was slightly smaller than dabigatran (35.5-41.6%). Only a small fraction of AF patients were prescribed apixaban (2.4-12.8%). The mean MPR was 0.95, 0.93, and 0.91 for apixaban, dabigatran, and rivaroxaban, respectively (P<0.023). Non-adherence (MPR<0.80) was observed in 16.2% of rivaroxaban users, 11.6% of dabigatran users and 8.3% of apixaban users. **CONCLUSIONS:** In 2014, 921 elderly AF patients using NOACs had generally high drug adherence. However, adherence to apixaban was significantly better than the adherence of dabigatran and rivaroxaban. The little differences in mean MPR between 3 NOACs may be explained by differences in dosing regimen and adverse reactions profile. Further research is warranted to explore the reason of different drug adherence between NOACs and the impact of adherence on outcomes.

PCV75

THE EFFECT OF A REGULATORY FIT INTERVENTION ON STATIN MEDICATION ADHERENCE

Iaconi A, Farris K, Bagozzi R, Erickson S, Dorsch M, Piette J
UNIVERSITY OF MICHIGAN, ANN ARBOR, MI, USA

OBJECTIVES: To design and test the effect of a regulatory fit intervention on the behavior of statin medication adherence. **METHODS:** Patients taking a statin medication participated in a randomized, prospective field experiment. Patients completed two online questionnaires designed to capture patient variables and deliver the intervention, and two weeks later to assess subsequent behavior. The intervention consisted of manipulations priming patients with framed messages that created a Fit or Non-fit between patients' regulatory orientation and implementation intentions. The three study groups were: Fit, Non-Fit and Control. ANOVA pairwise comparisons were run to determine whether significant differences between groups exist. **RESULTS:** Patients in the regulatory Fit group experienced greater statin medication adherence levels compared to the patients in the Non-Fit and Control groups. When patients' motivational intensity, behavioral intentions, self-efficacy, or outcome expectancies were strong – there was no difference in statin medication adherence levels between the Fit, Non-Fit, and Control groups. A statistically significant difference in adherence was detected between the Fit and Non-Fit and between the Fit and Control groups for the weak condition for both intention and motivation. A difference between the Fit and Non-Fit groups was seen when patients' outcome expectancies were weak. Regardless of the strength of self-efficacy, there was no difference found between any of the groups in statin medication adherence levels. **CONCLUSIONS:** The regulatory Fit intervention revealed that statin medication adherence levels are highest in the Fit condition, regardless of the strength of behavioral intention, motivational intensity, self-efficacy, or outcome expectancies. When these patient-related factors are weak, there is an opportunity to improve the behavior of statin medication adherence with a Fit Intervention as there was a significant difference found between the Fit and Non-Fit/Control groups.

PCV76

ASSESSMENT OF MEDICATION ADHERENCE IN HYPERTENSIVE PATIENTS OF QUETTA USING MMAS AND HILL BONE COMPLIANCE SCALE

Haq N[1], Idress S[1], Nasim A[1], Raiz S[1], Akram A[1], Hamid R[2]
[1]*University of Balochistan, Quetta, Pakistan,* [2]*University of Milan, Milan, Italy*

OBJECTIVES: This study aimed to assess the level of adherence of hypertensive patients in Quetta, by using MMAS-8 and Hill Bone Compliance Scale. **METHODS:** A Cross-sectional descriptive study was conducted in Sandeman Provincial Hospital and Bolan Medical Complex to assess the adherence among hypertensive patients of Quetta, Pakistan. Study has been conducted from March to October 2016. Convenience sampling technique was used to collect data. Those patients who were willing to participate and were suffering with hypertension and receiving medication treatment are included in study. MMAS-8 Urdu version and Hill bone compliance scale was used to assess the level of medication adherence. SPSS V 20 used for descriptive and inferential statistics. **RESULTS:** Respondents mean age was 45.1 years. Majority 223 (55.6%) were. Marital status showed that maximum respondents 361 (90.0%) were married. Majority of respondents 108 (26.9%) were uneducated. Majority 178 (44.4%) were housewives. And Ethnic group showed that maximum respondents 132 (32.9 %) were Pashtun. The MMAS-8 mean score of adherence in hypertensive patients was 3.55. Among 401 majority of patients 306 (76.6%) were poorly adhered to medications. Ninety-four (23.4%) had moderate adherence. While only (0.2%) had good adherence. The mean score of hill bone compliance Scale in hypertensive patients was 24.16, 83.4% (n=336) had imperfect adherence and 16.2% (n=65) have perfect adherence **CONCLUSIONS:** It is concluded, patients with hypertension were non-adherence to treatment regimen by using both the questionnaire and both MMAS-8 and Hill Bone Compliance Scale give similar results.

PCV77

NOVEL ORAL ANTICOAGULANTS (NOACS) ADHERENCE AND BLEEDING EVENTS IN ATRIAL FIBRILLATION PATIENTS: A SYSTEMATIC REVIEW AND META-ANALYSIS

Abegaz TM[1], Tamrat B[2], Bahagavathula A[2], Abdulla A[3], Asim A[4]
[1]*University of Gondar, Gondar, Ethiopia,* [2]*university of gondar, gondar, India,* [3]*UAE, dubai, United Arab Emirates,* [4]*3Pharmacy Program, Fathima College of Health Sciences, Al Ain Campus, UAE, dubai, United Arab Emirates*

OBJECTIVES: Non-adherence and discontinuation of anticoagulant therapy leads to increased ischemic stroke risk and contributes to suboptimal outcomes of the anticoagulant treatment. In fact, there is rising concern regarding poor adherence with these newer anticoagulant agents. This systematic review and meta-analysis was aimed to investigate the adherence to NOACs and adverse events in patients

with AF. **METHODS:** Original research articles conducted on patients with AF and using any NOACs (dabigatran, rivoraxaban and apixaban) reporting adherence for atleast 35 days were included. Scientific databases including PubMed, Web of Science, and Google Scholar were searched using MeSH keywords to obtaining literatures researched between 2008 to till June, 2016. Study characteristics, patient's sociodemographic and clinical characteristics, medication adherence levels and bleeding events reported were recorded. **RESULTS:** The overall sample size of the six studies is 1,640,157, with CHADS2 scores <2 in 551 patients, CHADS2-VASc ≥2 in 62,232 AF patients. Three-forth [75.6% (95%CI= 66.5-84.8), p<0.001] are adherent to NOACs. However, a higher rate [72.7% (62.5-82.9), p<0.001] of adherence was observed with Dabigatran than Apixaban [59.9% (3.2-123.1), p=0.063] and Rivaroxaban [59.3% (38.7-80.0), p<0.001]. Sub-group analysis revealed that nearly 57% of the AF patients on NOACs have CHADS2 scores <2 and 20% of these patients were non-adherent to NOACs. Overall bleeding events rate associated with NOACs non-adherent AF patients was found to be 7.5% (0.2-14.8), p=0.045. However, nearly 11.2% of AF patients experienced bleeding events were non-adherent to NOAC medications. A higher proportion of bleeding events were noticed with Dabigatran (14.7%). **CONCLUSIONS:** Adherence rates, while uniformly suboptimal, nevertheless varied considerably, lowest at 59.3% for rivaroxaban and 59.9% for apixaban, followed by dabigatran (75.6%). Overall bleeding events associated with NOACs rates were 7.5% However, lower adherence to NOACs was associated with worse outcomes.

PCV78

PATIENT PREFERENCES FOR ORAL ANTICOAGULATION THERAPY IN ATRIAL FIBRILLATION: A SYSTEMATIC LITERATURE REVIEW

Wilke T[1], Bauer S[2], Mueller S[2], Kohlmann T[3], Bauersachs R[4]
[1]IPAM, Wismar, Germany, [2]Ingress-Health HWM GmbH, Wismar, Germany, [3]University Medicine Greifswald, Greifswald, Germany, [4]Department of Vascular Medicine, Klinikum Darmstadt, Darmstadt, Germany

OBJECTIVES: The objective of this study was to systematically analyze the scientific literature assessing atrial fibrillation (AF) patients' preferences with regard to long-term oral anticoagulation (OAC) treatment. **METHODS:** We searched Medline, Scopus, Embase (1980-2015) and added records from reference lists of publications found. Outcomes of interest included any quantitative information about AF patient opinions or preferences towards OAC treatment. **RESULTS:** We included 27 publications describing results of studies conducted in 12 different countries. Among these, 16 studies analyzed patient preferences towards OAC in general. These studies predominantly assessed which benefits (mainly, lower stroke risk) AF patients would require to tolerate harms (mainly, higher bleeding risk) associated with an OAC. Most studies showed that patients were willing to accept higher bleeding risks if a stroke risk reduction is reached (2-4 major bleeds for 1 prevented stroke accepted). Most of the publications additionally showed that AF patient preferences towards OAC may differ from the perspective of clinical guidelines or the perspective of physicians.The remaining 11 included studies assessed AF patient preferences towards specific OAC medication options, namely NOACs versus VKAs. Here, our review showed that AF patients prefer easy-to-administer treatments, such as treatments that are applied once daily without any food/drug interactions and without a need for bridging and frequent blood controls. **CONCLUSIONS:** Stroke risk reduction and a moderate bleeding risk increase are the most important attributes for an AF patient's decision for or against OAC treatment. If different anticoagulation options have similar clinical characteristics, convenience attributes matter to patients. Here, AF patients favour attribute levels that describe NOAC treatment.

PCV79

CORONARY DISEASE PREFERENCES: A SYSTEMATIC REVIEW

Magliano CA, Monteiro A, Santos M
Instituto Nacional de Cardiologia, Rio de Janeiro, Brazil

OBJECTIVES: In clinical scenarios on which exists more than one clinically appropriate intervention strategy, patients preferences should inform decision-making. Preferences for different treatments may be particularly relevant for approximately 12% of patients with coronary artery disease (CAD) who are eligible for either angioplasty or surgery. While cardiologists debate on optimal revascularization method, little is understood about the patient viewpoint. This study aims to systematically identify published healthcare preference studies related to CAD. **METHODS:** Data sources Medline, EMBASE and Lilacs were searched on 10 December 2016. Two researchers independently reviewed titles. Disagreements were resolved by consensus. Study eligibility criteria involved preference studies related to CAD. **RESULTS:** Of the 1,001 citations, 11 met the inclusion criteria. Total sample size was 3,499 patients and 177 physicians. Studies were conducted in the USA (7) and Europe (4). The studies used conjoint analysis (1), standard gamble (1), rating (3), ranking (1), and willingness to pay (1). Importantly, many outcomes not used in clinical trials were valued as more important than repeat revascularization, a very usual outcome. Physicians chose angioplasty over surgery significantly less than the patients when risk of death was quoted as 4% and 6%. Overall, by respondents preferred angioplasty to surgery, even when the hypothetic risk of repeat procedure was three times the risk observed in surgery. Patients weighted stroke more significantly than clinicians did; they also considered stroke worse than death. **CONCLUSIONS:** This study is the first systematic review of the methods used to explore patient's preferences between angioplasty and surgery. We considered the data scarce and identified some methodological challenges. Trials should include outcomes that are more important than repeat angioplasty and improve physician communication: neither the information given to patients nor the methods of presentation have been standardised. Compared to physicians, patients appear willing to accept considerable risk with angioplasty to avoid surgery.

PCV80

QUALITATIVE STUDY TO IDENTIFY PATIENT PERCEIVED SYMPTOMS OF STATIN INTOLERANCE

Martin ML[1], Jacobson T[2], Cheeley MK[2], Harrison DJ[3], Jones P[2], LaForge R[4], Lopez JA[5], Maki K[2], McCarrier KP[6], Miller T[6], Patel J[3], Thompson P[4], Cohen J[4]
[1]Health Research Associates, Inc., Seattle, CA, USA, [2]National Lipid Association, Jacksonville, FL, USA, [3]Amgen Inc., Thousand Oaks, CA, USA, [4]National Lipid Association, Jacksonville, CA, USA, [5]Amgen, Inc, Thousand Oaks, CA, USA, [6]Health Research Associates, Inc., Seattle, WA, USA

OBJECTIVES: Patient perceptions of symptoms related to statin intolerance are not well understood. This study describes patient perceived difficulties with statins and identifies key symptoms to assess when evaluating statin intolerance. **METHODS:** Adults with dyslipidemia and history of physician-reported statin intolerance to ≥2 statins within the past 6-months were recruited from three lipid clinics in the US. Qualitative interviews were conducted to understand patients' experiences with statins and describe adverse events they attributed to statins. Interview sessions were audio recorded, transcribed and coded for qualitative content analysis. Coded concepts were grouped by similar content for analysis. **RESULTS:** Twenty patients were interviewed, mean age 65 (range 48-83), 65% male. Sixty percent had tried ≥4 statins and tried lower doses, non-daily doses, pain relievers, and other supplements to reduce symptoms. There were 486 distinct patient expressions of symptoms related to statin intolerance in the transcript database. Symptoms most frequently described were muscle related pain/discomfort (35%) including aching, cramps, pain, soreness and general discomfort. Other muscle symptoms (9%) included muscle fatigue, heaviness, stiffness, tightness and weakness. Non-muscle-related pain symptoms were also reported (16% of symptom expressions) including bone and joint pain and pain in the chest, neck and back. Fatigue, exhaustion, tiredness and low energy made up 15% of all symptom expressions. Cognitive issues (memory and concentration) comprised 8% of the difficulties reported. Other patient symptom expressions included mood changes (e.g., irritability), gastrointestinal problems, and generally feeling ill. Across all reported symptoms, severity ratings (11 point scale) ranged from 2.0-10.0 (mean 7.2, sd 2.2). **CONCLUSIONS:** We identified a broad range of symptoms experienced by patients with statin intolerance. Levels of symptom severity are also important and both should be considered when evaluating statin intolerance. More research is needed to identify symptoms and severity that relate to patient's decision to withdraw from statins.

PCV81

LINGUISTIC VALIDATION OF MALAYSIAN VERSION OF HYPERTENSION SELF-CARE PROFILE (HBP-SCP) TOOL

WA Manan WZ[1], Neoh CF[1], Wong YY[2]
[1]Universiti Teknologi MARA, Puncak Alam, Malaysia, [2]Universiti Teknologi MARA, Penang, Malaysia

OBJECTIVES: To translate and provide a Malaysian version of HBP-SCP that was conceptually equivalent to the original English version for use in the Malaysian setting. **METHODS:** The linguistic validation of HBP-SCP was conducted according to the principles of good practice for translation and cultural adaptation process for patient-reported outcomes measures, delineated by the International Society for Pharmacoeconomics and Outcomes Research task force. These steps included preparation, forward translation, reconciliation, back translation, back translation review, harmonisation, cognitive debriefing, review of cognitive debriefing and finalisation. **RESULTS:** Some words were replaced during the initial translation process to ensure the meanings of the original items were culturally acceptable in Malaysian setting. For instance, the word "lard" was replaced by "margarine" (item 6 and 8) and the phrase "Oodles of Noodles" was replaced by "Instant Noodles" (item 3). In addition, the word "eat" in the sentence "Eat less than 1 teaspoon of table salt per day (6 grams)?" in item 5 (behaviour scale) and item 6 (motivation and self-efficacy scales) was literally translated as "mengambil (take)" instead of "makan (eat)" which culturally acceptable equivalents to original English version. Following the cognitive debriefing, the word "sodium" was not intuitively understood by 5 out of 7 hypertensive patients. Hence, an additional word "gram (salt)" was added to provide an easily comprehensible version. The item "Forget to take your blood pressure medicine" was initially translated to "Terlupa mengambil ubat darah tinggi" in item 15 (behaviour scale) and item 16 (motivation and self-efficacy scales). However, some patients misunderstood the meaning of "mengambil" as taking blood pressure medication from the pharmacy counter and thus, the word "mengambil" was changed to "makan". **CONCLUSIONS:** The translated Malaysian version of HBP-SCP tool was conceptually equivalent and culturally acceptable for use in Malaysia. Future psychometric validation is anticipated.

PCV82

PSYCHOMETRIC EVALUATION OF CONDITION SPECIFIC HEALTH RELATED QUALITY OF LIFE MEASURES AND RELATED CONSTRUCTS USED IN PERSONS WITH APHASIA

Gadson DS, Shisler Marshall R, Franic DM
University of Georgia, Athens, GA, USA

OBJECTIVES: Aphasia is a neurologically based language disorder caused by damage to the left hemisphere of the brain. Aphasia affects approximately one third of stroke survivors and has a significant impact on their health related quality of life (HRQL). The objective of this study was to compare and contrast the psychometric properties of condition specific HRQL measures and related constructs used in persons with aphasia (PWA). **METHODS:** Instruments were identified by conducting a comprehensive literature review of condition specific, self-report measures of HRQL in English used in persons with aphasia. Evaluation

of eight instruments was based on the following criteria: conceptual model, versatility (eg varying severity of aphasia), practicality (≤ 15 minutes to complete), depth (floor and ceiling effects), breadth (physical, mental, role, social and communicative functioning), reliability (internal consistency and test-retest), construct validity, and responsiveness. **RESULTS:** The most widely used scales were Stroke and Aphasia Quality of Life (SAQOL-39g), Burden of Stroke Scale (BOSS) and Assessment of Living with Aphasia (ALA). SAQOL-39g and BOSS met most study criteria but neither met the practicality criterion nor did they use pictures to enable nonverbal responses. Breadth criterion was met by SAQOL-39g, BOSS, Communication Disability Profile (CDP), ALA and Quality of Communication Life Scale (QCL). Construct validity criterion was only met for SAQOL-39g. Reliability criterion was met for SAQOL-39g, BOSS, Community Integration Questionnaire modified for PWA (CIQ), ALA, CDP and Communication Outcome after Stroke (COAST). In most cases unmet criteria was due to unreported data. **CONCLUSIONS:** Key consideration in instrument selection is validation in the target population: aphasia severity, type, setting and other stroke sequelae; and desired construct of measurement. Overall, although BOSS and SAQOL-39g scored highly, lack of visual prompts and length, limits their suitability in PWA. Only CDP provided breadth including communication functioning, aphasia type, and reliability for domain scores.

PCV83

PATIENT PREFERENCES FOR CHOLESTEROL TREATMENT OPTIONS: A DISCRETE CHOICE EXPERIMENT (DCE)

Lewey J[1], Choudhry NK[2], Gagne JJ[2], Avorn J[2], Najafzadeh M[2]
[1]University of Pennsylvania School of Medicine, Philadelphia, PA, USA, [2]Brigham and Women's Hospital and Harvard Medical School, Boston, MA, USA

OBJECTIVES: With the recent approval of PCSK9 inhibitors, patients with cardiovascular disease (CVD) and their clinicians face a choice between a statin and this potentially more effective but very costly medication class. We conducted a DCE to understand what trade-offs patients are willing to make among the benefits, risks, and costs of these two medication classes. **METHODS:** We selected a sample of patients with self-reported CVD from an online national panel. Respondents completed a web-based questionnaire that presented a hypothetical clinical scenario and 12 choice questions, each containing 2 treatment options. Patients were asked to select their preferred treatment by comparing their attributes. Using conditional logistic regression, we estimated relative preferences, maximum acceptable risk, and willingness to pay. **RESULTS:** Among the 689 patients who met inclusion criteria, 521 (76%) completed the questionnaire. The average age was 62 years. The odds of choosing a drug requiring an injection every two weeks compared to a daily pill was 0.57 (95% CI 0.54-0.61). In order to accept the need to inject, patients would expect a 17% reduced risk of non-fatal CVD events, 11% reduced risk of fatal CVD events, 60% reduced risk of muscle symptoms, or 16% reduced risk of memory loss over a 10-year period. Patients on average were willing to pay $51/month out of pocket, or to have their insurance pay up to $1670/month for a daily pill rather than a bimonthly injection. **CONCLUSIONS:** With all other attributes being equal, monthly treatment cost and the need for injection were major drivers of patient preferences for choice of treatment. The smaller positive impact of expected benefits of PCSK9 inhibitors compared to statins in terms of reducing risk of CVD events are unlikely to offset these negative impacts on patient preferences unless outcome studies demonstrate significantly higher benefit than currently anticipated.

PCV84

HEALTH RELATED QUALITY OF LIFE AMONG SURVIVORS OF MYOCARDIAL INFARCTION IN THE UNITED STATES: A PROPENSITY SCORE MATCHED ANALYSIS

Mollon LE, Bhattacharjee S
The University of Arizona, Tucson, AZ, USA

OBJECTIVES: To identify differences in health-related quality of life (HRQoL) domains between survivors of myocardial infarction (MI) and propensity score matched controls. **METHODS:** This retrospective, cross-sectional study examined HRQoL differences between survivors of MI and propensity score matched controls using data from the 2013 Behavioral Risk Factor Surveillance System (BRFSS) survey. The study sample consisted of adults aged 50 or older who: (i) completed the BRFSS survey, and (ii) reported data on HRQoL. Adults that reported they had ever been told they had an MI formed the case group and those who did not formed the control group. Propensity scores were generated using logistic regression based on gender, race/ethnicity, age, smoking status, and body mass index (BMI). Each case was matched to three controls (1:3) to increase the power of the analyses. Univariate analyses were conducted using chi-square tests before and after propensity score matching. Multivariable analyses were conducted to identify HRQoL differences between groups. Life satisfaction, sleep quality, and activity limitations were estimated using binary logistic regression. Social support, general health, physical health, and mental health were estimated using multinomial logistic regression. Significance was set at $p < 0.05$. **RESULTS:** The final sample consisted of 23,282 survivors of MI matched to 69,846 controls (n=93,128). Compared to controls, survivors were 3 times more likely to report fair/poor general health (Adjusted Odds Ratios (AOR)) = 3.06, 95% CI:2.769-3.396) and 1.7 times more likely to report daily activity limitations (AOR = 1.69, 95% CI:1.56-1.84). Survivors reported poorer physical health (AOR = 2.07, 95% CI:1.88-2.28) and poorer mental health (AOR = 1.56, 95% CI:1.35-1.80). There was no difference between groups in level of emotional support, sleep quality, or life satisfaction. **CONCLUSIONS:** Survivors of MI experienced lower HRQoL on domains of general health, physical health, and mental health compared to propensity score matched controls.

DETERMINATION OF HEALTH RELATED QUALITY OF LIFE IN CORONARY HEART DISEASE (CHD) PATIENTS ATTENDING DIFFERENT HOSPITALS IN QUETTA, PAKISTAN

Haq N[1], Sajjad B[2], Nasim A[1], Khan S[1], Raiz S[1], Ahmed N[1]
[1]University of Balochistan, Quetta, Pakistan, [2]University Road, Quetta, Pakistan

OBJECTIVES: This study was conducted to determine the health related quality of life in Coronary heart disease (CHD) patients attending different hospitals in Quetta, Pakistan. **METHODS:** This cross sectional study was undertaken in different hospitals of Quetta, Pakistan from January to October 2016 and recruiting patients with coronary heart disease attending the hospital for follow ups the data was obtained by using EQ-5D-3L questionnaire to evaluate health related quality of life (HRQOL) descriptive statistics were used to present result and united kingdom general population survey were used to evaluate EQ-5D scoring and analysis were perfumed using IBM SPSS v.20. **RESULTS:** Three hundred and fifty-three CHD patients were enrolled in study, majority were belonging to age group 56 – 65 years (n=126, 35.5%) with male dominancy (n=269, 75.8%), The mean EQ-5D descriptive score and EQ-VAS score were 0.54536±0.304 and 67.15±15.99. Demographic characteristics; number of medicines, gender, ethnicity, occupation, education and income were associated with the mean EQ5D and VAS and lower health related quality of life scores in patients with CHD. **CONCLUSIONS:** The present study showed that quality of life was low in those suffering from CHD. CHD had an adverse impact on all aspects of life such as physical and psychological functioning and general wellbeing.

PCV86

EVALUATION OF HEALTH-RELATED QOL IN HYPERTENSIVE PATIENTS USING EQ-5D IN SOUTHWEST CHINA

Long E[1], Feng S[2], Hu M[2], Bian Y[1]
[1]Sichuan Provincial People' s Hospital, Chengdu, China, [2]Sichuan University, Chengdu, China

OBJECTIVES: To assess the health-related QoL of hypertensive patients in southwest China and compare it with other area in China, and identify the factors that influence the QoL of hypertensive patients. **METHODS:** Face to face survey was conducted to 600 samples of hypertensive patients who were recruited from tertiary hospitals in Chengdu, the biggest southwest city in China. Sociodemographic of patients were collected through questionnaires, and health-related quality of life were measured using the EQ-5D-5L scale. Chi-square test, one-way analysis of variance (ANOVA) and student's t test were employed to estimate the differences between various sociodemographic conditions. **RESULTS:** 562 effective responded hypertensive patients were involved in this study. The mean of EQ-VAS score of hypertensive patients was 73.42±13.93 while the mean of EQ-5D index of the sample was 0.835±0.133. EQ-5D index of men (0.862) was higher than women (0.814) (chi-square = 4.311, $P < 0.001$).Patients who had exercise habits (0.845)gained higher EQ-5D index than those without exercise habits(0.816) ($P = 0.013$).Patients with complications(0.819) had lower EQ-5D index than those without complications (0.855) ($P = 0.002$).EQ-5D index increased gradually with the increase of reimbursement ratio ($P = 0.033$).EQ-5D index of patients with annual household income of less than 30,000 yuan(≈4348US$) was 0.809, while the EQ-5D index of patients with annual household income of 300,000 to 1,000,000 yuan(≈144927US$) was 0.869 , and there were statistical difference between this two income groups. The EQ-5D index of patients who smoking or drinking were higher than those who did not smoke or drink, and the difference was statistically significant ($P < 0.001$). **CONCLUSIONS:** The EQ-5D index of hypertensive patients in southwest China felled in literature reported 0.78-0.93, but the EQ-VAS score was lower than it in Peking urban hypertensive patients (77.39±14.41). Gender, exercise habits, complications, reimbursement ratio, and household income are the main factors influenced the QoL of hypertensive patients.

PCV87

HEALTH RELATED QUALITY OF LIFE ASSESSMENT WITH MEDICAL OUTCOMES STUDY THE 12-ITEM SHORT- FORM HEALTH SURVEY (MOS SF 12) AND THE 14-ITEM SHORT-FORM HEALTH SURVEY FOR CHRONIC VENOUS INSUFFICIENCY (MOS CIVIQ 14) THAI VERSIONS

Udombhornprabha A[1], Kanchanakhan N[2], Phongmanjit P[3], Thaneepanichsakul S[2], Udombhornprabha A[2]
[1]Eastern Asia University School of Pharmacy, Pathumthani, Thailand, [2]College of Public Health Science, Chulalongkorn University, Pathumwan, Bangkok, Thailand, [3]Chiang Rai Prachanukroh Hospital, Chiang Rai, Thailand

OBJECTIVES: High incidence of Chronic venous disease(CVD) was noted meanwhile patients did not seek treatment at an early stage. Relevance leg symptoms spotted for primary screening remains clinical challenges. **METHODS:** The medical outcomes study (MOS) with health-related quality of life, a 12-Item Short-Form Health Survey(SF-12) and a 14-Item Health Short-Form Health Survey for Chronic Venous Insufficiency(CIVIQ-14) were employed in hospital-setting together with physical examinations for an interventional study. A cross-sectional analysis was performed to assess reliability and correlation of the questionnaires with specific implication of leg symptoms. **RESULTS:** 120 patients were screened, 48 patients clinically diagnosed with CVD. For the inter-scale correlation and internal consistency reliability interpreting with Cronbach's alpha coefficients, CIVIQ-14 Thai version were reliable with Cronbach's alpha coefficient of 0.914(for 14-item global score), 0.867(for 7-item physical and pain score) and 0.787(for 7-item psychological score), whereas SF-12 were reliable, with the same of 0.810(for 12-item for global score), 0.939(for 7-item physical and pain score) and 0.661(for 5-item mental score). These two questionnaires were well correlated for physical score, interpreting with bivariate Pearson correlation coefficient, with a 95% CI of 0.713(0.663 to 0.790), $p<0.001$ and for global score, 0.745 (0.640 to 0.819),

p<0.001. No significant correlation of psychological score of -0.062(-0.197 to 0.091), p=0.501. The major leg symptoms significantly have rendered impacts on the raw score for physical components score and for global score but not for mental components of both SF-12 and CIVIQ-14. Patients with CIVIQ-14 score lower than 75.7 were more likely to have been diagnosed CVD. **CONCLUSIONS:** Both the CIVIQ-14 and the SF-12 were highly correlated for scoring on physical function, useful for primary screening of chronic venous disease. Though majority of leg symptoms and adjustment of appropriate threshold scores were suggested to be a useful tool for screening CVD.This CIVIQ-14 Thai version was useful but larger heterogeneous patient exploration confirmation suggested.

CARDIOVASCULAR DISORDERS – Health Care Use & Policy Studies

PCV88
EFFECT OF DIRECT-TO-CONSUMER ADVERTISING (DTCA) ON STATIN USE IN THE UNITED STATES

Chang H[1], Murimi IB[2], Daubresse M[3], Qato D[4], Emery SL[5], Alexander GC[2]
[1]*Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, USA,* [2]*Johns Hopkins Bloomberg School of Public Health, Center for Drug Safety and Effectiveness, Baltimore, MD, USA,* [3]*Johns Hopkins School of Public Health, Baltimore, MD, USA,* [4]*University of Illinois, Chicago, IL, USA,* [5]*NORC at the University of Chicago, Chicago, IL, USA*

OBJECTIVES: The value of direct-to-consumer advertising (DTCA) of prescription drugs is widely debated, as is the effect of DTCA on prescription sales and health care utilization. We examined the association between DTCA intensity for statin medications and prescription sales and cholesterol-related health care utilization. **METHODS:** We conducted an ecological study for 75 designated US market areas (DMAs) from 2005 to 2009 using linked data regarding: (1) televised DTCA volume for rosuvastatin and atorvastatin derived from Nielsen television ratings; (2) non-DTCA marketing and promotion derived from IMS Health Integrated Promotion Services; (3) retail, mail order and long-term care prescription drug sales derived from IMS Health Xponent; (4) prescription drug and ambulatory care health care utilization derived from Truven MarketScan; (5) contextual factors such as health care density and socioeconomic status derived from the Area Resource File. We derived information for each month at each DMA and used multi-level negative binomial regression to account for nesting of individuals. Main outcomes and measures were: (1) Volume of total, new and refilled prescription sales; (2) number of statin prescriptions dispensed; (3) high cholesterol-related outpatient visits. **RESULTS:** The average intensity of statin ad exposures per household varied substantially across DMAs. After adjustment for socioeconomic, demographic and clinical characteristics, each 100-unit increase in advertisement viewership was associated with a 2.22% (95% confidence interval [CI] 0.30 to 4.19%) increase in statin sales. Similar patterns were observed between DTCA and statin dispensing among the commercially insured. DTCA was associated with increases in high cholesterol-related outpatient visits among adults 18-45 years of age (3.15% increase in visits per 100-unit increase in viewership, 95% CI: 0.98 to 5.37%) but not among those 46-65 years (0.51%, 95% CI: -1.49 to 2.55%). **CONCLUSIONS:** DTCA for statins is associated with increases in statin utilization and hyperlipidemia-related outpatient visits, especially for young adults.

PCV89
A NOVEL VENTRICLE RESTRAINT DEVICE (ASD) REPETITIVELY DELIVER SALVIA MILTIORRHIZA TO EPICARDIUM HAVE A GOOD CURATIVE EFFECTS IN HEART FAILURE MANAGEMENT

Naveed M[1], Wenhua L[2], Gang W[1], Akhtar F[3], Khan M[4], Abbas M[1], Ihsan AU[1], Yang M[1], Li Z[1],
Xiaoqian L[1], DingDing C[1], Zhijie W[5], Feng Y[1], Lei H[6], Xiaohui Z[1]
[1]*China Pharmaceutical University, School of Pharmacy, Nanjing, China,* [2]*Aviation General Hospital, Beijing, China,* [3]*China Pharmaceutical University, Nanjing, China,* [4]*Hazara University Mansehra, Mansehra, Pakistan,* [5]*Chinese Academy of Sciences, Beijing, China,* [6]*Jiangsu Jiankang Vocational College, Nanjing, China*

OBJECTIVES: Passive ventricular restraint is non-transplant surgical option for the management of end stage dilated heart failure (HF). The objective of this work is to expand the therapeutic techniques of current medicine , for this purpose we design a novel ventricle restraint device (ASD) which has ability to deliver a therapeutic drug directly to the heart. In this study we deliver a Traditional Chinese Medicine (TCM) Salvia Miltiorrhiza (Danshen Zhusheye, SM) through active hydraulic ventricles support drug delivery system (ASD) and we hypothesize that it will have better result in heart failure management than the restraint device and drug alone. **METHODS:** Sprague Dawley (SD) rats were selected and divided into five groups (n=6), Normal, HF, HF+SM (IV), HF+ASD, HF+ASD+SM groups respectively. Prior to surgery ECG were performed which showed a normal heart function in all groups. **RESULTS:** The HF+ASD-SM group showed a significant therapeutic improvement with respect to other treatment groups. Masson-Trichrome staining was used to study histopathology of cardiac myocytes, large blue fibrotic area was observed in HF, HF+ASD and HF+SM (IV) groups while HF+ASD+SM showed negligible fibrotic myocytes in histological examination at the end of study period (30 day). The The diastolic and systolic parameter (LVEDP and LVSP) were brought to normal when treated with HF+ASD+SM and show significant (P value< 0.05) over individual ASD and SM therapy. Blood Brain Natriuretic Peptide (BNP) significantly declines in HF+ASD+SM group animals compared with HF and HF+SM (IV) groups respectively. **CONCLUSIONS:** It is concluded that novel ASD device augment the therapeutic effect of drug and can deliver Salvia miltiorrhiza to the cardiomyocytes significantlyas well as provide additional support to the dilated ventricles by the result of heart failur.

PCV90
RISK FOR CARDIOVASCULAR ADMISSIONS IN SGLT2 AND DPP4 THERAPIES

Gautam S[1], Agiro A[1], Barron J[1], Power TP[2], Weisman H[3], White J[4]
[1]*HealthCore, Wilmington, DE, USA,* [2]*AIM Specialty Health, Chicago, IL, USA,* [3]*Anthem, Indianapolis, IN, USA,* [4]*Anthem, Inc, Costa Mesa, CA, USA*

OBJECTIVES: The Food and Drug Administration (FDA) approved formal indication for an antidiabetic drug for preventing cardiovascular deaths compared to placebo. It is not clear if cardiovascular hospitalizations are lower for sodium glucose transporter 2 inhibitors (SGLT2) compared to dipeptidyl peptidase 4 inhibitors (DPP4). Second, it is uncertain if any benefit occurs in heart failure. Recognizing both needs, we assessed the association between initial dispensing of either class with cardiovascular hospitalizations in general and heart failure in particular. **METHODS:** The new user study design was applied to type 2 diabetic patients initiating SGLT2 versus DPP4 medications from April 2013 to December 2014 and followed through June 2015. We analyzed time to first cardiovascular (myocardial infraction, stroke or angina) and heart failure admissions after initiating therapy (index date). We adjusted for post-index time-varying covariates and baseline characteristics. Continuous enrollment for 6 months pre-index was required to assess baseline factors. We conducted a marginal structural model (MSM) analyses to estimate Cox proportional hazards. **RESULTS:** Patients initiating SGLT2 (N=5,484) were younger (mean 55 years) compared to 59 years for DPP4 (N=32,113). Overall, 2.6% and 6.0% patients had cardiovascular admissions after initiating therapy for SGLT2 (n=142) and DPP4 (n=1,928) cohorts respectively. About 0.9% and 3.6% patients had heart failure admissions after initiating therapy for SGLT2 (n=50) and DPP4 (n=1,151) cohorts respectively. Using DPP4 as a reference, the Cox MSM adjusted risk for heart failure admissions was significantly lower for patients on SGLT2 (HR = 0.64, 95% CI 0.48 – 0.85, p = 0.002). There was no difference in cardiovascular admissions (HR=0.86, 95% CI 0.72 – 1.03, p = 0.10). **CONCLUSIONS:** This study found a significantly lower risk in heart failure but not cardiovascular admissions for SGLT2 users. Clinical studies are needed to provide evidence on each SGLT2 agent's impact on heart failure exacerbations.

PCV91
DRG BASED PERFORMANCE INDICATORS OF ANGIOLOGICAL ACTIVE INPATIENT CARE

Endrei D, Boncz I
University of Pécs, Pécs, Hungary

OBJECTIVES: Angiological active inpatient care has been a field with a separate professional entity and code since 2012. Our study aimed at analysing the performance indicators of angiological active inpatient care. **METHODS:** Data analysed were taken from the DRG-based financial database of the National Health Insurance Fund Administration and the year examined was 2015. In our study, we determined average nursing times, the case-mix index (CMI), case numbers and cost weight for activities listed under professional code '0101 Angiology, phlebology, lymphology'. **RESULTS:** In the year 2015, 13 health care institutions out of 7 counties reported having provided angiological care with a separate professional code to the National Health Insurance Fund Administration in Hungary. The national annual angiological active inpatient volume amounted to12,076 cases and 101,546 nursing days which was financed by the National Health Insurance Fund Administration with a DRG cost weight of 13.573. The market share of angiological care was 0.54% of the total active inpatient care based on case numbers, 0.57% based on cost weight, 0.80% based on number of active beds and 0.83% when calculated according to nursing days. The national average case-mix index for all medical specialist fields was 1.15249, while the average number of nursing days was 5.3 days/case. The national case-index of angiology (1.17373) was the highest in university clinics (1.39419) and the lowest in hospitals in the capital (1.02154). The national average length of stay was (8.1 days/case) was longer than the national professional average and was the shortest in town hospitals (7,6 days/case) and the longest in special hospitals (9.8 days/case). **CONCLUSIONS:** Performance indicators of angiological care suggest that the its case-mix index is higher than the national professional average, whereas nursing times are somewhat longer. Performance indicators of different types of institutions (universities, town and county hospitals, Budapest hospitals) show significant differences.

PCV92
A FEASIBILITY STUDY ON 10-YEAR CVD RISK ASSESSMENT AS A PRIMARY PREVENTION TOOL FOR CARDIOVASCULAR DISEASE

Shi R, Lan Y, Yu W
Pfizer, Beijing, China

OBJECTIVES: China National Center for Cardiovascular Disease launched a guideline-based 10-year risk assessment of cardiovascular disease (CVD) phone APP, and created a heart age index to visualize the CVD risk to public. This is the first time using totally Chinese local database which includes 40,000 people following up 10-15 years to assess CVD incidence risk. We assessed the self-test effect of the app in China and the feasibility of promoting the app as a secondary prevention tool for CVD by government. **METHODS:** Media and government projects encouraged people spontaneously using the app and answering 8 CVD risk factor's questions. We analyzed the current status of cardiovascular risk in Chinese residents, the prevalence of hypertension, hyperlipidemia, diabetes, the distribution of heart-age and so on by SPSS. **RESULTS:** During 5 months, 18,214 people (39.7% of men, 60.3% of women) used the app around the whole country. The mean age was 55.9 years, the mean heart-age was 64.8 years, and the mean 10-year CVD risk was 4.1%. For hypertension, hyperlipidemia and diabetes patients, the mean 10-year CVD risks were 8.7%, 7.1%, and 9.5% respectively. Prevalence of hypertension (SBP≥140 mmHg or DBP≥90 mmHg), hyperlipidemia (total cholesterol>6.2mmol/L) and diabetes mellitus were 15.8%, 14.4% and 8.5%,

respectively. Among hypertensive patients, 33.4% had hyperlipidemia at the same time, and 10.5% of diabetes patients had hyperlipidemia. The correlation coefficient between hypertension and hyperlipidemia was 0.101 (P<0.001), between hyperlipidemia and diabetes was 0.022 (P=0.003), and between hypertension and diabetes was 0.038 (P<0.001). **CONCLUSIONS:** The 10 years CVD risk evaluation app can be a primary prevention tool for CVD in China. For Chinese population, heart-age is 10 years older than actual age. Hyperlipidemia is highly associated with hypertension and diabetes, so it's necessary for Chinese government to include blood lipid management in its national policy.

PCV93

SIMULTANEOUS ENDOVASCULAR ANEURYSM REPAIR AND CORONARY ARTERY BYPASS GRAFTING

Avdeyev A[1], Mendykulov S[1], Mussayev S[1], Albayev R[1], Kaptagayeva A[2], Sharip B[1], Tabarov A[1], Zhanabekova L[1], Gizatullina A[1], Makalkina L[3]

[1]*Hospital of the Medical Center of the President's Affairs Administration of the Republic of Kazakhstan, Astana, Kazakhstan,* [2]*the Ministry of Healthcare and Social Development of the Republic of Kazakhstan, Astana, Kazakhstan,* [3]*Medical University Astana, Astana, Kazakhstan*

OBJECTIVES: Simultaneous endovascular aneurysm repair (EVAR) and coronary artery bypass grafting (CABG) includes two different surgical operations doing by two teams of operating surgeons during one anaesthetic support. Patients with concomitant aortic aneurismal disease and coronary artery disease stay in group of high risk of perioperative aortic aneurism rupture and myocardial infarction. Therefore, simultaneous EVAR/CABG can reduce the incidence of late aortic aneurism rupture and myocardial infarction and can improve survival in the short and long-term period. This research aim is to evaluate clinical effectiveness, safety and economic effectiveness of simultaneous EVAR/CABG compared with conducting these surgical operations separately. **METHODS:** For opportunity to evaluate clinical effectiveness, safety and economic effectiveness of simultaneous EVAR/CABG the systematic literature search was conducted in databases of evidence-based medicine named MEDLINE, EMBASE, Tripdatabase, Clinical Trials. Publication date: no later than 10 years (since 2007). **RESULTS:** As a result of systematic search we found 12 articles; all of these articles confirmed clinical effectiveness and safety of simultaneous EVAR/CABG in patients with large and/or symptomatic aortic aneurism and severe coronary artery disease. Simultaneous EVAR/CABG can be viable procedure with low operative mortality and acceptable rate of perioperative complications. From the side of economic effectiveness conducting simultaneous EVAR/CABG can reduce costs for 1 patient treatment by a mean of 7.5% (1 120 USD) due to 1) reducing duration of hospital stay and postoperative rehabilitation; 2) no need for additional anaesthetic support; 3) decreasing in incidence of post-operative aortic aneurism ruptures and myocardial infarctions in patients with concomitant aortic aneurismal and coronary artery diseases. **CONCLUSIONS:** Simultaneous endovascular aneurysm repair and coronary artery bypass grafting can be viable procedure for patients with concomitant large and/or symptomatic aortic aneurism and severe coronary artery disease with low operative mortality, acceptable rate of perioperative complications and has some economic advantages over conducting these surgical operations separately.

PCV94

MEN ARE PREDICTABLE: MODELING CARDIOVASCULAR DISEASE PREVALENCE FROM POPULATION SURVEY DATA

Davis JA, Saunders R

Coreva Scientific, Freiburg im Breisgau, Germany

OBJECTIVES: Calculating the economic burden of disease requires data regarding disease prevalence. National estimates can be derived from surveys of the general population, which may also access individuals not actively participating in the healthcare system. The Behavioral Risk Factor Surveillance System (BRFSS) is the largest annual country-wide population sampling of health and risk factors. The fidelity of these data, however, may be questionable, relying on accurate self reporting. Cardiovascular disease (CVD) prevalence was examined by gender to assess the feasibility of predicting future trends. **METHODS:** BRFSS data were trimmed to complete cases for 9 CVD risk factors: gender, age, race, overweight, physical activity, diabetes, high blood pressure, smoking and alcohol consumption. Data from 2011 and 2013 were used to train Bayesian and tree-based algorithms to evaluate predictor performance on unseen data from subsequent years (2013 and 2015) by comparing predicted with reported prevalence. **RESULTS:** For algorithms used, predictions of future prevalence were significantly better for males than females ($p < 0.001$, Šidák multiple testing correction). In the best performing algorithm (Naïve Bayes), the mean percent difference from the actual prevalence for males was 3.8±2.5% and females 151±62% ($p < 0.05$, two-tailed t-test). Data from 2013 yielded better 2-year predictions (2015) for women than the same time span with 2011 data (2011 to 2013, $p < 0.05$, two-tailed t-test), while for men, there was no significant difference ($p = 0.54$, two-tailed t-test). Models trained on the genders combined resulted in underestimates of prevalence ($p < 0.001$, Z-test). **CONCLUSIONS:** Patient-reported survey data can be used to predict cardiovascular disease prevalence. Accuracy of estimation is better in males versus females. Given that BRFSS data are retrospective, our findings may reflect more substantial lifestyle changes in females or suggest discussion on changes in how survey data from female respondents are collected.

PCV95

PROJECTED IMPACT OF ADOPTING A MULTIPLEXED PREEMPTIVE GENOTYPING INTERVENTION IN CARDIAC CATHETERIZATION LABORATORY PATIENTS

Dong O[1], Li A[1], Suzuki O[1], Oni-Orisan A[2], Stouffer G[1], Lee C[1], Wiltshire T[1]

[1]*University of North Carolina, Chapel Hill, NC, USA,* [2]*University of California, San Francisco, CA, USA*

OBJECTIVES: To estimate the impact of preemptive genotyping in cardiac catheterization laboratory patients based on the number of clopidogrel, warfarin, and simvastatin prescribing changes recommended by the Clinical Pharmacogenetics Implementation Consortium (CPIC). **METHODS:** A retrospective analysis was conducted in a cohort of patients referred for coronary angiography at UNC Hospitals from 2012 to 2014 who consented to participate in a single-center study with medication data available at discharge and follow-up (n=122). Patient DNA samples were sequenced using a custom pull-down method for library preparation and next-generation sequencing using the Illumina HiSeq platform. Bioinformatic tools (i.e. Burrows-Wheeler aligner, Freebayes) were used for the genetic analysis, and a minimum sequencing depth of 20x was required for genotype and haplotype calling. Pharmacogenetic-guided drugs and genes included in the analysis were: clopidogrel (CYP2C19 *1, *2, *3, *17), simvastatin (SLCO1B1 rs4149056), and warfarin (CYP2C9 *1, *2, *3; VKORC1 rs9923231). **RESULTS:** Prescription data for warfarin, clopidogrel, and simvastatin were available for all patients. Haplotype calling was successful in 118 patients (96.7%) for CYP2C19, 112 patients (91.8%) for CYP2C9/VKORC1, and 122 patients (100%) for SLCO1B1. A total of 87 prescriptions were given for clopidogrel, warfarin, and simvastatin. Based on the CPIC guidelines, 17 of these prescriptions (19.5%) were eligible for a change in dose or drug. According to the presence of an at-risk genotype, the number of CPIC recommended prescribing changes included: 10 (16.9%) out of 59 patients on clopidogrel, 2 (18.2%) out of 11 patients on warfarin, and 5 (29.4%) out of 17 patients on simvastatin. **CONCLUSIONS:** Adopting a preemptive genotyping intervention that multiplexes CYP2C19, CYP2C9/VKORC1, and SLCO1B1 would be relevant for approximately 1 out of 5 cardiac catheterization laboratory patients. Additional studies in larger cohorts are needed to confirm the generalizability of these findings.

PCV96

PLACEMENT OF NEW FDA-APPROVED DRUGS IN MEDICARE PART D FORMULARIES, 2009-2014

Stuart B[1], Tom S[1], Choi M[1], Qato D[1], Johnson A[1], Sun K[1], Zacker C[2], Obi E[3], Arcona S[3], Park Y[3]

[1]*University of Maryland School of Pharmacy, Baltimore, MD, USA,* [2]*Novartis, East Hanover, NJ, USA,* [3]*Novartis Pharmaceuticals, East Hanover, NJ, USA*

OBJECTIVES: To assess time-to-formulary-placement (TFP) of selected drugs post-FDA approval among Medicare Part D plans. **METHODS:** Data obtained from CMS public use files. TFP was calculated for 34 drugs in 8 therapeutic classes (anti-hyperglycemics, anticoagulants, antiplatelets, MS agents, DMARDS, COPD drugs, antiepileptics, and antipsychotics) as the difference in months between first observed formulary placement among all Part D plans and plan-specific formulary placement dates for a sample of 863 plans with continuous CMS contracts, 2009 to 2014. A 2-part multivariable model estimated the impact of drug characteristics (new chemical entity, line extension, combination product, number of competing products in class) and Part D plan characteristics (basic vs enhanced benefits, PDP vs MAPD, Star rating), on the probability of adoption of each drug (part 1) and TFP (part 2). **RESULTS:** First Part D formulary placements varied from 3 to 9 months post-FDA approval with longest delays for rivaroxabam, ticagrelor, and indacaterol. On average, 58.5% of plans placed each drug within 6 months, and 65.9% within one year of first formulary placement. Mean TFP was 4.3 months across all drugs with the most rapid adoption for antipsychotics (2.7 months) and antiepileptics (3.3 months). The longest TFP (6.5 months) was for COPD drugs and antiplatelets. In adjusted analyses, enhanced benefit plans and higher Star ratings increased odds of formulary placement (ORs=1.38 and 1.36, respectively, p<.0001) whereas being a benchmark plan lowered odds of placement (OR=0.78, p=.03). Line extensions and combination products had very low odds of placement (OR=0.10 and 0.22, respectively, p<.0001). There were no significant differences in TFP between PDPs and MAPDs. Follow-on products in the same pharmacological class were placed significantly more often than first-in-class products, but TFP was slower. **CONCLUSIONS:** There is significant heterogeneity in probability of placement and TFP on new drug introductions in the Part D marketplace.

PCV97

USE OF SECONDARY PREVENTION MEDICATIONS AMONG PATIENTS WITH ACUTE CORONARY SYNDROMES IN TIANJIN, CHINA

Wang Y[1], Cong H[2], Lu C[3], Liu J[4], Wu J[1]

[1]*Tianjin University, Tianjin, China,* [2]*2. Tianjin Chest Hospital, Tianjin, China,* [3]*3. Tianjin First Center Hospital, Tianjin, China,* [4]*Tianjin Health Insurance Research Association, Tianjin, China*

OBJECTIVES: To examine the use of secondary prevention medications including antiplatelets, beta-blockers, ACEIs/ARBs, and statins among patients with acute coronary syndromes (ACS) in Tianjin, China. **METHODS:** Data were obtained from Tianjin Urban Employee Basic Medical Insurance database (2011-2014). Patients with primary discharge diagnosis of ACS during 2012.01.01-2013.12.31, and who were under the insurance cover for a minimum 12months before (baseline) and after (follow-up) index hospitalization were included. Patients were divided into two groups according to percutaneous coronary intervention (PCI) during index hospitalization. The use of secondary prevention medications was measured during index hospitalization and follow-up (0-3, 4-6, 7-9,10-12 months after discharge) for both total cohort and subgroups. Optimal medical therapy (OMT) was defined as receiving antiplatelet drug, statins, ACEIs/ARBs and beta-blockers during the specific study period. **RESULTS:** In total, 14,358 patients (64.7±10.7 years; 54.6% male) with ACS were identified. Of these 22.1% (N=3,172) had PCI. They were significantly younger (62.3±10.0 vs. 65.4±10.8 years, P<0.001) and more were males (73.3% vs. 49.3%, P<0.001) compared with non-PCI group. Of total patients, 81.0% had ≥1 prescriptions of antiplatelet during index hospitalization, followed by statins (79.7%), ACEIs/ARBs (59.8%) and beta-blockers (57.2%).The use of each medication class decreased gradually during follow-up. Only 31.5% of them were prescribed with OMT during index hospitalization, which decreased to 22.6% at 0-3 months, 12.9% at 4-6 months, 10.3% at 7-9 months and 10.6% at 10-12 months. Compared with non-PCI group, PCI group had more patients with OMT at index hospitalization (53.9% vs. 25.2%, P<0.001), but it also decreased during

follow-up (46.2%, 26.7%, 19.8% and 20.6%, respectively). **CONCLUSIONS:** The use of secondary prevention medications and OMT were suboptimal and decreased over follow-up among Chinese ACS patients, including those with PCI procedure. Further strategies to promote the optimal medical care of ACS are needed.

PCV98

UTILIZATION PATTERNS OF NON-VITAMIN K ANTAGONIST ORAL ANTICOAGULANTS IN ELDERLY PATIENTS WITH ATRIAL FIBRILLATION WHO FAILED WARFARIN THERAPY

Han S, Jeong HS, Kim HT, Suh HS
Pusan National University, Busan, South Korea

OBJECTIVES: To assess drug utilization pattern of non-vitamin K antagonist oral anticoagulants (NOACs), including potentially inappropriate dosing, switching, and concomitant use of contraindicated drugs. **METHODS:** We used nationally representative data named Health Insurance Review and Assessment Service-Aged Patient Sample 2014 that contained medical and pharmacy claims of approximately 1 million elderly patients aged 65 or older. We included patients who had at least one diagnosis of atrial fibrillation (AF) and had at least one prescription of NOACs (apixaban, dabigatran, or rivaroxaban) between January 1, 2014 and December 31, 2014. Switching was defined as initiating another NOAC and using it $\geq$ 8 days. Contraindicated drugs were defined according to package insert of each NOAC. Logistic regression model was used to assess factors associated with concomitant use of contraindicated drug. **RESULTS:** We identified 1,234 elderly patients with AF treated with apixaban (n=106), dabigatran (n=593), and rivaroxaban (n=535). The proportion of potentially inappropriate dosing was the highest in rivaroxaban users (16.9%), followed by dabigatran and apixaban users (9.3% and 0.9%, respectively). Switching occurred in 5.4%, 2.6%, and 0.9% of patients treated with dabigatran, rivaroxaban, and apixaban, respectively. Among 1,234 patients, 236 patients (19.1%) were prescribed contraindicated drugs. The concomitant use of other oral anticoagulants was relatively frequent. Clinic · hospital compared with tertiary hospital (odds ratio (OR): 2.434; 95% confidence interval (CI): 1.215-4.876) and outpatient setting compared with inpatient setting (OR: 4.718; 95% CI: 3.692-6.028) were significantly associated with concomitant use of contraindicated drugs. **CONCLUSIONS:** Among 1,234 elderly AF patients using NOACs in 2014, 11.8% were not treated with appropriate dosing and 19.1% were prescribed contraindicated drugs that could affect bleeding risk and treatment effectiveness. Furthermore, NOACs use in clinic · hospital or in outpatient setting was significantly associated with concomitant use of contraindicated drugs. Therefore, careful monitoring is warranted for these patients.

PCV99

COMBINATION THERAPY VERSUS INTENSIFICATION OF STATIN MONOTHERAPY FOR THE PREVENTION OF CORONARY HEART DISEASE: AN ADAPTED REPORT TO THE TUNISIAN CONTEXT

Jameleddine M[1], Grati H[1], Ben Brahem Touil A[1], Zghal K[1], Attieh R[2], Asua Batarrita J[3], Gutierrez-Ibarluzea I[3]
[1]*National Instance for Assessment and Accreditation in Health Care, Tunis, Tunisia,* [2]*Laval University, Québec, QC, Canada,* [3]*Basque Office HTA-OSTEBA. Ministry for Health, Basque Government, Bilbao, Spain*

OBJECTIVES: Coronary heart disease (CHD) is the most common cause of mortality worldwide. The burden of CHD causes 27,14 % of total mortality in Tunisia. Statins are the leading molecules in CHD prevention. The national insurance fund paid 9% of its total drug expenditures in 2015 in statins. INASanté has launched an HTA study aiming to compare the intensification of statin monotherapy versus a combination therapy for the prevention of CHD in patients with moderate to high cardiovascular risk. This study aims to reduce prescription variability and not justified therapies. **METHODS:** Research was carried out on the basis of HTA on the net from 2006 to 2016. Title, abstract and full text screening, was performed by two independent reviewers, using prespecified eligibility criteria. A critical appraisal was performed using INAHTA, PRISMA checklists, FLC 2.0 and EUnetHTA adaptation toolkit. One review from Agency for Healthcare Research and quality (AHRQ) elaborated in 2014 was retained. An adaptation process has been started. We gathered lipid lowering agents' consumption data from key institutions and we started a qualitative study through interviews with cardiologists and general practitioners from public and private sector and representatives from scientific societies. Interviews will be computerized and analyzed using NVIVO. After discussing the results with the working group the report will be synthesized and validated. **RESULTS:** According to AHRQ report, all evidence for clinical outcomes were graded insufficient when comparing the therapies. Effect on lowering LDL-C depends on the combination agent. In Tunisia, according to the first interviews, the only combination reported is with fibrates, in case of associated hypertriglyceridemia. BAS are no more prescribed; Ezetimibe has not yet obtained the marketing authorization. **CONCLUSIONS:** There are significant differences among practitioners in prescription habits. This can be related to the populations' characteristics, availability of molecules and lack of common guidelines.

PCV100

USING GROUP BASED TRAJECTORY MODELS TO CHARACTERIZE STATIN MEDICATION ADHERENCE PATTERNS AMONG PATIENTS ENROLLED IN A MEDICARE ADVANTAGE PLAN (MAP)

Abughosh SM[1], Fleming ML[1], Johnson ML[1], Essien EJ[1], Esse TW[2], Serna O[2], Vadhariya A[1], Boklage S[3], Choi J[4]
[1]*University of Houston, Houston, TX, USA,* [2]*Cigna HealthSpring, Houston, TX, USA,* [3]*Regeneron Pharmaceuticals, Inc., Tarrytown, NY, USA,* [4]*Sanofi, Bridgewater, NJ, USA*

OBJECTIVES: Despite the well-documented efficacy of statins in primary and secondary prevention of cardiovascular disease, adherence to statins remains suboptimal, compromising potential effectiveness. The Centers for Medicare and Medicaid Services (CMS) utilizes the proportion of days covered (PDC) as a measure for medication adherence, with a PDC > 80% considered optimal. PDC provides a single value to represent a follow-up period but cannot fully capture variations in adherence behavior patterns. These patterns should be considered when designing interventions, as they may influence prognosis. Our objective was to characterize different adherence patterns using group-based trajectory models among statin users in a MAP. **METHODS:** This project utilized data from a Texas MAP. Patients enrolled from January 2013 to June 2016 with prescription claims were included. The index date was defined as the first statin prescription between January to June 2015, and baseline characteristics were determined from the period 2 years prior to index. Patient adherence was assessed for 1 year after. Monthly PDCs were calculated during the follow-up and dichotomized as adherent (PDC >0.8) or not. Twelve monthly PDC values were then modeled as a longitudinal response in logistic group-based trajectory models. Patients were assigned to a trajectory based on those models. We estimated between 2 to 6 groups for evaluation. **RESULTS:** 7,850 patients were included in the trajectory modeling. The model with 4 groups was determined the most clinically relevant for the development of tailored interventions. Trajectory groups included: (1) high or nearly perfect adherence; (2) rapid decline or discontinuation; (3) gradual decline; and (4) a gap or declining adherence that improved later. **CONCLUSIONS:** Trajectory models can depict varying patient adherence patterns and facilitate the development of tailored interventions. Future research will focus on identifying predictors associated with the identified trajectories and developing trajectory customized interventions to enhance adherence.

PCV101

GEOGRAPHIC VARIATION IN ORAL ANTICOAGULANT PRESCRIBING PATTERNS AMONG US VETERANS

Done N[1], Yuan Y[2], Roy A[3], Prentice JC[1]
[1]*Veterans Health Administration, Boston, MA, USA,* [2]*Northeastern University, Boston, MA, USA,* [3]*Northeastern University School of Pharmacy, Burlington, MA, USA*

OBJECTIVES: The objectives of this study are to describe (1) recent trends in TSOAC prescriptions, (2) the source of financing for OACs prescriptions, and (3) geographic variation of provider prescribing patterns for TSOACs among VHA and Medicare dual enrollees. **METHODS:** We identified patients with a first diagnosis of AF (ICD-9-CM code 427.31 and ICD-10 codes I48.X) in the VHA Corporate Data Warehouse (CDW) between 2012 and 2016. We linked the prescriptions for OACs these patients had in the VHA and in Medicare Part D between 2012 and 2013. **RESULTS:** We identified 64,763 patients diagnosed with AF who were prescribed OACs during 2012 and 2013. There were 300,659 VHA prescriptions and 106,102 Part D prescriptions during the study period. The proportion of Medicare prescriptions increased from 23.2% in 2012 to 28.0% in 2013. Among the 18 Veterans Integrated Service Networks (VISNs), the proportion of Medicare prescriptions varied between 16.4% (VISN 12, Name) and 46.3% (VISN 4) (median=25.1%). The proportion of TSOACs increased from 18.0% in 2012 (range 11.5%–32.0% across VISNs) to 25.0% in 2013 (range 16.3%–39.0%). Dabigatran was the most prescribed TSOAC, accounting for 14.8% of all prescriptions in 2012 and 13.2% in 2013. VISN 4 had the highest rate of TSOAC adoption in 2013, with 20.0% of prescriptions for Dabigatran and 16.6% prescriptions for Rivaroxaban. Medicare prescriptions were more likely to be for TSOACs than for warfarin compared to prescriptions within the VHA system. TSOAC prescriptions increased substantially across all VISNs during the study period. **CONCLUSIONS:** There is substantial geographic variation in TSOAC prescriptions in the VHA. Dual VHA and Medicare use accounts for a significant and increasing proportion of veterans diagnosed with AF. Our results also show significant geographic variation in the adoption of novel anticoagulants within the VHA. Reliance on Medicare Part D has increased during the study period.

PCV102

UTILIZATION AND EFFECTIVENESS OF PCSK9 INHIBITORS IN IMPROVING LIPID PROFILE IN ROUTINE CLINICAL PRACTICE

Yao X, DeMartino R, Lopez-Jimenez F, Gersh BJ, Sangaralingham LR, Shah ND, Noseworthy PA
Mayo Clinic, Rochester, MN, USA

OBJECTIVES: Proprotein convertase subtilisin/kexin type 9 inhibitors (PCSK9-I) are a new class of drugs that have been shown to further reduce low-density lipoprotein cholesterol (LDL-C) by 50-70% against various background lipid-lowering therapies. We aimed to assess the use of two PCSK9-I, alirocumab and evolocumab, and compare their effectiveness in improving lipid profile to statins in routine practice. **METHODS:** Using a large U.S. administrative database, OptumLabs Data Warehouse, with linked laboratory data, we identified 798 patients who initiated PCSK9-I between 8/1/2015-7/31/2016. Among patients with lipid measurements at both baseline and follow up, we propensity score matched patients treated with PCKS9-I (alone or with statins) to those treated with statins (alone or with other non-PCKS9-I lipid lowering drugs). Patients were balanced on 40 baseline characteristics, including socio-demographics, lipid levels, comorbidities, prior lipid lowering treatment and other medication use. We used linear regression to compare the absolute change and percentage change of lipid levels. **RESULTS:** The mean LDL-C of PCSK9-I users was 122.2 mg/dL prior to the initiation of PCSK9-I, similar to those observed in the Phase III trials. However, over one third of the patients had LDL-C<100 mg/dL. Most users (72%) used non-PCKS9-I cholesterol lowering drugs (mostly statins) at baseline. In the matched cohort (N=166), over an average of 10 weeks, PCSK9-I were associated with a greater reduction in LDL-C (-14.0 mg/dL, p=0.02; -12%, p=0.01) and non-high-density lipoprotein cholesterol (-15.3 mg/dL, p=0.03; -9.4%, p=0.01) in comparison to statins. Neither drugs significantly reduced LDL-C in patients with LDL-C<100 mg/dL. **CONCLUSIONS:** PCSK9-I were commonly prescribed for patients who

either had low LDL-C or already achieved low LDL-C on statins, which is a group largely excluded from clinical trials. Consistent with trials, PCSK9-I demonstrated a greater reduction in LDL-C than statins in routine clinical practice, but this benefit was not seen in patients with low LDL-C.

PCV103

ANALYSIS OF SECONDARY PREVENTION MEDICATION USE AMONG PATIENTS WITH NON-CARDIOEMBOLIC ISCHEMIC STROKE IN BEIJING

Wei C[1], WANG Y[2], Fan D[3], PAN Y[2], HAN Q[4], HU Y[1]
[1]Peking University Health Science Center, Beijing, China, [2]Capital Medical University, Beijing Tiantan Hospital, Beijing, China, [3]Peking University Third Hospital, Beijing, China, [4]Hospital Health Insurance Management Committee of Chinese Hospital Association, Beijing, China

OBJECTIVES: To describe the secondary prevention medication use of patients with non-cardioembolic ischemic stroke in Beijing, China. **METHODS:** This was a retrospective cohort study using Beijing Urban Employee Basic Medical Insurance database. Patients (≥18 years old) hospitalized with a primary diagnosis of non-cardioembolic ischemic stroke (index event) between Oct.01 2012 and Dec.31 2014 were included. High-risk patients were further identified by Essen Score ≥ 3, with absence of smoking information in the database. The period from 2 years prior to index date to Dec 31 2015 or death (whichever comes first) was observed to analyse baseline characteristics and secondary prevention medication usage. **RESULTS:** In total 33,730 patients were included in the study, with mean age of 67.1 years and 68.7% male. Among which, 59.1% were high-risk patients. During the index hospitalization, 85.4% of the total patients received antiplatelet medication, 83.7% of patients combined with hyperlipidaemia received lipid-lowering medication, 78.2% of those with hypertensive received antihypertensive medication, and 70.1% of those with diabetic patients received antidiabetic medication. The percentages decreased to 43.1%, 44.1%, 50.6% and 43.4% during 10-12 month after index hospitalization, respectively. Similar trend was found among the high-risk patients: 84.3% with antiplatelet medication, 81.8% with lipid-lowering medication, 79.6% with antihypertensive and 68.6% with antidiabetic medication at index hospitalization; but decreased to 42.7%, 41.7%, 49.0% and 41.2% during 10-12 month after index hospitalization, respectively. Among the patients treated with antiplatelet therapy at index hospitalization, 50.1% used aspirin, 23% clopidogrel and aspirin, and 19.2% clopidogrel. 39.9% of those patients experienced antiplatelet therapy modification during follow-up period. **CONCLUSIONS:** More than half of the included stroke patients were high-risk patients. The secondary prevention medication usage was suboptimal in the clinical practice even for high-risk patients. Efficient intervention is needed to improve the adherence to guideline.

PCV104

PRESCRIPTION PATTERNS OF ANTIHYPERTENSIVE MEDICINES IN CHINA: A DESCRIPTIVE ANALYSIS IN REAL-WORLD CONDITIONS

Li L[1], Liu D[2], Xie X[2], Dong P[2], Lin Y[1]
[1]PalanDataRx, Shanghai, China, [2]Pfizer Investment Co., Ltd., Beijing, China

OBJECTIVES: Hypertension is one of the key risk factors for cardiovascular disease, stroke and renal failure. Limited data is available on prescription patterns of the antihypertension in China in recent years. The objective of this study was to assess the prescription patterns of antihypertensive medicines for outpatients in the real-world conditions in China. **METHODS:** A cross-sectional study was conducted to describe the current prescribing practices for outpatients diagnosed with hypertension, from May 2011 to May 2015. Prescribing patterns of antihypertensive medicines were analysed, including monotherapy, two-drug combination therapy and three-drug combination therapy. For each pattern, prescriptions of different classes of medicines were studied. In addition, different drugs in each class were described for monotherapy. **RESULTS:** A total of 18,562 outpatients were included in the study, 51% was female, age ranged from 14 to 107 years old. The prescription analysis indicated that monotherapy pattern was the most frequently prescribed (55.6%), followed by two-drug combination (30.9%) and three-drug combination (13.5%). Calcium channel blockers (CCBs) ranked the highest as monotherapy (55.0%). The combination of CCBs and angiotensin-I receptor blockers (ARBs) or CCBs and angiotensin-converting-enzyme inhibitors (ACEIs) accounted for the highest proportion in two-drug therapy (39.3%). The combination of CCBs, ARBs/ACEIs and beta blockers (BB) was the most frequently prescribed in three-drug therapy (37.7%). Additionally, in monotherapy, Amlodipine was the most prescribed agent in CCBs class (56.5%). In the other classes, Valsartan in ARB or ACEI class (35.0%), Indapamide in DI class (41.1%), Bisoprolol Fumarate in BB class(42.2%), and Terazosin Hydrochloride in the others (57.5%). **CONCLUSIONS:** The result observed that majority of outpatients in this study were prescribed monotherapy, followed by two drugs, a few required three of drugs. It is found that the most frequently used class of antihypertensive drug was CCBs, of which Amlodipine was the most frequently prescribed drug.

PCV105

ANALYSIS OF STATIN PRESCRIPTION FOR DYSLIPIDEMIA WITH THE NATION-WIDE HEALTH INSURANCE CLAIMS DATA IN JAPAN: A REPEATED CROSS-SECTIONAL STUDY

Ohtera S[1], Sakai M[1], Iwao T[2], Neff Y[1], Takahashi Y[1], Kato G[2], Nakayama T[1]
[1]Kyoto University School of Public Health, Kyoto, Japan, [2]Kyoto University Hospital, Kyoto, Japan

OBJECTIVES: Although statin therapy for dyslipidemia is recommended widely in the world, the age ranges recommended by clinical guidelines differ among countries. In Japan, there is great interest in how statin is prescribed specially for very elderly population because of facing an unprecedented aging society. However, little is known about how statins are used in the real world. This study aimed to exam the state of statin prescription in Japan. **METHODS:** The prevalence of statin prescription for dyslipidemia in Octobers between 2011 and 2014 was measured with randomly sampled outpatient data from the national claims database that covered over 90% of the domestic patients. The rate of sampling was 1%. We analyzed the prevalence stratified by age and sex to adjust the covariates. **RESULTS:** Of 136613 patients with dyslipidemia in 2011, 49.8% was used statins. After the year, the prevalence was increased (52.4% n=145215, in 2012; 56.6% n=150428, in 2013; 56.7% n=155999, in 2014; p for trend <0.001). In 2014, the prevalence was higher in women than men (68.7% vs 59.2%, $p<0.001$) and differed among age groups of 64-year-old and younger, 65 to 74, 75 to 84 and 85-year-old and older (51.4%, 75.7%, 69.4% and 73.4%, respectively, $p<0.001$). **CONCLUSIONS:** In Japan, the prevalence of statin prescription for dyslipidemia has increased recently. Most of very elderly patients with dyslipidemia used statins. Further study is needed to evaluate the cost-effectiveness of statin use in very elderly patients.

ASSOCIATION BETWEEN PRIMARY CARE ACCESS AND ACUTE CARE UTILIZATION FOR HYPERTENSION: A SYSTEMATIC REVIEW

Qureshi H[1], Adhikari Dahal K[1], Walker R[1], Cunningham C[2], McBrien K[1], Ronksley P[1]
[1]University of Calgary, Calgary, AB, Canada, [2]Alberta Health Services, Calgary, AB, Canada

OBJECTIVES: Conditions for which hospitalizations can be avoided through timely and effective outpatient care are often referred to as ambulatory care sensitive conditions (ACSC). These conditions can generally be managed effectively in a primary health care setting however the expected inverse association between primary health care access and ACSC hospitalizations is not strongly supported in the medical literature. We conducted a systematic review to assess the association between primary care access and hospitalizations and/or emergency department visits for hypertension, an ambulatory care sensitive condition. **METHODS:** We searched electronic databases (Medline and Embase) from inception to October 2015 to identify all observational studies evaluating the association between primary care access and hospitalizations and/or emergency department visits for patients diagnosed with hypertension. Study quality was assessed using components of the Newcastle Ottawa Scale and the Downs and Black Checklist. **RESULTS:** Our search strategy yielded 4170 articles and of the 42 potentially relevant articles, three met criteria for inclusion within our review. Results and metrics used to assess this association varied substantially across the three studies. Two studies found a positive correlation between the number of primary care visits or general practitioner density and hospitalization rates for hypertension, while one study found increases in general practitioner density resulted in a reduction in hospitalization rates for hypertension. Study quality also varied with few studies adjusting for key patient- and system-level factors and severity of hypertension **CONCLUSIONS:** There is limited and inconclusive evidence on the relationship between access to primary care and acute care utilization for hypertension. Further research adjusting for disease severity and key confounders is required to elucidate this relationship.

PCV108

CHOLESTEROL MANAGEMENT BY US HEALTH PLANS

Brook RA[1], Carlisle JA[2], Smeeding JE[3]
[1]The JeSTARx Group & NPRT, Newfoundland, NJ, USA, [2]The Pharmacy Group, Glastonbury, CT, USA, [3]The TPG-NPRT & JeSTARx, Glastonbury, CT, USA

OBJECTIVES: Many of the agents to treat hypercholesterolemia have become generically available. In recent years, newer targeted therapies have become available with different targets, higher prices and requiring clinician-administration. To understand how US managed care (MC) plans were using the various tools available to manage their formularies and members with hypercholesterolemia, hyperlipidemia and high trigylcerides. **METHODS:** Managed care medical directors and pharmacy directors completed an online interactive survey. Topics included: advisor and plan information, copays and drug/treatment usage of different classes for cholesterol management (classifying as: Unrestricted,1st tier, 2nd tier, 3rd tier, or requiring prior authorization [PA]). **RESULTS:** There were 54 responses ( ) between December-16 and January-2017. Fifty-nine percent of respondents were Medical Directors, with the remainder comprised mostly of pharmacists who mostly worked for a health plan (62.3%). The health plans were 41.1% national, 30.4% regional, and 28.6% local. Plans could cover multiple types of members and 79.6% covered commercial lives, 61.1% Medicaid; 68.5% Medicare. Responses identified the highest PA rates were for: Proprotein Convertase Subtilisin/Kexin type 9 (PSCK9s) inhibitors (alirocumab and evolocumab)=84.62%, lomitapide=71.1%. The PSCK9s are injected, require self-administration training, and will likely be subject to a specialty copay. Classes with generic options were often first tier and included statins=47.2%, triglycerides management products=33.3%; and fibrates=29.4%. Combination cholesterol agents=44.2% and cholesterol/cardiovascular combinations=43.1% and were mostly in tier 2. While over the counter fish-oil products and supplements were generally unrestricted in Medicaid plans, not covered by Commercial or Medicare plans; the prescription therapy icosapent was PA restricted by 17.3% of plans. The most common tier 2 products included ezetimibe (40.4%) followed by the bile-acid sequestrants (32.7%). **CONCLUSIONS:** As new products enter the cholesterol management market, health plans will likely impose restrictions and plan designs on new classes favoring less expensive generically available agents until real world effectiveness data becomes available.

PCV109

NON-ADHERENCE TO STATINS AND ANTIHYPERTENSIVE MEDICATIONS AND HOSPITALIZATIONS AMONG ELDERLY FEE-FOR-SERVICE MEDICARE BENEFICIARIES WITH PRE-EXISTING CORONARY ARTERY DISEASE AND INCIDENT CANCER

Chopra I[1], Dwibedi N[2], Mattes M[1], Tan X[1], Findley P[3], Sambamoorthi U[2]
[1]West Virginia University, Morgantown, WV, USA, [2]West Virginia University, School of Pharmacy, Morgantown, WV, USA, [3]Rutgers University, New Brunswick, NJ, USA

OBJECTIVES: To examine the relationship between adherence to both statins and ACEIs/ARBs/beta-blockers and coronary artery disease (CAD)-related

hospitalizations. **METHODS:** A retrospective observational longitudinal study was conducted using SEER-Medicare data. Elderly Medicare fee-for-service beneficiaries with pre-existing CAD and incident breast, colorectal, or prostate cancer (N = 12,096) were observed for a period of 12 months before and 12 months after cancer diagnosis. Hospitalizations measured every 120-days were categorized into three groups: (1) any CAD-related hospitalization; (2) other hospitalizations; or (3) no hospitalization. Medication adherence was categorized into five mutually exclusive groups: (1) adherent to both statins and ACEIs/ARBs/beta-blockers (reference group); (2) not adherent to both statins and ACEIs/ARBs/beta-blockers; (3) adherent to either statins or ACEIs/ARBs/beta-blockers; (4) use of one medication class and adherent to that class; or (5) use of one medication class and not adherent to that medication class. The unadjusted and adjusted relationship between medication adherence and hospitalization was analyzed using repeated measures multinomial logistic regressions. Inverse probability treatment weights were used to control for observed group differences among medication adherence categories. **RESULTS:** Adherence to both statins and ACEIs/ARBs/beta-blockers was estimated at 31.2% during the 120-day period immediately after cancer diagnosis; 13.7% were not adherent to both medication classes during the same period; 27.4% had CAD-related hospitalizations immediately after cancer diagnosis and this percentage declined to 10.6% during the last four months of the post-cancer period. In the adjusted analyses, those not adherent to both statins and ACEIs/ARBs/beta-blockers were more likely to have CAD-related hospitalization compared to those who were adherent to both medication classes [AOR = 1.82; 95% CI = 1.72, 1.92; P < 0.0001]. **CONCLUSIONS:** Given the complexity of interaction between CAD and cancer, it is important to routinely monitor medication adherence in general clinical practice and provide linkages to support services that can increase medication adherence.

PCV110

CLINICAL AND ECONOMIC BURDEN OF TRANSFUSION IN CARDIAC SURGERY: A SYSTEMATIC REVIEW

Ikeme S[1], Rock M[1], Bin Sawad A[2], Kuntze E[2], Martin M[3]
[1]*Baxter Healthcare Corporation, Deerfield, IL, USA,* [2]*Baxter Healthcare, Deerfield, IL, USA,* [3]*inVentiv Health, London, UK*

OBJECTIVES: We conducted a systematic review to identify published evidence from observational studies on the clinical and economic burden of transfusion in cardiac surgery. **METHODS:** We searched Embase, Pubmed and the Centre for Reviews and Dissemination (CRD) suite of databases for English language articles and analyzed these qualitatively. The search was limited to evidence published in the last 10 years (2006-2016). **RESULTS:** The review identified 16 publications and 15 were observational study design. Majority of the studies examined patients undergoing coronary artery bypass graft (CABG) and aortic valve replacement (AVR). The rate of transfusion ranged from 15% to 84% in those patients who experienced excessive bleeding after cardiac surgery. A significant reduction in transfusion rates and red blood cell (RBC) usage was observed with patients who did not experience bleeding, use blood conversation strategies and less invasive surgical techniques (n=6). Platelet use ranged from 9.8% to 84% and was significantly higher in patients who experienced bleeding or underwent re-exploration (n=5). Fresh Frozen Plasma (FFP) use ranged from 2.4% to 63% (n=5) and there was a significant difference in units of FFP transfused in patients with post-operative bleeding and re-exploration (n=2). Transfused cardiac surgery patients had significantly longer hospital stays, were more frequently hospitalized and utilized more ICU services. Total costs of blood and transfusions were highest in the United States and correlated significantly with transfusion rate. Mortality data (n=5) showed that patients who received transfusion had higher in-hospital (1.7%-3.07%) and long-term (5.8%-6.4%) mortality and a dose-dependent relationship between unit of packed RBC and higher odds for post-operative mortality. **CONCLUSIONS:** Transfusion of blood products and the resultant higher resource utilization in cardiac surgery patients pose substantial clinical burden to the patient and economic consequences to the hospital/health system. Reducing both factors has the potential to reduce patient morbidity and healthcare cost.

PCV111

CLINICAL AND ECONOMIC BURDEN OF BLEEDING IN CARDIAC SURGERY: A SYSTEMATIC REVIEW

Ikeme S[1], Rock M[2], Bin Sawad A[2], Kuntze E[2], Martin M[3]
[1]*Baxter Healthcare Corporation, Deerfield, IL, USA,* [2]*Baxter Healthcare, Deerfield, IL, USA,* [3]*inVentiv Health, London, UK*

OBJECTIVES: We conducted a systematic review to identify published evidence from observational studies on the clinical and economic burden of bleeding in cardiac surgery. **METHODS:** We searched Embase, Pubmed and the Centre for Reviews and Dissemination (CRD) suite of databases for English language articles and analyzed these qualitatively. The search was limited to evidence published in the last 10 years (2006-2016). Relevant studies were identified using a priori defined inclusion and exclusion criteria relating to the burden of bleed in a mixed cardiac surgery population. **RESULTS:** The review identified 13 publications all based on observational study design. Majority of the studies examined patients undergoing coronary artery bypass graft (CABG) (n=6) and aortic valve replacement (AVR) (n=3). The rate of bleeding ranged from 94.2% in those requiring re-exploration and 4.94% in those with more than one complication. On average (n=6), bleeding and complications lead to significantly higher rates of re-exploration (1.2% to 50%) compared to patients without bleeding events or complications. The length of intensive care unit (ICU) (n=3) and hospital (n=4) stay was significantly shorter in those with no/minor bleeding compared to those who experienced major bleeding. Post-operative ventilator use (n=6) ranged from 8.8% to 35.5% in those who experienced bleeding. Mortality increased for patients who underwent re-exploration or experienced uncontrolled bleeding; 1.9% to 21.1% operative death and 3.1% to 22.4% 30-day mortality. Eleven publications found significant higher average cost of cardiac surgery for those who experienced peri-operative bleeding and re-operation due to bleeding. **CONCLUSIONS:** Bleeding related complications and higher resource utilization in cardiac surgery patients who experience uncontrolled surgical bleeding pose substantial clinical burden to the patient and economic consequence to the hospital/health system.

PCV112

ESTIMATED ANNUAL NUMBER OF US ACUTE-CARE HOSPITAL INPATIENTS MEETING ACCP CRITERIA FOR VENOUS THROMBOEMBOLISM PROPHYLAXIS

Huang W[1], Cohen AT[2], Zayaruzny M[1], Wyman A[1], Anderson F[1]
[1]*University of Massachusetts Medical School, Worcester, MA, USA,* [2]*Guy's and St Thomas' NHS Foundation Trust, London, UK*

OBJECTIVES: To use the most recent available data (Y2014) to estimate the annual number of US acute-care hospital inpatients who could benefit from venous thromboembolism (VTE) prophylaxis. **METHODS:** We applied the 2012 American College of Chest Physicians (ACCP) Consensus VTE prophylaxis guideline to hospitalized patients based on the Clinical Classification System (CCS) codes for major surgery and acute medical illnesses available from the National Inpatient Sample (NIS), a nationwide acute-care hospital database sponsored by the US Agency for Health Care Quality and Research. **RESULTS:** Of a total of 35.4 million inpatients discharged from US acute-care hospitals in Y2014, 11.6 million (33%) matched the ACCP risk criteria for VTE prophylaxis. When ACCP surgical risk criteria were applied to 7.5 million patients who had a procedure in an operating room, 4.4 million (59%) were found to be at VTE risk; and, among 20.8 million evaluable medical patients, 7.1 million (34%) met ACCP criteria for VTE prophylaxis based on non-surgical VTE risk factors. **CONCLUSIONS:** Approximately one-third of all patients hospitalized in the US meet ACCP criteria for VTE prophylaxis due to risk factors associated with surgery and/or an acute medical illness. Given that approximately 60% of all VTE events occurring in the community are related to recent acute-care hospitalization, providing universal, safe and effective VTE prophylaxis to this population affords an important opportunity to significantly reduce the incidence of VTE and to reduce the rate of hospital readmissions. These data provide support for developing and monitoring compliance with hospital-wide guidelines for VTE prevention. In addition, these data can support the estimation of costs and benefits of providing VTE prophylaxis to at risk US hospitalized patients.

PCV113

CARDIOVASCULAR DISEASE PATTERN IN OUTPATIENT DEPARTMENT OF GONDAR UNIVERSITY REFERRAL HOSPITAL: A 6 YEAR RETROSPECTIVE CROSS SECTIONAL STUDY

Tefera YG, Mekuria Ab, Abegaz TM, Abebe TB
University of Gondar, Gondar, Ethiopia

OBJECTIVES: The aim of this study is to assess the pattern of cardiovascular diseases and associated factors in outpatient department of cardiac clinic of Gondar university referral hospital. **METHODS:** A retrospective cross-sectional study was employed to describe pattern of cardiovascular diseases among patients registered and started follow-up at the outpatient chronic illness clinic of Gondar University Referral Hospital during the period from October, 2010 – October, 2015. The data was collected from August, 2015 till December, 2015.The collected data were cleaned, entered and analyzed in SPSS for Windows version 20.0. Chi square and binary logistic regression was performed to test significant difference among predictive variables and cardiovascular diseases. **RESULTS:** Out of 1105 patient medical records 862 fulfilled the inclusion criteria. Majority of the patients were females (65%) and living in urban (62.7%).Two third (65.2) of cardiovascular patients were above 50 years old and a quarter of CVD patients were in age range of 50-59. In 37.7% of patients headache was the reason for first time visit to hospital and to be diagnosed for CVDs. Hypertension accounts for the majority (62.3%) of cardiovascular patients followed by heart failure (23.9%). Dyslipidemia (86.2%), Hypertension (72.8%) and Ischemic heart diseases (73.2%) were associated with urban residency($p<0.01$). Patients from rural (COR=1.306 (1.026-2.166), AOR=1.272(1.017-2.030)) and patients with additional illnesses (COR= 1.813(1.279-2.782), AOR =1.551(1.177- 2.705)) were more likely to poor cardiovascular disease outcome by the physician assessment on their last follow up ($p<0.05$, CI- 95%). **CONCLUSIONS:** Hypertension was found to be the most frequent cardiovascular disease followed by heart failure; and hypertensive heart disease was the leading cause of cardiac diseases. Most of the patients had improved assessment by their physician on their last follow up, but patients from rural and with Comorbidty conditions were risks to increase poor cardiovascular outcome.

PCV114

CHRONIC HEART FAILURE TREATMENT IN THE US: CHALLENGING ENVIRONMENT FOR NEW BRANDED AGENTS IN GENERICIZED MARKET

Rudnicka-Noulin DM[1], Lewis C[2], Moore R[2], Walsh C[1]
[1]*Decision Resources Group, London, UK,* [2]*Decision Resources Group, Nashville, TN, USA*

OBJECTIVES: In chronic heart failure (CHF) the standard of care is comprised of inexpensive evidence-based generic agents. Novel CHF therapies sacubitril/valsartan and ivabradine offer improvements in clinical outcomes and are attractive treatment options for patients who continue to suffer from high mortality and

morbidity rates. However, in a highly-genericized CHF market, prescribing of these therapies could result in significantly increased expenditures in an environment of tightening healthcare budgets for U.S. insurers. This research explores how payers and physicians interact and how reimbursement decisions impact the prescribing of novel CHF therapies. **METHODS:** In September 2016, 72 cardiologists and 71 primary care physicians across the U.S. were surveyed regarding their current prescribing of sacubitril/valsartan and ivabradine. Thirty U.S. managed care organization pharmacy and medical directors were also surveyed. **RESULTS:** Despite being viewed as more efficacious than standard of care CHF therapies by surveyed cardiologists, sacubitril/valsartan is being prescribed to only a fraction of CHF patients. Cost-related issues, unfavorable payer coverage, and restrictions set by payers are major barriers to prescribing of sacubitril/valsartan and ivabradine by surveyed physicians. For 35-45% of physicians, payer-imposed restrictions have contributed to them not prescribing these drugs to eligible patients. Meanwhile, cost drives formulary inclusion decisions for 47% of surveyed payers, who impose significant access and reimbursement restrictions on sacubitril/valsartan and ivabradine. Prior authorization is the main cost-containment strategy, employed by over 50% of surveyed payers. One strategy being explored to overcome the barriers to drug access is engagement in outcomes-based contracts, whereby payers reward good outcomes through improved formulary placement of the drug or a credit toward rebates given. **CONCLUSIONS:** In a highly-genericized CHF market, health plans provide less-favorable coverage and reimbursement for the premium-priced therapies. Engaging in OBC may be one way forward for manufacturers to get better coverage of their drugs and demonstrate their cost-effectiveness.

PCV115

PCSK-9 INHIBITORS – COVERAGE AND COST-SHARING FOR MEDICARE PART D BENEFICIARIES NATIONWIDE

Lu CY[1], Kazi DS[2], Lin G[2], Dejong C[2], Dudley RA[2], Yazdany J[2], Chen R[3], Tseng C[4]
[1]*Harvard Medical School and Harvard Pilgrim Health Care Institute, Boston, MA, USA,* [2]*University of California, San Francisco, San Francisco, CA, USA,* [3]*Pacific Health Research & Education Institute, Honolulu, HI, USA,* [4]*University of Hawaii John A. Burns School of Medicine, Mililani, HI, USA*

OBJECTIVES: PCSK9 inhibitors are effective in reducing low-density lipoprotein cholesterol (LDL-C) among persons with familial hypercholesterolemia or pre-existing cadiovascular disease (CVD) whose LDL-C levels remain high on maximally tolerated statin therapy. However, the expense of PCSK9 inhibitors (> $14,000/year versus < $120 for generic statins) can pose substantial burden on patients' out-of-pocket costs and on insurers' drug expenditures. This is of particular concern for Medicare given the high prevalence of CVD (27% ischemic heart disease) and hyperlipidemia (45%) among Medicare beneficiaries. We examined coverage and cost-sharing for PCSK9 inhibitors (alirocumab and evolocumab) in Medicare Part D plans. **METHODS:** Data came from the June 2016 Centers for Medicare and Medicaid Services Prescription Drug Plan Formulary, Pharmacy Network, and Pricing Information Files for Part D plans. We determined: 1) the proportion of plans providing coverage, 2) monthly and annual out-of-pocket cost, and 3) total drug cost (plans' 30-day retail cost), averaged across 2,575 Part D plans in 50 states and the District of Columbia. We projected beneficiaries' annual out-of-pocket costs under a standard 2016 Part D benefit with a $360 deductible and a coverage gap, where cost-sharing increased when beneficiaries' total drug expenditures exceeded the $3310 threshold set for 2016. **RESULTS:** As of June 2016, alirocumab and evolocumab were covered by 87% and 42% of plans, respectively. Required mean monthly out-of-pocket costs were high for both drugs: $336 for alirocumab and $321 for evolocumab. Beneficiaries would have entered the coverage gap in March even without filling any other prescriptions, with projected annual cost-sharing of $4988 for alirocumab and $4958 for evolocumab. This represented 35% of the annual total drug costs ($14814 for alirocumab and $13596 for evolocumab). **CONCLUSIONS:** The substantial cost-sharing required for PCSK9 inhibitors for Medicare beneficiaries covered by Part D may adversely affect their real-world access and adherence.

PCV116

EVALUATION OF AWARENESS REGARDING HYPERTENSION AMONG HYPERTENSIVE PATIENTS OF PUNJAB, PAKISTAN

Arooj S[1], Masood I[1], Naz M[1], Amir S[1], Nazir A[1], Qamar-Uz-Zaman M[2], Akbar J[2]
[1]*The Islamia University Of Bahawalpur, Bahawalpur, Pakistan,* [2]*The Islamia University of Bahawalpur, Bahawalpur, Pakistan*

OBJECTIVES: The present study aimed to evaluate the knowledge among hypertensive patients. **METHODS:** A questionnaire based descriptive, cross-sectional study was conducted in the outpatient setting of Benazir Bhutto hospital Rawalpindi, Sir Ganga Ram hospital Lahore, Nishtar hospital Multan and Bahawal Victoria hospital in Bahawalpur, Pakistan. Knowledge regarding hypertension was assessed by using Hypertension Fact Questionnaire. Statistical package for social sciences (SPSS) version 20.0 was used to analyze data. Descriptive statistics was used to summarize data and chi square test was used to assess the association between categorical and dependent variable. Non parametric tests (Mann Whitney U test and Kruskal Wallis test) were used to find statistical difference in the scores based on categorical variable. **RESULTS:** Among the 340 participants, mean age (SD) was 50.25 (11.49), with 60.6% of females dominating the entire cohort. Majority of the participants (73.6%) belonged to urban area. About 35.6% had HTN for more than 5 years, 53.5% had family history of hypertension and 53.2% had hypertension along with co-morbidity. The mean score of hypertension knowledge was 8.43+3.44. The result of the study demonstrated that hypertensive patients have average knowledge. **CONCLUSIONS:** The current study findings revealed the importance of educational programs to increase the awareness of the patients regarding the importance of lifestyle modifications and medication for control of disease.

PCV117

POSSIBILITIES OF INCORRECT BLOOD PRESSURE MEASURING – COMPARISON TRIAL OF VALUES MEASURED WITH DIFFERENT TOOLS

Őszné Vörös T[1], Pakai A[2], Szunomár S[1], Müller Á[1], Szabó L[1], Boncz I[1], Fusz K[1], Oláh A[1]
[1]*University of Pécs, Pécs, Hungary,* [2]*University of Pécs, Zalaegerszeg, Hungary*

OBJECTIVES: Hypertension is endemic in Hungary today. Incorrect measuring tool of blood pressure can be responsible for hypertonia diagnosed improperly. Our goal was to examine differences between values measured with different tools. **METHODS:** Our survey was a quantitative, cross-sectional study in the Kaposi Mór Teaching Hospital Outpatient care unit, Somogy County, Hungary in 2016. Non-randomized, purposive sampling was used to enroll patients between 18-85 years of age. (N=201). Exclusion criteria were: pregnancy, injured, amputated, paralyzed, fractured arm, having lymphoedema, contracture, chimino fistule, midline iv. catheter or other that can hinder correct measuring on the upper arm. We used mercurial, aneroid, oscillometric, patient-monitor attached blood pressure meters. Descriptive and mathematical statistics (t-test, chi-square test, ANOVA) were made on MS Excel software ($p<0.05$) **RESULTS:** ANOVA statistics approved significant difference between systolic and diastolic parameters measured by different tools.($p<0.05$) Post-hoc analysis showed significant difference between systolic values measured by mercurial and monitor-attached, and aneroid and monitor-attached oscillometric measuring ($p<0.05$). From the aspect of the diastolic values, we found significant differences between mercurial and monitor/oscillometric device. There is also a significant difference between the aneroid and monitor/oscillometric measuring. ($p<0.05$) **CONCLUSIONS:** We can consider mercurial and aneroid blood pressure meters accurate, the monitor- and oscillometric devices recorded higher blood pressure rates. It is important – especially in patients with hypertension – to control the blood pressure with validated measurement tools in the everyday practice.

PCV119

CLINICAL CHARACTERISTICS AND PROGNOSIS OF HEART FAILURE PATIENT'S WITH REDUCED AND PRESERVED EJECTION FRACTION ADMITTED TO UNIVERSITY OF GONDAR REFERRAL HOSPITAL, NORTH WEST ETHIOPIA: A RETROSPECTIVE COHORT STUDY

Abebe TB, Gebreyohannes EA, Tefera YG, Abegaz TM
University of Gondar, Gondar, Ethiopia

OBJECTIVES: The aim of this study is to outline the clinical characteristics and medication profile, assess the survival status and prognostic factors of Ethiopian HF patients with HFrEF and HFpEF. **METHODS:** A retrospective cohort study was carried out and we employed medical records of patient's, admitted as a result of HF to the University of Gondar Referral Hospital in the period between December 02, 2010 and December 01, 2015 due to HF. **RESULTS:** Of the 850 patients who were admitted due to HF, 311 patients met the inclusion criteria. Majority of the patients had HFpEF (52.73%) and tend to be women (76.22%) . They predominantly had etiologies of valvular and hypertensive heart diseases, and took calcium channel blockers and anticoagulants. Conversely, patients with HFrEF had etiologies of ischemic heart disease and dilated cardiomyopathy and were prescribed angiotensine converting inhibitors (ACEI) and beta blockers. Kaplan Meier curves and Log rank test ($p= 0.807$) showed that there was no statistically significant difference in the mortality difference among patients with HFpEF and HFrEF. On the other hand, Cox regression analysis showed advanced age, lower sodium level, higher creatinine level and absence of medications like ACEI, spironolactone and statins independently predicted mortality in all HF patients. **CONCLUSIONS:** Different clinical characteristics were found in both groups of HF patients. There was no difference in survival outcome between patients with HFrEF and HFpEF. A retrospective cohort study was carried out and we employed medical records of patient's, admitted as a result of HF to the University of Gondar Referral Hospital in the period between December 02, 2010 and December 01, 2015due to HF. Kaplan Meier curve was used to analyze the survival status and log rank test was used to compare the curves. Cox regression was used to analyze independent predictors of mortality in all HF patients.

PCV120

TREND IN 30-DAY READMISSION RATES AMONG PATIENTS WITH ACUTE MYOCARDIAL INFARCTION: RESULTS FROM A LARGE, SINGLE HEALTHCARE ORGANIZATION

Dabbous F[1], Zamfirova I[1], Kozmic S[1], Carlson KB[2], Rosca A[1], Warren B[1], Summerfelt WT[3], Chaptini N[4]
[1]*Russell Institute for Research & Innovation, Park Ridge, IL, USA,* [2]*Advocate Health Care, Oak Lawn, IL, USA,* [3]*Advocatte Health Care, Downers Grove, IL, USA,* [4]*Advocate Lutheran General Hospital, Park ridge, IL, USA*

OBJECTIVES: Hospital readmissions can be proxy of poor health and quality. Reducing readmission rates has been a priority for healthcare providers and payers. We examined the trend over time in 30-day all-cause readmission rates among patients with AMI in a large, single healthcare network of 11 hospitals in the Chicagoland area. **METHODS:** AMI patients admitted from 2008 to 2016 who were 18 years or older, discharged to home self-care, home health, or home infusion were included in the analysis. Adjusted logistic regression with Generalized Estimating Equations was used to account for clustering of multiple admissions within patients. Additionally, the model adjusted for age, gender, race, insurance, length of hospital stay, and discharge disposition. **RESULTS:** Records of 15,243 patients were analyzed and it was determined that 10% of these patients were readmitted within 30 days.The Majority of the patients in the sample were males (62%), primarily White (60%), and were discharged to home (76%).The Average age of the sample was 65 years (±13.7) and more than half (55%) had public insurance (i.e., Medicare & Medicaid). Patients who were readmitted were slightly older (67 vs 65 years) and had longer length of stay (5 vs 4.1 days). Females, patients with public

insurance, and those who were discharged to home health were more likely to be readmitted. A significant downward trend over time was observed in 30-day readmission rates in the fully adjusted model (OR=.96; CI=.94 –.97). **CONCLUSIONS:** We found a significant reduction in 30-day readmission rates over time between the years 2008 and 2016. This reduction is substantial as it reduces both physical and economic burden of readmissions on our patients and healthcare system and remains a significant quality measure closely linked to incentives and penalties for care providers by the private and public payers.

PCV121

THE EFFECT OF PATIENT EDUCATION PROGRAM ON HYEPRTENSION-RELATED KNOWLEDGE AMONG USERS OF COMPLEMANTRY AND ALTERNATIVE MEDICINES

Ibrahim IR[1], Hassali MA[1], Saleem F[2], Al Tukmagi H[3]
[1]Universiti Sains Malaysia, Penang, Malaysia, [2]University of Baluchistan, Quetta, Pakistan, [3]University of Baghdad, Baghdad, Iraq

OBJECTIVES: To assess hypertension-related knowledge among patients pursuing complementary and alternative medicines (CAM) as a way of self-care; and find the differences in patient's knowledge following educational intervention. **METHODS:** The study was conducted between May to December 2015 among hypertensive patients attending two major teaching hospitals in Baghdad, Iraq. A cross-sectional design was adopted; and a convenience sampling technique was used for patients' recruitment. Data collection based on the use of standard validated questionnaire for patient assessment on enrollment and follow-up clinical visit thereafter. Patients were engaged in two separate CAM education sessions and a four-page booklet was used for the purpose of education. **RESULTS:** Inadequate knowledge towards hypertension (mean=6.94+3.2) was prevalent among the respondents. A significant difference in hypertension-related knowledge was seen among CAM users and no-users (P=0.007). Where, CAM users were less (mean=6.69+3.3) in their level of hypertension-related knowledge than CAM non-users (mean=7.6+3.4). This was affected by demographic characteristics like gender (P=0.004), education (P<0.001), monthly income (P=0.002), and marital status (P=0.003). However, a significant improvement in patients' a knowledge was detected following the enrollment in the education program (P<0.001). **CONCLUSIONS:** Hypertension-related knowledge was inadequate among Iraqi hypertensive patients pursuing CAM as a way of self-care. This poor knowledge among CAM users was affected by diverse patient's characteristics like gender, education, monthly income, and marital status. A significant improvement in hypertension-related knowledge was seen following the educative information. The education program was effective and provide reliable information for the purpose of patient's education in the context of CAM.

PCV122

DELAYING TREATMENT WITH CHOLESTEROL-LOWERING MEDICATIONS IN PATIENTS MEETING NEW TREATMENT GUIDELINES: A RETROSPECTIVE COHORT ANALYSIS

Han X[1], Chu ML[1], Dougherty S[2], McCombs JS[1]
[1]University of Southern California, Los Angeles, CA, USA, [2]Pharmaceutical Research & Manufacturer's of America, Washington, DC, USA

OBJECTIVES: The 2013 American College of Cardiology/American Heart Association (ACC /AHA) guidelines may expand eligibility for cholesterol-lowering therapy to a large number of new users. The objective of this paper is to document the potential for this expansion in to improve clinical outcomes and reduce cost. **METHODS:** Patients meeting 2013 guideline classification criteria were identified using Humana data [2007-2013] and divided into three groups: elevated LDL [identified in earlier guidelines], selected diabetes patients and patients with atherosclerotic cardiovascular diseases [ASCVD]. Patients with no pre-classification cholesterol treatment were then selected and divided in two treatment groups: early [before any CVD event] and late/never treated. The clinical outcomes were the time to four separate events [AMI, stroke, coronary stenting, coronary artery bypass graft surgery (CABG)]. Costs were measured over the first year following a risk classification. Clinical outcomes were analyzed using Cox proportional hazards models. Costs were analyzed using generalized linear models [GLM] and the RAND two-step model for hospital costs. **RESULTS:** 237,856 people were classified according to ACC/AHA guideline criteria and met study inclusion/exclusion criteria. Only 3.5% of study patients fell into the elevated LDL risk group identified under previous guidelines and 65% of these patients were treated 'early.' Early treatment rates were lower for ASCVD patients [37%] and diabetes patients [46%]. Early treatment significantly reduced event risks [H.R 0.26 to 0.34, p<0.0001] across the 4 events and reduced cost over the first year -$3,607 [p<0.001]. Early treatment was most effective in the 'new' ASCVD risk group which was the largest, at highest risk, and most expensive to treat of the 3 ACC/AHA risk group. **CONCLUSIONS:** The 2013 treatment guidelines for cholesterol-lowering therapy will significantly increase the number of patients eligible for treatment. However, all eligible patients must receive 'Early' treatment to experience reduced CVD event risk and lower health care.

INDIVIDUAL'S HEALTH – Clinical Outcomes Studies

ASSOCIATION OF SEDATIVE HYPNOTICS AND FALL RISK IN COMMUNITY-DWELLING OLDER ADULTS WITH CHRONIC CONDITIONS: A SYSTEMATIC LITERATURE REVIEW

Hohmann N, Garza KB, Qian J, Hansen RA
Auburn University Harrison School of Pharmacy, Auburn, AL, USA

OBJECTIVES: Degree of fall risk attributed to sedative hypnotics in older adults is unclear when complicated by chronic conditions with underlying fall risk. Accordingly, the objective of this review was to assess the risk of falling, fall-related fractures, and fall-related hospital admissions in community-dwelling older adults with chronic conditions who are prescribed sedative hypnotics. **METHODS:** PubMed, PsychInfo, CINAHL, and ClinicalTrials.gov were searched using keywords such as "sedative hypnotic," "fall-risk," and "older adult." Criteria for article inclusion were: 1) English-language; 2) peer-reviewed; 3) published between 1980-2016; 4) experimental or quasi-experimental study designs; 5) adults > 65 years of age; 6) adults with a chronic condition that increases baseline risk of falling (diabetes, heart disease, atrial fibrillation, hypertension, osteoporosis, depression, cancer); 7) adults with a fall from the same level in the community setting; and 8) adults prescribed 1 or more benzodiazepine(s) or z-hypnotic(s) indicated for insomnia (triazolam, temazepam, flurazepam, zolpidem, (es)zopiclone, zaleplon). Exclusions were verified by a second independent investigator. Quality assessment utilized the Mixed Methods Appraisal Tool (MMAT). **RESULTS:** After full-text review, 5 articles were retained. Studies used cross-sectional or single-group longitudinal designs, with MMAT quality scores of 50%-75% and sample sizes ranging from 124-1,062. Only one study assessed fracture risk and no studies assessed healthcare utilization. The risk of falls was inconsistent across studies and population subgroups. For example, benzodiazepines increased the odds of falling by 18 times (OR: 18.22, 95% CI 2.71-122.38) in older adults with atrial fibrillation. However, sedative hypnotics did not statistically significantly increase odds of falling in older adults with stroke (OR: 2.3, 95% CI 0.76-6.76). **CONCLUSIONS:** Increased risk of falling attributable to use of sedative hypnotics in older adults may vary based on underlying chronic conditions. Further studies should investigate contributors to fall risk in older adults with specific types of chronic conditions.

PIH2

ASSESSMENT OF THE SAFETY AND EFFICACY OF LONG-TERM ACTING REVERSIBLE CONTRACEPTIVE METHODS (LARC) COMPARED TO CONVENTIONAL METHODS (NON-LARC) IN ADOLESCENTES: AN META-ANALYSIS

Farah D, De Bella Z, Moraes R, Girao M, Fonseca M
Federal University of São Paulo, São Paulo, Brazil

OBJECTIVES: The aim of this study was to analyze the efficacy and safety of long-acting reversible contraceptive methods (LARC) compared to conventional contraceptive methods in adolescents. **METHODS:** We performed, a systematic search in Medline, Embase, Lilacs and the Cochrane Database from inception to May 2016, for observational studies and randomised controlled trials comparing the use of LARC versus non-LARC in adolescents. Two reviewers independently selected studies, assessed quality, and extracted data. Discrepancies were resolved through consensus. The outcomes were adherence, pregnancy rate, adverse events, abortion rates, and adolescent's contraception choice. We used the RevMan 5.0 to combine results across studies. We derived risk ratios (RRs) and mean differences with 95% CIs using a random-effects meta-analytic model. **RESULTS:** Nine relevant studies were included. LARC's 12 months adherence is better than non-LARC (RR 1.38 [95% CI 1.01 – 1.87]); analyzing only more recent studies, those since 1999, an even better 12 months adherence (RR 1.53 [95% CI 1.05 – 2.23]) was observed. There was no difference between LARC and non-LARC concerning the pregnancy rate (RR 0.46 [95% CI 0.09 – 2.52]). Also, there was no difference between the methods in relation to adverse events (RR 0.78 [95% CI 0.59 – 1.03]), abortion rates (RR 1.88 [95% CI 0.07 – 47.60]). Adolescent's contraception choice favored non-LARC (RR 0.63 [95% CI 0.33 – 1.19]). **CONCLUSIONS:** LARC presents better adherence with no difference in relation to the pregnancy and abortion rates. Also, there is no difference concerning adverse events between LARC and non-LARC. Notwithstanding, non-LARC is still preferred by the adolescents, although without statistical significance. We conclude that LARC has potential benefits on preventing unplanned pregnancy among adolescents. However, it is noteworthy that most of the included studies are from the 1970's and the absence of more recent studies comparing new available technologies may impact our results.

POTENTIAL DRUG-DRUG INTERACTIONS IN PEDIATRIC WARDS OF GONDAR UNIVERSITY HOSPITAL, ETHIOPIA: A CROSS SECTIONAL STUDY

Seid MA
University of Gondar, Gondar, Ethiopia

OBJECTIVES: To determine the prevalence, level of severity of potential drug–drug interactions (PDDIs) and the associated factors for PDDIs in hospitalized pediatric patients of Gondar University Hospital. **METHODS:** A retrospective cross-sectional study was conducted for a period of 3 months from March to May 2014 in pediatric wards of Gondar University Hospital. Systematic random sampling technique was used to select charts from all pediatric patients' charts with every 7th interval to get sample size of 384. Univariate and multivariate analysis were performed to compute crude odds ratio and adjusted odds ratio respectively. Statistical significance was set at P value < 0.05. **RESULTS:** A total of 176 (45.8%) patients had at least one PDDI. A total of 393 PDDIs, which were comprised of 283 types of interacting combinations, were identified. Of the total of 393 PDDIs, most were of moderate severity [201 (51%)] followed by minor [152 (39%)] and major severity [40 (10%)]. The most common interacting pairs of major severity were gentamicin + furosemide (6), cotrimoxazole + methotrexate (4) and phenytoin + artemether (4). The occurrence of PDDIs was significantly associated with age and polypharmacy. **CONCLUSIONS:** The study showed that most of the interactions had moderate severity followed by minor severity. Age and polypharmacy were found to show statistically significant association with the occurrence of PDDIs. Due to sensitive nature of pediatrics population, close monitoring is recommended for the detection and management of PDDIs to prevent its negative consequences.

READMISSIONS TO HOSPITAL DUE TO ADVERSE DRUG REACTIONS IN ELDERLY AUSTRALIANS

Parameswaran Nair N[1], Chalmers L[1], Bereznicki B[1], Curtain C[1], Connolly M[2], Bereznicki L[1]
[1]University of Tasmania, Hobart, Australia, [2]Royal Hobart Hospital, Hobart, Australia

OBJECTIVES: To investigate the rate of adverse drug reaction (ADR)-related hospital readmissions in elderly patients previously hospitalized due to an ADR, and identify predictors of ADR-related readmission. **METHODS:** This retrospective study was conducted at the Royal Hobart Hospital, Tasmania, Australia. Data were collected from the digital medical records of 768 elderly patients in the PADR-EC (Prediction of Hospitalization due to Adverse Drug Reactions in Elderly Community-Dwelling Patients) study. The PADR-EC score is the sum of points assigned to five significant predictors of ADR-related hospitalization - antihypertensive use (3 or 5 points if 1-2 or ≥3 antihypertensives, respectively), renal failure (eGFR <60mL/min/1.73m2), dementia, anticholinergic use and drug changes in the preceding 3 months (2 points each). Causality, preventability and severity of each ADR admission were assessed using the Naranjo algorithm, Schumock and Thornton criteria and Hartwig's criteria, respectively. **RESULTS:** ADR-related readmissions occurred after 20% (n=31) of 153 ADR-related index admissions. Patients readmitted with ADRs had significantly higher PADR-EC scores at discharge of their index admission (median PADR-EC score 7, interquartile range 5-9) than patients who were not readmitted with ADRs (6, 5-7, P=0.012). Most (80%) ADR-related readmissions were considered 'preventable'. ADR severity was 'moderate' in 97% and 'severe' in 3% of admissions. Renal disorders (27%) represented the most common ADRs, followed by cardiovascular (22%) and endocrine/metabolic disorders (16%). The most frequently implicated drug classes were diuretics (26%) and agents acting on the renin-angiotensin system (23%). Using the Naranjo algorithm 84% of ADRs were probable and 16% were possible. For most admissions (94%) the ADR resolved and the patient recovered. **CONCLUSIONS:** One in five elderly patients hospitalized due to an ADR were readmitted with an ADR within 12 months of discharge. The PADR-EC score could potentially be used at hospital discharge to prioritise patients for interventions to prevent subsequent ADR-related hospital admission.

PIH5

ERECTILE DYSFUNCTION SEVERITY, RISK FACTORS, AND HEALTH OUTCOMES AMONG 40-70 YEAR-OLD MEN ACROSS EIGHT COUNTRIES

Goldstein I[1], Goren A[2], Li V[3], Tang WY[4], Hassan T[4]
[1]Alvarado Hospital, San Diego, CA, USA, [2]Kantar, New York, NY, USA, [3]Kantar Health, New York, NY, USA, [4]Pfizer Inc., New York, NY, USA

OBJECTIVES: Erectile dysfunction (ED) prevalence and burden of illness can vary according to geography, time, and methodologies. The current study examined health-related quality of life (HRQoL) and productivity impairments associated with varying ED severity and associated risk factors. **METHODS:** Data on adult men (40-70 years old) were analyzed from the 2016 National Health and Wellness Survey in Brazil, China, France, Germany, Italy, Spain, United Kingdom, and United States. Men with ED were selected on the basis of self-reporting any difficulty achieving/maintaining an erection in the past six months, and this measure was also used to define four levels of ED severity (mild, moderate, moderate/severe, and severe). Men with benign prostatic hyperplasia (BPH) were excluded. HRQoL measures included Mental and Physical Component Summary scores (MCS and PCS, respectively) derived from the SF-36v2, as well as SF-6D health utility scores. Work Productivity and Activity Impairment questionnaire-based measures were also included. Generalized linear models analyzed each outcome as a function of ED severity and risk factors, controlling for country, demographics, health characteristics and behaviors, and Charlson comorbidity index scores. **RESULTS:** Among 24,100 men with ED, moderate, moderate/severe, and severe ED were associated with significantly more negative MCS (-1.86, -3.67, and -4.38, respectively), PCS (-1.42, -2.94, and -4.45), and health utilities (-0.023, -0.049, and -0.064), and higher absenteeism (1.38, 2.16, and 2.53 times the rate, respectively), presenteeism (1.33, 1.84, and 1.94), overall work impairment (1.32, 1.85, and 1.94), and activity impairment (1.29, 1.66, and 1.75) than those with mild ED (all $p<.001$). The presence vs. absence of other comorbid conditions (depression, diabetes, obesity, smoking, and hypertension) was also associated with poorer outcomes; statistical significance varied by condition. **CONCLUSIONS:** Among 40-70 year-old men with ED, severity and comorbidities such as smoking, depression, and hypertension were associated with poorer health outcomes globally.

PIH6

IDENTIFICATION AND EVALUATION OF CLINICAL AND ECONOMIC IMPACT OF POTENTIAL DRUG RELATED PROBLEMS IN THE ELDERLY

Menon VB[1], Ramesh M[1], Undela K[1], Pereira P[2], CR V[2]
[1]JSS College of Pharmacy, JSS University, Mysore, India, Mysore, India, [2]JSS Hospital, Mysore, India

OBJECTIVES: To evaluate pattern and predictors of potential DRPs among elderly inpatients and its consequential clinical and economic impact. **METHODS:** Prospective interventional study was performed for a period of 18 months among the internal medicine department inpatients. Potential DRPs were determined and grouped into categories. Clinical impact of pharmacist-initiated drug therapy changes were evaluated by the research pharmacist and an independent clinical panel for any possible impact on the readmission probability, length of hospital stay, treatment failure, etc. To analyse the economic impact of pharmacist interventions, the impact of cost savings on the length of stay, readmission probability, medical procedures and drug cost were considered. **RESULTS:** Among the 863 admitted patients, 728 DRPs (84%) were identified from 661 patients (1.10 DRPs/person). Most frequent DRPs were those involving drug selection/administration (35%) and the commonly implicated drug category was drugs used for alimentary tract and metabolism (N=318). Major clinical pharmacist intervention was deletion of the drug (29%) and in 55% cases the intervention was accepted and the treatment was changed. The total cost of DRPs were estimated to be approximately USD 5,818.96, out of which approximately USD 4,887.93 could have been preventable as 84% of the potential DRPs were of preventable nature. According to the clinical panel, 28% of the pharmacist interventions had possibly important clinical relevance. Pharmacist interventions reduced the length of hospitalization, disease relapse and treatment failure in 41%, 19% and 16% cases respectively. The total cost saving from interventions was estimated to be USD 3,816.49. Regarding the predictors of DRP, incidence of DRPs was significantly higher among females, middle aged elderly, patients with polypharmacy, multiple diseases, longer duration of hospitalisation and lower survival rate. **CONCLUSIONS:** Many DRPs in elderly are preventable with structured patient care. Geriatric pharmacotherapy services by clinical pharmacist can contribute to minimize DRPs in elderly.

TRENDS OF OPIOID UTILIZATION DURING PREGNANCY AND INCIDENCE OF NEONATAL ABSTINENCE SYNDROME

Dave C, Zhu Y, Winterstein A, Wang X, Alrwisan A, Hartzema A
University of Florida, Gainesville, FL, USA

OBJECTIVES: An increase in opioid utilization during pregnancy in recent years has contributed to a surge in the incidence of Neonatal Abstinence Syndrome (NAS). The objective of the study was to compare the pattern and intensity of opioid utilization during pregnancy in deliveries with and without NAS. **METHODS:** We examined women in a commercial claims database for years 2011-14 who filled an opioid prescription during pregnancy for a non-cancer indication. Pregnancies were stratified into pre-term and full-term. NAS was identified using ICD-9 code 779.5. For each prescription, the morphine equivalent dose (MED) was calculated, and the average daily MED was estimated on a bi-weekly basis for each patient during the gestation period. We matched one NAS delivery to one non-NAS delivery on eight risk factors—including cumulative opioid use in the first two trimesters—to create a matched set that theoretically differed in its risk for NAS through a difference in opioid utilization in the last trimester. **RESULTS:** We found 314 cases of NAS in 61,568 pregnancies (5.10 cases per 1,000 deliveries). In the unmatched analysis, we found that compared to non-NAS pregnancies, NAS pregnancies had a significantly higher average daily MED during the gestation period (+36 mg MED, $p<0.01$). In NAS pregnancies, we noted a decrease in the average daily MED following the onset of pregnancy, which remained stable up until the third trimester where it subsequently increased. In the matched analysis, the mean MED in the third trimester was higher in the NAS group compared to the non-NAS group (+2.41 mg MED). Our findings in the pre-term pregnancy group were similar. **CONCLUSIONS:** While opioid exposed patients who developed NAS made a concerted effort to decrease their opioid utilization following the onset of pregnancy, opioid utilization remained high throughout the gestation period. Near-term opioid use was associated with NAS.

CLAIMS-BASED IDENTIFICATION OF PEDIATRIC HYPONATREMIA PATIENTS IN THE UNITED STATES

Kamat SA, Krasa H, Watkin S, Stellhorn RA, Dandurand A, Sikes K
Otsuka Pharmaceutical Development & Commercialization, Princeton, NJ, USA

OBJECTIVES: Retrospective database analyses can be used to conduct feasibility of clinical studies by estimating potential cases of interest in real-world settings. The objective of this study was to identify potential cases of pediatric patients with hyponatremia using three large patient databases in the United States. **METHODS:** Analyses of two administrative claims databases - Optum Clinformatics data (1/1/2014-12/31/2014) and the Truven Marketscan Commercial Claims data (1/1/2014 - 12/31/2014) and one electronic health records database - Humedica data (1/1/2013 – 12/31/2013) was conducted. For the Optum and Truven databases, patients with ICD-9 codes for 276.1x (hyponatremia, hyposmolality) either in the inpatient or outpatient setting and <17 years of age (pediatric hyponatremia) were identified; results were expressed as the number of potential pediatric cases per all health plan members covered. For the Humedica database, occurrence of at least two serum sodium values <130 mmol/L was used as a confirmatory criteria for hyponatremia among patients with ICD-9 codes for 276.1x and results were expressed as the number of pediatric cases with serum sodium < 130 mmol/L per all patients with ICD-9 codes for 276.1x. **RESULTS:** In the Optum database, there were 22,373 cases of hyponatremia out of approximately 12.3 million members of which 1,004 were <17 years of age. This resulted in a rate of 1 patient with pediatric hyponatremia per 12,334 members covered. Similarly, analysis of the Truven database resulted in a rate of 1 patient with pediatric hyponatremia per 15,374 members. Results of the Humedica database indicated a rate of 1 pediatric hyponatremia patient with at least two labs for serum sodium < 130 mmol/L per 318 patients with hyponatremia. **CONCLUSIONS:** A rare occurrence of potential cases of pediatric hyponatremia in the real-world setting may present challenges for clinical trial recruitment in this patient population.

ASSESSMENT OF THE CHILDREN CHARACTERISTICS DIAGNOSED WITH MALNUTRITION IN DIFFERENT HOSPITALS OF QUETTA, PAKISTAN

Haq N, Hanif S, Nasim A, Yasmin R, Razaque G
University of Balochistan, Quetta, Pakistan

OBJECTIVES: The present study is done to assess the characteristics of children who are diagnosed with malnutrition in different hospitals of Quetta, Pakistan. **METHODS:** A cross-sectional study conducted in private and government

hospitals of Quetta from February to August 2016. Children aged from 2 months to 12 years were included in the study. Data was collected using a special Performa made for this particular study WHO guideline was used to developed. The Performa include information regarding clinical appearances, current complain, measurements of weight, Height, Mid-Upper Arm Circumference (MUAC) circumference of head (COH). As per WHO guideline the Z-score were calculated and standard scoring (Standard Deviation (SD)) was used to identified malnutrition status. The patients were categorized as 0 to-1 SD mild, -1 to -2 SD moderate and ≤-2 SD severe malnutrition categories. **RESULTS:** A total of 344 patients were included in the study. Out of which 52% (n=177) were male. According to the Z-score the patients were categorized to malnutrition status as; mild (n= 38, 11.3%), moderate (n=72, 21.5%), severe 157 (46.9%). Most of the patients (n=140, 41.8%) come with the malnutrition as their current complain. Result shows that malnutrition was more prevalent in children age less than 2 years (n=185, 55.2%) with majority 43.6 % had improper breast feeding and (n=168,49%) had improper weaning. Majority of the patients (n=209, 60%) have no records of their vaccination. Most of the parents of the patients (n=160,47%) are uneducated. **CONCLUSIONS:** The present study concluded that most of the children diagnosed with malnutrition were categorized as severally mal-nutrient, the malnutrition in children was most prevalent in early ages and improper breast feeding and weaning were the main cause of malnutrition, which may be because of the reason that majority of the parents of the children diagnosed with malnutrition were uneducated.

PREDICTORS OF ANAEMIA AMONG ANTENATAL CLINIC REGISTRANTS IN URBAN GHANA: AN ANALYTIC CROSS-SECTIONAL STUDY 2016

Amo-Mensah P[1], Davies-Teye B[2], Antwi-Agyei K[3], Avorga DA[4], Vanotoo L[4]
[1]*Ghana Health Services, Accra, Ghana,* [2]*Drifney Consult Ltd and Ghana Health Service, Accra, Ghana,* [3]*Ghana College of Physicians and Surgeons/Ghana Health Servic, Accra, Ghana,* [4]*Ghana Health Service, Accra, Ghana*

OBJECTIVES: Anaemia in pregnancy remains disease of Public Health Concerns in Ghana, however limited intervention exits for its prevention during preconception period. This study aimed at determining prevalence and factors associated with it at ANC registration at District Health facility to inform policy. **METHODS:** We conducted analytic cross-sectional study. A total of 232 ANC registrants aged 15-45 years were randomly selected between February –July 2016. We interviewed participants on socio-demographic, past medical, obstetrics, diet, medications using interviewer administered structured questionnaires, and routinely requested Hemoglobin and malaria parasitamia data were analyzed. Data abstracted was managed in EPI info 7 and Stata 13.0. Univariate and Multiple logistic regression analysis were done at 95% confidence level. **RESULTS:** Prevalence of anaemia among participants was 31.0%. While 44% of participants aged 25-29, 25% aged 30-34 years. Fifty two percent had primary education, 30.2 and 11.6 percent had secondary and tertiary respectively. Whiles 72.8 percent registered in 2nd and 3rd trimesters, only 27.2% registered in the 1st trimester. Logistic regression analysis (95% confidence level) showed low monthly income < 25.00 USD [APOR= 2.33; Pvalue 0.05], Sickle Cell Disease [APOR= 3.41; Pvalue 0.01], eating fish [APOR= 0.29; Pvalue 0.01], and eating of fruits [APOR= 0.24; Pvalue 0.00] were significantly associated with developing anaemia in pregnancy at registration. However, only bivariate analysis showed preconception haematenic intake [POR= 1.20; CI 0.51-2.79], having some formal education [POR=0.56; CI 0.20-1.52], eating cereal/grain [POR=2.34; CI 1.07-5.12] and tubers [POR=0.62; CI 0.35-1.10] to be associated with the disease. **CONCLUSIONS:** Undoubtedly, there is high prevalence of anaemia in pregnancy particularly among low income earning women with majority of registrants presenting late. Preconception sickle cell disease screen coupled with comprehensive dietary counseling and support among prospective pregnant women has the potential to prevent anaemia in pregnancy.

CORRELATES FOR HEALTH-RELATED QUALITY OF LIFE AMONG PREGNANT WOMEN IN CHENGDU OF CHINA: RESULTS FROM A HOSPITAL BASED SURVEY

Zhu P[1], Pan X[2], Qi X[3], Zhao Z[4]
[1]*Sichuan University, Chengdu, China,* [2]*Tongji Medical College, Huazhong University of Science and Technology, Wuhan, China,* [3]*West China Women's and Children's Hospital, Sichuan University, Chengdu, China,* [4]*Chinese Academy of Medical Sciences and Peking Union Medical College, Kunming, China*

OBJECTIVES: Health-related quality of life (HRQOL) is a patient-reported outcome among pregnant women that is often neglected in clinical practice. We conducted a cross-sectional survey to examine the status of HRQOL among pregnant women and its correlates in Chengdu of China. **METHODS:** We enrolled women during the third trimester of pregnancy at antenatal clinics of West China Second Hospital from October 30, 2013 to February 28, 2014. Participants completed the Chinese version of Short Form 36 Health Survey (SF-36) to assess the HRQOL. Social demographics, pregnancy history, and personal characteristics were also collected during the survey. **RESULTS:** A total of 2244 pregnant women aged 30.0 (standard deviation: 4.0 years) were recruited. The overall score for SF-36 was 66.91 (standard deviation: 11.6), and scores for eight domains ranged from 51.30 (standard deviation: 24.7) for role physical to 78.2 (standard deviation: 12.6) for mental health. Univariate analyses showed age, education level, occupation, living condition, age of first pregnancy, and relationship with mother-in-law were associated with all or most domains of SF-36 (all $P<0.05$). Multiple linear regression demonstrated that education level, living condition, and relationship with mother-in-law remained statistically significant after controlling for age, occupation, annual household income per capita, age of first pregnancy, and other potential confounders. The SF-36 score for the general health domain increased with increasing level of satisfaction with living condition (β coefficient -3.67, $P<0.001$ for dissatisfactory and 2.96, $P=0.003$ for fully satisfactory versus the satisfactory). Pregnant women who had good relationship with mother-in-law reported higher score for the mental health domain than those who did not (β coefficient 1.76, $P<0.001$). **CONCLUSIONS:** Our findings indicate that personal characteristics may affect HRQOL among pregnant women, and deserve particular attention to improve HRQOL in clinical practice.

PIH12

NUTRITIONAL AND SOCIO ECONOMIC DETERMINANTS OF HEMOGLOBIN LEVEL IN CHILDREN AGED 12-24 MONTHS

Fotedar A[1], Bhasin J[2], Chakravarty A[3], Kulkarni A[4]
[1]*Pediatric, delhi, India,* [2]*BL Kapur super Speciality hospital, delhi, India,* [3]*Childrens Clinic, Delhi, India,* [4]*Kulkarni Children's Medical Centre, Delhi, India*

OBJECTIVES: Anemia is multifactorial in etiology. Preventative efforts, predominantly focused on increasing iron intake between the period of conception and 24 months of age as this duration is sensitive to nutrient effects on child growth, cognition, and school attainment. However, Data on association of various factors on hemoglobin level are limited. Heance the objective was to determine biological, nutritional and socioeconomic factors associated with hemoglobin level in Indian children aged 0-24 months. **METHODS:** A cross sectional Pilot study was conducted over a period of 4 months (Nov 2015 – Feb 2016) in three pediatric outpatient clinics of New Delhi, India. A predesigned questionnaire was used to record data by the pediatrician from 66 mother and child pair. Socio-demographic profile, birth weight, anthropometric, feeding pattern and consumption of Iron fortified cereals was collected. Hemoglobin estimation was done as a part of normal examination by the pediatrician. A child was considered to be on Iron fortified cereals if a minimum 1-2 serving/day was feed along with homemade foods. **RESULTS:** The prevalence of anemia (hb <11 g/dl) in study sample was 42.4%.The mean age with hemoglobin of <11g/dl and >11g/dl was 13.7+3.7 months and 12+1.0 months respectively. Similarly for these two group mean birthweight and BMI was 2.6+0.6 kg, 2.9+0.3kg and 14.6+1.14 kg/m2 , 16.1+1.01 kg/m2 respectively. The results of multiple linear regression showed that Hemoglobin was significantly associated with birth weight ($p = 0.0001$) and consumption of iron fortified cereals ($p=0.001$) whereas age of mother ($p=0.145$), parity ($p=0.08$) and maternal education ($p=0.09$) were not significant. **CONCLUSIONS:** Consumption of iron fortification cereals was significantly associate with hemoglobin level. Given the negative impact of anemia on the development of children in future, there is an urgent need for effective remedial public health interventions. due to limited geographic location and small sample size, further larger and controlled studies are needed.

PIH13

PREVALENCE AND ASSOCIATED FACTORS OF HERBAL MEDICINE USE AMONG PREGNANT WOMEN ON ANC FOLLOW-UP AT GONDAR UNIVERSITY REFERRAL HOSPITAL, ETHIOPIA: A CROSS-SECTIONAL STUDY

Birru EM
University of Gondar, Gondar, Ethiopia

OBJECTIVES: The present study aimed at assessing the prevalence and correlates of herbal medicine use among pregnant women on ANC follow-up at Gondar university referral hospital, Ethiopia. **METHODS:** An institutional-based cross sectional study was employed on 364 pregnant women attending ANC clinic from March to May 2016 at Gondar university referral hospital, northwest Ethiopia. Data on socio-demography, pregnancy related information as well as herbal medicine use was collected through an interviewer-administered questionnaire. Descriptive statistics, univariate and multivariate logistic regression tools were used to analyze with the prevalence and correlates of herbal medicine use. **RESULTS:** From 364 respondents, 48.6% of them used herbal medicine during current pregnancy. Ginger (40.7%) and Garlic (19%) were the two most commonly used herbs in pregnancy. Common cold (65%), constipation (14.7%) and inflammation (13%) were the most common reasons for herbal use. Majority of herbal medicine users (89.8%) have not consulted their doctors about their herbal medicine use. Average monthly income less than 100 USD (AOR: 3.079 95 % CI: 1.221-7.767) were found to be strong predictors of herbal medicine use. **CONCLUSIONS:** The use of herbal medicine during pregnancy is a common practice and associated with being rural residency, illiteracy and low average monthly income. Given the high frequency of herbal medicine and a very low disclosure rate, health care providers should be open to discuss the use of herbal medicines with their pregnant women as it will lead to better health outcome.

A FIVE-YEAR BUDGET IMPACT ANALYSIS OF THE INCLUSION OF ETONOGESTREL IMPLANT FROM THE PRIVATE HEALTH SECTOR PERSPECTIVE IN BRAZIL

Coutinho MB, Haas LC, Carvalho LC, Risso F
MSD Brasil, São Paulo, Brazil

OBJECTIVES: Oral contraceptives are effective in the prevention of unplanned pregnancy, but are associated with low adherence and may result in contraceptive failure. Long acting reversible contraceptive methods combine reversibility with high effectiveness. This analysis aimed to estimate the projection of costs using the etonogestrel implant and the levonorgestrel intrauterine system for five years, from the private health perspective of Brazil. **METHODS:** The eligible population was female beneficiaries in September 2016, aged 19 to 48 years. Cost and market-share of contraceptives data were obtained from local sources. The prices for etonogestrel implant and levonorgestrel intrauterine system were 902.85 BRL and 760.33 BRL, in addition to 173.5 BRL and 236.52 BRL, respectively, as reimbursement by procedure. For levonorgestrel intrauterine system, it was also considered a hysteroscopy or

surgical curettage in 25% of cases in the base case and 75% in the alternative scenario. **RESULTS:** In five years, the budget impact in the base case was 1,583,792,751 BRL and 1,560,566,016 BRL without and with the inclusion of etonogestrel implant, respectively, resulting in savings of 23,226,735 BRL. In the alternative scenario, savings with the inclusion of etonogestrel implant would be of 106,230,590 BRL. **CONCLUSIONS:** The inclusion of the etonogestrel implant in private health sector in Brazil could save from 23.2 to 106.2 million reals, depending on the rate of hysteroscopy, supplementing the contraceptive options for Brazilian women, also having fewer clinical restrictions compared to use of the levonorgestrel intrauterine system.

NUMETA BUDGET-IMPACT MODEL FOR PEDIATRIC PARENTERAL NUTRITION

Londoño D[1], Taborda A[1], Bermudez L[2], Ariza JG[3]
[1]*Fundación Santa Fé de Bogotá, Bogotá, Colombia,* [2]*Independent, BOGOTÁ, Colombia,* [3]*BAXTER, BOGOTA, Colombia*

OBJECTIVES: To estimate the budget impact of NUMETA for neonatal and pediatric patients who are unable to tolerate oral or enteral feeding, requiring parenteral nutrition from the health care provider perspective. **METHODS:** A budget impact model was adapted from a global version in order to capture, from the hospital perspective, all resource such as ingredients, consumables, installations and device costs and staff-time of the whole production chain of preparing parenteral nutrition. In addition, costs due to medication errors and complications were included as well. Patients can switch from in-hospital compounded products (manual or automated) or externally produced products to NUMETA and the budget impact of these switches are calculated for a three year time horizon. Model inputs were collected from different sources such as: secondary data review, twelve expert interviews and four administrative data bases from health care providers, compounding center and benefit plan manager. Local currency; Colombian Pesos COP. **RESULTS:** Baseline scenario cost of standard of care COP 77,199,921,044. Cumulative budget impact in conservative forecast (5.6% of Numeta adoption in 3 years): 1st year COP -50,467,362; 2nd year COP -334,598,067 and 3rd year COP -993,123,652. Cumulative budget impact in high adoption scenario (15.4% of Numeta adoption in 3 years): 1st year COP -216,231,139; 2nd year COP -1,429,679,947 and 3rd year COP -3,198,051,979. **CONCLUSIONS:** Based on the assumed perspective and inputs, Numeta is not expected to impact negatively the pediatric parenteral nutrition budget in Colombia.

PIH16

COST COMPARISON OF SHORT PROTOCOL OF STIMULATION AND JAPANESE PROTOCOL (TERAMOTO'S PROTOCOL) OF ART IN UKRAINE

Horbachevska K
Danylo Halytsky Lviv National Medical University, Lviv, Ukraine

OBJECTIVES: In Ukraine state funding of ART was launched on the Orders of MoH №579 from 24.11.2004. During the recent times, there is a tendency for protocols with minimal stimulation and minimal hormonal load which aim at obtaining not the largest number of ovules, but more high-quality ovules. Japanese protocol of IVF is the most physiological and contains minimal hormonal interventions during couple of cycles. In short protocol used drugs Elonva 150, Orgalutran, Pregnil 5000, Progesterone. In average a general cost per 1 cycle is 24 261 UAH. It is 842,10$ (1 $=28,81 UAH). In Japanese protocol used drugs Clomifenum 500, Menopur 75 ME, Orgalutran and Pregnil 5000. The total value of the 1 cycle is 14 864UAH. It is 515,93$ (1 $=28,81 UAH). worth noting that Teramoto's protocol does not foresee supporting therapy with progesterone drugs.Peculiarity of the short protocol is work on the woman's natural hormonal background with using drugs that prevent early maturation of the ovule. **METHODS:** We compared the average price for each medical guideline. We used actual prices taken from database MORION (Kyiv) on 1.11.2016. **RESULTS:** We have conducted comparison characteristics of the price of short protocol and Teramoto's protocol. Having analyzed average dosage of medical means(л13) it was found out that the use of medical means by Teramoto's protocol is for 38,73% cheaper in comparison with medical means of extracorporeal fertilization short protocol. Additionally supporting therapy with vitamins is prescribed which is individually for every woman and is determined by doctor. **CONCLUSIONS:** Teramoto's protocol treatment will be by one third cheaper in comparison with short stimulation. Also specific feature is usage of small dose of medication which allows to avoid numerous complication of hormonal therapy. Great advantage of Japanese protocol is absence of painful sensations by woman.

PIH17

POTENTIAL OUT-OF-POCKET SAVINGS FOR DUAL-ELIGIBLE BENEFICIARIES WITH DEVELOPMENTAL DISABILITIES AFTER MEDICARE PART D PLAN OPTIMIZATION

Li H, Patel R, Rogan E, Valle-Oseguera CS
University of the Pacific, Stockton, CA, USA

OBJECTIVES: Approximately 7% of dual-eligible (Medicare/Medicaid) beneficiaries suffer from Development Disability (DD). They often have a high medication burden and thus may be prone to higher than necessary out-of-pocket (OOP) drug costs under the Medicare prescription drug benefit (Part D). **METHODS:** Community clinics were conducted by University of the Pacific pharmacy students during the fall 2016 Medicare open enrollment period. Beneficiaries were provided Part D plan assistance by trained student pharmacists. Demographic, drug, subsidy, plan and cost data were collected during each intervention; the latter items were retrieved from the online Medicare Plan Finder Tool (www.medicare.gov). Formulary coverage and potential OOP cost-savings by optimizing a beneficiary's drug plan were recorded/calculated. **RESULTS:** In total, 106 dual-eligible beneficiaries (51 with DD) were assisted. Beneficiaries with DD took on average 7 prescription medications/month, whereas those without DD took 8 prescription medications/month. Approximately 88% of those with DD could have achieved lower OOP drug costs; on average they could have saved $2,133 by switching Part D plans in the upcoming year. Similarly, 84% of non-DD beneficiaries could have minimized their OOP costs, with average savings of $1,988 by switching to a new 2017 Part D plan. However, the average potential annual opportunity cost saving from switching to the lowest cost PDP was $2133 among Duals with DD, which was $145 higher than Duals without DD on average. **CONCLUSIONS:** Part D plans change formulary and cost-structure each year. It is imperative that all beneficiaries reevaluate Part D plan offerings during Medicare open enrollment. PDP optimization can play a vital role decreasing OOP costs. Beneficiaries with developmental disabilities may lack the resources necessary to effectively navigate the benefit. Partnerships between organizations/agencies that serve those with DD and trained pharmacy students can prove fruitful and beneficial to all involved.

PIH18

THE IMPACT OF MALNUTRITION ON HOSPITAL OUTPATIENT COST AMONG COMMUNITY-DWELLING OLDER CHINESE ADULTS

Zhang Y[1], Fan L[2], Li S[2], Partridge J[2], Claytor L[2], Goates S[3]
[1]*China Health Economics Association, Beijing, China,* [2]*Abbott Nutrition, Abbott Park, IL, USA,* [3]*Abbott Nutrition, Columbus, OH, USA*

OBJECTIVES: Malnutrition and its associated outpatient costs are of concern among older adults in general. The association of malnutrition and outpatient costs however is of particular interest in China, which has the largest elderly population in the world. This paper aims to study the association between nutrition status, number of outpatient visits, and outpatient cost per month among community-dwelling Chinese elderly. **METHODS:** We used 2013 China Health and Retirement Longitudinal Study (CHARLS) survey data, which included a nationally representative sample of 7,768 community-dwelling Chinese elderly. Measures of hand grip strength, Body Mass Index, and weight loss were used as indicators of malnutrition status. We excluded regular physical examinations and immunization to focus on the outpatient visits requiring treatment of illness. We employed multivariate regressions to analyze the impact of malnutrition on the number of outpatient visits and costs per month. We also control for socio-demographics, health status, health insurance and quality of health care and in our regressions. **RESULTS:** We found that malnutrition increased both the number of outpatient visits per month and the cost associated with each individual outpatient visit. Specifically, malnutrition was associated with 17% more outpatient visits (0.54 vs. 0.46; $p < 0.01$), and 9% higher outpatient costs per month (¥195.27 vs ¥178.42; $p < 0.01$). In total, malnutrition was associated with ¥4.45 billion additional outpatient costs for older adults in China every year. **CONCLUSIONS:** Malnutrition was associated with significantly higher hospital outpatient visits and associated costs. These results suggest that malnutrition is an independent predictor of outpatient cost, thus highlighting the importance of malnutrition screening, identification, and treatment for Chinese elderly (age $\geq$60 years old) living in the community. Improving nutrition requires relatively inexpensive clinical and educational interventions and could potentially be cost-effective methods to reduce health care costs of malnourished older Chinese adults.

PIH19

THE PUBLIC HEALTH AND ECONOMIC IMPACT OF PNEUMONIA IN THE ELDERLY POPULATION IN BRAZIL

Coutinho MB, Serra FB, Haas LC
MSD Brasil, São Paulo, Brazil

OBJECTIVES: In the elderly population, acute respiratory infections are an important cause of morbidity and mortality, especially with the rapid changes in demographic structure in Brazil. Streptococcus pneumoniae is a major cause of illness and death worldwide. Current Immunization Program in Brazil includes pneumococcal vaccination in high risk groups (e.g. diabetic patients, immunosuppressed, with pulmonary disease, among others). This study evaluated the burden of pneumonia among elderly in Brazil from the public healthcare perspective. **METHODS:** A retrospective analysis of Brazil public hospital admissions for pneumonia was developed according to ICD-10 classification (Pneumonia J12-J18) in elderly (aged $\geq$ 60 years), as reported in Brazilian Hospital Information System (SIH/DATASUS) database from January 2014 to December 2015. **RESULTS:** In this population, respiratory infections were the leading cause of mortality, and pneumonia was responsible for more than 60% of it. Hospital admissions by pneumonia were 231,921 and 242,465 in 2014 and 2015, respectively, and deaths were 39,807 and 43,112 for the same period. Mean length of stay was 7 days for the analyzed period. The total admissions cost was 256,638,420 BRL and 267,012,950 BRL in 2014 and 2015 respectively, which represents 51.4% of total respiratory diseases costs. Mean cost per admission was 1,103.85 BRL over the two year period. **CONCLUSIONS:** The costs associated with hospitalizations for pneumonia in the elderly from the public healthcare perspective can be substantial in Brazil. Despite the existence of an Immunization Program for high risk groups, the number of admissions for pneumonia remains high. A universal vaccination program for the elderly population could bring a higher benefit in the current vaccination program.

PIH20

THE ASSOCIATION BETWEEN MALNUTRITION AND HOSPITAL INPATIENT COST AMONG COMMUNITY-DWELLING OLDER CHINESE ADULTS

Zhang Y[1], Fan L[2], Li S[2], Partridge J[2], Claytor L[2], Goates S[3]
[1]*China Health Economics Association, Beijing, China,* [2]*Abbott Nutrition, Abbott Park, IL, USA,* [3]*Abbott Nutrition, Columbus, OH, USA*

OBJECTIVES: China has a large and growing elderly population. In 2012, 171 million Chinese residents were over 60 years old, and this segment of the population is expected to grow to 487 million by 2050. Malnutrition is widespread among older Chinese adults, with estimates of prevalence in the literature ranging

from 5.3% to 37.5%. However, there is little research on the impact of malnutrition on hospital costs for older Chinese adults. This study aims to investigate the association between malnutrition and hospital inpatient cost in community-dwelling elderly Chinese. **METHODS:** We use 2013 China Health and Retirement Longitudinal Study (CHALRS) data, which consists of nationally representative socio-demographic, economic and health information of community-dwelling adults aged 45 years or older (our sample is limited to those age 60 and older). Measures of hand grip strength, Body Mass Index (BMI), and weight loss were used as indicators of malnutrition status. Multivariate regressions were used to explore the effect of malnutrition on respondent's number of hospital admissions and total inpatient cost in the past year. In addition, we controlled for socio-demographics, health status, and quality of health care in the regression tests. **RESULTS:** Malnutrition was associated with more hospital admissions and higher inpatient costs (both p values < 0.01). Specifically, an average malnourished older Chinese adult has 32% more hospital admissions (0.29 vs. 0.22; $p < 0.01$), and 31% higher costs for all inpatient services in the past year compared to a well-nourished senior (¥2,066 vs. ¥1,580; $p < 0.01$). In total, malnutrition increased hospital inpatient cost by ¥10.69 billion. **CONCLUSIONS:** Malnutrition was associated with more hospital admissions and higher inpatient costs among community-dwelling older Chinese adults. Therefore, inexpensive efforts to address malnutrition including malnutrition screening and oral nutrition supplements could be effective in reducing hospital cost for the Chinese elderly.

PIH21

ECONOMIC BURDEN ASSOCIATED WITH PEDIATRIC OPIOID POISONINGS

Patel AM, Wheeler DC, Rose SR, Nadpara PA, Pakyz AL, Carroll NV
Virginia Commonwealth University, Richmond, VA, USA

OBJECTIVES: The main objectives of this study were to: 1) Estimate the economic costs associated with opioid poisonings and 2) Examine the characteristics associated with opioid poisoning-related costs in children. **METHODS:** Economic costs were estimated using the 2012 Nationwide Emergency Department Sample, Kids' Inpatient Database, Multiple Cause-of-Death file and other published sources, applying a societal perspective. Direct costs included costs associated with emergency department (ED) visits, hospitalizations and ambulance transports. Indirect costs included productivity costs due to caregivers' absenteeism and premature mortality among children. Markov chain Monte Carlo analysis was used to impute missing costs and sensitivity analyses were performed. A generalized linear model with a log-normal distribution was used to estimate the association of sociodemographic, clinical, payer and hospital characteristics with ED and inpatient costs. **RESULTS:** Total economic costs of pediatric opioid poisonings in the United States were calculated at $230.8 million in 2012. Total direct costs were estimated to be $21.1 million. Total productivity costs were calculated at $209.7 million, and 98.6% of these costs were attributed to opioid poisoning-related mortality. There were a total of 4,584 ED visits, 1,877 hospitalizations and 123 deaths related to opioid poisonings in children. Mean costs for pediatric opioid poisoning-related ED visits and hospitalizations were estimated at $1,289 (SE = 54) and $6,633 (SE = 630), respectively. Teenagers had 1.39 (95% CI: 1.15-1.68) times higher ED costs compared to ≤6 year olds. Inpatient costs were significantly higher among children with higher median household income, moderate-to-extreme loss of function, post-discharge transfer, and private insurance. **CONCLUSIONS:** Opioid poisonings in children resulted in direct and indirect costs of $230.8 million in 2012. Quantified healthcare costs associated with pediatric opioid poisonings can help decision-makers understand the economic trade-offs in planning interventions.

PIH22

ESTIMATION OF BREAST CANCER INCIDENT CASES AND MEDICAL CARE COSTS ATTRIBUTABLE TO ALCOHOL CONSUMPTION AMONG INSURED WOMEN UNDER AGE 45 YEARS IN THE UNITED STATES

Ekwueme D[1], Allaire B[2], Parish W[2], Thomas C[1], Guy, Jr. G[1], Lahoti S[2], Fairley T[1], Trogdon J[3]
[1]*US CDC, Atlanta, GA, USA,* [2]*RTI International, Research Triangle Park, NC, USA,* [3]*University of North Carolina at Chapel Hill, Chapel Hill, NC, NC, USA*

OBJECTIVES: To estimate the percent of breast cancer cases, total number of incident breast cancer cases, and the total annual medical care costs attributable to alcohol consumption among insured younger women by type of insurance (Medicaid, private, and both groups) and by stage at diagnosis. **METHODS:** We used data from the 2012-2013 National Survey on Drug Use and Health, the Centers for Disease Control and Prevention's National Program of Cancer Registries, the National Cancer Institute's Surveillance, Epidemiology, and End Results Program, and published literature to estimate: 1) the alcohol-attributable fraction of breast cancer cases among younger women aged 18-44 years by type of insurance; 2) the total number of breast cancer incident cases attributable to alcohol consumption by stage at diagnosis and insurance status; and 3) the total annual medical care costs of treating breast cancer incident cases attributable to alcohol consumption. All costs were expressed in 2013 US dollars. **RESULTS:** Among younger women enrolled in Medicaid, private insurance, and both groups, we estimated that 8.7%, (95% confidence interval [CI]:7.4-10.0%), 13.8% (95% CI:13.3-14.4%), and 12.3% (95% CI:11.4-13.1%) or 1-in-12, 1-in-7, and 1-in-8 of all breast cancer cases were attributable to alcohol consumption. Across both insurance groups, the largest proportion of estimated attributable incident cases were in localized stage. The estimated total number of breast cancer incident cases attributable to alcohol consumption was 2,212 (95% CI: 2,125-2,303). These breast cancer incident cases accounted for estimated total annual medical care costs of $201.7 million (95% CI: $191.1-$212.2 million). **CONCLUSIONS:** Alcohol use in younger women is a modifiable risk factor for breast cancer. We estimate that breast cancer attributable to alcohol has medical care costs in excess of $200 million per year. Thus the findings from this study could be used to support evidence-based interventions to reduce alcohol consumption in younger women.

PIH23

ABSENTEEISM AND INDIRECT ECONOMIC BURDEN ASSOCIATED WITH PRIMARY AND SECONDARY HYPOGONADISM: A RETROSPECTIVE MATCHED COHORT ANALYSIS OF EMPLOYED COMMERCIALLY-INSURED PATIENTS IN THE US

Johnson BH[1], Hepp Z[2], Kim G[3]
[1]*Truven Health Analytics, an IBM Company, Cambridge, MA, USA,* [2]*AbbVie Inc., North Chicago, IL, USA,* [3]*Truven Health Analytics, an IBM Company, Ann Arbor, MI, USA*

OBJECTIVES: To characterize the indirect economic burden associated with primary and secondary hypogonadism (PSHG) in the United States. **METHODS:** Using the MarketScan® Health and Productivity Management Database, patients who had ≥1 medical claim with a diagnosis related to PSHG (initial claim=index date) and had evidence of testosterone therapy (TTh) within 12 months of index between 1/1/2010 and 12/31/2014 were identified (cases). Included cases were ≥18 years and had ≥12 months of continuous enrollment with absenteeism eligibility and medical and pharmacy benefits before and after (follow-up) index. Controls with no diagnoses related to PSHG and no evidence of TTh were matched 3:1 to PSHG cases based on patient characteristics (age, region, insurance type, index year) and absenteeism eligibility. Overall and non-recreational absenteeism hours missed from work and associated productivity costs were measured during the 12 month follow-up period. Non-PSHG controls and PSHG cases were compared using descriptive statistics (chi-square tests for categorical variables and t-tests for continuous variables). Associated productivity cost was calculated by multiplying missed work-hours by an average hourly wage constant of $25.14/hour based on the US Bureau of Labor Statistics 2015 report. **RESULTS:** The study identified 2,300 PSHG cases and 6,899 non-PSHG controls (mean age 49 [SD=8] years), of which 84.6% and 81.2% had ≥1 absenteeism claim and 74.5% and 67.9% had ≥1 non-recreational absenteeism claim, respectively. PSHG cases missed an average 251.7 (SD=207.9) work-hours overall including 85.6 (SD=167.9) non-recreational hours. Non-PSHG controls missed an average 202.4 (SD=154.3) work-hours overall including 46.6 (SD=97.9) non-recreational hours. PSHG was associated with significantly higher overall and non-recreational missed work-hours (49.3 and 39.0 respectively; both $p<0.001$). The additional hours missed from work translated to overall productivity cost of $1,240, of which $979 was non-recreational (both $p<0.001$). **CONCLUSIONS:** PSHG is associated with significantly higher absenteeism compared to non-PSHG controls which translates to significantly increased indirect economic burden.

PIH24

HOUSEHOLD COST OF INJURIES IN CHILDREN UNDER FIVE YEARS IN THE EJISU-JUABENG MUNICIPALITY OF THE ASHANTI REGION, GHANA: A CROSS SECTIONAL STUDY

Amissah J
KWAME NKRUMAH UNIVERSITY OF SCIENCE AND TECHNOLOGY, KUMASI, Ghana

OBJECTIVES: To estimate the household cost and assess the burden of injury in children less than five years on household in an urban setting in Ghana. **METHODS:** A multistage sampling was used to select 600 households in Ejisu in the Ejisu-Juabeng Municipality of Ashanti Region. Structured questionnaire was used in the data collection. The data were analysed into descriptive statistics in STATA version 13.0 to estimate the direct, indirect and total cost of injury. Sensitivity analysis was run on the cost estimates for a period of 5-10 years **RESULTS:** The educational level 2.2[95% CI: 1.6, 3.0], living room 0.6 [95% CI:0.4, 0.7]) and household size 0.7[95% CI: 0.6, 0.9] were statistically significant risk factors of injury in children under five years. The total sum of GHC 3,922.60 (US$ 1,028.20) averaging GHC6.67 (US$ 1.83) was incurred on injury per household. An indirect cost of over four million Ghana Cedis (GHC4, 808,938) US$ 1,260,534.81 was lost averaging GHC814.89 (US$ 213.60) per household. The time value lost was 10,690 cumulative working days with a monetary equivalence of GHC 4,754,320 (US$1,246,217.56) averaging GHC17, 873 (US $ 4,684.92) per household. In 20.0% of respondents, the burden was in the form of disabilities; amputation 24.2%, and visual disabilities 8.3%. Physical and educational developments of the children were also affected. **CONCLUSIONS:** The study revealed high household cost and varying burden of injury in children under five years. The findings are significant for policy update, design and implementation of safety and preventive interventions for injury control.

PIH25

COST EFFECTIVENESS ANALYSIS OF THE USE OF IUS-LNG AGAINST ORAL CONTRACEPTIVES AND NSAIDS, FOR THE TREATMENT OF HEAVY MESTRUAL BLEEDING IN COLOMBIA

Vargas J[1], Alandete J[2], Herran SE[3], Meneses E[3], Marrugo RD[3]
[1]*Econopharma, Mexico City, Mexico,* [2]*Bayer LATAM, Whippany, Mexico,* [3]*Bayer andina, Bogota, Colombia*

OBJECTIVES: To estimate the cost-effectiveness ratios for the use of IUS-LNG versus the use of oral contraceptives and three NSAIDs (mefenamic acid, tranexamic acid and naproxen) for the treatment of heavy menstrual bleeding in Colombia **METHODS:** A Markov model was developed to estimate the rate of bleeding control evaluating frequency of hysterectomies as the main clinical outcome and the total healthcare costs. The base case is patients with excessive loss of menstrual blood that affect quality of life related to health. It uses a 12-month horizon, with monthly cycles. The chances of menstrual bleeding control were estimated from clinical trials. It includes the costs of the technologies extracted from local data base and the events from insurance costs. Healthcare costs included: hysterectomies with their complications and ablation. **RESULTS:** IUS-LNG was found as the technology that prevents the largest number of hysterectomies in one year: 72% of patients treated with the IUS-LNG did not arrive to hysterectomy, compared to 45% of patients under oral contraceptives and 41% under NSAIDS. In terms of average costs, patients treated with IUS-LNG, ACOs and NSAIDs are estimated at USD $438, USD $507 and USD $751,

respectively. Thus, IUS-LNG is considered a dominant technology in the control of heavy menstrual bleeding **CONCLUSIONS:** IUS-LNG is a dominant first line alternative compared to other technologies covered by the Colombian health care system reducing between 13,5% and 41,5% of costs and avoiding between 49,0,% and 53,3% histerectomies versus other non-surgical options as NSAIDs and ACOs, respectively.

PIH26

COST-EFFECTIVENESS ANALYSIS OF ETONOGESTREL IMPLANT VERSUS LEVONORGESTREL INTRAUTERINE SYSTEM FROM THE PRIVATE HEALTH SECTOR PERSPECTIVE IN BRAZIL

Coutinho MB, Haas LC, Carvalho LC, Risso F
MSD Brasil, São Paulo, Brazil

OBJECTIVES: An unplanned pregnancy can have profound consequences, e.g., unsafe abortion, which is a public health problem in Brazil. Ensure access to highly efficient contraceptive may impact in reducing unplanned pregnancies. Therefore, this analysis aimed to evaluate the cost-effectiveness of long acting reversible contraceptives (etonogestrel implant versus levonorgestrel intrauterine system), from the Brazilian private health perspective. **METHODS:** The eligible population was private insurance beneficiaries in September 2016 that were current users of levonorgestrel intrauterine system, aged 19 to 48 years. Efficacy, cost and market-share of contraceptives data were obtained from local sources. Annual discontinuation and failure rates of each method were considered. Average cost of an unplanned pregnancy was 3,181.33 BRL. The prices for etonogestrel implant and levonorgestrel intrauterine system were 902.85 BRL and 760.33 BRL, in addition to 173.5 BRL and 236.52 BRL, respectively, as reimbursement by procedure. For levonorgestrel intrauterine system, it was also considered a hysteroscopy in 25% of cases in the base case and 75% in the alternative scenario. Time horizon was 15 years, with yearly cycles. Costs and benefits were discounted by 5% per year. **RESULTS:** In an initial population of 213,714 women, etonogestrel implant avoided 395 unplanned pregnancies after 15 years, with savings in device costs and unplanned pregnancies costs, therefore being cost-saving, in both scenarios. The reduction in total costs was of 27.117.307 BRL for the base case and 159.161.722 BRL for the alternative scenario. **CONCLUSIONS:** Compared to levonorgestrel intrauterine system, etonogestrel implant was cost-saving, with a reduction of unplanned pregnancies and costs. Given its high efficacy and cost-effectiveness, etonogestrel implant should be included as an option for women in the private health sector of Brazil.

KNOWLEDGE, ATTITUDE AND PRACTICE (KAP) TOWARDS VACCINATION: A CROSS SECTIONAL STUDY AMONG THE PARENTS IN URBAN REGION OF MALAYSIA

Aziz S[1], Iqbal MZ[1], Mohiuddin SG[1], Ravichandran S[2], Ravichandran V[1], Iqbal MS[3], Prajapati SK[4], Tahir M[5], Ahmed MU[5], Parveen S[6]
[1]*Aimst University, Sungai Petani, Malaysia,* [2]*KMCH College of Pharmacy, Coimbatore, India,* [3]*MAHSA University, Kuala Lumpur, Malaysia,* [4]*AIMST University Kedah Malaysia, Sungai Petani, Malaysia,* [5]*University of Veterinary and Animal Sciences, Lahore Pakistan, Lahore, Pakistan,* [6]*The Islamia University of Bahawalpur, Bahawalpur, Pakistan*

OBJECTIVES: To evaluate parent's knowledge attitude and practice (KAP) on vaccination and also to assess factors associated with low adherence to vaccination due to pharmacoeconomic factors in urban region of Malaysia. **METHODS:** Pre-validated questionnaire was used to obtain response from 200 parents from different communities with different educational and socioeconomic status. Proper adherence and appropriate knowledge was noted on the basis of selected socioeconomic parameters. **RESULTS:** One hundred and fifty five (77.6%) parents were having appropriate knowledge with mean score of ± 62%. A p-value <0.05 was considered significant. There was statistically significant association observed between educational level and adherence to vaccination schedule ($\Phi = 0.583$, $p < 0.021$). Low socioeconomic status directly influenced adherence and practice related to vaccination schedule ($p < 0.001$, $\Phi = 0.753$) provided by ministry of health, Malaysia. No statistically significance was seen between any other variable and vaccination schedule provided by ministry of health, Malaysia. **CONCLUSIONS:** Female participants had good knowledge and practice in comparison to male participants. All the participants rejected the involvement of religious beliefs in their decisions for vaccinating their children. There is a good knowledge, attitude and practice towards vaccination in all three communities i.e. Malay, Indian and Chinese. There is some gap in attitude about vaccination which should be discussed and resolved.

ASSESSING MOTIVATIONS FOR CHOOSING THE PLACE TO GIVE BIRTH AMONG PREGNANT WOMEN

Tauker A[1], Farkas P[2], Csákvári T[3], Boncz I[4], Ferenczy M[1], Komlósi K[1], Oláh A[4], Pakai A[3]
[1]*University of Pécs, Szombathely, Hungary,* [2]*Markusovszky Hospital, Szombathely, Hungary,* [3]*University of Pécs, Zalaegerszeg, Hungary,* [4]*University of Pécs, Pécs, Hungary*

OBJECTIVES: A government decree legalized home birth under strict conditions since May 2013 in Hungary. In our study we examined women's oppinion about such topics as pregnancy and giving birth, what choice do they make in order to take an active part of the whole process of pregnancy. **METHODS:** A cross-sectional, quantitative study with non-probability, targeted sampling was performed between 2014. 12. 01. – 2015. 02. 15. Our sample consists of pregnant women (N=163). Results were calculated with SPSS 22.0. Besides descriptive statistics we calculated χ2-test and independent samples t-test ($p<0.05$). **RESULTS:** There is a significant connection between frequent prenatal care attendance and choosing home birth ($p<0.05$). However it does not show correlation with socio-demographic data nor parity ($p>0.05$). There is also a significant connection between concerning for the newborn baby and choosing place to give birth ($p<0.05$), and women concerning for their own health and choosing place to give birth ($p<0.05$). **CONCLUSIONS:** Our survey could give an insight into the current situation, when home birth is legally approved. Regarding the importance of this topic we find it necessary to make further research. Women have an increasing need to give birth in a pleasant, relaxing, loving, homely atmoshpere. It is important to give scope to alternative care in hospitals, allow the presence of family, doulas and midwives to help pregnant women with their combined force.

PIH29

ASSESSING THE NUTRITIONAL STATUS OF THE ELDERLY LIVING AT ELDERLY NURSING HOMES

Oláh A[1], Havasi-Sántha E[1], Váradyné Horváth Á[1], Csákvári T[2], Rozmann N[1], Pusztai D[1], Boncz I[1], Pakai A[2]
[1]*University of Pécs, Pécs, Hungary,* [2]*University of Pécs, Zalaegerszeg, Hungary*

OBJECTIVES: Malnutrition has a negative affection for elderly people's health and quality of life, yet it is not an uncommon phenomenon in elderly homes. The aim of our study was to assess the nutritional status and factors affecting their nutritions of elderly people living in homes in Kalocsa, Hungary. We were also assessing the connection between nutritional status of the elderly, their mental health and other diseases. **METHODS:** A longitudinal, quantitative study was carried out with non-probability, targeted sampling at the eldery nursing home in Kalocsa, Hungary between 2015. 08. 04. and 2015. 12. 12. Our sample consists of people above 60 years (N=100). Data collection was made with a self-made questionnaire, document analysis, anthropometric measurements and standard questionnaires (MUST, MNA-SF, MNA, SNAQ65+, MMSE). SPSS 22.0 was used for calculating descriptive statistics, χ2-test, paired samples t-test and ANOVA ($p<0.05$). **RESULTS:** Mean age of responders is 81.24±8.758 years. Prevalence of malnutrition in the sample: MNA3=8%; MNA-SF3=11%; MUST3=13%; SNAQ65+3=14%. Nutritional status of elderly people decreased significantly according to MUST and MNA-SF ($p<0.05$). There is a strong connection between the presence of dementia and malnutrition according to MNA ($p=0.018$). Nutritional status is influenced by hypertonia ($p<0.05$), gastrointestinalis ($p=0.008$), psychiatrial condition ($p=0.037$), bone and muscle disorders ($p=0.008$), appetite ($p<.,001$) ability to swallow ($p<0.05$) and self-sufficiency ($p<0.001$). **CONCLUSIONS:** Nearly one quarter of elderly living in homes suffers from malnutrition. Malnutrition or the risk of it occurs more frequently in people with dementia – this result is similar to the findings of Malara et. al in 2010.

PIH30

RURAL-URBAN MIGRATION AND THE HEALTH OF ELDERLY PARENTS IN CHINA

Zhang X
University of New South Wales, Sydney, Australia

OBJECTIVES: Large-scale rural-urban labour migration and rapid population ageing are two important demographic developments in China. Both result in a growing number of left-behind rural elderly. The paper investigates the effects of adult children's rural-urban migration on the health of their left-behind elderly parents in China. **METHODS:** We use a panel data set constructed from the 2011 and 2013 waves of the China Health and Retirement Longitudinal Study (CHARLS). We employ an instrumental variables (IV) strategy to account for the endogeneity of children's migration decision. We use village level sent-down youth (SDY) numbers as an exogenous source of variation in the likelihood of adult children's migration. To improve the measure we calculate an interaction effect between the SDY number and the GDP growth in the cities where SDY originally came from. **RESULTS:** A strong first stage result is confirmed in our research for the effect of SDY on individuals' migration decisions. The preliminary second stage result shows that children's migration has a positive effect on the left-behind parents' health outcomes. We argue that the income effect from remittances is the most likely transmission channel of children's migration on elderly left-behind parents' health. This explanation is confirmed by studying how the effects differ across socio-demographic sub-groups. We also compare different dimensions of elderly health to provide a detailed picture of the health effects of rural-urban migration in China. **CONCLUSIONS:** This paper contributes new findings for China to the growing international literature analysing the effects of rural-urban migration on the health of elderly left-behind family members, controlling for self-selection of the migration-decision making. We also provide new evidence on the changing mechanisms of intergenerational support in the context of rapid urbanisation and population ageing in China.

PIH31

CRITICAL NEED FOR A NEW PATIENT-RELATED OUTCOMES (PRO) MEASURE IN CLINICAL PRACTICE AND RESEARCH FOR PATIENTS WITH VULVODYNIA

Joensson L[1], Duttagupta S[2], Nash P[3], Yang M[2]
[1]*Grunenthal GmbH, Aachen, Germany,* [2]*CBPartners, New York, NY, USA,* [3]*CBPartners, San Francisco, CA, USA*

OBJECTIVES: To appraise existing PRO measures used in clinical practice and research for vulvodynia. **METHODS:** The study employed a literature review followed by interviews with clinicians and payers to appraise PRO measures in vulvodynia. Exhaustive review of literature, and review of trials from Clinicaltrials.gov were carried out, accompanied by structured interviews of 27 clinicians and payers from France, Germany, Spain, Great Britain, Italy, and the USA. Strengths, weaknesses, and unmet needs associated with existing PRO measures

were identified in the context of evidence development as well as importance of PRO-generated data on future access to treatments for patients with vulvodynia. **RESULTS:** Nine PROs were identified through secondary research, five were generic measures including Numerical Rating Scale (NRS), Visual Analog Scale (VAS), Short Form-McGill Pain (SF-MPQ), Brief Pain Inventory (BPI), and SF-36. Four disease-specific measures were identified including Female Sexual Functioning Index (FSFI), Female Sexual Distress Scale (FSDS), Marinoff Dyspareunia Scale (MDS), and Vulvovaginal Symptoms Questionnaire (VSQ). Pain and sexual functioning were important attributes captured in these measures. Stakeholders were satisfied with the NRS and VAS for measuring pain, while clinicians were somewhat satisfied with the FSFI and SF-36 to capture the impact on daily life. Critical gaps identified in existing PROs included their relevance to patients' daily lives, such as ability to wear tight pants, use tampons, or ride a bike without pain. Payers in Spain and Germany identified the need for such specificity in order to understand the impact of new treatments, and to provide broader access. **CONCLUSIONS:** Pain intensity and sexual quality of life were adequately captured, however, existing PROs did not capture all aspects of the patient experience with vulvodynia, as communicated by both clinicians and payers across six countries. Therefore, there is a critical need for a robust disease-specific PRO for clinical practice and research.

PIH32

PREDICTORS OF ANXIETY AND DEPRESSION AMONG PREGNANT WOMEN ATTENDING A TERTIARY HEALTHCARE INSTITUTE IN QUETTA CITY, PAKISTAN

Ghaffar R[1], Iqbal Q[1], Haider S[1], Saleem F[2]
[1]University of Balochistan, Quetta, Pakistan, [2]University of Baluchistan, Quetta, Pakistan

OBJECTIVES: Anxiety and depression (A&D) are commonly reported among pregnant women; however, there is paucity of information from developing countries. The current study therefore aims to evaluate the frequency of A&D and to highlight the predictors among pregnant women attending a tertiary healthcare institute in Quetta city, Pakistan. **METHODS:** A questionnaire based, cross-sectional survey was conducted. The pre-validated Hospital Anxiety and Depression Scale (HADS) was used to assess the frequency of A&D among study respondents. Anxiety and depression scores were calculated via standard scoring procedures while logistic regression was used to identify the predictors of A&D. SPSS v. 20 was used for data analysis and $p<0.05$ was taken as significant. **RESULTS:** Seven hundred and fifty pregnant women responded to the survey. Majority of the respondents belonged to age group of 26-35 year (424, 56.4%) and had no formal education (283, 37.6%). Furthermore, 612 (81.4%) of the respondents were unemployed and had urban residencies (651, 86.6%). Mean anxiety score was 10.08±2.52; mean depression score was 9.51±2.55 and total HADS score was 19.23±3.91 indicating moderate A&D among the current cohort. Logistic regression analysis reported significant goodness of fit (Chi square = 17.63, $p = 0.030$, $df = 3$), indicating that the model was advisable. Among all variables, age had a significant association when compared with HADS scores (adjusted OR=1.23, 95 % CI = 1.13 – 1.62, $p < 0.001$). **CONCLUSIONS:** Moderate A&D was reported among the study respondents. Furthermore, age was highlighted as a predictor of A&D. The evidence from this and other studies provide an impetus for support programs for anxious and depressed pregnant women. The benefits of implementing good mental health in antenatal care have long lasting benefits for both mother and infant. Therefore, there is a need to incorporate A&D screening in the existing antenatal programs.

PIH33

LONGITUDINAL ASSESSMENT OF USING COMMON BENZODIAZEPINE/NON-BENZODIAZEPINE HYPNOTICS AMONG THE ELDERLY

Lin H[1], Lin C[2], Li T[1], Wu H[2], Hung C[1], Lin C[2], Hsieh Y[2], Chang C[2], Tsai H[3], Liao C[2], Chou C[2], Lin Y[1]
[1]China Medical University, Taichung, Taiwan, [2]China Medical University Hospital, Taichung, Taiwan, [3]Providence University, Taichung City, Taiwan

OBJECTIVES: Concerning that elderly should avoid to use benzodiazepine (BZD) and non-BZD hypnotics for long-term, this study aimed to observe elderly patients' disease statuses, efficacy outcomes, and safety concerns of using BZD/Z-drugs longitudinally. **METHODS:** We enrolled elderly patients who regularly visited a 2000-bed medical center and were prescribed with listed BZD/Z-drugs for more than 1 week in study group and those who had not taken these medications in control group. Those elderly who ever had severe neuropsychiatric disorders, active cancer, received organ transplantations, or couldn't cooperate with interview were excluded. All enrolled patients were interviewed for the following measures every three month and up to one year: changes in insomnia quality, functional statuses, Mini-Mental State Examination, fall experience, depression scale, occurrence of adverse drug reactions (ADRs), Morisky Medication Adherence Scale 8-item, EuroQol EQ-5D-5L, and health utilizations. **RESULTS:** Up to January 19, 2017, 239, 160, 114, 64 and 17 patients, respectively, completed the first, second, third, fourth and fifth visit assessments. 53.2% of 239 elderly patients were enrolled in the study group. Comparing to that in control group, elderly patients in study group tended to: have poor EQ-5D-5L scores, have more cognitive impairment, and have poor medication adherence in first visit. More elderly in study group ever experienced falls and 42 encountered BZD/Z-drug ADRs. Of 17 patients completed 1-year follow-up, 9 patients in the study group tended to have less diseases, visited less outpatient units, spent less outpatient expenses, had better sleep quality, but had more complex medication regiments and encountered more BZD/Z-drug ADRs across times, comparing to 8 patients in control group. **CONCLUSIONS:** Those elderly patients taking BZD/Z-drugs had poor clinical and humanistic outcomes, poor medication adherence, and more complex medication regiments and encountered more BZD/Z-drugs related ADRs across time than those patients not taking these medications.

PIH34

MALNUTRITION ASSOCIATION WITH FUNCTIONAL STATUS AND HEALTH OUTCOMES AMONG COMMUNITY-DWELLING OLDER CHINESE ADULTS

Zhang Y[1], Fan L[2], Wei J[3], Li S[2], Partridge J[2], Claytor L[2], Sulo S[2]
[1]China Health Economics Association, Beijing, China, [2]Abbott Nutrition, Abbott Park, IL, USA, [3]Beijing Hospital Department of General Surgery, Beijing, China

OBJECTIVES: Malnutrition is associated with multiple adverse outcomes among both hospitalized and community-dwelling older adults. Although China has the largest elderly population in the world, limited research assessing the impact malnutrition has on the physical health of Chinese older adults exists. We investigated the association between malnutrition, functional status, health outcomes, and healthcare costs among community-dwelling older Chinese adults. **METHODS:** A national sample of adults aged 60 years or older collected as part of the Wave II-2013 China Health and Retirement Longitudinal Study (CHARLS) survey were included in the analysis. Measures of hand grip strength, body mass index, and weight loss were used as indicators of malnutrition status. Functional status was assessed via adapted versions of the Katz Index of independence in basic activities of daily living (ADLs) and the Lawton-Brody Index of independence in instrumental ADLs (IADLs). Health outcomes included self-reported health status and probability of having one of the 14 assessed comorbid conditions (e.g., stroke, chronic stomach disease, hypertension, etc.). Multivariate regressions were used to analyze the associations. **RESULTS:** Malnutrition was associated with lower but insignificant basic ADLs ($p > 0.1$), but significantly lower instrumental ADLs, poorer health status, higher probability of having stroke and chronic stomach disease (all p values < 0.1). As a significant contributor of poorer health status, malnutrition, increased hospital cost by ¥214 (14% increase, $p < 0.01$) per person per year. Although malnutrition contributed to lower functional independence (IADLs), higher probability of having stroke and chronic stomach disease, no significant increase in hospital costs was observed. **CONCLUSIONS:** Malnutrition was associated with poorer functional, health status, and cost outcomes among community-dwelling older Chinese adults. Therefore, malnutrition screening and treatment with oral nutritional supplements are essential in improving the health of older Chinese adults living in the community, and potentially lowering the costs of healthcare.

HEALTH-RELATED QUALITY OF LIFE OF PREGNANT WOMEN ATTENDING THE TERTIARY CARE HOSPITAL QUETTA, PAKISTAN

Haq N, Bibi P, Nasim A, Khan M, Yasmin R, Ahmed N
University of Balochistan, Quetta, Pakistan

OBJECTIVES: The study aimed to evaluate Health Related Quality of Life (HRQoL) in pregnant women attending the teaching hospital of Quetta, Pakistan. **METHODS:** A cross sectional study was conducted from February to September 2016 to evaluate the HRQoL in pregnant women attending Bolan medical Complex Hospital. The data was collected by using WHOQOL-BREF questionnaire developed by WHO. Descriptive analysis was used for elaborating patients' demographic characteristics. All analyses were performed using SPSS 22.0 **RESULTS:** A total of 387 pregnant women were included in the study. Majority of the respondent were between the age group of 26-35 years, majority were housewives (n=280, 72.2%). Most of the respondents were surveyed in third trimester (n=163, 42%). The overall WHOQOL-BREF mean score was 49.16 and the mean score for each domain were; Physical domain; 12.58, psychological domain; 11.47, social domain; 13.50 and environmental domain; 11.61. **CONCLUSIONS:** The results of the study showed that Health Related Quality of life in pregnant ladies are adversely affected. The pregnancy affect all the aspects of life of the women this may cause physiological and psychological issues to the pregnant ladies during or after the termination of the pregnancy. Focusing on the quality of life during pregnancy can be beneficial for health of women as well as the child.

IMPACT OF ICD-10 ON CODING OF HYSTERECTOMY PROCEDURES

Sobolewski C[1], Flynn C[2]
[1]Duke University, Durham, NC, USA, [2]Medtronic, Mansfield, MA, USA

OBJECTIVES: Beginning on October 1, 2015, International Statistical Classification of Diseases, or ICD-10 coding was implemented in the US healthcare system. Number of procedure codes increased from 3,882 to 71,974 in ICD-10. The change has implications of coding infrastructure and potentially reimbursement. Goal of the study was to describe how commonly performed surgeries are coded using ICD-10. **METHODS:** We used Premier hospital inpatient database for Q4,2015 (first full quarter with ICD-10 data). We identified discharges with a primary diagnosis and relevant Medicare Severity-Diagnosis Related Group (MS-DRGs) for hysterectomy (734-743). Descriptive analysis was conducted to report the top ICD-10 procedure codes. **RESULTS:** 8,975 discharges were identified for hysterectomy, with MS DRGs 734-743 and relevant primary diagnoses codes, the top three including: 1) D259: Leiomyoma of Uterus, Unspecified, with 2,201 discharges; 2) D251: Intramural Leiomyoma of Uterus, with 760 discharges and; 3) C541: Malignant Neoplasm of Endometrium with 625 discharges. Top primary procedures included: 1) OUT90ZZ: Resection of Uterus, Open Approach, with 4,211 or 46.92% of discharges; 2) OUT94ZZ: Resection of Uterus, Percutaneous Endoscopic Approach (PEA), with 872 (9.72%); 3) OUT9FZZ: Resection of Uterus, Via Natural or Artificial Opening, with PEA, with 646 (7.2%); 4) OUB90ZZ: Excision of Uterus, Open Approach, with 561 (6.25%) and; 5) OUT97ZZ: Resection of Uterus, Via Natural or Artificial Opening, with 547 (6.1%). **CONCLUSIONS:** We report the first, real-world experience of ICD-10 coding. Code for open abdominal hysterectomy was reported in nearly half of hysterectomy procedures and was the single most commonly used procedure code.

MEASURING THE IMPACT OF GERIATRIC CARE AMONG MEDICARE BENEFICIARIES

Miyasato G[1], Suh M[1], Wang Z[2], Yang S[2], Liu Z[2], Han Z[2], Fu F[2], Zhao Z[2], Qin Q[2], Zhao P[2], Wang Z[1], Yajima M[2], Kokkotos F[1]
[1]Trinity Partners, LLC, Waltham, MA, USA, [2]Boston University, Boston, MA, USA

OBJECTIVES: To measure the impact of geriatric care on patient outcomes using Medicare claims data **METHODS:** A matched cohort analysis was performed, comparing patient outcomes among those with and without geriatrician care. The study cohorts were created from claims spanning 2010-2014, representing a random 5% sample of Medicare FFS beneficiaries that were aged 65+ in 2010. Patients with at least one geriatric care claim between (but not before) 2011-2014 were propensity score matched to those without any geriatric care claims from 2010-2014. Survival rates, healthcare resource utilization (HCRU) and costs were compared between matched cohorts. **RESULTS:** 118,382 patients receiving geriatric care were identified, along with a random sample of 535,526 patients not receiving geriatric care. Samples of the cohorts were taken and propensity score matching was performed to create 10,000 matched pairs. Kaplan-Meier plots comparing the two matched cohorts indicated that, overall, the geriatric care group had shorter survival times than their counterparts. Among sicker patients, however, the analysis suggested that survival times were relatively longer in the geriatric care group. In terms of HCRU, patients receiving geriatric care were, on average, likely to have more inpatient, outpatient and physician office claims (62%, 18% and 49% more, respectively). Mean monthly costs were comparable in the two matched cohorts (p=0.53). **CONCLUSIONS:** Geriatric care has the potential to improve the longevity of those afflicted by multiple chronic conditions. Geriatricians' focus on coordination of care increases the amount of healthcare resource utilization but costs are on par with patients not receiving geriatric care, possibly the result of support that is more efficient and preventative in nature. While only a small proportion of elderly patients receive geriatric care, this study suggests that more patients and the healthcare system at large could benefit from promoting the involvement of and increasing access to geriatricians.

17-ALPHA-HYDROXYPROGESTERONE ADMINISTRATION TO HIGH-RISK PREGNANT MOTHERS RESULTS IN SIGNIFICANT GAINS IN PREGNANCY-RELATED OUTCOMES IN GEOOGRAPHICALLY DIVERSE MEDICAID POPULATIONS

Pradhan S[1], Keleti D[1], Donia T[1], Michael KE[2], Gelzer AD[2]
[1]AmeriHealth Caritas, Philadelphia, PA, USA, [2]Keystone First, Philadelphia, PA, USA

OBJECTIVES: Administration of weekly 17-alpha-hydroxyprogesterone caproate (17P) injections in high-risk pregnancy from 16–24 weeks until delivery reduces pre-term birth (PTB) rates by up to 30%. This retrospective cohort analysis investigated the impact of 17P on gestational age and neonatal intensive care unit (NICU) utilization in 17P-treated versus untreated cohorts. **METHODS:** The study cohort consisted of Medicaid members (ages 16–45 years) from six geographically diverse managed care organizations with ≥1 estimated gestational live birth registered in our claims database who were administered 17P from 2014–2015 (N=382). The comparator cohort consisted of members with the same high-risk characteristics in the Medicaid population who were not administered 17P, delivering babies from 2013–2015 (N=7,918). Intra-cohort comparisons (pre- versus post-gestational weeks within cohorts) and inter-cohort comparisons (difference-in-differences [DID] estimation between cohorts) for primary outcome measures were calculated using two tailed t-tests and unadjusted generalized least square regression models, respectively. **RESULTS:** 17P-users averaged two years older than non-users, with higher rates of comorbidities, healthcare and pharmacy utilization, acute hospitalization, and gestational risk (56% versus 28%). With 17P administration, the average gain in gestational age was 1.4 weeks (p<0.001; 35.6 to 37.0 weeks pre- to post-17P) versus -0.2 weeks (p<0.0001; 38.7 to 38.5 weeks pre- to post-delivery for comparator). DID analysis between pre- and post-periods of the 17P cohort revealed a statistically significant gain of 1.6 weeks (p<0.0001). The average reduction in NICU rate was -5% (p=0.1; 26% to 21% pre- to post-17P) versus -0.3% (p=0.695; 7.8% to 7.5% pre- to post-delivery for comparator). DID analysis revealed a statistically significant gain of +4.7% (p=0.013). Total medical cost savings were projected at >$12 million USD. **CONCLUSIONS:** 17P is an effective treatment for Medicaid members in managed care with a history of PTB in increasing gestational age, decreasing NICU utilization, and reducing health care costs.

PIH39

COST BURDEN OF SARCOPENIA ASSOCIATED HOSPITALIZATION IN ADULTS BY AGE AND RACE/ETHNICITY

Goates S[1], Du K[2], Arensberg ME[1], Pereira S[1], Gaillard T[3], Hegazi R[1]
[1]Abbott Nutrition, Columbus, OH, USA, [2]University of Illinois at Urbana-Champaign, Champaign, IL, USA, [3]University of Cincinnati, Cincinnati, OH, USA

OBJECTIVES: Estimate the cost of increased hospitalizations associated with sarcopenia within age and race subpopulations. **METHODS:** Sarcopenia was defined as having a low appendicular lean body mass index (less than 0.789 for males and 0.512 for females) and functional limitation. We examined age related sarcopenia in older adults (age≥65), and non-age related sarcopenia in the middle-aged (age 40-64). The prevalence of sarcopenia and associated hospitalizations were estimated using the National Health and Nutrition Examination Survey (NHANES) for 1999-2004. The cost of increased hospitalizations is estimated for age and race/ethnicity subpopulations using the 2014 Healthcare Utilization Project National Inpatient Sample (HCUP NIS). The subpopulation burden is calculated using the size of the subpopulation (U.S. Census), subpopulation prevalence, subpopulation increased hospitalizations and the subpopulation average cost per hospitalization. Confidence intervals were estimated by simulation. **RESULTS:** Individuals with sarcopenia incur $2263 (2014 USD, CI: $947, $3778) more hospital costs per year than individuals without sarcopenia. The average cost per subpopulation member (total cost divided by subpopulation size) varies by race/ethnicity: $238 (CI: $96, $417) for Whites; $45 (CI: $16, $87) for Blacks; $451 (CI: $191, $814) for Hispanics and $379 (CI: $95, $900) for Others (p<0.05). The overall cost of increased hospitalizations associated with sarcopenia was $39.5 billion (CI: 16.2B,67.4B), or $254 (CI: $193, $433) per individual. Whites accounted for the largest portion of this cost (age 40-64: $12.9B; age ≥65: $12.7B; Total: $25.6B), followed by Hispanics (age 40-64: $5.9B; age≥65 : $3.1B; Total: $9.0B), Others (age 40-64: $2.1B; age≥65 : $2.0B; Total: $4.1B) and Blacks (age 40-64: $0.1B; age ≥65 : $0.6B; Total: $0.8B). **CONCLUSIONS:** Sarcopenia is a costly condition across age and race/ethnicity subpopulations. Hispanics bear the highest per capita cost, followed by Others, Whites and Blacks. Further study is needed to understand the differential impact of sarcopenia on these groups.

PIH40

EXTENDED-SPECTRUM-B-LACTAMASE PRODUCING ENTEROBACTERIACEAE IN GESTATIONAL URINE CULTURES: PREVALENCE AND RISK FACTORS

Guri A[1], Flaks-Manov N[2], Ghilai A[2], Hoshen M[2], Flidel O[1], Ciobotaro P[1], Zimhony O[1]
[1]Kaplan Medical Center, Rehovot, Israel, [2]Clalit Research Institute, Tel Aviv, Israel

OBJECTIVES: Extended-spectrum-β-lactamase producing Enterobacteriaceae (ESBL-PE), once prevalent only in the hospital setting, are becoming major pathogens of obstetric and neonatal infections. A better understanding of ESBL-PE epidemiology in pregnant women may help guide better screening policies and appropriate empirical antibiotic treatment. The study was aimed to analyze the prevalence of ESBLE-PE in gestational urine cultures and the risk factors associated with ESBL-PE growth in gestational urine cultures. **METHODS:** A retrospective cohort study was conducted with electronic health records (EHR) from the centralized Clalit Health Services (CHS) database. The study population included pregnant members who delivered in one of the CHS hospitals between 2009-2013 who provided at least one urine culture during the pregnancy. **RESULTS:** The study population included 134,152 women (95% of total CHS deliveries). 15,282 (11.4%) of the cultures yielded Enterobacteriaceae growth, with 603 (3.9%) ESBL-PE positive results. The proportion of ESBL-PE in gestational urinary cultures increased from 2.8% in 2009 to 6.4% in 2013. In the multivariate logistic regression model, Arab ethnicity (OR=1.33 CI95% 1.11-1.58), assisted fertilization procedures (AFP) (OR=1.48 CI95% 1.09-2.02), and the use of antibiotics (especially penicillins OR 1.36 CI95% 1.32-1.65 and quinolones OR 1.71 CI95% 1.28-2.27) were found to be associated with ESBL-PE growth in gestational urine cultures. **CONCLUSIONS:** The prevalence of ESBL-PE in gestational urine cultures in this large epidemiological study was increasing at an alarming rate. In this, usually healthy, population the most important risk factors are related to multiple encounters with health-providers and those connected to previous antibiotic treatment. The risk factors can be implicated in screening and cohorting strategies. The policy to prevent ESBL-PE outbreaks in neonatal units should include maternal and neonatal screening, cohorting and notifying the medical staff when ESBL-PE positive women and their neonates are admitted.

PIH41

LONGITUDINAL CHANGES IN HEALTH CARE UTILIZATION AND RELATED COST AMONG ELDERLY WITH DIFFERENT FARAITY LEVEL IN TAIWAN

Wen Y[1], Chen L[2], Hsiao F[3]
[1]Health Data Research Center, National Taiwan University, Taipei, Taiwan, [2]Center for Geriatrics and Gerontology, Taipei Veterans General Hospital, Taipei, Taiwan, [3]Graduate Institute of Clinical Pharmacy, College of Medicine, National Taiwan University, Taipei, Taiwan

OBJECTIVES: To longitudinally evaluate the impact of frailty on health care utilization and corresponding expenditure in a nationally-representative elderly cohort. **METHODS:** We conducted a retrospective cohort study using the 2005-2013 Taiwan's Longitudinal Health Insurance Database. The study cohort consisted of 86,133 subjects aged between 65 and 100 years in 2005. Using cumulative deficit approach, we constructed the frailty index (FI), which included deficits from outpatient and inpatient diagnosis during 2005. Further, we categorized study population into 4 groups according to the FI: fit (FI=0-0.0625), mild frailty (FI=0.0625-0.125), moderate frailty (FI=0.125-0.1875) and severe frailty (FI>0.1875). Health care utilizations (including outpatient, emergency department and inpatient visits) and corresponding direct medical costs for 4 groups were estimated annually during the 8-year follow-up period (2006-2013). **RESULTS:** Overall, 2.9% (n=2,498) subjects were classified as severe frailty, 5.5% (n=4,741) as moderate frailty, 16.54% (n=14,244) as mild frailty and 75.06% (n=64,650) as fit. We found that frailer elderly would have more outpatient visits (during 1st year of the follow-up period, severe frailty: 57.36, moderate frailty: 48.02, mild frailty: 39.16 and fit: 21.54 visits/person-year). The annual numbers of emergency department visits and hospital admissions were also increased with frailty during the 8-year follow-up period. Mean direct medical cost during follow-up period was highest for severe frailty group ($5,026/person-year), followed by moderate frailty ($3,835/person-year), mild frailty ($2,966/person-year) and fit groups ($1,766/person-year). For severe frailty group, the direct medical cost associated with hospital admissions (during 1st year of the follow-up period, $3,433/person-year) was higher than the cost associated with outpatient visits ($2,415/person-year). However, the direct medical cost associated with outpatient visits was higher than the cost associated with hospital admissions among other 3 groups. **CONCLUSIONS:** We provided the important real-world data for patient-level longitudinal changes in health care utilization and direct medical costs among older population categorized by frailty.

PIH42

VARICELLA-RELATED HEALTH CARE RESOURCE UTILIZATION IN PERU

Castillo ME[1], Gutierrez R[2], Monsanto H[3], Rampakakis E[4], Altland A[5], Wolfson LJ[5]
[1]INSN (Instituto Nacional de Salud del Niño), Breña, Lima, Peru, [2]Merck Sharp & Dohme Peru S.R. L, Lima, Peru, [3]Merck Sharp & Dohme IA LLC, Carolina, PR, PR, [4]JSS Medical Research, Saint-Laurent, QC, Canada, [5]Merck & Co. Inc., Kenilworth, NJ, USA

OBJECTIVES: Varicella-zoster virus (VZV) is a serious health concern that results in considerable burden to public health systems, with a minimal estimate of

375,000 cases per year in children under 15 in Peru. Since the introduction of safe and effective varicella vaccines, several countries have implemented routine childhood varicella immunization programs that have drastically reduced associated morbidity and mortality. Peru currently does not include the varicella vaccine in their public childhood immunization schedule. The purpose of this study was to evaluate the burden of illness associated with varicella in Peru. **METHODS:** This was a multicenter, retrospective chart review study of patients aged 1-12 years with a primary varicella diagnosis between 2011 and 2016 in Peru. Clinical complications due to varicella, along with associated healthcare resource utilization (HCRU) were assessed in both the inpatient and outpatient settings using summary statistics. **RESULTS:** A total of 179 children with varicella (101 outpatients, 78 inpatients) from 9 centers (6 public, 3 private), were included in the study, with a mean age of 3.3 (SD: 3.3) and 2.4 (SD: 3.4) years, respectively. Among outpatients, 5.9% experienced at least one complication, specifically skin and soft tissue infections (100% of those experiencing complications), compared with 96.2% of inpatients, among which the most common complications included skin and soft tissue infections (75.3%), pneumonia (6.2%), and encephalitis (3.7%). HCRU estimates included use of over-the-counter (OTC) medications (72.3% outpatients, 89.7% inpatients), prescription medications (30.7% outpatients, 94.9% inpatients), tests/procedures (0.0% outpatients, 80.8% inpatients), and consultation with allied health professionals (0.0% outpatients, 39.7% inpatients). The average duration of hospital stay was 6.8 (95% CI: 5.8 , 8.0) days for inpatients. **CONCLUSIONS:** Varicella is associated with substantial clinical complications and healthcare resource utilization in Peru, subsequently indicating a significant health and economic burden, which supports the need for the implementation of a routine childhood varicella vaccination plan.

PIH43

PRESCRIPTION DRUG USE AND COST ASSOCIATED WITH A PEDIATRICIAN-LED CARE MODEL SERVING CHILDREN WITH SPECIAL HEALTHCARE NEEDS (CSHCN) WITH COMPLEX CHRONIC CONDITIONS (CCC)

Marshall LZ[1], Rascati KL[2]
[1]University of Texas- Austin, Austin, TX, USA, [2]The University of Texas at Austin, Austin, TX, USA

OBJECTIVES: Care for children with medical complexities represents a significant challenge for health care systems and has emerged as an increasingly important component of pediatric practice. A pediatrician-led care coordination may increase the quality of care for medically complex children. We examined the prescription utilization and cost patterns of children with special healthcare needs having complex chronic conditions. **METHODS:** This was a retrospective secondary analysis of prescription utilization and costs using Texas Medicaid administrative claims data for patients with complex chronic conditions (N=229) who were enrolled in the Specially for Children pilot study and patients with complex chronic conditions not enrolled in the Specially for Children pilot study. Daily dispense cost was determined by dividing amount paid for a claim by its corresponding days supply. Descriptive statistics were used for determining the costliest and most frequently paid drug claims. **RESULTS:** A total of 229 patients with 24,478 drug claims were included in the study. The average cost per prescription was $443. The costliest drug claim had a daily dispense cost of $5,706 (HP Acthar Gel 80 unit/ml) with the top ten ranging from $5,706 to $1,454. Average daily dispense cost of the ten most frequent drug claims ranged from $0.57 to $10.30. The AHFS category with the highest attributed cost was for hemostatic agents ($2,085,711, N=55 prescriptions). The most frequent paid drug claim was levetiracetam 100mg/ml solution (N=715). Additionally, AHFS category anticonvulsants, miscellaneous accounted for the most drug claims (N=846). Of the ten costliest AHFS categories, enzymes had the highest average cost per claim ($41,358, N=18). **CONCLUSIONS:** We found the ten most expensive drugs to all exceed a daily dispense cost of $1,450. The next step is to compare differences in prescribing trends and costs between the pediatrician-led model and usual care model.

PIH44

CHANGES IN HEALTHCARE SPENDING AFTER DIAGNOSIS OF COMORBIDITIES AMONG ENDOMETRIOSIS PATIENTS

Epstein AJ[1], Surrey ES[2], Soliman AM[3], Davis M[1], Johnson SJ[1], Castelli-Haley J[4], Snabes MC[3]
[1]Medicus Economics, LLC, Milton, MA, USA, [2]Colorado Center for Reproductive Medicine, Lone Tree, CO, USA, [3]AbbVie Inc., North Chicago, IL, USA, [4]AbbVie Inc., Mettawa, IL, USA

OBJECTIVES: To characterize health care spending associated with endometriosis-related comorbidities. **METHODS:** Women aged 18-49 with endometriosis (N=128,088) were extracted from 2006-2015 de-identified ClinformaticsTM DataMart (Optum Insight, Eden Prairie, MN) claims data. Endometriosis was identified by ICD-9 diagnosis code 617.x on ≥1 inpatient or emergency room claim or ≥2 outpatient claims. For 22 comorbidities, comorbidity patients (first diagnosis after initial endometriosis diagnosis) and controls (no comorbidity diagnosis) were identified. Controls were matched 1:1 to comorbidity patients using geographic region, insurance plan type, age and baseline healthcare spending. Index date was defined as first comorbidity diagnosis date for comorbidity patients, and equal number of days after earliest endometriosis claim for controls. Total medical and pharmacy spending was measured during 12 months before and after the index date. Pre-post differences for comorbidity patients and controls were compared using difference-in-differences linear regression. **RESULTS:** The number of patients with each of the 22 comorbidities varied between 121 and 16,177. Mean age was 37 years. Spending was significantly higher after onset of 8 comorbidities: breast cancer (+$54,453), ovarian cancer (+$19,881), pregnancy complications (+$7,728), systemic lupus erythematosus/rheumatoid arthritis/Sjogren's/multiple sclerosis (+$5,073), infertility (+$4,630), uterine fibroids (+$4,007), ovarian cyst (+$3,866) and headache (+$373) ($p<0.001$ except for headache [$p=0.045$].) Spending was significantly lower for fatigue (−$385), cystitis/UTI (−$1,312) and eczema (−$1,626) ($p<0.001$ except for fatigue [$p=0.048$]). Spending was not different for endometrial cancer, interstitial cystitis, stress, pelvic inflammatory disorder, mood disorders, constipation, fibromyalgia, depression, sprue, hypothyroidism, and irritable bowel syndrome. Difference-in-differences estimates were significantly higher for comorbidity patients for all comorbidities except eczema ($p\leq0.003$). **CONCLUSIONS:** For 8 comorbidities associated with endometriosis, there were significant absolute increases in health care spending after onset; for another 13, there were significant relative increases in spending. Whether these relationships reflect the diagnosis or extent of endometriosis or the pathophysiology of the disease requires further investigation.

PIH45

SURGICAL TREATMENT PATTERNS AND RELATED COSTS FOR WOMEN WITH NEWLY DIAGNOSED UTERINE FIBROIDS

Bonafede MM[1], Miller JD[1], Riehle EC[1], Pohlman SK[2], Troeger KA[2]
[1]Truven Health Analytics, an IBM Company, Cambridge, MA, USA, [2]Hologic, Inc., Marlborough, MA, USA

OBJECTIVES: This study had two objectives: 1) Describe surgical treatment patterns among women with newly diagnosed uterine fibroids (UF), and 2) Estimate the medical costs associated with these surgical interventions. **METHODS:** The Truven Health Analytics MarketScan Commercial and Medicare Supplemental Databases were used to identify women aged ≥30 years with continuous enrollment for at least 12 months before and after the new diagnosis of UF (ICD-9-CM code 218.x) during 2010-2014. Patients with prior UF surgeries or evidence of large uterus or gynecological cancer during the study period were excluded. Receipt of hysterectomy, hysteroscopic myomectomy or uterine artery embolization (UAE) were primary outcomes. Healthcare resource utilization and costs were estimated for gynecologic-related costs (GYN) among women with at least 12 months of continuous enrollment following one of these surgical procedures. **RESULTS:** A total of 292,318 women with newly diagnosed UF met the selection criteria. Overall, 33.1% of patients underwent a surgical procedure for fibroids within 1 year of diagnosis. 21.9% of women underwent hysterectomy within 1 year of diagnosis, decreasing from 24.0% in 2010 to 19.3% in 2014 ($p<0.001$). Yearly rates of hysteroscopic myomectomy were relatively stable (range 4.8% to 5.4%). 86,767 patients met the selection criteria for the cost analysis, consisting of 72,448 hysterectomy, 10,544 hysteroscopic myomectomy, and 3,775 UAE patients. In the first month post-surgery, GYN-related costs for hysteroscopic myomectomy patients ($6,113) were approximately one-half those of hysterectomy ($13,370) or UAE ($11,237). Total annual GYN-related costs were highest for hysterectomy ($14,662) followed by UAE ($13,540), and hysterscopic myomectomy ($9,492). **CONCLUSIONS:** Hysterectomy was the most common UF surgical intervention and represented the greatest healthcare costs following surgery compared to minimally invasive approaches like hysteroscopic myomectomy. These results can help inform future quality and cost-effective decisions about UF surgical treatment choices.

PIH46

CENTENARIANS IN COLOMBIA: AN ANALYSIS OF THREE DATABASES

Yucuma D, Polania MJ, Machado JC, Rosselli D
Pontificia Universidad Javeriana, Bogota, Colombia

OBJECTIVES: To estimate the number and geographical distribution of centenarians in Colombia. **METHODS:** The study was a retrospective analysis, based on three different databases: the Colombian 2005 census, death certificates from 2010 to 2013, and Individual Registry of Health Services (RIPS), the official database of the Ministry of Health, for the year 2014. **RESULTS:** In the census, 3,165 centenarians (1,972 women, 62.3%) were identified, the highest rates of individuals over a hundred years of age (centenarian) were then in La Guajira (2.23 x 10,000), Chocó (1.90) and Sucre (1.61), all of them located in the Caribbean region, and with some of the highest poverty indicators including child mortality. In the four years analyzed, 3,611 centenarians died, with the highest proportions (per thousand deaths) in Chocó (10.4), La Guajira (9.4) and Sucre (6.5). The RIPS identified 3,390 centenarians in 2014, with the highest rates in Sucre (2.17 per 10,000), Chocó (1.29) and Córdoba (1.11). **CONCLUSIONS:** Although the results are consistent in terms of the number and geographical distribution of centenarians, there could have been errors in the record of the date of birth, which is the basic information used to estimate age in all the three sources analyzed. Another explanation may involve higher physical activity, traditional family and community support, low levels of stress, and healthy diet in these regions; these factors have been also associated with longevity in the denominated as "blue zones" (areas of the world with centenarian population rates 10 times higher than in the US). More studies are required to assess geographical distribution of elderly in Colombia and to evaluate factors that could be associated with certain specific geographical distribution.

PIH47

TRENDS IN EXTERNAL CAUSES OF CHILD MORTALITY IN COLOMBIA

Carlier JC, Murcia LH, Arango-Lozano M, Rosselli D
Pontificia Universidad Javeriana, Bogota, Colombia

OBJECTIVES: Infant mortality figures have been improving worldwide. We analyzed official figures for Colombia, with emphasis on “external” causes of death (particularly drowning, traffic accidents, homicides, poisoning and burns). These causes, in general, have been neglected compared with communicable, perinatal, maternal and nutritional (Group 1 diseases in WHO classification). **METHODS:** The National Administrative Department of Statistics (DANE) and the Ministry of Health information system (SISPRO) publish periodic reports from all deaths certificates in Colombia by age, gender, cause of death and geographic location. We analyzed the information from January 2005 through

December 2013. **RESULTS:** During this nine-year period, 106 339 infants (children under 5 years of age) died in Colombia; 85 897 of them (81%) in the first year of life; 4 043 (3.8%) from the five external causes analyzed (males 59%). There was a decrease in the overall number of deaths over the period, from 14 266 in 2005, to 9 499 in 2013. Among external causes of death, the first one was drowning, responsible for 1 749 deaths (around 4 each week), followed by traffic accidents, with 1 282. Homicides were responsible for 692 deaths, and burns for 199. In all the cases analyzed there was a decrease in overall causes of death during the decade, highest (up to 62% reduction) in the Central Andean regions, and lower (on average 22%) in the Caribbean region. Three Colombian departments in the Amazonic region, bordering Brazil (Amazonas, Guainía and Vaupés) did not show any change at all. **CONCLUSIONS:** Despite large regional inequalities, Colombia is achieving the fourth United Nations' Millennium Development Goal: reducing the mortality of children less than 5 years of age. Some progress has been made in deaths from external causes, but there is still a way to go, since these causes of death are, in principle, all preventable.

PIH48

IMPACT OF CLINICAL PHARMACIST INTERVENTION ON THE KNOWLEDGE OF IMMUNIZATION IN PARENTS OF PEDIATRICS IN TERTIARY CARE HOSPITAL

Rangrej MI

Al-Ameen Colege of Pharmacy, Bangalore, India

INTRODUCTIONS: Childhood mortality and morbidity is high due to infectious diseases. The burden of infectious diseases in pediatrics has been reduced primarily due to immunization. Studies show evidence regarding misconceptions on parents' knowledge and negative attitudes towards childhood immunization. This study aims at promoting childhood immunization by improving the parent's knowledge on immunization. **OBJECTIVES:** The objectives were to understand the knowledge level of parents on immunization, educate them regarding the same and post-counseling, assess the impact of education on immunization. **METHODS:** The study was divided into pre and post-intervention phases. In the pre-intervention phase, the parent completed a quantifiable pre-validated questionnaire after which the parent about importance of immunization and also by providing patient information leaflet. In the post-intervention phase, parents completed the post-intervention questionnaire and both pre and post intervention questionnaires were quantified and interpreted. **RESULTS:** 150 children were enrolled in the study, of whom 81(54%) were female babies. 115 mothers and 35 fathers attended the counseling session. 78 (52%) were working, 50 (33.3%) non-working and 22 (14.7%) did not reveal their working status. The commonly observed ADRs were fever alone (33%) and fever with swelling (17.2%). In most children (62 of 150 [41%]) no ADRs were observed. Most of the parents in pre-intervention phase, got the score of 3-6 (which is considered as low knowledge as per the questionnaire scoring and in the post-intervention phase, 9-10 (which is considered good knowledge). Comparison of pre and post-intervention scores showed that parents' knowledge got improved after counseling by the clinical pharmacist. **CONCLUSIONS:** From our study, a significant difference was observed in the pre and post-intervention scores. This study recommends the inclusion of clinical pharmacist in the national immunization program as counselor who certainly will be helpful in imparting education on immunization to parents which improves the national immunization rates. **Key words:** Counseling, Immunization, Pediatrics, Vaccination

QUALITY OF LIFE OF GYNECOLOGIC CANCER PATIENTS

Kozmann K[1], Pakai A[2], Kovács Z[1], Behul B[1], Rozmann N[1], Lendvai-Emmert D[1], Kis T[1], Boncz I[1], Oláh A[1], Váradyné Horváth Á[1]

[1]*University of Pécs, Pécs, Hungary,* [2]*University of Pécs, Zalaegerszeg, Hungary*

OBJECTIVES: Mortality from cancer covers 25% of all mortality from diseases in Hungary. Cancers are more and more unsparing and getting more younger victims every year. The aim of our study was to analyze the quality of life (QoL) of patients suffering from breast or cervical cancer, and to assess the factors influencing QoL. **METHODS:** We carried out a quantitative, cross-sectional study with non-probability, targeted sampling between 2015.10.01-2015.12.22. Our sample consists of patients who have histologically confirmed diagnosis of breast cancer (n=29) or cervical cancer (n=43). A self-made questionnaire and standard questionnaires (EORTC-QLQ C30, QLQ-BR23, EORTC QLQCX24) were used as well. SPSS 22.0 was used to calculate descriptive statistics and t-test ($p<0.05$). **RESULTS:** Mean age of responders is 43.2 (SD: 9,02) years. Socio-demographic data and QoL have a significant connection ($p<0.05$). Age correlates with exacting physical activity; fulfilling family's needs; longer, strenuous walks; enjoyment of life in cervical cancer patients ($p<0.05$). There is no connection between age and any of the assessed QoL related factors ($p>0.05$) in breast cancer patients. We also found significant connection between age and sexual activity, enjoyment of coitus, level of interest in coitus and fear of pain in our population ($p<0.05$). **CONCLUSIONS:** Based on our results we can conclude that several socio-demographic data affect QoL in cancer patients, which are considered as supporting factors of successful coping. We found many similarities with other studies according to our results.

QUALITY OF LIFE OF PATIENTS WITH ENDOMETRIOSIS

Kovács Z[1], Pakai A[2], Oláh A[1], Kozmann K[1], Behul B[1], Rozmann N[1], Kis T[1], Boncz I[1], Váradyné Horváth Á[1]

[1]*University of Pécs, Pécs, Hungary,* [2]*University of Pécs, Zalaegerszeg, Hungary*

OBJECTIVES: Clinically the deeply infiltrating endometriosis regarded as the most severe form of the disease and 20-35% of patients are affected. The organ involvement causes a variety of symptoms and complaints and it has an unfavorable effect on the quality of life.This study aimed: to investigate the perioperative changes of the deeply infiltrating endometriosis disease impacts of the quality of life and sexuality. To examine and compare the possibilities of the surgical techniques in the context of the complications. **METHODS:** A retrospective, partly longitudinal research, following surgery document analysis (n = 61) and we made a processing of the individually structured questionnaire with standard elements. We used 15D to measure the quality of life and MFSQ standard questionnaire to measure the sexuality (n=44). We calculated relative and absolute frequency, mean, standard deviation, paired t-test, χ2- test, correlation and one way analysis of variance ($p<0,05$) with the help of the SPSS 22. program. **RESULTS:** The average age was 34.73 years (SD=5.12). 73.8% of the patients had at least 3 organ with endometriosis involvement and 82.5% were removed by laparoscopic surgery. The length of stay showed an upward turn tendency in the context of the complications ($p<0.05$). The sample vitality and sexual relations 40.9% were characterized by no complaint and between sexual partners and satisfaction ($r = 0.44$, $p<0.05$) and between orgasm and sexual partners ($r = 0.52$, $p<0.05$) medium correlation were detected. **CONCLUSIONS:** The surgery was efficient in the treatment of the DIE. Moreover the surgery significantly improve the work, physical activity, leisure activities, social relationships and the individual emotional function. The social relationships and emotional state stable, but correlation is not detectable by the positive perception of sexual satisfaction unlike Kössi and mtrsai's study described (2012).

SOCIOECONOMIC DETERMINANTS OF UNDERNUTRITION AMONG UNDER-FIVES IN LA GUAJIRA, COLOMBIA

Alvis-Zakzuk NJ[1], Diaz-Jimenez D[1], Castañeda-Orjuela CA[2], Carrasquilla-Sotomayor M[3], Cotes-Cantillo K[1], Alvis Guzman N[4], De la Hoz Restrepo F[5]

[1]*Instituto Nacional de Salud, Bogotá, Colombia,* [2]*INSTITUTO NACIONAL DE SALUD, Bogotá, Colombia,* [3]*ALZAK Foundation, Cartagena, Colombia,* [4]*ALZAK Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia,* [5]*Universidad Nacional de Colombia, Bogotá, D.C., Colombia*

OBJECTIVES: Worldwide childhood undernutrition is a major risk factor for death and disability. La Guajira (Colombia) is a mostly rural state, with the highest proportion of indigenous population. The aim of this study was to estimate the factors related to undernutrition in under-five population (U5P) in one of the regions with the highest burden of disease due to undernutrition in Colombia. **METHODS:** We designed a cross-sectional study with data from the National Survey of the Nutritional Situation in Colombia (ENSIN, 2010), to identify the undernutrition associated factors in U5P. The outcome variable was undernutrition, defined as weight-for-age lesser or equal than 2 standard deviation (SD). Odds Ratios (OR) adjusted by taking into account the muestral design were calculated to assess the risk of each group compared to a reference group. Statistical analyzes were performed in STATA 12. **RESULTS:** A total of 622 children under-five were analyzed. The prevalence of undernutrition was 11.2%, 58.3% were male, 79.1% lived in rural areas, 36.2% do not have health insurance, and 73.1% were indigenous. According to the birth order, 13% were the first, 26% were the 2-3, 25% the 4-5 and 36% the 6 or more. In the logistic model, children living in houses with sewage had a lower risk of acute undernutrition (OR, 0.16; 95% CI, 0.05-0.57), while being the sixth child or later increases the risk of undernutrition (OR, 4.07; 95% CI, 1.50-10.99). **CONCLUSIONS:** Community-based interventions are needed to reduce the high prevalence of undernutrition in La Guajira, Colombia. Priority should be given to nutritional and other socioeconomic interventions for large families. Being able to identify high risk households will increase the efficiency of the policies to prevent and control undernutrition in La Guajira.

REMOVAL OF ENDOMETRIAL POLYPS USING HYSTEROSCOPIC MORCELLATION: A SYSTEMATIC REVIEW

Jo S[1], Chung S[1], Choi W[2]

[1]*NECA, Seoul, South Korea,* [2]*National Evidence-Based Healthcare Collaborating Agency, Seoul, South Korea*

OBJECTIVES: Hysteroscopic morcellation (HM) is a technique for removing endometrial polyps using the rotational mechanical energy of the morcellator. The objective of this review is to pool the result of HM for removal of endometrial polyps in terms of the safety and effectiveness. **METHODS:** Two reviewers independently selected the articles using 8 Korean databases, MEDLINE, EMBASE, and Cochrane Library and collected data regarding the safety outcomes based on complication rate and fluid deficit, and for the effectiveness outcomes based on success rate, surgical usability (operating time, resection time, installation time, and the number of insertions of instrument), and pain. **RESULTS:** Out of 270 articles searched, a total of 9 articles including 5 comparative studies compared HM with hysteroscopic resection (HR) and 4 single arm studies were finally included in this review. The results of our meta-analysis indicated that complication rate was not significantly different in between the 2 groups (RR=0.67, 95% CI: 0.43~1.03, p=0.07, I2=0.0%), whereas success rate was significantly higher in the HM group than in the HR group (RR=1.13, 95% CI: 1.02~1.26, p=0.02, I2=60.0%). Fluid deficit was significanty less in HM group than in the HR group in 1 comparative study while the other study presented no significant difference in between two groups. Four comparative studies reported significantly better surgical usability and pain in the HM group compared to the HR group, or similar results in between the 2 groups without significant difference. **CONCLUSIONS:** On the basis of current data, HM is a safe and effective technique for removing endometrial polyps compared with HR since there was no significant difference in complications and fluid deficit between the two groups and besides better results on success rate, surgical usability, and pain in the HM group than in the HR group.

KNOWLEDGE AND AWARENESS REGARDING CERVICAL CANCER AND ITS PREVENTION AMONG NURSES WORKING IN DIFFERENT HOSPITALS OF QUETTA, PAKISTAN

Haq N, Haider S, Nasim A, Yasmin R, Khan S, Raiz S
University of Balochistan, Quetta, Pakistan

OBJECTIVES: This study aimed to assess the knowledge and awareness regarding cervical cancer and its prevention among nurses working in different hospitals of Quetta, Pakistan **METHODS:** The cross sectional, descriptive study was conducted by using structured questionnaire in different hospitals of Quetta from January to September 2016. Convenient sampling technique was applied by targeting all the nurses working in different hospitals of Quetta city. Study questionnaire was developed and tested for validity and reliability. Descriptive and inferential statistics (Mann Whitney U test and Kruskal Wallis tests, $p < 0.05$) were used to assess the significance among study variables and were performed by using IBM SPSS v.20. **RESULTS:** Out of 415 distributed questionnaires 324 were returned (response rate of 78%). The mean Age of respondents were 28.18±9.5 years. Majority (n=127, 43.3%) of participants were interns and had no or less than one year of experience (n=128, 43.7%) with negative family history of any cancer (n=275,93.9%). Mean knowledge score was 18.52±4.84 with majority (n=258, 88.1%) had adequate knowledge regarding cervical cancer. Respondents age, current area of practice, qualification, Institute of degree and past family history were contributing factors ($p > 0.05$) in adequate knowledge in this study. The results also reviled that not only 68.3% (n=200) and 65.5% (n=192) respondents knew that cervical cancer is vaccine preventable and availability of the vaccine for it. **CONCLUSIONS:** Nurses working in different hospitals of Quetta city had better understanding of the disease cervical cancer and its prevention. Yet many of the respondent are not aware of it vaccine and its availability.

ASSESSMENT OF KNOWLEDGE AND AWARENESS REGARDING POSTMENOPAUSAL SYNDROME AMONG FEMALES IN QUETTA, PAKISTAN

Haq N[1], Khanda G[2], Nasim A[1], Khan S[1], Ahmed N[1]
[1]University of Balochistan, Quetta, Pakistan, [2]University Road, Quetta, Pakistan

OBJECTIVES: The present study was conducted to evaluated knowledge and awareness regarding postmenopausal syndrome (PMS) among the females in Quetta, Pakistan. **METHODS:** A cross-sectional study was conducted among the females aged 30 years and above from January to September 2016. Knowledge regarding postmenopausal syndrome was assessed by a self-administrated structured questionnaire contain different questions related to PMS. Descriptive analysis was used to demonstrate the characteristics of the study population. Inferential statistics (Kruskal Wallis tests, $p < 0.05$) were used to assess the significance among study variables. **RESULTS:** A total of 550 distributed questionnaires, 447 were returned (with response rate of 81%). Mean age of the respondents was 38.06 ±6.194 years. Mean of the total knowledge score was 12.77±3.910. Fifty-three percent had adequate knowledge regarding postmenopausal syndrome and 47.0% had poor knowledge regarding postmenopausal syndrome.73.5% of the respondents were aware about the age of menopause. None of the demographic characteristics has statistical significant association with the mean knowledge scores of the study participants. **CONCLUSIONS:** The study respondents had poor level of knowledge about postmenopausal syndrome Healthcare professionals should give information to females about postmenopausal syndrome so that, the knowledge could be improved.

ASSOCIATION BETWEEN DEMENTIA, DISCHARGE DIAGNOSIS, AND 30-DAY READMISSION

Downer B[1], Kumar A[2], Mehta HB[1]
[1]University of Texas Medical Branch, Galveston, TX, USA, [2]Brown University, Providence, RI, USA

OBJECTIVES: Study aims were to (1) determine the association of dementia with 30-day readmission, and (2) determine if this association varies by most common primary discharge diagnosis at the index hospitalization. **METHODS:** This retrospective cohort study used data from the 2013 Nationwide Readmission Database. The cohort included 265,466 patients aged 65 and older. A 1:1 matching procedure by age, gender, discharge disposition, and emergency department use was used to match 132,733 patients with dementia to patients with no dementia. Descriptive statistics was used to determine top five primary diagnoses for patients with a 30-day readmission. **RESULTS:** 30-day readmission rates were higher among dementia patients (17.2%) compared to non-dementia patients (14.9%) ($p< 0.01$). In adjusted analysis, dementia was associated with 1.15 (95% CI=1.13-1.18) higher likelihood for 30-day readmission. The top five primary discharge diagnoses among patients with a 30-day readmission were septicemia, congestive heart failure, urinary tract infection, pneumonia, and hip fracture. Dementia was associated with higher odds for 30-day readmissions for patients with a primary discharge diagnosis of septicemia (OR=1.34, 95% CI=1.12-1.61) and pneumonia (OR=1.40, 95% CI=1.04-1.90), but not congestive heart failure (OR=1.29, 95% CI=0.96-1.75), urinary tract infection (OR=1.02, 95% CI=0.76-1.38) or hip fracture (OR=0.99, 95% CI=0.77-1.27). **CONCLUSIONS:** Dementia is associated with higher odds for 30-day readmissions regardless of their primary reason for admission. The risk of 30-day readmission is greater for patients with a primary diagnosis of septicemia or pneumonia at the index hospitalization. Care plans for specific conditions may reduce the risk for readmission associated with dementia.

PMH2

CONCOMITANT PSYCHOTROPIC USE AND RISK OF HOSPITALIZATION IN ELDERLY MEDICARE BENEFICIARIES

Spence O, Slejko JF
University of Maryland School of Pharmacy, Baltimore, MD, USA

OBJECTIVES: The objective of this study was to assess the prevalence of concomitant psychotropic use and its association with all cause-hospitalization among Medicare beneficiaries. **METHODS:** In this longitudinal study, the Medicare Current Beneficiary Survey (MCBS) was used to identify beneficiaries who were psychotropic drug users between 2007 and 2012, >=65 years old, community dwelling and continuously enrolled in parts A, B and D for >= 2 consecutive years. Each year, beneficiaries were characterized as single users, short-term concomitant users (<=90 days overlap of 2+ drugs), or long-term concomitant users (>90 days overlap of 2+ drugs). Hospitalization for any cause was measured yearly. In this repeated measures design, we assessed psychotropic use in the year prior to hospitalizations to address temporality. Generalized estimating equations (GEE) in multivariable logit models were used to estimate the odds of hospitalizations adjusted for demographic covariates, smoking, reported health status, total activities of daily living, instrumental activities of daily living and number of chronic conditions. **RESULTS:** Of the 1,612 beneficiaries identified as psychotropic drug users, 64% were single users, 9% were short-term concomitant users and 28% were long term concomitant users at baseline. 24% were hospitalized during follow up. From 2007 to 2012, concomitant psychotropic use consistently ranged from 36% to 38%, with the exception of 2008, when concomitant use increased to 40%. Long-term concomitant use was more prevalent than short-term use, ranging from 27% to 31% vs. 6% to 9%. Short-term concomitant use decreased from 9% in 2007 to 7% in 2012. Compared to single users, short-term concomitant users and long-term users had 45% (95% CI: 1.07-1.95) and 30% (95% CI: 1.07-1.57) increased odds of hospitalization. **CONCLUSIONS:** Among older Medicare beneficiaries, short and long-term concomitant psychotropic use is associated with all-cause hospitalizations. Providers should exercise caution when prescribing psychotropic drugs concomitantly in this patient population.

PMH3

RISKS ASSOCIATED WITH CONTINUED USE OF RISPERIDONE FOR DEMENTIA IN THE ELDERLY LONG-TERM CARE POPULATION

Teigland C, Parente A, Jones BT
Avalere Health - An Inovalon Company, Bowie, MD, USA

OBJECTIVES: To evaluate the relative likelihood of adverse events, including relapse of psychosis, stroke and death, associated with continued "off-label" use of risperidone in elderly patients with dementia compared to those who discontinued use of the drug after four months. **METHODS:** This population-based cohort study analyzed long-term care (LTC) patients in a large nationally representative and statistically de-identified administrative claims database. The sample consisted of dementia patients aged 65+ treated with risperidone between 2008 and 2011. Patients were identified by the existence of a new prescription fill for risperidone (treatment naïve) and a diagnosis for dementia (without bipolar or schizophrenia) within one year prior to the index fill. Patients were followed from 30 days up to 24 months after four consecutive months of risperidone use to assess the relative risk of death, stroke and time to relapse of psychosis. **RESULTS:** The study population included 4,672 patients with dementia that were prescribed risperidone between 2008 and 2011 (female = 65.3%, mean age = 82.3 [± 5.6]). Findings reveal significantly higher incidence of psychosis in patients with continued use compared to those who discontinued use of risperidone (22.0% vs. 12.0%, $p<0.01$), which contradicts clinical trials. **CONCLUSIONS:** Contrary to existing literature, this study found that elderly LTC dementia residents who discontinued use of risperidone after four months had a lower risk of psychosis as compared to those who continued use of the drug. This large claims-based analysis demonstrates the value of validating clinical trial outcomes in real-world settings. Additional research is needed to further investigate the safety of long-term "off-label" use of risperidone in elderly LTC patients with dementia.

PMH4

IMPACT OF PRENATAL EXPOSURE TO ANTIDEPRESSANTS ON ADVERSE BIRTH OUTCOMES

Pahuja S
University of South Carolina, Columbia, SC, USA

OBJECTIVES: There has been an increase in the diagnosis of depression and the use of antidepressants, especially in women of childbearing age, in the past decade. This has drawn attention to the potential impact of depression and antidepressants on pregnancy and fetal development. To determine the impact of prenatal exposure to antidepressant on the risk of adverse birth outcomes. **METHODS:** The study was conducted using a population-based cohort including all singletons deliveries in years 2008 to 2014 in SC Medicaid population. Information on antidepressant medication and diagnosis of depression and birth outcomes were obtained from South Carolina Medicaid database and birth certificates. The exposed group comprised children of mothers who had a diagnosis of depression and used antidepressants at any time during their pregnancy. The reference group comprised children of mothers who had a diagnosis of depression but did not use any antidepressants during pregnancy. We estimated the association using Marginal Structural Models. **RESULTS:** Approximately 107, 683 women had a diagnosis of depression in the SC Medicaid population. After applying the study inclusion and exclusion criteria, we got the study sample of 4,450 women. And approximately 36% women received antidepressants during pregnancy. In our study we found that the odds of preterm delivery were 1.72 times (95% CI: 1.63 – 1.79) in the group that received antidepressants during pregnancy as compared to those who did not.

Prenatal exposure to antidepressants also increased the odd of having low birth weight/small for gestational age 1.63 times (95%CI: 1.53 – 1.73) and the increased odds of NICU admission by 1.66 times (95% CI: 1.58 – 1.73). **CONCLUSIONS:** In conclusion we found that prenatal exposure to antidepressants is significantly associated with a higher risk of adverse birth outcomes such as preterm delivery, low birth weight/small for gestational age, and NICU admissions.

PMH5

NATIONAL ESTIMATES OF POTENTIAL DRUG-DRUG INTERACTIONS OF ANTIDEPRESSANTS IN THE UNITED STATES: AN ANALYSIS OF THE NATIONAL AMBULATORY MEDICAL CARE SURVEY DATA

Lai L[1], Wertheimer A[1], Ting A[2], Shah A[1], Fadil H[1], Almutairi M[1]
[1]Nova Southeastern University, Davie, FL, USA, [2]University of Florida, Ft. Lauderdale, FL, USA

OBJECTIVES: Antidepressants are among the most common prescription drugs taken by Americans. However, some antidepressants can cause clinically significant drug-drug interactions. The study aims to examine the prevalence and factors associated with potential drug-drug interactions of antidepressants in U.S. outpatient settings. **METHODS:** This project proposed a secondary data analysis using the 2012 National Ambulatory Medical Care Survey (NAMCS) conducted by the National Center for Health Statistics. All patient visits with at least one antidepressant prescription were included. Drug-drug interaction was defined according to Drug Interaction Facts. A series of weighted descriptive analyses were performed to evaluate the prevalence of potential drug interactions. A multivariate logistic regression was developed to examine how patient characteristics impact the presence of drug interactions. Receiver operating characteristic (ROC) curve was used for assessing the discrimination in the proposed logistic regression model. **RESULTS:** Approximately 93.7 million antidepressants were prescribed in US outpatient settings including selective serotonin re-uptake inhibitors (SSRI) (63.2 million), atypical antidepressants (20.4 million), tricyclic antidepressants (TCA) (10.1 million), etc. Among these, 6.9% of them had at least one potential major or moderate drug interaction. The most frequent drugs interacting with antidepressants were: sertraline, fluoxetine, venlafaxine, oxycodone, citalopram, etc. The results of multivariate logistic regression showed that there was a significantly increased likelihood of encountering drug interactions in relationship with patient's age, race, and number of medication used($P<0.001$). The area under the ROC curve was computed as 0.61, corresponding to the logistic regression model with moderate discrimination. **CONCLUSIONS:** Unfortunately, drug-drug interaction can be difficult to remember and are commonly missed. However, its adverse effects can lead to morbidity or even mortality if appropriate clinical actions are not taken. As with all perspectives in pharmacovigilance, when determining the relevance and significance of the choice of drugs, considering patient's individual characteristics is of the utmost importance.

PMH6

UNDERSTANDING OPIOID OVERDOSE RISK IN A COMMERCIALLY INSURED POPULATION

Halim L, Shah J, Bretzke D, Needs P, Couto J
The Cigna Companies, Bloomfield, CT, USA

OBJECTIVES: To determine important risk factors for opioid overdose in a commercially insured population using integrated medical and pharmacy claims data, as well as publically available data published by the CDC and CMS. **METHODS:** Patients with at least one prescription opioid claim during January 2014 – August 2016 (n = 2,443,769) were selected from an administrative claims database of commercially insured members. Patients were followed on a monthly basis until the conclusion of the study period or until a lapse in eligibility. Patient characteristics including medical diagnosis groups, medical and utilization as well as use of multiple prescribers, and family member opioid use were captured. A binary logistic regression analysis was performed on a stratified random sample to estimate likelihood of overdose in the following month (n=60,867). Recognizing that integrated medical and pharmacy data may not be available, an additional binary logistic regression model was created without medical data. **RESULTS:** The model using integrated medical and pharmacy data included 16 variables, with prior opioid overdose, substance use and mental health related diagnosis, and utilization of drugs associated with overdose. History of prior opioid overdose (ICD9 965.X and ICD10 T40X) showed the strongest ability to predict overdose, with 25.1% of those overdosing having a prior overdose (OR 16.0 95% CI 8.8 – 28.9). Age was also a strong predictor, with 33.6% of those overdosing in the 15-25 age range (OR 2.5 95% CI 1.9 – 3.3). The model had a c-stat of 0.850 on the training data and 0.881 for the validation data. The model which was restricted to pharmaceutical data had a lower c-stat, with 0.817 for the training data and .839 for the validation data. **CONCLUSIONS:** Medical and pharmacy utilization patterns can identify members with a history of opioid use at an elevated risk of overdose and thus inform targeted behavioral health interventions.

PMH7

PATTERNS AND PREDICTORS OF DEPRESSION TREATMENT AMONG COMMUNITY-DWELLING ELDERLY INDIVIDUALS WITH DEMENTIA AND DEPRESSION IN THE UNITED STATES

Bhattacharjee S[1], OH M[2], Reiman EM[3], Burke WJ[3]
[1]The University of Arizona, Tucson, AZ, USA, [2]University of Arizona, Tucson, AZ, USA, [3]Banner Alzheimer's Institute, Phoenix, AZ, USA

OBJECTIVES: This study examined the patterns and predictors of depression treatment among community-dwelling elderly individuals with comorbid dementia and depression using a nationally representative sample in United States. **METHODS:** A retrospective, cross-sectional study was conducted using multiple years of Medical Expenditure Panel Survey (MEPS) [2002, 2004, 2006, 2008, 2010, and 2012] data. The study sample consisted of elderly (age ≥ 65 years) individuals with dementia, depression and alive during the calendar year. Elderly individuals with dementia were identified by ICD-9-CM code of 290.XX or 294.XX or 331.XX or if they reported use of cholinesterase inhibitors or memantine. Depression was identified by ICD-9-CM code of 296.xx, or 311.xx. The dependent variable of this study was depression treatment, defined as antidepressant medication use with or without psychotherapy. Multinomial logistic regression was conducted to identify factors associated with depression treatment in the study sample. All analyses adjusted for the complex survey design of MEPS to obtain national-level estimates. **RESULTS:** An overwhelming majority (nearly 88%) of the study sample (unweighted N=173) reported receipt of depression treatment. Antidepressants only and combination therapy (antidepressant with psychotherapy) was reported by 75% and 13% respectively of the study sample. Selective serotonin reuptake inhibitors (65%) and escitalopram (17.38%) were the most prescribed antidepressant class and individual agent respectively. Age, race/ethnicity, marital status, limitations of instrumental activities of daily living, perceived mental health status, and pain were significantly associated with the reporting of receipt of depression treatment. For example, Whites were approximately three (Odds Ratio=3.10, 95% CI: 1.23-7.82) and five (Odds Ratio=4.93, 95% CI: 2.30-10.5) times more likely to report use of antidepressant alone and combination therapy respectively compared with other race/ethnicities. **CONCLUSIONS:** Almost 90% of individuals with comorbid dementia and depression received depression treatment and several subgroup differences existed in terms of reporting the use of depression treatment.

PMH8

APPLICATION OF ANALYTICAL HIERARCHY PROCESS FOR COMPARING VORTIOXETINE TO AGOMELATINE AND VENLAFAXINE XR IN MAJOR DEPRESSIVE DISORDER

Briquet B[1], Diamand F[2], François C[3], Brignone M[4]
[1]Benjamin BRIQUET, LEVONCOURT, France, [2]Lundbeck SAS, Paris, France, [3]Lundbeck, Deerfield, IL, USA, [4]Lundbeck SAS, Issy-les-Moulineaux, France

OBJECTIVES: To assess the overall performance priority of three antidepressants: vortioxetine, agomelatine and venlafaxine XR in major depressive disorder using the Analytical Hierarchy Process (AHP), a Multi-Criteria Decision Analysis approach. **METHODS:** An AHP decision model, combining outcomes of efficacy, tolerability and quality of life was developed on Excel®. Weights for each outcome were extracted from a publication reporting patients' and professionals' relative preference. Two head-to-head randomised clinical studies were the main sources of inputs of the AHP decision model: SOLUTION (NCT01571453) and REVIVE (NCT01488071). SOLUTION was an 8-week double-blind, randomized, fixed dose study comparing vortioxetine (10mg) to venlafaxine XR (150 mg) in MDD patients in Asia. REVIVE was a 12-week double-blind, randomized, flexible dose study comparing vortioxetine (10-20 mg) to agomelatine (25-50 mg) in patients who switched due to an inadequate response to previous antidepressant treatment. The performance priorities of the antidepressants on each outcome were measured in terms of odds-ratio or mean differences within each study. The overall performance priority of an antidepressant (range [0-1]) is the sum of the performance priority regarding each outcome measure multiplied by the weight of this outcome measure. **RESULTS:** With SOLUTION inputs, the overall performance priority was higher for vortioxetine versus venlafaxine XR from the patients' (0.56 vs. 0.44) and professionals' (0.54 vs. 0.46) perspective. Similar findings were obtained with REVIVE inputs for vortioxetine versus agomelatine from the patients' (0.61 vs. 0.39) and professionals' (0.60 vs. 0.40) perspective. **CONCLUSIONS:** The AHP is a useful decision-making tool combining multiple criteria into an overall score translating the treatment performance into a treatment preference as defined by patients or professionals. The results show greater preference for vortioxetine versus venlafaxine XR and agomelatine due to its good combined effect on efficacy, tolerability and quality of life.

PMH9

COMPARATIVE EFFECTIVENESS OF OPIOID ABUSE TREATMENTS: A SYSTEMATIC REVIEW

Hohmann LA, Qian J, Garza KB, Hansen RA, Westrick SC
Auburn University Harrison School of Pharmacy, Auburn, AL, USA

OBJECTIVES: Opioid abuse and overdose is a major public health issue in the United States. Accordingly, the purpose of this review is to compare the impact of opioid abuse treatments (methadone, buprenorphine, buprenorphine-naloxone, naloxone, and naltrexone) on mortality and healthcare utilization. **METHODS:** A systematic literature review was performed in Fall 2016 using PubMed, PsychINFO, IPA, and CINAHL according to PRISMA guidelines. Outcomes of interest included opioid overdose mortality and healthcare utilization rates. Study eligibility was determined by two reviewers in an un-blinded and standardized manner. English-language studies utilizing a quasi-experimental or experimental design in a sample of U.S. adults at least 18 years of age were eligible for review. Additional inclusion criteria consisted of: prescription or nonprescription opioid use in the study sample; provision of methadone, buprenorphine, buprenorphine-naloxone, naloxone, or naltrexone; and a measure of suspected opioid overdose death or healthcare utilization rates. **RESULTS:** Eleven eligible full-text articles were identified over the period of 1998 to 2016. Sample sizes varied from 25 to over 8,000, with 5 observational and 6 experimental study designs. Five articles addressed opioid overdose mortality only, 5 examined healthcare utilization rates only, and one assessed both overdose mortality and healthcare utilization. Only one study directly compared two opioid dependence medications (buprenorphine-containing products versus methadone); 10 studies used counseling or no treatment (usual care) as the comparator. Buprenorphine and buprenorphine-naloxone resulted in a lower number of ambulatory care visits at 6 months compared to methadone

(mean difference=-71, p< 0.0001). Overdose mortality and healthcare utilization rates were lower across all treatments compared to usual care. No appreciable risks of bias were found. **CONCLUSIONS:** All treatments illustrated benefits in terms of overdose mortality and healthcare utilization rates, but buprenorphine-containing treatments may be associated with lower healthcare utilization rates compared to methadone. Additional comparative studies are needed.

PMH10

REAL LIFE ASSESSMENT OF ABILIFY MAINTENA (RELIAM): INTERIM ANALYSIS FROM A CANADIAN NATURALISTIC STUDY OF ARIPIPRAZOLE LONG-ACTING INJECTABLE IN PATIENTS WITH SCHIZOPHRENIA

Bougie JK[1], Malla A[2], Miguelez M[3], Proulx J[1]
[1]Lundbeck Canada, Montreal, QC, Canada, [2]McGill University, Montreal, QC, Canada, [3]Otsuka Canada Pharmaceutical Inc., Saint-Laurent, QC, Canada

OBJECTIVES: In patients with schizophrenia, non-adherence to treatment with oral antipsychotics contributes to suboptimal management of the disorder through increased rates of relapse, reduced time in remission, and eventually poor functional outcomes. With the objective of increasing the utility of findings from controlled clinical trials to real-life clinical settings, ReLiAM (**Re**al **Li**fe Assessment of **A**bilify **M**aintena) was designed as a naturalistic, prospective, non-interventional, Canadian study, with functioning and illness severity as the main outcomes, for patients with schizophrenia treated with aripiprazole once-monthly 400 mg (AOM) in routine clinical environments. **METHODS:** Canadian patients with schizophrenia, prescribed AOM prior to screening, were initiated for treatment with once-monthly AOM and followed for 24 months. Study assessments were recommended, but not imposed for the purpose of the study, to occur every 3 months. The primary endpoint is functional status, assessed by the Global Assessment of Functioning (GAF) Scale at 12 months. Additional measures include changes in illness severity, social and occupational functioning, productivity loss, caregiver burden, and safety and tolerability. **RESULTS:** As of November 2016, 192 eligible patients at 18 sites in Canada were enrolled, with 158 patients (79.8%) having at least one post-baseline assessment. Patients were classified as early psychosis (≤5 years from original diagnosis; 65.2%, n = 103) or later (>5 years; 32.9%, n = 52). Interim analysis at 12 months showed mean increase in GAF score from baseline of 10.6 (n = 100; 95% CI 7.63, 13.65; p<0.001), and mean change in Clinical Global Impression – Severity (CGI-S) of Illness score from baseline of -0.9 (n = 90; 95% CI -1.09, -0.64; p<0.001). Safety and tolerability were consistent with the Canadian Product Monograph of AOM. **CONCLUSIONS:** In this first report of naturalistic data for AOM in Canadian patients with schizophrenia, significant improvements in overall patient functioning and illness severity were observed over 12 months of treatment.

PMH11

ASSESSMENT IN WORK PRODUCTIVITY AND THE RELATIONSHIP WITH COGNITIVE SYMPTOMS (ATWORC): PRIMARY ANALYSIS FROM A CANADIAN OPEN-LABEL STUDY OF VORTIOXETINE IN PATIENTS WITH MAJOR DEPRESSIVE DISORDER (MDD)

Bougie JK[1], Chokka P[2], Rampakakis E[3], Proulx J[1]
[1]Lundbeck Canada, Montreal, QC, Canada, [2]Chokka Center for Integrative Health, Edmonton, AB, Canada, [3]JSS Medical Research, Saint-Laurent, QC, Canada

OBJECTIVES: Cognitive dysfunction is an important dimension of Major Depressive Disorder (MDD). However, few studies have assessed the relationship between cognitive dysfunction and workplace productivity. AtWoRC (**A**ssessmen**t** in **Wo**rk productivity and the **R**elationship with **C**ognitive symptoms in patients with MDD taking vortioxetine; NCT02332954) is an interventional, open-label, Canadian study designed to assess the association between cognitive symptoms and work productivity in gainfully employed patients with MDD receiving vortioxetine. **METHODS:** Patients diagnosed with MDD were prescribed vortioxetine and assessed over a total of 52 weeks at routine care visits that emulated a real-life setting. Patients were classified as having not been treated with another antidepressant (first treatment) or having inadequate response to a previous antidepressant (switch). The primary endpoint is partial correlation between changes in patient-reported cognitive symptoms (20-item Perceived Deficits Questionnaire; PDQ-D-20) scores and self-reported work productivity loss (Work Limitations Questionnaire; WLQ) scores over 12 weeks of vortioxetine treatment. Additional assessments include changes in symptom and disease severity, functioning, pharmacoeconomics, and safety and tolerability. Data presented here is from the primary analysis at Week 12; the study is currently ongoing. **RESULTS:** As of November 2016, 196 eligible patients (97 first treatment, 99 switch) at 26 sites were enrolled, received at least one treatment dose, and attended at least one post-baseline study visit. Primary analysis at Week 12 indicated a significant correlation between PDQ-D-20 and WLQ scores (r = 0.633; p<0.001). The correlation between PDQ-D-20 and WLQ scores was comparable and significant in both first treatment (r = 0.671; p<0.001) and switch patients (r = 0.584; p<0.001). Safety and tolerability were consistent with the Canadian Product Monograph for vortioxetine. **CONCLUSIONS:** After 12 weeks of treatment with vortioxetine, improvements in self-reported cognitive dysfunction were significantly associated with improvements in self-reported workplace productivity in Canadian patients with MDD.

PMH12

CLAIMS-BASED ASSESSMENT OF MEDICAL AND DRUG TREATMENT FOR POSTPARTUM DEPRESSION DURING THE FIRST YEAR AFTER DELIVERY

Carls GS[1], Chace M[1], Chawla A[1], Epperson CN[2], Bonthapally V[3]
[1]Analysis Group, Menlo Park, CA, USA, [2]University of Pennsylvania, Philadelphia, PA, USA, [3]Sage Therapeutics, Inc., Cambridge, MA, USA

OBJECTIVES: Postpartum depression (PPD) is a serious affective disorder, estimated to occur in 10-20% of postpartum women and characterized by depressed mood, insomnia, anxiety, and in some cases, suicidal ideation and thoughts of harming the baby. First line-treatments for PPD include psychosocial interventions, psychotherapy, and antidepressants. Inpatient (IP) and emergent care may be needed for some women who do not respond adequately to these treatments. The objective of this study was to assess PPD treatment patterns during the 12 months after delivery among women who were covered by U.S. private payers. **METHODS:** This retrospective study using the OptumHealth Care Solutions, Inc. claims database (January 2010-September 2015) identified PPD cases based on diagnoses for PPD or depression 12 months postpartum on at least one IP or emergency department (ED) visit, or two outpatient (OP) visits, or one OP visit and an antidepressant or antianxiety prescription drug fill. **RESULTS:** Among 163,565 deliveries, 11,514 PPD cases were identified. Nearly all (93%) received some form of treatment; the first observed treatment or claim with a diagnosis was on average 17 weeks postpartum. Pharmacotherapy (antidepressant or antianxiety) was most common (78%), with an average of 5.2 fills. Almost half (45%) received psychotherapy, primarily OP (99%), with an average of 9.2 visits. Few had IP residential psychotherapy (N=27; average length of stay (ALOS), 9 days) or partial hospital psychotherapy (N=17). Most with PPD-related IP (7%, ALOS 15 days) or ED care (4%) had pharmacotherapy (65%) or psychotherapy (73%) after delivery but prior to care in IP or ED settings. **CONCLUSIONS:** Pharmacotherapy and psychotherapy were the most common treatments for PPD; but treatment in an ED or IP setting was required for some despite prior pharmacotherapy. New treatments that can effectively and quickly treat PPD are needed to limit risk for more intensive and costly treatment.

PMH13

COMPLEX PHARMACOTHERAPY USE AND RESPONSE PREDICTORS IN BIPOLAR DISORDER

Fung V[1], Overhage L[2], Sylvia L[1], Gao K[3], Shelton RC[4], Ketter TA[5], Bobo WV[6], Thase ME[7], Calabrese J[3], Tohen M[8], Deckersbach T[9], Nierenberg AA[1]
[1]Massachusetts General Hospital, Harvard Medical School, Boston, MA, USA, [2]Massachusetts General Hospital, Boston, MA, USA, [3]CWRU School of Medicine, Cleveland, MA, USA, [4]UAB School of Medicine, Birmingham, MA, USA, [5]Stanford University School of Medicine, Stanford, MA, USA, [6]Mayo Clinic, Rochester, MA, USA, [7]Perelman University of Pennsylvania School of Medicine, Philadelphia, MA, USA, [8]The University of New Mexico, School of Medicine, Albuquerque, MA, USA, [9]Harvard Medical School, Boston, MA, USA

OBJECTIVES: Medications are frequently used in combination to treat bipolar disorder (BP), although there is limited evidence on the effects of complex pharmacotherapy (CP) on outcomes. We examined demographic and clinical characteristics and response in relationship to CP. **METHODS:** The Bipolar CHOICE study compared the effectiveness of lithium + adjunctive personalized therapy (APT) versus quetiapine + APT over 6 months in 482 adult BP patients. We defined CP use as taking for ≥50% of visits ≥3 of the following BP drug treatments: lithium, antipsychotics, antidepressants, lamotrigine, divalproex, carbamazepine, other anticonvulsants, and anxiolytics. We used multivariate logistic regression to assess associations between CP use and demographic and clinical characteristics and, among those with CP use, the characteristics associated with clinical response (≥0.50 Clinical Global Impression-Severity for BP (CGI-S-BP) score decrease (range: 1-7)) or remission (CGI-S-BP ≤2 for ≥8 weeks). **RESULTS:** Overall, mean age was 39 years, 68% had bipolar I, mean baseline CGI-S-BP was 4.5, and the mean number of BP medications was 2.5, with 45% having CP. Patients age 35-44 (vs. <25), with prior psychiatric hospitalization and higher BISS depression scores were more likely to have CP, while those with Black (vs. White) race and prior suicide attempt were less likely to have CP. Among patients with versus without CP, 47% vs. 62% responded. Among patients with CP, having comorbid social or generalized anxiety disorder (OR=0.23, 95% CI [0.07-0.74]) and higher BISS mania score (OR=0.31 [0.13-0.73]) were associated with lower likelihood of clinical response. **CONCLUSIONS:** Nearly half of patients had CP; among these fewer than half responded and comorbid anxiety disorder and worse manic symptoms were associated with non-response. More studies are needed to assess other outcomes (e.g., adherence and side effects) associated with CP.

PMH14

PROMINENT NEGATIVE SYMPTOMS IN PATIENTS WITH SCHIZOPHRENIA: FINDINGS FROM THE EUROSC STUDY

Millier A[1], Mejri A[2], Toumi M[3]
[1]Creativ-Ceutical, Paris, France, [2]Creativ-Ceutical, Tunis, Tunisia, [3]Aix-Marseille University, Marseille, France

OBJECTIVES: Negative symptoms in schizophrenia are characterised by a reduction or removal of normal processes, and may include loss of emotional responsiveness or motivation and poverty of speech. The aim of the present study is to describe the impact of negative symptoms on patients' clinical characteristics, quality of life and healthcare resource utilisation, using a 2-year cohort study. **METHODS:** We analysed data from EuroSC, a 2-year European cohort study conducted in France, Germany and UK, including a total of 1,208 patients. Patients were classed as presenting with prominent negative symptoms if they scored ≥4 on at least three negative items or ≥5 on at least two negative items of PANSS. Numerous clinical characteristics, including presence of depression, functioning, quality of life, medication and resource utilization, were assessed at baseline and compared between patients with and without prominent negative symptoms. **RESULTS:** Prominent negative symptoms affected 20.5% of patients, and were associated with a higher depression score (CDSS, 4.23 vs 2.57, p<0.0001), more abnormal involuntary movements (AIMS, 3.74 vs 1.96, p<0.0001), worse functioning (GAF, 39.52 vs 54.52, p<0.0001), reduced quality of life (physical dimension of SF36, 46.92 vs 48.33, p=0.048) and utility (EQ5D, 0.68 vs 0.75, p=0.002), higher caregiver burden (IEQ, 0.93 vs 0.73, p=0.01), and increased risk of relapse at 12 months (47.7% vs 31.2%, p<0.0001). In addition, these patients were found to receive multiple antipsychotics (1.48 vs 1.28, p=0.001), and were more likely to switch treatment after 24 months (21.7% vs 17.9%, p=0.01). Finally,

they required longer hospitalisation over a 6-month prospective follow-up period (11.48days vs. 7.13days, p=0.04). **CONCLUSIONS:** Our results showed that patients with prominent negative symptoms experience significant burden in terms of clinical characteristics, but also require more intense healthcare management. This stresses the need for new treatments targeting negative symptoms.

PMH15

USE OF ANTIDEPRESSANT DRUGS IN ADOLESCENTS OF COLOMBIA: A PRESCRIPTION-INDICATION STUDY

Machado-Alba J[1], Machado-Duque M[2], Echeverry-Chabur J[1]
[1]Universidad Tecnológica de Pereira-Audifarma S.A., Pereira, Colombia, [2]Universidad Tecnológica de Pereira, Pereira, Colombia

OBJECTIVES: Determine the indications for use of antidepressants medications in adolescent's population (14- 19 years) of Colombia. **METHODS:** Cross-sectional study, including adolescent patients of either sex who were receiving an antidepressant between January 2015 and June 2016, in general and psychiatric medical consultations of the health system in a follow-up period 18 months. The medical records were reviewed to assess sociodemographic, pharmacological and clinical variables, including diagnosis, approved or not indication and comedications. Multivariate analyzes were performed. The study received bioethical approval. **RESULTS:** A total of 350 adolescents treated with antidepressants were evaluated, with a mean age of 16.3±1.4 years, with slight female predominance (59.7%). Most prescriptions were made by general practitioner (n=258; 73.7%). The most commonly used antidepressants were fluoxetine (n=130; 37.1%), sertraline (n=56; 16.0%) and trazodone (n=47; 13.4%). The main indications for use were depression (n = 92; 26.3%), anxiety (n=53; 15.1%), migraine (n=48; 13.7%), control abuse of psychoactive substance use (n=34; 9.7%), and insomnia (n=20; 5.7%). Only 150 (42.9%) prescriptions were performed according to approval by regulatory agencies. Multivariate analysis of the prescription unapproved indications showed that having depression (OR:0.004; 95%CI:0.001-0.018), anxiety (OR:0.028; 95%CI:0.010-0.076) or bipolar affective disorder (OR:0.071; IC95%:0.011-0.461) were associated with lower likelihood that its use was outside the approved. **CONCLUSIONS:** The prescription of antidepressant drugs in Colombian adolescent patients is being done especially with fluoxetine, sertraline and trazodone, mainly for unapproved indications according to FDA and INVIMA. There are no guidelines for clinical practice in the country for the use of these drugs in the adolescent population. It is necessary to know more about this topic of interest because of the high frequency of use and the general lack of knowledge about effectiveness, safety and use of these drugs in the adolescent population

PMH16

NATIONAL TREND AND PREDICTORS OF ANTIPSYCHOTIC MEDICATION USE IN U.S. ADULTS WITH SCHIZOPHRENIA: ANALYSIS OF DATA FROM THE 2008–2013 MEPS

Almalki Z, Guo JJ, Penm J, Alahmari AK
University of Cincinnati, Cincinnati, OH, USA

OBJECTIVES: To examined the national trends and predictors associated with antipsychotic use among individuals with schizophrenia. **METHODS:** A retrospective cross-sectional study were conducted using 2008–2013 Medical Expenditure Panel Survey (MEPS) data. Descriptive and Chi-square tests were used to describe patterns of antipsychotic use. Multivariate logistic regression analyses were conducted to explore the relationship between the different variables in the study with antipsychotic use. **RESULTS:** Overall, antipsychotic-medication users decreased from 582,581 in 2008 to 478,553 in 2013, a 17% decrease. The multivariate analyses revealed that no antipsychotic use was associated with patients who were older than 59 [OR=0.28, 95% CI= 0.08, 0.94], female [OR=0.44, 95% CI= 0.26, 0.74], non-white [OR=0.34, 95% CI= 0.19, 0.62], previously or never married [OR=7.88, 95% CI= 3.13, 19.84], or who had prescription coverage by Medicare, Medicaid or other [OR=3.38, 95% CI= 1.38, 8.29], [OR=3.89, 95% CI= 1.74, 8.72], or [OR=7.29, 95% CI= 2.25, 23.66], respectively. Respondents who perceived themselves as having good general health were negatively associated with not receiving antipsychotic medication [OR=0.42, 95% CI= 0.23, 0.76]. **CONCLUSIONS:** During the study period, antipsychotic medication use declined for patients with schizophrenia. This finding suggests targeting subgroups for specific improvement strategies to protect high-risk patients with schizophrenia.

PMH17

THE PREVALENCE, PREDICTORS, AND ECONOMIC IMPACT OF DRUG-DRUG INTERACTION INVOLVING ANTIPSYCHOTIC MEDICATIONS IN UNITED STATES

Almalki Z[1], Guo JJ[2]
[1]University of Cincinnati, College of Pharmacy, Cincinnati, OH, USA, [2]University of Cincinnati, Cincinnati, OH, USA

OBJECTIVES: To estimate the national prevalence, socio-demographic and health characteristics, and direct incremental expenditures of of drug-drug interactions (DDIs) involving antipsychotics among adult in united states. **METHODS:** A retrospective database analysis was conducted and individuals who were exposed to any DDI were identified from the 2010-2014 Medical Expenditure Panel Survey. The prevalence of DDI was evaluated by four international drug interaction compendia. The predictors and expenditures were estimated by employing multiple regression models and the propensity score method. **RESULTS:** From 2010 to 2014, the national prevalence of DDIs was 4.7 million (36%) with incremental costs of $4,563 per person annually. Adults exposed to DDIs cost 55% more annual total health care expenditures than those are not exposed (RR = 1.55, 95% CI [1.25, 1.92]). Likewise, cost of office-based (RR = 1.78, 95% CI [1.34, 2.38]), and prescription drugs (RR = 2.08, 95% CI [1.55, 2.78]) were significantly associated with exposure to DDIs. Factors associated with greater odds of DDIs exposure were age, sex, race, type of health insurance, general health, and polypharmacy. **CONCLUSIONS:** The prevalence of DDIs is substantially high among adults using antipsychotics. A significant relationship between the exposure to the DDI and higher total health care expenditures were found. This finding can help policy makers in implement intervention strategies that are effective in lowering the DDI incidence and in reducing the overall cost of care.

PMH18

PSYCHOTROPIC POLYPHARMACY IN THE TREATMENT OF CHILDREN AND ADOLESCENTS WITH MENTAL DISORDERS: PREVALENCE AND DETERMINANTS

Medhekar R[1], Fujimoto K[2], Aparasu RR[3], Bhatara V[4], Johnson ML[1], Alonzo J[1], Schwarzwald H[5], Chen H[1]
[1]University of Houston, Houston, TX, USA, [2]The University of Texas Health Science Center at Houston (UTHealth) School of Public Health, Houston, TX, USA, [3]College of Pharmacy, University of Houston, Houston, TX, USA, [4]University of South Dakota, Vermillion, SD, USA, [5]Texas Children's Health Plan, Bellaire, TX, USA

OBJECTIVES: To evaluate the prevalence and determinants of long-term multiclass psychotropic polypharmacy (PP) among children and adolescents with mental disorders. **METHODS:** A retrospective cross-sectional study was conducted using the 2013-2015 administrative claims data from Texas Children's Health Plan. PP was defined as the receipt of ≥ 2 psychotropic medications from different drug classes concurrently for 60 days or more. Based on the number of prescribers involved in the treatment, the patients were categorized into two groups: a) single prescriber (SP) and b) multiple prescribers (MP). Logistic regression models and the Farilie decomposition method (extension of Blinder-Oaxaca [BO] decomposition) were conducted to assess the relative importance of determinants of PP based on the Andersen Behavioral Model. **RESULTS:** A total of 24,147 children and adolescents with a diagnosis of mental disorder and prescription of psychotropic medication were identified. The prevalence of PP was 20.09%. Logistic regression analyses revealed that patients with specialist involvement (enabling factor) had 5.3 and 3.6 times higher likelihood of receiving PP in the SP (OR=5.32; 95% CI 4.62-6.14) and MP (OR=3.57; 95% CI 3.20-3.99) groups, respectively. Other significant factors associated with PP were patient race (predisposing factor) and diagnosis of bipolar disorders and depression, as well as the number of mental disorders diagnosed (need factor) and number of prescribers involved in treatment (MP group only). The Farilie decomposition analysis estimated that the observed need factors explained only 25% of the difference in the receipt of PP between patients seen by PCPs and specialists within both SP and MP groups. **CONCLUSIONS:** The most prominent enabling factor associated with PP was involvement of a specialist in the treatment of mental disorders. Only one-fourth of the difference between PCPs and specialists' prescribing of PP was explained by observable need factors, underscoring the importance of evaluating different prescribing practices by PCPs and specialists.

PMH19

PREVALENCE AND PREDICTORS OF POTENTIALLY INAPPROPRIATE MEDICATIONS IN DEMENTIA PATIENTS

Mehta HB[1], Sura SD[2], Raji MA[1], Holmes HM[3], Kuo Y[1], Aparasu RR[2], Goodwin JS[1]
[1]University of Texas Medical Branch, Galveston, TX, USA, [2]University of Houston, Houston, TX, USA, [3]The University of Texas Health Science Center, Houston, TX, USA

OBJECTIVES: Potentially inappropriate medication (PIM) use contributes to increased morbidity and mortality in dementia patients. Prior studies have focused on specific classes of PIMs (e.g. strong anticholinergics) or on nursing home dementia patients. No study has comprehensively evaluated PIM use in community-dwelling dementia patients. The current study thus used Medicare database to examine the prevalence and predictors of PIMs in elderly dementia patients. **METHODS:** This retrospective cohort study used the 5% national Medicare data from 2011-2012. The cohort included elderly patients diagnosed with dementia in the baseline year, i.e. 2011. PIMs were defined in the follow-up year, i.e. 2012, using the American Geriatric Society Beers criteria for PIM use due to drug-disease interactions. Predictors were identified in the baseline year based on the Andersen Behavioral Model, and included predisposing (sociodemographic), enabling (dual eligibility) and need factors (Elixhauser comorbidities, medication use and healthcare utilization). Descriptive statistics was used to determine the prevalence of PIMs. Multivariable logistic regression analysis was used to determine predictors of PIMs in dementia patients. **RESULTS:** The cohort included 57,469 elderly dementia patients. The mean age was 85±8 years, and most patients were females (77%) and non-Hispanic whites (82%). Overall, 53.1% of dementia patients received PIMs. The prevalence of different classes were as follows: antipsychotics (31.3%), H2-receptor antagonists (11.3%), antihistamines (10.3%), antimuscarinic urinary incontinence (9.1%), antiemetics (6.7%), nonbenzodiazepine receptor agonist hypnotics (6.1%), tricyclic antidepressants (5.7%), antispasmodic (3.3%), skeletal muscle relaxants (1.6%), antiparkinsons (1.5%), benzodiazepines (1.1%). Mutivariable logistic regression found that females (odds ratio [OR], 1.16), Blacks (OR, 1.18), patients with Elixhauser comorbidities (twelve conditions), emergency room visit (OR, 1.1) and more than five prescription medications (OR, 3.0) were associated with higher likelihood of receiving PIMs. **CONCLUSIONS:** One out of two dementia patients received at least one PIMs. Predictors identified in the study can be targeted to reduce PIM use in dementia patients.

EPIDEMIOLOGY OF BIPOLAR DISORDER TYPE I (BD-I) IN THE UNITED STATES: A SYSTEMATIC REVIEW OF THE LITERATURE

Greene M[1], Clark OA[2], Paladini L[2], Hartry A[3]
[1]Otsuka Pharmaceutical Development & Commercialization Inc., Princeton, NJ, USA, [2]Evidencias - Kantar Health, Campinas, Brazil, [3]Lundbeck Pharmaceuticals Services, LLC, Deerfield, IL, USA

OBJECTIVES: To perform a systematic literature review (SR) of studies in peer reviewed journals on 10 epidemiologic aspects of BD-I in the US: its annual

incidence, prevalence and respective trends; mortality rates and trends; associated comorbid disorders; stages, severity levels and its natural progression. **METHODS:** A literature search was performed using relevant search terms to identify articles published between 2006 and 2016. Studies were identified through electronic Embase, MEDLINE, and PubMed databases. Manual review of bibliographies allowed for the detection of complementary studies. **RESULTS:** Eleven SR and five complementary studies addressed the incidence and prevalence of BD-I. US National Institute of Mental Health (NIMH) estimated the prevalence of BD-I as 1% (lifetime) and 0.6% (12-month). Mean age of disease onset was 20 years, with over 70% of cases diagnosed at the age of 30. Available data was inconclusive for trends on prevalence and there was no incidence data available for US population. Fourteen SR and eight primary studies addressed comorbid disorders. Substance use disorder was highly prevalent with alcohol abuse over 40% and drug dependence between 18% and 30.4%. Borderline personality disorders (12.5%) and anxiety disorders (65% to 86.7%), including generalized anxiety disorder (14.4% to 38.7%) and obsessive-compulsive disorders (10.7% to 24.6%) were highly prevalent and have a negative impact over the course of BD-I. We retrieved 9 SR and one primary study regarding BD-I's staging and natural progression. Staging models identified several features in common: an earlier phase, prodromal phase, initial phase, relapsing phase and end-stage. **CONCLUSIONS:** BD is a chronic and disabling disease with onset in early adulthood. Knowledge on epidemiologic features may help increase awareness and early diagnosis, although there is a gap in our understanding of prevalence rates over time. Also, physicians must be attentive of the high comorbidity rates associated with BD-I.

PMH21

ROUTINE ELECTROLYTE MANAGEMENT AMONG ALCOHOLIC WITHDRAWAL IN HOSPITALIZED SETTING ALCOHOLIC DEPENDENT PATIENTS: ANTICIPATING A FINDING FOR BENEFITS IN CLINICAL MANAGEMENT

Phumpaisalchai P[1], Phumpaisalchai W[2], Ruengorn C[2], Udombhornprabha A[3], Silpakit P[1], Thongpongneim N[4]

[1]*Suanprung Hospital, Chiangmai, Thailand,* [2]*Chiangmai University, Chiangmai, Thailand,* [3]*Eastern Asia University School of Pharmacy, Pathumthani, Thailand,* [4]*Kasemrad Sriburin hospital, Chiang Rai, Thailand*

OBJECTIVES: This study aimed to investigate if there is possible association of both hypomagnesemia and hypokalemia with the severity of alcohol withdrawal syndrome. **METHODS:** A prospective cohort study was conducted in alcohol dependence male patients with age >18 years, admitted in Suanprung Psychiatric Hospital, Chiang Mai Thailand during May to October, 2014. The severity of alcohol withdrawal syndrome was assessed using criteria for Clinical Institute Withdrawal for Alcohol Revised (CIWA-Ar) score which divided into mild, moderate, severe, and very severe. Hypokalemia grade was defined as serum potassium < 3.5 mEq/L meanwhile the Hypomagnesemia grade was serum magnesium < 1.4 mEq/L. The multivariable ordinal logistic regression was performed for data analysis **RESULTS:** A total of 172 male patients, average aged of 44.3±10.1 years. The hypokalemia was found in 71 patients (42.0%) whereas only 38 patients (22.5%) had hypomagnesemia. However, further analysis with controlled for potential confounders, surprisingly hypomagnesemic patients had more severity of alcohol withdrawal as compared with a non-hypomagnesemia (adj. OR 3.49; 95%CI 1.20-10.11, p=0.02). Similarly, patients with hypokalemia showed higher severity of alcohol withdrawal compared to those with non-hypokalemia (adj. OR 2.89; 95%CI 1.05-7.99, p=0.04). **CONCLUSIONS:** Both hypomagnesemia and hypokalemia were strongly associated with severity of alcohol withdrawal syndrome. Suggesting that the plasma Magnesium level determination should be also placed in a routine laboratory test. As such clinicians should be well aware and provide magnesium sulfate sufficiently to prevent severe alcohol withdrawal syndrome.

MENTAL HEALTH – Cost Studies

A BUDGET IMPACT ANALYSIS OF ABUSE DETERRENT OPIOID FORMULATION

Descoteaux A, Borrelli E, Kogut S

University of Rhode Island, Kingston, RI, USA

OBJECTIVES: To model the economic impact associated with increased use of abuse-deterrent formulations of prescription opioids. **METHODS:** A budget impact model was conducted from the payers' perspective considering a population of 1,000,000 lives, using a 3-year timeframe. Utilization of prescription opioids was determined using data from a state Prescription Drug Monitoring Program for the year 2015, focusing on the long-acting opioids fentanyl, hydrocodone, hydromorphone, methadone, morphine, oxycodone, and oxymorphone. Hospital cost associated with prescription opioid overdose was derived from the Healthcare Cost and Utilization Project. The base case assumed a 5%, 7%, and 10% increase in the use of abuse-deterrent opioid products in each of the three years respectively. We estimated that this would equate to approximately 194 additional patients per year, with a corresponding average annual reduction of 14 emergency department visits and 16 hospital discharges for prescription opioid overdose. A sensitivity analysis accounted for the uncertainty of model parameters on overall and per-member-per-month costs. **RESULTS:** The costs associated with the utilization of long-acting prescription opioids increased from $11,446,622.38 in the base year to $12,736,268 in year 1, $13,252,126 in year 2, and $14,025,914 in year 3 corresponding to a per-member-per-month cost of $1.06 in year 1, $1.10 in year 2, and $1.17 in year 3. We estimated the total cost of overdose of the 3-year period to be $5,428,061.20 ($ 1,854,913.00 in year 1, $1,815,862.20 in year 2, and $1,757,286.00 in year 3). **CONCLUSIONS:** Increased use of abuse-deterrent opioid formulations was associated with an increase in total cost of $5,674,441 and an average increase of $0.16 in per-member-per-month spending as compared with the current mix of long-acting prescription opioids. Reduction in prescription opioid overdoses resulting from the increased use of abuse-deterrent opioid formulations yielded savings of $429,558.80.

PMH23

ECONOMIC BURDEN OF BIPOLAR DISORDER IN THE UNITED STATES: A SYSTEMATIC REVIEW OF THE LITERATURE

Greene M[1], Clark OA[2], Paladini L[2], Touya M[3]

[1]*Otsuka Pharmaceutical Development & Commercialization Inc., Princeton, NJ, USA,* [2]*Evidencias - Kantar Health, Campinas, Brazil,* [3]*Lundbeck LLC, Deerfield, IL, USA*

OBJECTIVES: Bipolar disorder (BD) is one of the leading causes of disability secondary to mental/behavior disorders worldwide. We aimed to evaluate the economic burden imposed by BD over employability; work performance and health related quality-of-life (HRQoL) of patients in the United States (US). **METHODS:** We conducted a comprehensive search in Medline and EMBASE from 2006 to 2016 for studies addressing the following aspects: cost-of-illness (direct and indirect costs and impact of specific pharmacological treatments), impact over employability and work productivity, HRQoL (over course of illness and during specific pharmacological treatments). **RESULTS:** We included 26 studies evaluating cost-of-illness. Annual societal costs per BD patient varied from $1,904 to $33,090, with production losses making up to 20%-94% of costs. Overall direct healthcare costs ranged from $8,000-$14,000 purchasing power parities. Total annual health care costs were higher for BD patients than for those without ($12,764 vs $3,140). Improved adherence to medication was related to lower medical costs in BD (1-point increment in MPR reduced $123-$439 mental health expenditures in manic/mixed symptoms patients receiving antipsychotics). Fifteen studies addressed impact of BD over employability and work productivity. Around 40%-60% of BD patients were employed, with higher employment rates during early phases of disease compared to later stages. Mean annual absence costs (sick leave, short/long-term disability, and workers' compensation) were significantly higher for BD employers when compared with those without the disease ($1,995 vs $885). Results from 11 studies showed that HRQOL is impaired in BD patients compared with healthy individuals and with patients diagnosed with other chronic psychiatric and medical conditions. BD pharmacological and non-pharmacological treatments have a positive effect on HRQOL. **CONCLUSIONS:** When compared with other populations, BD patients imposed higher medical costs for payers; however, treatment adherence was associated with reduced health expenditures. Both employability and work productivity were negatively affected by the disease, as was HRQoL.

PMH24

ECONOMIC BURDEN OF UNCONTROLLED ATTENTION DEFICIT HYPERACTIVITY DISORDER IN THE US: A RETROSPECTIVE ANALYSIS OF DATABASE CLAIMS FROM A COMMERCIALLY INSURED POPULATION

Pliszka SR[1], Rajagopalan K[2], Davis BM[3], Montejano LB[4], Loebel A[5]

[1]*The University of Texas Health Science Center at San Antonio, San Antonio, TX, USA,* [2]*Sunovion Pharmaceuticals Inc., Marlborough, MA, USA,* [3]*Truven Health Analytics, part of the IBM Watson Health Business, Ann Arbor, MI, USA,* [4]*Truven Health Analytics, an IBM Company, Ann Arbor, MI, USA,* [5]*Sunovion Pharmaceuticals Inc., Fort Lee, NJ, USA*

OBJECTIVES: Despite availability of several treatment options, adequate symptom control remains a major concern in attention-deficit/hyperactivity disorder (ADHD). Lack of symptom control may impose a significant economic burden, yet few studies have quantified the frequency of uncontrolled symptoms and its relation to costs. This retrospective claims database analysis assessed the impact of ADHD symptom control on health care costs. **METHODS:** MarketScan® Commercial Database claims between January 1, 2010 and June 30, 2015 were used to identify pediatric (age 6-12), adolescent (13-17), and adult (18+) patients with ≥2 ADHD diagnoses (ICD-9 314.0x), ≥1 newly-started ADHD medication pharmacy claim, and continuous enrollment 6 months before and 12 months following ADHD medication initiation ("index"). Symptom control cohorts were defined from 6-month post-index treatment changes: (i) "well controlled"—without dose increase or treatment switching/augmentation; (ii) "partially controlled"—dose increase; and (iii) "poorly controlled"—dose increase and/or treatment switching/augmentation. Annual adjusted cost differences were estimated using generalized linear models. **RESULTS:** The ADHD patient sample (97,230 pediatric; 58,641 adolescent; 135,177 adults) was 69.7%, 65.0%, and 48.7% male, respectively. Mean (SD) age was 8.9 (1.9), 15.0 (1.4), and 31.2 (12.1) years for the pediatric, adolescent, and adult groups, with percent well- (62.1%, 73.7%, 73.0%), partially- (8.8%, 6.4%, 6.1%), and poorly-controlled (29.1%, 19.9%, 20.9%), respectively. Well-controlled pediatric patients had lower annual mean total costs ($3,709) than partially- ($4,269) and poorly-controlled patients ($5,127) (all p-values <0.001). Annual mean medical and pharmacy costs were also lower among well-controlled patients ($2,180, $1,572, respectively) than partially- ($2,163, $2,123) and poorly-controlled ($2,776, $2,363) patients. Similar cost trends were observed for adolescent and adult populations. **CONCLUSIONS:** Our findings suggest that, after one year of treatment, 20.9% - 29.1% of ADHD patients were poorly controlled, and incurred 20.7% - 38.2% greater costs than well-controlled patients, suggesting better symptom control may have economic benefits.

PMH25

HEALTH CARE COSTS OF TREATMENT-RESISTANT DEPRESSION IN A MEDICAID POPULATION

Olfson M[1], Marcus S[2], Benson C[3], McRae J[4], Amos T[3]

[1]*Columbia University, New York, NY, USA,* [2]*University of Pennsylvania, Philadelphia, PA, USA,* [3]*Janssen Scientific Affairs, LLC, Titusville, NJ, USA,* [4]*Thomas Jefferson University, Philadelphia, PA, USA*

OBJECTIVES: Among adults in the Medicaid program who were initiating antidepressant medications for depression, we compared the health care economic

burden of patients who did and did not develop treatment-resistant depression (TRD). **METHODS:** A retrospective longitudinal cohort analysis was performed of the Truven Market Scan Medicaid database (2008-2014). We selected non-elderly adults (18-63 years) with continuous pharmacy and service coverage during a study period spanning 12 months before and after an index antidepressant prescription. Eligible patients had 1) an antidepressant fill after ≥ 6 months without antidepressant possession, 2) a depression diagnosis within 30-days of the index antidepressant fill; and 3) no claims for schizophrenia, bipolar disorder, or dementia and no Medicare coverage during the study period. TRD was defined as initiation of a third treatment course (antidepressants or augmentation therapy) after 2 treatment courses at an adequate dosage and duration (≥6 weeks) during the study period. We compared the health care costs of TRD and non-TRD patients during the 12-months following antidepressant initiation. Costs were compared using ordinary least squares (p-value obtained using a nonparametric bootstrap). **RESULTS:** Approximately 25.1% (2,733 of 10,872) of the cohort met criteria for TRD. Patients with TRD had significantly higher mean (SD) total health care costs than patients without TRD $17,590 ($42,768) vs. $9,138 ($23,885). This difference included higher inpatient $5,776 ($36,277) vs. $2,578 ($19,348), outpatient $6,315 ($9,968) vs. $4,091 ($8,111), emergency department $522 ($1,857) vs. $284 ($1,080), prescription pharmacy $4,225 ($11,582) vs. $1,740 ($4,984), and other medical care $752 ($4,520) vs. $446 ($2,887) costs. All group comparisons had a $p<0.0001$. **CONCLUSIONS:** Within the Medicaid program, approximately one-quarter of adults initiating antidepressant treatment for depression develop treatment-resistant depression during the subsequent year. In relation to depressed patients without treatment-resistance, TRD patients have substantially higher health care costs across every major cost category.

PMH26

HEALTHCARE RESOURCE USE IN SCHIZOPHRENIA SUFFERERS - FINDINGS FROM THE EUROSC COHORT

Millier A[1], Ma F[2], Toumi M[3]
[1]*Creativ-Ceutical, Paris, France,* [2]*Creativ-Ceutical, Beijing, China,* [3]*Aix-Marseille University, Marseille, France*

OBJECTIVES: Schizophrenia is associated with extensive healthcare resource use which may relate to symptom type and severity. This study aims to quantify healthcare resource utilisation associated with different profiles of schizophrenia symptoms, based on data from the European Schizophrenia Cohort – a naturalistic two-year follow-up of 1,208 patients. **METHODS:** At each of the five semi-annual follow-up visits, patients were classed into eight health states based on the Lenert classification, accounting for symptom type (positive/negative/cognitive) and severity (mild/moderate/severe). We estimated consultations with general practitioner (GP), psychologist, psychiatrist and other specialists, day-clinic visits and the length of inpatient stay over six months preceding each visit, using a two-part statistical model based on two generalised mixed models. **RESULTS:** GP visits over 6 months ranged from 1.15 to 2.08, with highest burden linked to moderate positive and negative symptoms. Psychologist visits were the least frequently utilised resource type; highest use was estimated in patients who experienced moderate (0.50) or severe (0.44) predominantly negative symptoms, or severe positive and cognitive symptoms (0.51). All patients frequently visited their psychiatrist – with those experiencing mild symptoms requiring fewest visits (3.01) – but were far less likely to visit other specialists (probability 10–20%), with an average number of visits below 1.0 for all health states. Day clinic use varied widely between health states, both in terms of probability (2–14%) and the number of visits amongst those who did attend (7.9–91.7). Between 11% and 35% of patients required hospital admission, with patients experiencing extremely severe symptoms at highest risk. However, amongst those admitted, hospitalisation was generally prolonged regardless of health state (39–57 days). **CONCLUSIONS:** We quantified the substantial healthcare requirements of schizophrenia patients with different symptom characteristics, which is likely to assist future understanding of differences in resource utilisation of treatments along different health states in this disease.

PMH27

HEALTHCARE RESOURCE UTILIZATION AND COSTS AMONG ADULT SCHIZOPHRENIA PATIENTS USING ONCE-MONTHLY VERSUS TWICE-MONTHLY LONG-ACTING ANTIPSYCHOTICS

Benson C[1], Alcusky M[2], Pilon D[3], Durkin M[1], Xiao Y[3], Thompson-Leduc P[3], Lafeuille M[3], Lefebvre P[3]
[1]*Janssen Scientific Affairs, LLC, Titusville, NJ, USA,* [2]*UMass Medical School, Worcester, MA, USA,* [3]*Groupe d'analyse, Ltée, Montréal, QC, Canada*

OBJECTIVES: To compare real-world healthcare resource utilization (HRU) and costs between schizophrenia patients stabilized on once-monthly (OM) second generation long-acting injectable antipsychotic (LAI) versus twice-monthly (TM) second generation LAI. **METHODS:** Medicaid data from 6 states were used to identify adults with schizophrenia. Patients with ≥2 consecutive claims of the same OM LAI (paliperidone palmitate or aripiprazole) or TM LAI (risperidone) within 45 days with the same dosage and days supplied were selected. Patients needed ≥6 months of eligibility prior to LAI initiation and were observed from the second consecutive claim (index date) to the end of data availability. Outcomes were measured for 12 months after the index date. HRU was compared using incidence rate ratios (IRRs) and 95% confidence intervals (95%CIs) from multivariate generalized linear regression models with a negative binomial distribution. Costs were compared using linear regressions, with p-values estimated using bootstrap techniques with re-sampling (B=499). **RESULTS:** A total of 785 OM patients and 625 TM patients met all study criteria. Patients in the OM cohort were younger (40 vs. 42 years, p=0.022) and were more likely to be men (68% vs. 63%, p=0.043) than in the TM cohort. After adjustment for potential confounders, patients in the OM cohort had fewer outpatient visits (IRR: 0.89, 95%CI: 0.79; 1.00), inpatient visits (IRR: 0.73, 95%CI: 0.58; 0.92), and long-term care visits (IRR: 0.58, 95%CI: 0.35; 0.94). There was no significant difference in total healthcare costs (mean difference: -$146, p=0.228) between OM and TM patients. OM patients had significantly higher pharmacy costs (mean difference: $313, $p<0.001$) and significantly lower medical costs (mean difference: -$460, $p<0.001$) compared to TM patients. **CONCLUSIONS:** Patients stabilized on an OM LAI had lower frequency of HRU and lower medical costs, which offset the higher pharmacy costs compared to patients stabilized on a TM LAI.

PMH28

ANALYSIS OF THE MEDICAL SERVICE UTILIZATION AND EXPENSES OF THE HOSPITALIZED PATIENTS WITH ALZHEIMER'S DISEASE IN SHANGHAI

Yang Y, He J, Kang Q, Hu S
Shanghai Medical Information Center (Shanghai Health Development Research Center), Shanghai, China

OBJECTIVES: To investigate the medical service utilization and the economic burden of the hospitalized patients with Alzheimer's disease in Shanghai. **METHODS:** We collected the homepage information of the discharged Alzheimer's disease patients in various medical institutions in Shanghai at various levels in 2015, and conducted statistical analysis on the sex, age, medical payment approach, length of stay, and hospitalization expenses of the patients. **RESULTS:** There were 940 discharged Alzheimer disease patients in Shanghai in 2015, among whom 342were male, 124 were aged 60-69 years old, 182 were aged 70-79, 468 were aged 80-89 and 131 were aged over 90. Nursing homes and community health centers constituted the major part of the primary medical institutions. In the nursing homes, there were 271 patients; the per capita hospitalization expense was 30415 Yuan. The largest parts accounting for the hospitalization expenses were general medical services (43.62%). In the community health centers, there were 116 patients; the per capita hospitalization expense was 18065 Yuan. The largest parts accounting for the most of hospitalization expenses were general medical services (40.93%). General hospitals and psychiatric hospitals constituted the major part of the tertiary medical institutions. In the general hospitals, there were 146 patients; the per capita hospitalization expense was 24359 Yuan. The largest parts accounting for the most of hospitalization expenses were western pharmaceutical (32.39%). In the psychiatric hospitals, there were 175 patients; the per capita hospitalization expense was 54189 Yuan. The largest parts accounting for the most of hospitalization expenses were general medical services (25.90%). **CONCLUSIONS:** The results show that the economic burden of patients with Alzheimer's disease in Shanghai is relatively high. At the institutional level, the tertiary medical institution undertakes most of diagnostic service, but the primary medical institutions which should assume the primary nursing and rehabilitation function have not demonstrated the advantages.

PMH29

PRICE ANALYSIS OF ANTIDEPRESSANT MEDICATIONS MARKETED IN U.S

Alanazi A[1], Alyahya S[1], Goswami H[2], Seoane-Vazquez E[3]
[1]*MCPHS University, Boston, MA, USA,* [2]*MCPHS UNIVERSITY, Boston, MA, USA,* [3]*Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA*

OBJECTIVES: Antidepressants is one of the most prescribed class of drugs in the US. The AWP does not represent the drug acquisition cost, but it is one of the most commonly used benchmarks for drug reimbursement. This study assessed the trends in average wholesale prices (AWP) at market entry of antidepressant drugs approved by the FDA and marketed in the US as of October 31, 2016. **METHODS:** Regulatory information was derived from the FDA website. Average wholesale prices (AWP) per unit at market entry were derived from the RedBook (Truven Health Analytics, Inc.). The AWP history was collected from approval to October 31, 2016. The FDA daily-defined dosage (DDD) for adult patients was obtained from FDA-approved labels. The AWP per DDD, 30 DDD and year were calculated. Prices were adjusted for inflation using the consumer price index (CPI). Descriptive statistics were performed in the study. **RESULTS:** FDA listed 56 approved antidepressant drugs as of October 2016. There were 20 antidepressant drugs approved by FDA in 1980s, 15 in 1990s, 14 in the 2000s, and 7 in the period 2010-2016. The median AWP per DDD at market entry was $4.02(range=$0.28- $58.27) in the 1980s, $10.75 (range=$1.04 -$37.35) in the 1990s, $24.96(range=$4.54 - $84.39) in the 2000s, and $25.38 (range=$8.67-$149.33) in the period 2010-2016. The median CPI-adjusted AWP per DDD of antidepressant drugs at market increased in average $0.7 per year. **CONCLUSIONS:** The pharmaceutical companies' inflation-adjusted listed prices at market entry increased 6.6 times over the period of analysis. Prices of marketed antidepressant drugs also increased faster than the inflation.

PMH30

THE IMPACT OF LONG ACTING INJECTABLE ANTIPSYCHOTICS ON THE HEALTH AND ECONOMIC OUTCOMES OF SCHIZOPHRENIA PATIENTS

Zheng Y, Keenan A
Janssen R&D US, Raritan, NJ, USA

OBJECTIVES: To investigate the health and economic impact of long acting injectable (LAI) antipsychotics on schizophrenia patients. Schizophrenia is a chronic severe and disabling mental disorder typically onset in early adulthood. Treatment persistence with the traditional daily oral antipsychotics has been suboptimal. LAIs reduce the administration frequency to biweekly, monthly or quarterly, and have been shown to improve treatment persistence. **METHODS:** A health economic model was developed to compare the health and cost outcomes of patients treated with commonly prescribed antipsychotics in France as

maintenance therapy from the patient perspective to put it in context of self-pay economics. The LAI comparators included paliperidone, aripiprazole and risperidone, along with commonly used oral treatments. The model tracked treatment persistence, relapse, key adverse events and direct and indirect costs (associated with unemployment, care giving, loss in productivity and mortality). Clinical inputs were based on mixed treatment comparisons of pivotal phase III clinical trials, while cost inputs were based on published literature. **RESULTS:** Over a 1-year period, schizophrenia patients without treatment on average had 0.57 relapses and incur €6,092 direct medical costs and €31,187 total costs (direct and indirect). Patients on LAIs experienced fewer relapses (0.20~0.25) than those on oral (0.29~0.43) or no treatment. Paliperidone palmitate 3-month dosing (PP3M), LAI with the lowest administration frequency, had the lowest number of relapses (0.20) due to improved treatment persistence and better efficacy. Receiving either LAIs (€4,959~€5,719) or oral treatment (€3,711~€4,975) reduced direct medical costs compared to no treatment. When indirect costs were included, patients receiving LAIs had lower costs than those receiving oral or no treatment, with cost being the lowest for PP3M. **CONCLUSIONS:** Schizophrenia imposes significant health and cost burden on patients and families. LAIs provided a better alternative to orals in reducing relapses and total costs, with PP3M delivering the best outcome.

PMH31

POSTPARTUM DEPRESSION SCREENING IN ALBERTA, CANADA: A COST EFFECTIVENESS ANALYSIS USING ADMINISTRATIVE DATA

Premji S[1], McDonald SW[1], McNeil DA[1], Spackman E[2]
[1]*Alberta Health Services, Calgary, AB, Canada,* [2]*University of Calgary, Calgary, AB, Canada*

INTRODUCTION: Postpartum depression (PPD) is a debilitating disease that affects women's quality of life, social functioning and productivity. In Canada, the prevalence of PPD is estimated to be between 10-15%. Left untreated, PPD can lead to significant consequences for the mother, father and child**. OBJECTIVES:** To examine the cost effectiveness of screening versus not screening for PPD in Alberta using the Edinburgh Postnatal Depression Scale (EPDS) with a cut point of 12/13 within the first year postpartum. **METHODS:** A decision analytic model was created to determine the incremental cost per quality adjusted life-year (QALY) of PPD screening over one year postpartum using a public payer perspective. The majority of model inputs were derived using an Alberta-based research cohort linked to administrative data. Costs are reported in 2016 Canadian dollars. Sensitivity and scenario analyses were completed to test the uncertainty surrounding varying model inputs. **RESULTS:** Screening for PPD using the EPDS at a cut point of 12/13 appears to be more costly ($66) and more effective (0.0021 QALYs) compared to not screening, with an incremental cost effectiveness ratio (ICER) of $30,822 per QALY. The base case inputs were chosen to be conservative, the ICER for all other scenarios ranged from $13,382-$30,077 per QALY. Sensitivity analyses indicated that the utilities of having and not having PPD were important drivers of the model. **CONCLUSIONS:** Following extensive scenario and sensitivity analyses, it appears that the ICERs for PPD screening falls within the acceptable threshold range ($50,000 per QALY) for health programs and services in Canada. We therefore recommend screening for PPD using the EPDS with a cut point of 12/13 in Alberta.

PMH32

PHARMACOECONOMIC ANALYSIS OF AGOMELATINE FOR THE TREATMENT OF MAJOR DEPRESSIVE DISORDER IN KAZAKHSTAN

Adilgozhina G[1], Abdukhakimova D[1], Zhumagali Y[1], Bektur C[2], Kostuyk A[3], Nurgozhin T[2]
[1]*Nazarbayev University, Astana, Kazakhstan,* [2]*PI "National Laboratory Astana", Astana, Kazakhstan,* [3]*PI "Kazakh Agency for Health Technology Assessment", Astana, Kazakhstan*

OBJECTIVES: The aim of this study is to conduct an economic evaluation of agomelatine compared with venlafaxine and its most common alternative in routine clinical practice for the treatment of patients with major depressive disorder (MDD) in Kazakhstan. **METHODS:** Markov's model was developed to assess the 2-year efficiency of agomelatine relative to the antidepressant analog (venlafaxine) in the treatment of patients with MDD in Kazakhstan. The analysis was conducted from the perspective of the Ministry of Health and Social Development of the Republic of Kazakhstan. Costs are expressed in US dollars (USD) at the exchange rate of 2015 (185.05 KZT = 1 USD), the health benefits were counted in QALYs. Costs and results that occur outside of one year were discounted at an annual rate of 3%. **RESULTS:** Cumulative costs for patients with MDD during the biennium amounted to 220.17 USD and 329.57 USD in the case of treatment with venlafaxine and agomelatine, respectively. Agomelatine therapy predicts 0.466 QALY per patient, whereas treatment for venlafaxine the figure is 0.386 QALY. Thus, CER 706.64 USD/QALY vs 571.06 USD/QALY, respectively. The indicator of the incremental cost-effectiveness of ICER is 1677.05, which is "very cost-effective," according to WHO recommendations (less than 1 per capita GDP). **CONCLUSIONS:** Pharmacoeconomic analysis showed that the use of agomelatine in the "standard treatment strategies of MDD," proved to be more cost-effective than conducting a standard therapy with venlafaxine for ICER indicators.

PMH33

COST-OFFSET ANALYSIS OF SOCIAL AND EMOTIONAL LEARNING PROGRAMS FOR THE PREVENTION OF EXTERNALIZING BEHAVIOR PROBLEMS: AN ECONOMIC MODELING STUDY

Nystrand C, Sampaio F, Feldman I
Uppsala University, Uppsala, Sweden

OBJECTIVES: Externalizing behavior problems are common among children, and place a high disease and financial burden on individuals and society. Social and Emotional Learning (SEL) programs are commonly used to prevent such problems, but little is known about their possible longer-term cost-offsets. This study estimates the costs and longer term savings of the two evidence based SEL programs currently available in Sweden, Good Behavior Game and Second Step, for the reduction of externalizing behavior problems in children. **METHODS:** A population-based Markov model was developed to estimate the cost-savings of the two SEL programs compared to a no intervention scenario, achieved by a reduction in clinical cases of attention-deficit/hyperactivity disorder (ADHD), Conduct disorder (CD) and comorbid ADHD/CD. Epidemiological data were collected from the 2015 Global Burden of Disease Study. Intervention effectiveness parameters were estimated from a meta-analysis of relevant studies, where effects assumed to reduce to zero after one year. This study adopted a limited societal perspective including costs accruing to the health care and education sectors while intervention costs were based on intervention descriptions. The target population was a cohort of 8-10-year-old healthy children in the 2015 Swedish population followed through to the age of 15 years, assuming 100% intervention coverage. Multivariate probabilistic and univariate sensitivity analyses were conducted to test model assumptions. **RESULTS:** Intervention cost per child amounted to 70 USD and total cost-savings per child over the modeling period were estimated at 330 USD. The cost-offset relationship for prevention was 1.49, implying that for 1 USD invested, 1.49 USD can be gained over the modeling period. **CONCLUSIONS:** Our results suggest that these two evidence based SEL programs are likely to yield cost-savings to society. Further research is needed to investigate cost-savings accruing to other sectors of the society, as well as the cost-effectiveness of such interventions.

PMH34

COST-EFFECTIVENESS EVALUATION, INCLUDING COGNITIVE OUTCOMES, OF VORTIOXETINE IN PATIENTS WITH MAJOR DEPRESSIVE DISORDER SWITCHING FROM FIRST ANTIDEPRESSANT THERAPY IN THE UNITED STATES

François C[1], Atsou K[2], Diamand F[2], Brignone M[2], Briquet B[3], Mucha L[4], Danchenko N[2], Ereshefsky L[5]
[1]*Lundbeck, Deerfield, IL, USA,* [2]*Lundbeck SAS, Paris, France,* [3]*Benjamin Briquet, Levoncourt, France,* [4]*Takeda Pharmaceuticals U.S.A., Inc, Deerfield, IL, USA,* [5]*Follow the Molecule: CNS Consulting LLC, Marina del Rey, CA, USA*

OBJECTIVES: A US-setting, cost-effectiveness evaluation was performed comparing vortioxetine versus levomilnacipran and vilazodone for the treatment of major depressive disorder (MDD) after a switch due to first antidepressant inadequate response. **METHODS:** A decision tree, supplemented with a 2-month cycle Markov model of additional antidepressant switches, was built (1-year time horizon). Published data were used for comparative efficacy (remission, recovery, and relapse), tolerability (withdrawal due to adverse events [AEs]), health state–associated utilities, and short- and long-term AE-related disutilities. Cognition-related inputs (cognition rates, disutilities, and costs) were based on analyses of clinical trial results (published and unpublished). Using a societal perspective, direct healthcare costs and indirect costs from absenteeism were considered (2015 US dollars). The main outcome was the incremental cost-effectiveness ratio (ICER). Sensitivity analyses, including burden of cognition, were conducted. **RESULTS:** The total costs and initial treatment-line recovery rates were $6615 and 34.1% for vortioxetine, $6763 and 28.3% for levomilnacipran, and $6294 and 28.8% for vilazodone. Vortioxetine was associated with a greater quality-adjusted life year (QALY) versus levomilnacipran (0.0070) or vilazodone (0.0083); was dominant versus levomilnacipran, and cost-effective versus vilazodone (ICER, $38,608/QALY); and had a 75% probability of being cost-effective at a $50,000 willingness-to-pay threshold (recommended US-based lower limit). In sensitivity analyses using residual cognition rates of 49.3% for vortioxetine, 58.0% for levomilnacipran, and 63.7% for vilazodone, vortioxetine was associated with an additional QALY versus levomilnacipran (0.0085) or vilazodone (0.0109), and was dominant versus levomilnacipran and cost-effective versus vilazodone (ICER, $27,633/QALY). Similar results (base and cognition scenarios) were found taking into account only direct costs (>60% of total costs). **CONCLUSIONS:** In this analysis of MDD treatment after first antidepressant switch, vortioxetine showed higher QALYs and lower costs than levomilnacipran, and was cost-effective versus vilazodone; an ICER reduction was found after cognition outcomes inclusion (28% versus base). These data suggest potential benefits of switching to vortioxetine.

PMH35

ECONOMIC EVALUATION OF PALIPERIDONE PALMITATE FOR TREATING CHRONIC SCHIZOPHRENIA PATIENTS IN THE UAE

Nuhoho S[1], Saad A[2], Saumell G[3], Ribes-Arbonés D[3], El Khoury AC[1]
[1]*Janssen GCC, Dubai, United Arab Emirates,* [2]*Janssen GCC, Riyadh, Saudi Arabia,* [3]*Curo Consulting, Marlow, UK*

OBJECTIVES: Schizophrenia is a long-term mental disorder that affects how a person thinks feels and behaves. Management of these patients is both clinically and financially challenging. In the United Arab Emirates (UAE), standard of care (SoC) is daily oral antipsychotics which have adherence concerns. Paliperidone palmitate (PP-LAI) has recently been approved for chronic schizophrenia and is administered monthly. This is an economic evaluation of PP-LAI in the UAE. **METHODS:** A cost-utility analysis was conducted using a previously validated 1 year decision tree model reflecting the treatment pathways, costs and outcomes of three treatment options; PP-LAI monotherapy, SoC or PP-LAI plus SoC. Direct costs, inflated to 2016 where applicable, and treatment effects were obtained from literature and standard price lists. Where these were not available, data were collected from a local panel of experts who also validated the treatment pathways. The primary outcome was the cost per quality-adjusted life-year

(QALY) gained **RESULTS:** The average PP-LAI patient in the base case with or without SoC experienced 0.840 QALYs while the SoC patient experienced 0.812 QALY. Since the PP-LAI plus SoC group cost more than the PP-LAI monotherapy without additional QALY gains, PP-LAI plus SoC was discarded from further analysis. PP-LAI monotherapy resulted in incremental cost savings of AED 831 (USD 226) when compared to SoC. PP-LAI monotherapy is therefore projected to be an economically dominant treatment option. Dominance drivers were greater remission days and lower hospitalization and ER visits for PP-LAI vs SoC. The model was sensitive to a wide range of published SoC adherence rates. In scenario analyses, the conclusions were between increased economic dominance and highly cost-effective when PP-LAI monotherapy was compared to SoC. **CONCLUSIONS:** PP-LAI is projected to save costs and improve patient outcomes in the UAE and should be considered a viable treatment alternative by payers and prescribers alike.

PMH36

A SYSTEMATIC REVIEW OF HEALTH ECONOMIC STUDIES ON BIPOLAR DISORDER TYPE I IN THE UNITED STATES

Greene M[1], Clark OA[2], Piedade A[3], Lemmer T[3], Hartry A[4]
[1]Otsuka Pharmaceutical Development & Commercialization Inc., Princeton, NJ, USA, [2]Evidencias - Kantar Health, Campinas, Brazil, [3]Evidências - Kantar Health, São Paulo, Brazil, [4]Lundbeck Pharmaceuticals Services, LLC, Deerfield, IL, USA

OBJECTIVES: Bipolar disorder (BD) is a chronic disease associated with several medical and psychiatric comorbidities that can have serious economic impact. We aimed to identify, describe and critically assess health economic studies in BD-I in the US during the last ten years and provide recommendations for future researchers. **METHODS:** We searched MEDLINE, EMBASE, NHS EED and ISPOR's database to identify articles/posters with economic evaluations (cost-effectiveness-CEA, cost-utility-CUA, cost-minimization-CMA, cost-benefit-CBA and budget impact analysis-BIA) performed on BD-I patients. We collected information on: population, intervention/comparator, setting, modeling, data quality, clinical/economic outcomes and uncertainty analysis. For quality assessment, two checklists (Drummond/Philips) recommended by the Cochrane Collaboration were applied. **RESULTS:** Six studies were included (4 articles, 1 poster, 1 budget impact model-BIM) covering various medications alone or combined (lamotrigine, lithium, olanzapine, quetiapine, aripiprazole, lurasidone and risperidone) in several disease settings (overall maintenance, maintenance after stabilization or with recent manic episodes, acute depression or hospitalization following acute mania). Regarding study types (type of modeling) we found 4 CEA/CUA (Markov model), 1 CEA (decision tree) and 1 BIA (discrete event simulation). Measures of benefit included: number of acute episodes, euthymic days, QALY, remission rate and utilities. Four CEAs used ICER as economic outcome and one used Net Benefit Analysis (NBA). Quality assessment showed medium-to-high risk of bias, and very weak clinical bases supporting analyses. **CONCLUSIONS:** Further economic studies on BD-I should take into consideration the main comparators used in real-life. When no head-to-head comparison exists, researchers should perform systematic review and possibly network meta-analysis. Since BD-I is a chronic disease, a lifetime framework should be considered for time horizon. Parameters from previous publications should be used carefully, since many of them may be invalid. Economic analyses could be developed further to include other treatment options and Markov model should cover subsequent treatment lines.

PMH37

THE ECONOMIC BURDEN OF OPIOID USE DISORDER (OUD): RESULTS OF A STRUCTURED LITERATURE REVIEW

Sabar U[1], Rycroft C[1], Ronquest NA[2], Nadipelli VR[2], Wollschlaeger B[3], Akehurst R[4]
[1]Bresmed Health Solutions, Sheffield, UK, [2]Indivior Inc., Richmond, VA, USA, [3]Aventura Family Health Center, Florida, FL, USA, [4]Sheffield University, Sheffield, UK

OBJECTIVES: Opioid use disorder (OUD) is a chronic and relapsing medical illness associated with a high cost to individuals, families and society. We evaluated the current literature to identify evidence gaps and summarise published data on economic costs associated with OUD. **METHODS:** A structured, comprehensive literature review was conducted to identify articles describing the burden and treatment landscape of OUD including: risk factors, patient characteristics and comorbidities, epidemiology, humanistic and economic burden, employment and crime, treatment options and current clinical guidelines. Global literature databases, guideline databases, regulatory and health technology assessment agency websites and relevant society guidelines were searched for data published between 2000–2015. Articles were not restricted by language. Eligible articles were those reporting on OUD (including opioid dependence and abuse) and providing data on $\geq$1 topic of interest. **RESULTS:** A total of 2,234 records were screened; 202 articles met the selection criteria and were included in this literature review, 31 of which reported on economic burden. From these 31 articles, only one reported total economic burden associated with untreated opioid dependence as CAD$5,086 million/year (cost year: 1996). The remaining articles (Australia [7], UK [1], Canada [2], US [20]) focused on specific elements of economic burden, including costs of treatment programmes, criminal justice and use of prescription opioids. Of these, studies looking specifically at prescription opioid abuse, dependence and misuse, reported that the total societal cost was US$55.7 billion (2007) and US$78.5 billion (2013). **CONCLUSIONS:** The literature reports a substantial economic burden associated with OUD. However, the majority of the evidence is from studies reporting on specific elements of cost, with limited direct and indirect cost data. Furthermore, the latest comprehensive data were reported approximately 20 years ago. Thus, the lack of recent global data is likely to result in underestimation of the current economic burden associated with OUD.

MENTAL HEALTH – Patient-Reported Outcomes & Patient Preference Studies

PMH38

TREATMENT PATTERNS, ADHERENCE AND CLINICAL OUTCOMES IN BIPOLAR DISORDER TYPE I: A SYSTEMATIC REVIEW OF OBSERVATIONAL STUDIES

Piedade A[1], Greene M[2], Clark OA[3], Paladini L[3], Hartry A[4]
[1]Evidências - Kantar Health, São Paulo, Brazil, [2]Otsuka Pharmaceutical Development & Commercialization Inc., Princeton, NJ, USA, [3]Evidencias - Kantar Health, Campinas, Brazil, [4]Lundbeck Pharmaceuticals Services, LLC, Deerfield, IL, USA

OBJECTIVES: To perform a systematic review of literature on real-world data from observational studies on bipolar disorder (BD) treatment regarding patterns-of-care, adherence, and clinical outcomes of second-generation atypical antipsychotics (SGA). **METHODS:** A literature search was performed on Medline and Embase to identify articles on BD addressing patterns-of-care, adherence and clinical outcomes of SGA therapy from 2006 to 2016. **RESULTS:** Fifty-three studies were included for analysis. Regarding patterns of drug utilization, SGA monotherapy are prescribed for about 45% of patients as first antimanic therapy (quetiapine in 39.5% and aripiprazole in 37.2% of cases). Overall, prescriptions for BD patients include mainly SGA monotherapy or in combination (45-50%) and mood stabilizers (e.g.: lithium, anticonvulsants) for 65-80% of cases. During follow-up, combination therapy (SGA+mood stabilizers) is prescribed to 50-70% of patients. Adherence to clinical guidelines prescription recommendations range from 50%-83%. Adherence to medication was measured by medication possession ratio (MPR), with an MPR $\geq$80% considered as appropriate adherence to therapy. Some studies reported very poor adherence rates (MPR: 15-25% and MPR $\geq$80% for only 6-10% of patients receiving SGA), but the majority reported MPRs ranging from 40-75%. Mean duration of SGA use was 175 to 290 days over a 12-month period, but persistence was described as around 100 days. Reasons for non-adherence were: younger age; baseline substance use disorder; higher disease burden, with a greater number symptoms; side effects as a cause for frustration; comorbid anxiety and obsessive-compulsive disorder. **CONCLUSIONS:** Observations from real-world evidence are essential components in economic models development and decision-making process. This review showed which patterns-of-care are adopted in real practice for the treatment of BD patients. SGA monotherapy is used for 45% of patients during first antimanic episode, almost 50% of cases receive SGA (monotherapy or combination) overall and up to 70% are treated with SGA plus mood stabilizers during follow-up.

PMH39

EVALUATION OF DEPRESSION PREVALENCE AND ASSOCIATED DEMOGRAPHIC RISK FACTORS AMONG STUDENTS OF A PUBLIC SECTOR UNIVERSITY: A CROSS-SECTIONAL STUDY

Ahmad S, Rehman T, Masood I, Abbasi WM, Bilal M, Ghauri AO
The Islamia University of Bahawalpur, Bahawalpur, Pakistan

OBJECTIVES: To obtain the prevalence of depression and whether the socio-demographic variables were associated with depression in professional university students. **METHODS:** A cross-sectional study was carried out on students of ages between 18-25 years in faculty of pharmacy and alternative medicine in The Islamia University of Bahawalpur, Pakistan. Data was collected by self- administered questionnaire on socio-demographic variables. Depression was evaluated by Beck depression inventory (BDI). BDI scores of 17 or more than 17 are considered depressive. SPSS version 20.0 was used for data analysis. Mann-Whitney U test and Kruskal-Wallis analysis of variance were applied for continuous data analysis. **RESULTS:** Out of all respondents, 40% students suffered from depression and had BDI scores of 17 or above of it. The prevalence of depression among 2nd year students is 43.2%, 52.3% in students with poor study performance, 56.2% in students residing in urban areas, 50% in students of 20 years older or less, and 68.2% in students with poor socio-economic status. Depression was significantly associated with poor socio-economic status, study year and study performance showing p value $>$ 0.001 for all variables while depression levels were insignificantly high among females and urban residents showing p values 0.479 and 0.193 respectively. **CONCLUSIONS:** Professional Students of a public sector university of Pakistan have high prevalence of depression. Considering high prevalence of depression among university students, a student counseling service should be arranged to help the students with poor study performance and poor financial back ground.

PMH40

INCORPORATING PATIENT PERCEPTIONS ABOUT TREATMENT IN COST-EFFECTIVENESS ANALYSIS

Han D, Clement F, Spackman E
University of Calgary, Calgary, AB, Canada

OBJECTIVES: ACUDep, a randomized pragmatic trial, compared acupuncture, counselling, and usual care for relieving depression. Patient perceptions about the effectiveness of treatments may affect costs and health outcomes through compliance or a placebo effect. The objective of this study was to assess the cost-effectiveness for patient subgroups with different perceptions about treatment effect. **METHODS:** ACUDep reported outcomes on costs and EQ-5D for up to 12 months for 755 patients. Patient perceptions about the effectiveness of each treatment was measured on a five-level likert scale. A binary variable was generated indicating if a patient had a positive opinion about the treatment, i.e. they thought the treatment would be fairly effective or very effective. A seemingly unrelated regression was used to estimate costs and QALYs with coefficients for treatment received, positive perception of each treatment and an interaction term between all coefficients. **RESULTS:** Most patients did not have a positive perception of any of the treatments, 31.3% responded very ineffective, fairly ineffective or can't decide for their perception of effectiveness of all treatments. 5.7% of patients had a positive perception of all treatments. Using a threshold of £20,000

per QALY the cost-effective treatment varied depending on the expectation of treatment effectiveness. Acupuncture was the cost-effective treatment for patients that were not optimistic about any or all of the treatments. Counselling was the cost-effective treatment in the subgroups that thought only counselling would be effective, only acupuncture would be effective or either of them would be effective. Usual care was cost-effective in the patient populations that thought that only usual care would be effective or usual care and either acupuncture or counselling would be effective. **CONCLUSIONS:** In this analysis patient perception does affect observed treatment outcomes and alters which treatment is cost-effective. Further consideration should be given to assessment of patient perceptions and there use in reimbursement decisions.

PMH41

PRO INSTRUMENTS USED IN STUDIES OF BIPOLAR DISORDER SINCE 1960

Martin A
Crystallise Ltd., East Tilbury, UK

OBJECTIVES: To create an evidence map of the different patient-reported outcome instruments used in studies of patients with bipolar disorder, the geographical settings in which these studies were conducted and the interventions assessed. **METHODS:** We searched the heoro.com database (www.heoro.com) for PRO studies on bipolar disorder published between 1960 and December 16 2016, and analysed the abstracts identified by the search to determine the different PRO instruments cited across the range of geographical locations and interventions. We presented the findings as an evidence map. **RESULTS:** We found a total of 127 abstracts that reported the use of 85 different PRO instruments. Of these 85 instruments, 19 were specific for bipolar disorder, depression or mania, 45 were general instruments used to evaluate quality of life, functioning or utilities, nine assessed other conditions or diseases that were common comorbidities of people with bipolar disorder, including anxiety, eight assessed treatments or adherence, three evaluated the impact of the disease on work productivity and one assessed caregiver burden. The most frequently used tool was the SF-36, cited in 26 abstracts, followed by the Young Mania Rating Scale (18 abstracts), Q-LES-Q (17 abstracts), Hamilton Depression scale (15), MADRS (13) and SF-12 and WHOQOL-BREF (10 each). The United States was the most common setting, with 56 abstracts, followed by the United Kingdom (8 abstracts), Canada and Italy (7 abstracts each), then Australia, Brazil and Spain (6 abstracts each). Drug interventions were assessed in 28 abstracts,and psychological interventions in 15. **CONCLUSIONS:** A wide range of PRO tools have been used in studies of bipolar disorder, but only ten tools were cited in more than five abstracts each. Research into the quality of life in bipolar disorder has generally been assessed from a US perspective.

PMH42

PAIN ASSESSMENT AMONGST PATIENTS WITH DEMENTIA

Horváth É[1], Fullér N[1], Oláh A[1], Ferenczy M[2], Pakai A[3], Boncz I[1], Karácsony I[2], Szabó L[1]
[1]*University of Pécs, Pécs, Hungary,* [2]*University of Pécs, Szombathely, Hungary,* [3]*University of Pécs, Zalaegerszeg, Hungary*

OBJECTIVES: The aim of our study was to examine the possibilities of the assessment of pain in people with dementia and assess the clinical applicability of these scales in the nursing practice. **METHODS:** The study was a cross-sectional, descriptive, quantitative analysis. By purposive sampling we enrolled patients with dementia at the age of 60 or older (N=101). Exclusion criteria included not having any other mental or acute somatic disease and not being in terminal condition. The study was carried out at the facility of the Hungarian Baptist Aid in Pécs between 01.12.2015 and 31.01.2016. The analysis was done with Microsoft Office Excel software including descriptive statistics (absolute frequency, relative frequency, mean, standard deviation, confidence interval) and mathematical statistics (Chi2-test, T-test ANOVA) at $p<0.05$. We used five different assessment scales. The NRS (numeric rating scale) is a general one, while the other four scales, PAINAD (Pain Assessment in Advanced Dementia Scale), FLACC (Face, Legs, Activity, Cry, Consolability scale), Doloplus 2 and PACSLAC (Pain Assessment Checklist for Seniors with Limited Ability to Communicate) are special scales made to assess behavior in people with dementia who do not communicate. **RESULTS:** We found that the NRS scale indicates excessive sensitivity in people with mild dementia ($p=0.03$), while in people with severe dementia, the NRS scale did not assess pain so accurately compared to the findings of the other four scales. PAINAD, FLACC, and Doloplus 2 proved to be more reliable. PACSLAC was the most considerable, but its clinical usability seems to be limited due to long and complex evaluation. **CONCLUSIONS:** Considering all, we can state that the four dementia-specific scales which rely on patients' behavior are more reliable in terms of means than the NRS. Using these was more beneficial in our clinical practice.

PMH43

DEPRESSION ASSESSMENT IN PATIENTS DIAGNOSED WITH PARKINSON'S DISEASE FOR CLINICAL PRACTICE

Sisu R, Popescu A, Turcu-Stiolica A, Bogdan M
University of Medicine and Pharmacy of Craiova, Craiova, Romania

OBJECTIVES: To show the complexity of patients with Parkinson's disease (PD) by illustrating an accurate profile based on the prevalence of depression and other complications and differences observed among patients from UK and USA, for further good practices recommendations. **METHODS:** A cross sectional descriptive study was conducted using an electronic survey among patients from UK and USA diagnosed with PD. Patients (n=104) were screened for depression by using the Zung Self-Rating Depression Scale (SDS). Prevalence of movement and nervous system symptoms was assessed by using multiple choice questions and the distress of each category was scored from 0 to 3 (0–no, 1–mild, 2-moderate, 3-severe) where a higher score indicates greater distress. Cronbach's alpha (α) was calculated to confirm the reliability of the SDS and distress questionnaire. Comparisons between patient groups were made with ANOVA and two-tailed t-test, correlations were interpreted based on calculations of Pearson's R and descriptive statistics summarized the features of the sample. **RESULTS:** Most of the patients were from UK (65.38%), 50.96% were female and 54.81% showed depression according to SDS ($\alpha=0.78$). Comparisons between UK and USA patient groups disclosed no significant differences (all $p>0.05$). Patients aged 40-50 showed a higher incidence of depression ($p=0.025<0.05$) with a more severe stage of depression ($p=0.0042<0.05$). Prevalence of movement and nervous system symptoms as well as the distress of these symptoms ($\alpha=0.75$) are up to two times higher in patients with depression than in those without ($p<0.05$). In patients with depression according to SDS, 51.80% consider themselves not being depressed and in those that do not have depression according to SDS, 15.20% consider themselves depressed. **CONCLUSIONS:** All patients with PD revealed a complex profile and require good management of frequent comorbidities. Prevalence of depression calls for medical professionals to be vigilant in the screening process.

PMH44

ASSOCIATION BETWEEN MALNUTRITION AND DEPRESSION AMONG COMMUNITY-DWELLING OLDER CHINESE ADULTS

Zhang Y[1], Fan L[2], Wei J[3], Li S[2], Partridge J[4], Claytor L[5], Sulo S[5]
[1]*China Health Economics Association, Beijing, China,* [2]*Abbott Nutrition, Chicago, IL, USA,* [3]*Beijing Hospital Department of General Surgery, Beijing, China,* [4]*Abbott Nutrition, Columbus, OH, USA,* [5]*Abbott Nutrition, Abbott Park, IL, USA*

OBJECTIVES: Malnutrition and depression are of important concern among older adults. Assessment of the two and their association is of particular interest in China, which has the largest elderly population in the world. We investigated the association between malnutrition and depression among community-dwelling older Chinese adults, and how their association impacts healthcare costs. **METHODS:** Data from 4,916 adults aged 60 years or older collected as part of the Wave II-2013 China Health and Retirement Longitudinal Study (CHARLS) survey were analyzed. Measures of hand grip strength, body mass index, and weight loss were used as indicators of malnutrition status. Subjects were categorized into "depressed" and "non-depressed" groups based on the Center for Epidemiological Studies Depression Scale (CES-D) scores. Logistic regression was used to analyze the association between malnutrition and depression after controlling for confounding factors including socio-demographics, health status, and functional independence. **RESULTS:** Of the adults studied, 23% were depressed, of whom 30% were malnourished. In the non-depressed group, only 21% of the adults were malnourished. Regression results indicated that malnourished individuals were 51% more likely to be depressed than their non-malnourished counterparts (OR=1.513, $p<0.001$). Hospital related service cost was ¥3,160 per person per year for malnourished and depressed adults compared to ¥1,824 for malnourished and non-depressed adults (73% decrease, $p<0.01$), and ¥1,902 for non-malnourished and depressed adults (66% decrease, $p<0.01$). **CONCLUSIONS:** Depression prevalence was significantly higher among malnourished older Chinese adults. These results suggest that depression is a common mental disorder among community-dwelling older adults and that malnutrition could induce depression as a result of the psychological vulnerability of this population. The incidence of depression coupled with malnutrition is associated with a significant increase in hospital related costs; thus highlighting the importance of both malnutrition and depression screening and treatment for older Chinese adults living in the community.

PMH45

FIT FOR PURPOSE REVIEW OF MEASURE OF DEPRESSION SYMPTOMS TO OBTAIN FDA PRO LABEL CLAIMS

Cheng R[1], Cole JC[2], Trivedi B[2]
[1]*PPD, San Diego, CA, USA,* [2]*ZS Associates, Thousand Oaks, CA, USA*

OBJECTIVES: A primary use for patient reported outcomes (PROs) is to measure latent states which are otherwise unmeasurable. As such, the CNS field offers a potpourri of disorders where the core of the disease must be measured via PRO. Depressive disorders are a quintessential CNS area where a number of PROs exist. However, since the 2006 draft guidance for PRO label claims was published, only two depressive disorders have obtained PRO label claims and neither of these were based on a measure of depression. The current study reviews the readiness of several commonly used depression measures to obtain a PRO-based label claim. **METHODS:** Commonly used fit-for-purpose review tables were used to evaluate qualitative and quantitative readiness of the following PROs, which are either exclusively depression scales or include a subscale for depression: Beck Depression Inventory II (BDI-II), Quick Inventory of Depressive Symptomatology—Self Report (QIDS-SR), Outcome Questionnaire (OQ-45), Clinically Useful Depression Outcome Scale (CUDOS), Center for Epidemiologic Studies Depression Scale (CES-D), Patient Health Questionnaire (PHQ-9), Patient-Reported Outcomes Measurement Information System Depression Scale (PROMIS). **RESULTS:** Although each of these scales has been used in medical and clinical research, virtually all of these scales have published qualitative research findings; many were developed before qualitative development approaches with patients were accepted practice. PROMIS Depression PRO meets most of the criteria but is strongest when used as an adaptive PRO, something the FDA has not yet endorsed. **CONCLUSIONS:** Work needs to be done to come out with a multidimensional depression PRO that can be used for PRO-based label claims. The FDA PRO Consortium is developing a tool for this purpose. However, if pharmaceutical companies wish to obtain differentiated messages then additional PRO depression measures are likely to be required, such as one sees in rheumatic disorders.

PMH46

A REVIEW OF HEALTH-RELATED QUALITY OF LIFE MEASUREMENT IN DUAL DIAGNOSIS POPULATION

Dunn TJ, Rao D, Williams S, Kamal KM
Duquesne University Mylan School of Pharmacy, Pittsburgh, PA, USA

OBJECTIVES: A literature review was conducted (1) to identify studies that utilized health-related quality of life (HRQoL) instruments in patients with dual diagnosis of mental illness and substance use disorder, and (2) to document the psychometric properties of the HRQoL instruments. **METHODS:** The literature review was conducted according to the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines. The search was conducted in PubMed electronic database up to November, 2016. Selected MeSH terms included "Mental Disorder," "Quality of Life," and "Substance-Related Disorders." Bibliographies of articles were screened for additional citations. The exclusion criteria included reviews, RCTs without HRQoL data, grey literature, and non-English articles. **RESULTS:** A total of 35 articles were included in the qualitative synthesis of the review. From the 35 studies, 19 different instruments that assessed HRQoL in the dual diagnosis population were reported. The most commonly used measurement was the Quality of Life Interview (QOLI), which was utilized in 7 (20%) studies. All but 3 measures (MQoL, EuroQoL-5D, Cantril's Ladder Scale) were previously tested for reliability, of which the Social Adjustment Scale Self-Report (SAS-SR) was not found to be reliable. Only SAS-SR was not previously tested for validity and 8 (42%) instruments were previously assessed for responsiveness. One measurement (MQoL) assessed all four main domains of HRQoL (physical, psychological, social, and spiritual). The amount of items each instrument contained varied from 1 (Cantril's Ladder and SOFAS) to 143 (QOLI). **CONCLUSIONS:** There are currently no instruments that are specifically designed to measure HRQoL in dual diagnosis population. The high variability of the number of instruments used in the studies demonstrate a need for a robust instrument in this vulnerable population. Since the dual diagnosis population requires specific tailoring due to their unique disease, future research could focus on creating a valid and reliable HRQoL measure.

PMH47

ANALYSIS OF HUMANISTIC BURDEN REVEALS A NEED FOR OPIOID USE DISORDER (OUD) DISEASE-SPECIFIC HRQOL INSTRUMENTS

Sabar U[1], Rycroft C[1], Ronquest NA[2], Nadipelli VR[2], Wollschlaeger B[3], Akehurst R[4]
[1]*Bresmed Health Solutions, Sheffield, UK,* [2]*Indivior Inc., Richmond, VA, USA,* [3]*Aventura Family Health Center, Florida, FL, USA,* [4]*Sheffield University, Sheffield, UK*

OBJECTIVES: Opioid use disorder (OUD) is characterised by repeated, compulsive seeking or use of an opioid, despite adverse social, psychological and/or physical consequences. Patients with OUD have a variety of symptoms and a reduced health-related quality-of-life (HRQoL). We performed a comprehensive literature review that included an evaluation of the types of instruments used to assess severity of patient symptoms and the impact of OUD on HRQoL. **METHODS:** A structured, comprehensive literature review was conducted to identify articles describing the humanistic (symptoms/caregiver) burden of OUD. Global literature databases, guideline databases, regulatory and health technology assessment agency websites, and relevant society guidelines were searched. Searches were conducted for articles published between 2000–2015. Articles were not restricted by language. Eligible articles were those reporting on OUD (including opioid abuse and dependence) and providing data on at least one topic of interest. **RESULTS:** A total of 2,234 records were screened, of which 202 articles met the selection criteria and were included in this literature review. Of these, 45 articles reported on a humanistic burden of OUD, within which 54 instruments were identified. These included: general HRQoL instruments (17), instruments for mental health assessment (9), specific instruments for drug abuse (13) and questionnaires on relationships and social support (15). Most instruments were reported only once, with 5 instruments (WHOQOL-BREF, SF-36, SF-12, Opiate Treatment Index and Addiction Severity Index) reported in $\geq$4 articles each. None of the instruments were specifically developed for OUD. **CONCLUSIONS:** Our review indicates a wide range of instruments are used to assess the humanistic burden in OUD. However, compared with patient symptoms, HRQoL was assessed less often and only using general instruments. Our findings suggest an unmet need for the development of OUD disease-specific HRQoL instruments that can effectively assess the different dimensions of the humanistic burden associated with this chronic relapsing disease.

PMH48

HRQOL IN NEGATIVE SYMPTOMS OF SCHIZOPHRENIA

Azaiez C[1], Llorca PM[2], Lancon C[3], Auquier P[1], Millier A[4], Toumi M[3]
[1]*Faculté de Médecine, Laboratoire de Santé Publique, Aix-Marseille Université, Marseille, France,* [2]*CMP B CHU Clermont-Ferrand, Universite d'Auvergne EA 7280, Clermont-Ferrand, France,* [3]*Aix-Marseille University, Marseille, France,* [4]*Creativ-Ceutical, Paris, France*

OBJECTIVES: Schizophrenia negative symptoms (SNS) represent the major contributor to poor functional outcomes, loss in productivity and poor quality of life (QoL) of schizophrenic patients. It is unclear which instruments may be used for assessing QoL of such patients. SNS are characterized by severe withdrawal and paucity of speech, and communication making patients elicitation of perception difficult. The aims of this study were to identify the health related quality of life (HRQoL) instruments used in patients suffering from schizophrenia with predominant negative symptoms (NS) or mixed NS and to assess the level of validation of the instruments used to assess QoL of patient with SNS. **METHODS:** A systematic literature review was performed using the Medline database via PubMed. Studies with a QoL measure in schizophrenic patients published between 1989 and March 2016 were identified. The studies involving SNS patients were included, then, the instrument used was reported and a targeted research was performed to identify if a conceptual framework was performed, the instrument, psychometric proprieties were identified as well as the pivotal and successive validation if available. **RESULTS:** Seventeen HRQoL instruments used in SNS patients were identified including 3 generic questionnaires, 8 for nonspecific mental health questionnaires, and 6 specific for schizophrenia. Conceptual frameworks were identified for 4 instruments, reported as performed but not described for 3 and for 10 instruments they were no mentions of conceptual framework. No HRQOL specific to SNS population was identified. No data are reported for those SNS patients specifically. **CONCLUSIONS:** No QoL instrument has been validated in SNS patients and it is even unclear for all of them if they are conceived for capturing HRQoL in SNS patients. SNS are widely prevalent in schizophrenic patients but their impact on QoL remains unknown. This requires further research.

MENTAL HEALTH – Health Care Use & Policy Studies

PMH49

ATYPICAL ANTIPSYCHOTIC USE IN ELDERLY PATIENTS WITH DEPRESSION

Rege SA[1], Sura SD[2], Aparasu RR[1]
[1]*College of Pharmacy, University of Houston, Houston, TX, USA,* [2]*University of Houston, Houston, TX, USA*

OBJECTIVES: Although atypical antipsychotics are indicated for management of late-life depression, little is known about their use in the elderly. The objective of this study was to determine the prevalence and predictors of atypical antipsychotics and augmentation therapy in elderly patients with depression. **METHODS:** This study utilized the 2010 and 2011 National Ambulatory Medical Care Survey and outpatient department component of the National Hospital Ambulatory Medical Care Survey data. The study included elderly patients (age >=65years) diagnosed with depression. Atypical antipsychotics and antidepressants were identified using American Hospital Formulary Service classification and Multum lexicon codes. Descriptive weighted analysis was performed to determine the prevalence of atypical antipsychotic use and multivariable logistic regression analyses were performed to determine the factors associated with the prescription of atypical antipsychotics and augmentation therapy. **RESULTS:** According to the national surveys, there were about 22 million ambulatory visits for depression during the study period; atypical antipsychotics were prescribed in 3.53% (95% CI, 2.02-5.04) of the visits. Among depression patients who were using antidepressants, 4.86% (95% CI, 3.07-6.04) used as an augmentation therapy. Multivariable regression analysis revealed that hispanics (odds ratio [OR] = 0.33; 95% CI, 0.12-0.90) was associated with decreased likelihood of antipsychotic prescription, whereas personality disorder and obsessive compulsive disorder (OR = 10.23; 95% CI, 2.80-37.40) were associated with increased likelihood of prescribing antipsychotics. For augmentation therapy, hispanics (OR = 0.06; 95% CI, 0.02-0.24) and primary physicians (OR = 0.24; 95% CI, 0.09-0.69) were associated with decreased likelihood; and obsessive compulsive disorder and personality disorder (OR = 7.56; 95% CI, 1.75-32.69) were associated with increased likelihood of antipsychotic prescription. **CONCLUSIONS:** Several clinical and demographic factors contribute to atypical antipsychotics use in the elderly. With the increased safety concerns, there is a need to monitor treatment related adverse effects in the elderly.

PMH50

ANTIDEPRESSANT MEDICATION USE AMONG ELDERLY PATIENTS WITH DEPRESSION

Xu Q, Rege SA, Aparasu RR
College of Pharmacy, University of Houston, Houston, TX, USA

OBJECTIVES: This study examined the prevalence and predictors of antidepressant medication use among elderly patients with depression in ambulatory settings. **METHODS:** This retrospective cross-sectional study utilized 2011 National Ambulatory Medical Care Survey (NAMCS) data. The study included patients aged 65 years or older diagnosed with depression. Antidepressant medications were operationally defined using the American Hospital Formulary Service Pharmacologic-Therapeutic classification and identified using Multum lexicon codes. Antidepressant medication classes included were Tricyclic antidepressants (TCAs), Selective Serotonin Reuptake Inhibitors (SSRIs), Monoamine oxidase inhibitors (MAOIs), Tetracyclic antidepressants, Selective Serotonin Norepinephrine Reuptake Inhibitors (SSNRIs), Phenylpiperazines and miscellaneous antidepressants.Descriptive weighted analysis was used to examine prevalence of antidepressant medications prescription. Independent variables included patient characteristics such as sex, age, race, ethnicity, region, and payment sources; and provider characteristics like physician medical degree, specialty type, office setting type, metropolitan statistical area, solo practice, primary physician and whether the patient was seen before. Multivariable logistic regression was used to assess the predictors of antidepressant therapy. Odds ratios (ORs) and 95% confidence intervals (CIs) were calculated using an a priori alpha level of 0.05. **RESULTS:** In 2011, a national estimate of 26.51 (95% CI, 21.70-31.32) million office visits were made by elderly patients with depression in the United States. Of these 11.82 (95% CI, 9.22-14.43, 44.59%) million involved prescribing of antidepressants. The most commonly prescribed antidepressants were SSRIs (31.16%), followed by SSNRIs (8.07%) and Phenylpiperazines (4.03%). Multivariable analysis revealed that compared to other payment sources, patients with Medicare (OR, 0.348; 95% CI, 0.17-0.71) and private insurance (OR, 0.37, 95% CI, 0.21-0.67) were less likely to receive antidepressant medication therapy. **CONCLUSIONS:** The study found that 45% of the elderly depression visits involved prescription of antidepressant medications. SSRIs were the most commonly prescribed antidepressants. Payment source was a significant predictor of antidepressant drug prescription.

PMH51

LAW ENFORCEMENT OFFICERS' READINESS TO PROVIDE NALOXONE IN AN EMERGENCY SITUATION IN THE COMMUNITIES OF WEST VIRGINIA

Thornton JD, Dwibedi N, Zhao X, LeMasters TJ
West Virginia University, School of Pharmacy, Morgantown, WV, USA

OBJECTIVES: Communities in West Virginia (WV) have been disproportionately impacted by the opioid epidemic with 35.5 drug-overdose deaths per 100,000 persons in 2015. Law enforcement officers (LEOs) have the legal authority to stock, carry, and use naloxone, but the real-world use and availability through LEOs in WV is unknown. The objective of our study was to assess the readiness of LEOs in WV to provide emergency naloxone in the communities they serve. **METHODS:** A prospective cross-sectional study was conducted using a self-administered questionnaire between September and December 2016. The questionnaire consists of demographic information, current experiences with naloxone, prior experience with opioid overdose situations, perceived barriers to carrying and administering naloxone, the level of knowledge of opioid overdose management, and attitudes towards managing an opioid overdose. **RESULTS:** The survey was completed by 149 active, non-retired WV officers who had an average age of 45.6(±11.4) years and 13.8(±10.0) years of experience at their department. The results indicated that the use of naloxone was rare, only 12.7% of respondents said that naloxone was available for use, 72.7% of LEOs reported being at the scene of an opioid overdose in the past 12 months, and the majority (58.6%) reported being at the scene before EMS. Half of the respondents were not interested in receiving training to administer naloxone, and of those individuals, 53.5% were serving counties with elevated prescription drug death rates (≥20 per 100,000). Knowledge scores were higher for officers who had completed training on naloxone than those who did not or were not interested (t=2.27,p=0.02). Barriers to naloxone use identified by the LEOs included lack of training, time, safety, cost, storage, and liability. **CONCLUSIONS:** We conclude that willing officers should continue to be trained, but for officers in counties where death rates are the highest, new strategies to increase buy-in are still needed.

PMH52

EFFICACY, SAFETY AND COST-EFFECTIVENESS OF ARIPIPRAZOLE COMPARED TO OLANZAPINE FOR SCHIZOPHRENIA: SYSTEMATIC REVIEW AND META-ANALYSIS

Santos AS[1], Godói IP[1], Guerra-Junior Aa[2], Acurcio FA[2], Brandão CM[1]
[1]*Universidade Federal de Minas Gerais, Belo Horizonte, Brazil,* [2]*SUS Collaborating Centre - CCATES - Universidade Federal de Minas Gerais, Belo Horizonte, Brazil*

OBJECTIVES: Aripiprazol is a dopamine-serotonine system stabilizer not included in the standard treatment of schizophrenia in Brazil's universal health system. It has been the reason of many court orders demanding its supply. This study proposes a systematic review with meta-analysis of the efficacy, safety and cost-effectiveness of aripiprazole compared to olanzapine, a standard drug for schizophrenia in Brazil, to evaluate the rationality of its use for the treatment of schizophrenia. **METHODS:** A systematic review was conducted in accordance to the Cochrane Handbook guidelines, including RCTs and complete economic evaluations. A eletronic search in the databases of Medline, The Cochrane Library and Lilacs and a complementary search in theses and dissertations databases, scientific journals, and abstracts of international meetings were conducted. Results of independent studies were combined via meta-analysis. **RESULTS:** Six RCTs and ten economic evaluations were included. None of the studies showed efficacy results that significantly favored aripiprazole and two studies significantly favored olanzapine. Most studies did not show difference between olanzapine and aripiprazole regarding neurological adverse effects. One paper reported a better neurological adverse effects profile for olanzapine. All six studies found worse metabolic profile for olanzapine. The meta-analysis of aripiprazole in comparison with olanzapine showed that patients in use of aripiprazole are more likely to discontinue treatment (RR[IC95%]=1.15[1.06-1.24]; I2=0%; p-value<0.0009) and less likely to have weight gain >7% (RR[IC95%]=0.44[0.25-0.55]; I2=0%; p-value<0.00001). Olanzapine was found dominant in seven economic evaluation studies and aripiprazole was dominant in two. In one study, aripiprazole was less expensive and less effective than olanzapine (RCEI of 3,951.72 €/remission). **CONCLUSIONS:** Aripiprazole was not found to be a better therapeutic alternative than olanzapine. But, despite of being less efficacious and show worse cost-effectiveness profile, aripiprazole might be useful for patients that were considered irresponsive or intolerant to olanzapine.

PMH53

IMPACT OF USING AFFILIATE IDS ON PQA'S OPIOID MULTIPLE PROVIDER MEASURE AMONG MEDICAID BENEFICIARIES

Inguva S[1], Ramachandran S[2], Banahan III B[1], Gangan N[1]
[1]*Center for Pharmaceutical Marketing and Management, University of Mississippi, University, MS, USA,* [2]*University of Mississippi, University, MS, USA*

OBJECTIVES: Computing the Pharmacy Quality Alliance (PQA) measure for obtaining opioids from multiple prescribers and pharmacies relies on the use of provider identifiers to distinguish different providers. However, prescriptions from different providers in the same facility are not reflective of "doctor shopping" and filling prescriptions from chain pharmacies in the same community are not reflective of "pharmacy shopping". This study examined the effect of using affiliate practice IDs compared to individual provider IDs when computing PQA's provider shopping measure. **METHODS:** Mississippi Medicaid claims for 2015-16 were used to identify beneficiaries ≥18 years of age, continuously enrolled, without a cancer diagnosis and ≥2 prescription claims for opioids. The proportion of beneficiaries receiving opioids from 4 or more prescribers AND 4 or more pharmacies were classified as provider shopping. The provider shopping measure was computed using the individual provider and pharmacy identifiers reported on the claims and using affiliate identifiers that grouped prescribers in the same facility and chain pharmacies in the same zip code. **RESULTS:** A total number of 30,494 beneficiaries were included. They were mostly female(72.79%), African American(50.63%), aged 18-44 years(50.22%) and enrolled in Medicaid managed care plans(90.79%). When using affiliate IDs, the number of beneficiaries identified as using 4+ prescribers dropped from 7,276 to 5,674 (22.02% reduction, p<0.0001) and the number identified as using 4+ pharmacies dropped from 2,446 to 2,079 (15.13% reduction, p<0.0001). The percentage of beneficiaries classified as "provider shopping" dropped from 5.21% to 4.01% (p<0.0001). **CONCLUSIONS:** The significant reduction in PQA's measure shows that failing to account for affiliates within the same practice may lead to an overestimation in the number of opioid misusers. Opioid misuse is a sensitive public health issue and affiliate IDs should be used, if possible, when identifying beneficiaries as potential misuse cases.

PMH54

MEDICATION ADHERENCE AND DISCONTINUATION IN PATIENTS WITH BIPOLAR DISORDERS WHO INITIATED A LONG ACTING INJECTABLE ANTIPSYCHOTIC VERSUS THOSE WHO CHANGED ORAL ANTIPSYCHOTICS

Yan T[1], Greene M[2], Chang E[1], Touya M[3], Broder MS[1]
[1]*Partnership for Health Analytic Research, LLC, Beverly Hills, CA, USA,* [2]*Otsuka Pharmaceutical Development & Commercialization Inc., Princeton, NJ, USA,* [3]*Lundbeck LLC, Deerfield, IL, USA*

OBJECTIVES: To examine medication adherence and discontinuation in patients with bipolar disorder (BP) initiating a long acting injectable antipsychotic (LAI) versus those who changed to a different oral antipsychotic. **METHODS:** This retrospective cohort analysis used Truven Health Analytics MarketScan® Commercial and Medicaid claims databases. Of the adult patients (≥18 years) diagnosed with BP, two mutually exclusive cohorts were created: LAI cohort, defined as initiating an LAI (no prior LAI therapy) between 01/01/2013 and 06/30/2014; and oral cohort, defined as patients who changed to a different oral antipsychotic (mono-therapy) during the same period. The first day of initiating an LAI or changing oral antipsychotic was the index date. Linear and Cox regression models were conducted to estimate medication adherence (proportion of days covered (PDC)) and time to medication discontinuation (continuous medication gap ≥ 60 days), respectively. Models adjusted for patient demographic and clinical characteristics, baseline medication use, and baseline ED or hospitalizations. **RESULTS:** The final sample consisted of 1,672 (14.7%) LAI initiators and 9,672 (85.3%) oral antipsychotic users. Compared with the oral cohort, LAI initiators had better medication adherence (PDC≥0.8: 30.9% vs. 21.5%, p<0.001; unadjusted mean: 0.51 vs.0.45; p<0.001). Controlling for covariates, the adjusted mean of PDC remained higher in the LAI initiators than in the oral cohort (0.50 vs. 0.45; p<0.001). Additionally, LAI initiators had a lower discontinuation rate (76.5% vs. 82.4%; p<0.001) and a significantly longer time to medication discontinuation than the oral cohort. The median time to discontinue index LAI was 149 days, compared with 99 days for oral monotherapy (p<0.001). The oral cohort had a higher hazard than the LAI cohort for discontinuing their index treatments (hazard ratio: 1.19; p<0.001). **CONCLUSIONS:** This real-world study suggests that patients with BP initiating LAIs had better medication adherence and lower discontinuation risk than those who changed to different oral antipsychotic monotherapy.

PMH55

ADHERENCE AND TREATMENT PATTERNS OF EARLY ADOPTERS OF BREXPIPRAZOLE THERAPY WITH SCHIZOPHRENIA – RESULTS FROM A RETROSPECTIVE ANALYSIS OF LONGITUDINAL PRESCRIPTION DATA

Greene M[1], Seetasith A[2], Hartry A[3], Burudpakdee C[2]
[1]*Otsuka Pharmaceutical Development & Commercialization Inc., Princeton, NJ, USA,* [2]*QuintilesIMS, Fairfax, VA, USA,* [3]*Lundbeck Pharmaceuticals Services, LLC, Deerfield, IL, USA*

OBJECTIVES: Brexpiprazole, a serotonin-dopamine activity modulator, was approved in the United States for the treatment of schizophrenia on 10-Jul-2015. This is the first opportunity to examine the characteristics, treatment patterns and adherence in schizophrenia patients treated with brexpiprazole, compared to other atypical antipsychotics (AAPs). **METHODS:** The study utilized longitudinal pharmacy prescription and outpatient medical claims databases. Patients were ≥18 years old, diagnosed with schizophrenia, and newly initiated on brexpiprazole or other AAPs (olanzapine, quetiapine, ziprasidone, risperidone, aripiprazole, or lurasidone) between 10-Jul-2015 and 31-Mar-2016. Patient characteristics and treatment history were measured in the 12 months before therapy initiation. Treatment adherence was measured as a variable medication possession ratio (MPRv) among patients with ≥2 fills. **RESULTS:** 225 patients on brexpiprazole and 30,808 patients on other AAPs (6,112 olanzapine; 7,419 quetiapine; 2,085 ziprasidone; 7,841 risperidone; 3,956 aripiprazole; 1,671 lurasidone) were identified. Brexpiprazole patients were younger (41±15.4 years) than those on other AAPs (p<.0001 for all; 50±15.9 for olanzapine, 50±14.8 for quetiapine, 48±14.0 for ziprasidone, 51±15.2 for risperidone, 48±14.9 for aripiprazole, 46±14.3 for lurasidone). 95% of brexpiprazole patients and 37-63% of other AAP patients had used ≥1 antipsychotic before initiating treatment. Psychiatrists/psychologists more frequently prescribed brexpiprazole (77%) compared to other AAPs (51-68%). Mean MPRv was 92% in brexpiprazole, 90% in olanzapine, 88% in quetiapine and risperidone, 91% in ziprasidone, 87% in aripiprazole, and 88% in lurasidone. Fewer patients treated with brexpiprazole (64%) used ≥1 concomitant psychotropic medication compared to other APPs (67-75%). **CONCLUSIONS:** This is the first study to describe brexpiprazole utilization in schizophrenia patients in the real-world setting. Patients treated with brexpiprazole were different from those treated with AAPs in terms of age, treatment history, prescribing physician specialty, and concomitant medication use. Patients treated with brexpiprazole and other AAPs had comparable therapy adherence. Brexpiprazole was prescribed more often by specialists than other AAPs.

PMH56

COMPARISONS OF 30-DAY RE-HOSPITALIZATION RATES IN PATIENTS WITH SCHIZOPHRENIA RECEIVING LONG-ACTING INJECTABLE ANTIPSYCHOTICS DURING HOSPITALIZATION

Greene M[1], Yan T[2], Stellhorn RA[3], Hartry A[4], Broder MS[2]
[1]Otsuka Pharmaceutical Development & Commercialization Inc., Princeton, NJ, USA, [2]Partnership for Health Analytic Research, LLC, Beverly Hills, CA, USA, [3]Otsuka Pharmaceutical Development & Commercialization, Inc., Princeton, NJ, USA, [4]Lundbeck Pharmaceuticals Services, LLC, Deerfield, IL, USA

OBJECTIVES: To examine 30-day hospital readmission rates in patients with schizophrenia treated with different long-acting injectable antipsychotics (LAIs) during their index hospitalization. **METHODS:** Inpatient claims from Premier Perspective Database™ were used to identify adult patients (age ≥ 18 years) hospitalized with a primary diagnosis of schizophrenia (ICD-9-CM diagnosis code 295.XX) between 01/01/2013 and 06/30/2015 who received an LAI and were discharged home or to a home care program during the first (index) hospitalization. Five mutually exclusive LAI cohorts were included: aripiprazole, fluphenazine, haloperidol, paliperidone, or risperidone. All-cause and psychiatric-related 30-day re-hospitalization rates were calculated across different LAIs. Logistic regression models controlling for patient demographic and clinical characteristics were constructed to estimate associations between different LAIs and 30-day hospital readmissions. **RESULTS:** Of the 73,222 hospitalized adult patients with schizophrenia, 15,286 (20.9%) were treated with LAIs: aripiprazole (206), fluphenazine (2,052), haloperidol (7,088), paliperidone (2,767), or risperidone (3,173). Compared with those in other LAI cohorts, patients in the aripiprazole cohort were younger (mean (SD) age: 37.3 (14.4)); a higher percentage of them were white (48.1%) and married (11.2%). The aripiprazole cohort had the lowest Charlson comorbidity score (mean (SD): 0.35 (0.68)), but the highest percentages of depression (12.1%) and anxiety (18.5%). The 30-day readmission rates were lowest in the aripiprazole cohort (all-cause: 9.7%; psychiatric-related: 8.7%), followed by haloperidol (10.0%; 9.5%), paliperidone (10.8%; 10.2%), risperidone (10.9%; 10.5%), and fluphenazine (11.0%; 10.4%). However, the differences were not statistically significant with and without adjusting for patient demographic and clinical characteristics. **CONCLUSIONS:** This real-world study is, to our knowledge, the first to examine 30-day re-hospitalization rates among schizophrenia patients treated with different LAIs. Our findings suggest that 30-day re-hospitalization rates were lowest in the aripiprazole cohort but relatively low across the different LAIs.

PMH57

COMPARISONS OF RE-HOSPITALIZATION RATES IN PATIENTS WITH BIPOLAR DISORDER RECEIVING LONG-ACTING INJECTABLE ANTIPSYCHOTICS DURING HOSPITALIZATION

Greene M[1], Yan T[2], Stellhorn RA[3], Touya M[4], Broder MS[2]
[1]Otsuka Pharmaceutical Development & Commercialization Inc., Princeton, NJ, USA, [2]Partnership for Health Analytic Research, LLC, Beverly Hills, CA, USA, [3]Otsuka Pharmaceutical Development & Commercialization, Inc., Princeton, NJ, USA, [4]Lundbeck LLC, Deerfield, IL, USA

OBJECTIVES: To examine hospital readmission rates in patients with bipolar disorder (BD) treated with different long-acting injectable antipsychotics (LAIs) during their index hospitalization. **METHODS:** Inpatient claims from Premier Perspective Database™ were used to identify adult patients (age≥18 years) hospitalized with a primary diagnosis of bipolar disorder between 01/01/2013 and 06/30/2015 who received an LAI and were discharged home or to a home care program during the first (index) hospitalization. Five mutually exclusive LAI cohorts were included: aripiprazole, fluphenazine, haloperidol, paliperidone, or risperidone. All-cause and psychiatric-related 60-, 90-, and 180-day re-hospitalization rates were calculated across different LAIs. Logistic regression models controlling for patient demographic and clinical characteristics were conducted to estimate associations between different LAIs and hospital readmissions. **RESULTS:** Of the hospitalized BD patients, 2,414 were treated with LAIs: aripiprazole (76), fluphenazine (261), haloperidol (839), paliperidone (538), or risperidone (700). Compared with those in other LAI cohorts, patients in the aripiprazole cohort were younger (mean (SD) age: 38.7 (15.3)). The 60-, 90-, and 180-day readmission rates were lowest in the aripiprazole cohort (all-cause 14.5% (60-day), 17.1% (90-day), 23.7% (180-day); psychiatric-related 14.5%, 17.1%, 22.4%), followed by fluphenazine (16.5%, 20.3%, 26.1%; 14.9%, 18.8%, 23.8%), risperidone (17.4%, 20.6%, 28.1%; 16.4%, 19.3%, 26.6%)), paliperidone (17.4%, 21.4%, 27.5%; 16.2%, 19.9%, 25.3%), and haloperidol (18.5%, 20.5%, 25.5%; 18.0%, 19.9%, 24.4%). However, none of these differences were statistically significant with and without adjusting for patient demographic and clinical characteristics. **CONCLUSIONS:** This real-world study is, to our knowledge, the first to examine 60-, 90-, and 180-day readmission rates among hospitalized BD patients treated with different LAIs. Only a small number of patients received aripiprazole LAI. While there were no statistically significant differences across the various LAIs, the aripiprazole cohort showed lower hospital readmission rates compared to the other cohorts.

PMH58

MEDICATION ADHERENCE AND DISCONTINUATION IN MEDICAID PATIENTS WITH SCHIZOPHRENIA INITIATING A LONG ACTING INJECTABLE ANTIPSYCHOTIC VERSUS THOSE WHO CHANGE TO A DIFFERENT ORAL ANTIPSYCHOTIC

Greene M[1], Yan T[2], Chang E[2], Hartry A[3], Broder MS[2]
[1]Otsuka Pharmaceutical Development & Commercialization Inc., Princeton, NJ, USA, [2]Partnership for Health Analytic Research, LLC, Beverly Hills, CA, USA, [3]Lundbeck Pharmaceuticals Services, LLC, Deerfield, IL, USA

OBJECTIVES: To compare medication adherence and discontinuation in patients with schizophrenia who initiate a long acting injectable antipsychotic (LAI) to those who change to a different oral antipsychotic. **METHODS:** This retrospective cohort analysis used the Truven Health Analytics MarketScan® Medicaid claims database. Of the identified adult patients (≥18 years) diagnosed with schizophrenia, two mutually exclusive cohorts were created: LAI cohort, or patients initiating LAI therapy between 01/01/2013 and 06/30/2014 (the identification (ID) period); and oral cohort, or patients who changed to a different oral antipsychotic mono therapy during the ID period. The first day of initiating an LAI or changing oral therapy was the index date. Primary outcome measures were medication adherence (proportion of days covered) during the 1-year post-index period and medication discontinuation (continuous medication gap ≥ 60 days) of the index LAIs or orals during the entire follow-up period. General linear Cox regression models were used to estimate medication adherence and time to medication discontinuation. Models adjusted for patient demographic and clinical characteristics, baseline medication, and baseline emergency department visits or hospitalizations. **RESULTS:** The study sample consisted of 2,861 (50.7%) LAI initiators and 2,777 (49.3%) oral monotherapy users. Compared with the oral cohort, LAI initiators had better medication adherence (adjusted mean: 0.55 vs. 0.50, $p<0.001$). LAI initiators also had a lower discontinuation rate (72.5% vs. 77.2%; $p<0.001$) and a significantly longer time to medication discontinuation than the oral cohort. The median time to discontinue index LAI was 196 days, compared with 123 days for the oral cohort ($p<0.001$). The oral cohort discontinued their index treatment at a higher rate than the LAI cohort (hazard ratio: 1.20; $p<0.001$). **CONCLUSIONS:** This real-world study suggests that patients with schizophrenia initiating LAIs had better medication adherence and lower discontinuation risk than patients who changed to different oral antipsychotic monotherapy.

PMH59

BREXPIPRAZOLE USE IN PATIENTS WITH MAJOR DEPRESSIVE DISORDER: RESULTS FROM A RETROSPECTIVE ANALYSIS OF LONGITUDINAL PRESCRIPTION DATA

Greene M[1], Seetasith A[2], Hartry A[3], Burudpakdee C[2]
[1]Otsuka Pharmaceutical Development & Commercialization Inc., Princeton, NJ, USA, [2]QuintilesIMS, Fairfax, VA, USA, [3]Lundbeck Pharmaceuticals Services, LLC, Deerfield, IL, USA

OBJECTIVES: Brexpiprazole, a serotonin-dopamine activity modulator, was approved in 2015 in the United States for the treatment of schizophrenia and for use as an adjunctive treatment for major depressive disorder (MDD). The aim of the study was to describe patient characteristics, treatment history before adjunctive atypical antipsychotic (AAP) initiation, and adherence to brexpiprazole and older AAPs indicated for MDD (quetiapine, aripiprazole, and lurasidone). **METHODS:** Prescription and medical history were obtained from longitudinal prescription and medical claims databases. Patients selected were ≥18 years of age with a diagnosis of MDD who initiated adjunctive brexpiprazole or other AAPs between 10-Jul-2015 and 31-Mar-2016. Patient characteristics and antidepressant use were measured in the 12 months before therapy initiation. Adherence was measured by variable medication possession ratio (MPRv) during a 3 month follow up period in patients with ≥2 fills. **RESULTS:** 4,265 brexpiprazole, 88,063 quetiapine, 63,004 aripiprazole, and 11,462 lurasidone patients were identified. Mean age of brexpiprazole patients was 49±14.4 years (quetiapine: 54±16.7 years, aripiprazole: 49±15.7 years, lurasidone: 44±14.3 years). 55% of brexpiprazole patients had prior use of a selective serotonin reuptake inhibitor (quetiapine: 59%, aripiprazole: 58%, lurasidone: 54%), and 48% of brexpiprazole patients had prior use of a serotonin and norepinephrine reuptake inhibitor (SNRI) (quetiapine: 30%, aripiprazole: 38%, lurasidone: 33%) in the previous year. Among patients newly diagnosed with MDD, 19% of brexpiprazole, 11% of quetiapine, 12% of aripiprazole, and 12% of lurasidone patients had used ≥3 antidepressants prior to current therapy. Mean MPRv was 90% in brexpiprazole, 89% in quetiapine, and 88% in aripiprazole and lurasidone. **CONCLUSIONS:** Brexpiprazole patients were more often treated with a prior SNRI compared to other AAP patients. Brexpiprazole patients had used ≥3 prior antidepressants. Adherence to brexpiprazole was similar to that of other AAPs.

PMH60

NON-BUPRENORPHINE OPIOID UTILIZATION AMONG PATIENTS USING BUPRENORPHINE/NALOXONE (SUBOXONE)

Daubresse M[1], Saloner B[2], Pollack H[3], Alexander GC[4]
[1]Johns Hopkins School of Public Health, Baltimore, MD, USA, [2]Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, USA, [3]University of Chicago, Chicago, IL, USA, [4]Johns Hopkins Bloomberg School of Public Health, Center for Drug Safety and Effectiveness, Baltimore, MD, USA

OBJECTIVES: Buprenorphine/naloxone is commonly used to treat opioid dependence, however, non-buprenorphine prescription opioid utilization among these patients has not been well defined. We sought to characterize patterns of opioid utilization among incident buprenorphine/naloxone (Suboxone) users in eleven states. **METHODS:** We used IMS Health anonymized, individual-level, all-payer pharmacy claims to identify incident users of buprenorphine/naloxone between January 2010 and August 2013. We focused on patients 18 years of age and defined each patient's first treatment episode as the length of time from the patient's incident prescription for buprenorphine/naloxone (index fill) until the first day of a gap where the patient had no buprenorphine/naloxone on-hand for 90 or more days. We calculated measures of non-buprenorphine opioid utilization during the first treatment episode as well as during 12-month periods prior to and following this episode. **RESULTS:** Of the 22655 individuals meeting inclusion criteria, 49% were female and 50% were between 25 and 46 years of age. The median length of the first treatment episode was 79 days (interquartile range [IQR], 30 to 226 days). More than half (58%) of buprenorphine/naloxone recipients filled prescriptions for other opioids following buprenorphine/naloxone treatment and 30% filled at least

one opioid prescription during their treatment episode. The median total of morphine milligram equivalents (MME) 12 months prior to treatment was 250 mg/per month (IQR 38 to 1347) then declined to 221 mg/per month (IQR 39 to 1034) and 175 mg/per month (IQR 25 to 1106) during and following the treatment episode, respectively. The median MME per opioid day supplied prior to, during and following the first treatment episode remained constant at 40 mg per day. **CONCLUSIONS:** Treatment with buprenorphine/naloxone is associated with reduced non-buprenorphine opioid use. However, a substantial proportion of patients fill prescriptions for non-buprenorphine opioids during and following such treatment.

PMH61

ADHERENCE AND TREATMENT PATTERNS IN BREXPIPRAZOLE THERAPY IN LONG-TERM CARE PATIENTS WITH SCHIZOPHRENIA: RESULTS FROM A RETROSPECTIVE ANALYSIS OF LONG-TERM CARE DATA

Greene M[1], Seetasith A[2], Hartry A[3], Burudpakdee C[2]
[1]Otsuka Pharmaceutical Development & Commercialization Inc., Princeton, NJ, USA, [2]QuintilesIMS, Fairfax, VA, USA, [3]Lundbeck Pharmaceuticals Services, LLC, Deerfield, IL, USA

OBJECTIVES: Brexpiprazole, a serotonin-dopamine activity modulator, was approved in 2015 in the United States for the treatment of schizophrenia. This is the first opportunity to examine real-world adherence and treatment patterns in patients with schizophrenia treated with brexpiprazole and atypical antipsychotics (AAPs) in the long-term care (LTC) setting. **METHODS:** Longitudinal LTC pharmacy and outpatient medical claims data from 10-Jul-2015 to 03-Mar-2016 were used. Patients were included if they had a diagnosis for schizophrenia, were ≥18 years old, and newly initiated brexpiprazole or other AAPs (olanzapine, quetiapine, ziprasidone, risperidone, aripiprazole, or lurasidone). The index date was the date of first AAP fill. Patient characteristics and treatment history were measured in the 12 months pre-index. Post-index adherence was measured as variable medication possession ratio (MPRv) among patients with ≥2 fills of the index medication. **RESULTS:** 77 patients on brexpiprazole and 21,403 patients on other AAPs (5,018 olanzapine; 4,638 quetiapine; 932 ziprasidone; 5,884 risperidone; 2,117 aripiprazole; 693 lurasidone) were identified. Mean ages (years±standard deviation) were 48±15.2 for brexpiprazole, 54±15.5 for aripiprazole, 50±14.2 for lurasidone, 56±15.6 for olanzapine, 56±15.4 for quetiapine, 57±14.8 for risperidone, and 52±14.4 for ziprasidone. Brexpiprazole was prescribed mainly by psychiatrists/psychologists (68%) while other AAPs, except lurasidone, were prescribed more by PCPs (olanzapine: 52%, quetiapine: 54%, ziprasidone: 50%, risperidone: 56%, aripiprazole: 49%, lurasidone: 41%). 96% of brexpiprazole patients were previously treated with ≥1 AAP compared to other AAPs (olanzapine: 56%, quetiapine: 65%, ziprasidone: 64%, risperidone: 49%, aripiprazole: 59%, and lurasidone: 72%). Mean MPRv values were 94% in brexpiprazole, 93% in aripiprazole, and 95% in all other AAPs. **CONCLUSIONS:** This is the first study to describe the use of brexpiprazole for schizophrenia in the LTC setting. Brexpiprazole was prescribed mainly by specialists, and most brexpiprazole patients were previously treated with AAPs. Adherence to brexpiprazole was similar to other AAPs.

PMH62

BREXPIPRAZOLE USE IN LONG-TERM CARE PATIENTS WITH MAJOR DEPRESSIVE DISORDER: RESULTS FROM A RETROSPECTIVE ANALYSIS OF LONG-TERM CARE DATA

Greene M[1], Seetasith A[2], Hartry A[3], Burudpakdee C[2]
[1]Otsuka Pharmaceutical Development & Commercialization Inc., Princeton, NJ, USA, [2]QuintilesIMS, Fairfax, VA, USA, [3]Lundbeck Pharmaceuticals Services, LLC, Deerfield, IL, USA

OBJECTIVES: Brexpiprazole, a serotonin-dopamine activity modulator, was approved in 2015 in the United States for the treatment of schizophrenia and for use as adjunctive therapy in major depressive disorder (MDD). Characteristics of patients with MDD and their treatment adherence to brexpiprazole have not been previously studied in the long term care setting. **METHODS:** The study used data from longitudinal long-term care pharmacy and outpatient medical databases. Patients aged ≥18 years, with a diagnosis of MDD, and who initiated brexpiprazole or an older atypical antipsychotic (AAPs; quetiapine, aripiprazole, or lurasidone) between 10-Jul-2015 and 3-Mar-2016 were included. Patient characteristics and prior use of antidepressants were measured in the 12 months prior to therapy initiation. Treatment adherence was measured by variable medication possession ratio (MPRv) over a 3 month follow up among patients with ≥2 fills. **RESULTS:** 177 brexpiprazole, 14,261 quetiapine, 5,376 aripiprazole, and 1,244 lurasidone patients were identified. Mean age of brexpiprazole patients was 49±15.4 years (quetiapine: 64±18.8 years, aripiprazole: 57±18.4 years, lurasidone: 48±16.4 years). Anxiety was observed in 54% of brexpiprazole patients. 52% of brexpiprazole patients received their prescriptions from psychiatrists/psychologists compared to other AAPs (25% of quetiapine, 35% of aripiprazole, 45% of lurasidone). More brexpiprazole patients were previously treated with a selective serotonin reuptake inhibitor, and fewer were treated with a selective norepinephrine reuptake inhibitor compared to other AAPs. Mean MPRv values were 94% in brexpiprazole, 94% in quetiapine, 93% in aripiprazole, and 92% in lurasidone. **CONCLUSIONS:** This is the first study to describe the use of brexpiprazole for MDD in the long-term care setting. Patients treated with brexpiprazole were more often treated with a prior selective serotonin reuptake inhibitor and were more often treated by a specialist compared to patients on other AAPs. Adherence to brexpiprazole was similar to that of other AAPs.

PMH63

USE OF ANTIPSYCHOTICS AMONG SENIORS LIVING IN LONG-TERM CARE FACILITIES, 2014

Rioux J, Hunt J
Canadian Institute for Health Information, Ottawa, ON, Canada

OBJECTIVES: This analysis examines the use of antipsychotics among seniors living in long-term care (LTC) facilities, and the concurrent use of antipsychotics with other psychotropic drugs, which further increases risk of side effects. It also looks at the characteristics of residents treated with antipsychotics, including diagnoses, behaviours and other functional measures. **METHODS:** Drug claims data from the National Prescription Drug Utilization Information System (NPDUIS) Database, housed at the Canadian Institute for Health Information (CIHI), provide detailed information about antipsychotic use. LTC resident assessment data from CIHI's Continuing Care Reporting System (CCRS) provide detailed resident information. **RESULTS:** Residents with severe cognitive impairment and those exhibiting highly aggressive behaviour were more likely to have used an antipsychotic. However, a large proportion of seniors exhibiting severe aggression were not treated with antipsychotics, suggesting that non-drug alternatives were often considered. Quetiapine was the most commonly used antipsychotic (19.2% of LTC residents), followed by risperidone (14.1%). Among seniors who were chronic users of an antipsychotic, nearly two-thirds (64.3%) were also chronic users of an antidepressant, while roughly 1 in 6 (15.0%) were also chronic users of a benzodiazepine. In Manitoba, antipsychotic use decreased from 38.2% in 2006 to 31.5% in 2014. This was due in part to initiatives implemented by the Winnipeg Regional Health Authority, to reduce inappropriate antipsychotic use in LTC facilities. **CONCLUSIONS:** In September 2014, The Canadian Foundation for Healthcare Improvement began supporting several health care organizations across Canada to adopt initiatives to reduce inappropriate antipsychotic use in LTC facilities. As more facilities start implementing similar strategies, the overall rate of antipsychotics use in LTC facilities may decrease.

PMH64

RETROSPECTIVE STUDY OF ANTIPSYCHOTICS UTILIZATION IN RUSSIAN FEDERATION

Vaskova L[1], Musina N[2], Tiapkina M[1]
[1]Sechenov First Moscow State Medical University, Moscow, Russia, [2]I.M. Sechenov First Moscow State Medical University, Moscow, Russian Federation

OBJECTIVES: This study aims to analyze the evolution of the consumption pattern of the antipsychotic drugs (APs) in Russian Federation. **METHODS:** The sales data of the antipsychotic drugs in Russian Federation during the period 2010-2015 was retrieved from the DSM-group marketing database and subsequently analyzed. The drugs have been classified into typical antipsychotics (TA), atypical antipsychotics (AA) and sustained-action APs. Consumption data have been expressed in daily-defined dose (DDD) per 1,000 inhabitants per day of treatment (DDD/1000/day) total for hospital, retail and reimbursable pharmaceuticals. The total number of DDD/1000/day was calculated for Russian Federation on the whole, as well as for each federal district, region and republic of the Russian Federation, by adding up the DDD/1000/day for the individual antidepressants. **RESULTS:** Antipsychotic consumption decreased from 3.80 in 2010 to 3.59 DDD/1000/day in 2015 (Δ -5.5%). TA consumption decreased (from 61% in 2010 to 55% in 2015) and that of the AA and sustained-action APs ones increased (from 17% (2010) to 19% (2015) and from 22% (2010) to 26% (2015) respectively). In 2010, the most consumed drug was haloperidol oral (0.99 DDD/1000/day). However, during the period 2010-2015 utilization of haloperidol oral decreased by 23%, but it remains the most consumed APs (0.76 DDD/1000/day) in 2015. The drug with the largest increase in consumption was olanzapine oral. Its consumption increased in three times in the period 2010 - 2015 (from 0.027 to 0.080 DDD/1000/day). **CONCLUSIONS:** It was found that the APs consumption in Russian Federation during the period 2010-2015 has not changed significantly (Δ -5.5%). At the same time TA (1-st generation drugs) consumption decreased and that of the AA and sustained-action APs ones increased. Therefore, the level of consumption of TA in Russian Federation remains high (over 50% of the total APs consumption).

PMH65

EFFECT OF ATYPICAL ANTIPSYCHOTIC PRIOR AUTHORIZATION IMPLEMENTATION ON PATIENT OUTCOMES AMONG OHIO MEDICAID BENEFICIARIES

Thompson JA, Kelton CM, Lin AC, Winstanley EL, Heaton PC
University of Cincinnati, Cincinnati, OH, USA

OBJECTIVES: A major concern regarding prior authorization (PA) policies for atypical antipsychotics (AAs) is that they produce undue burden on an already vulnerable population which may worsen outcomes. In October 2008 Ohio Medicaid implemented a PA-policy that contained a unique stipulation exempting psychiatrists. The objective of this study was to determine the impact of this PA-policy on healthcare utilization and cost for patients newly prescribed AAs. **METHODS:** Patient-level data analyzed came from Ohio Medicaid fee-for-service claims files June/2007-September/2009. A difference-in-differences regression approach was used to compare outcomes in the PA-active year to the year pre-implementation between patients treated by psychiatrists and those treated by nonpsychiatrists. Patients were stratified based on index-AA prescribing-physician type, and those treated by PA-exempt psychiatrists served as the control. Patients were included if they were ≥18, had an AA claim following 120-days of washout, and had 180 days of post-index healthcare utilization data. Patients with any gap in coverage and those dual-eligible for Medicare were excluded. Logistic regression was used to estimate the policy-attributable effect on all-cause and psychiatric-related hospitalizations, emergency department visits, outpatient visits, and physician office visits. Policy-attributable changes in all-cause and psychiatric-related expenditures were assessed using a generalized linear model with a log-link function and gamma distribution. All regressions included the following covariates to control for confounding: age, sex, race, diagnosis, comorbidities, previous healthcare utilization, index-AA type, and AA-adherence. **RESULTS:** 1,129

patients from the pre-PA-period (psychiatrist-treated=400; nonpsychiatrist-treated=729) and 2,032 patients from the PA-period (psychiatrist-treated=955; nonpsychiatrist-treated=1,072) were included in the difference-in-differences analysis. No statistically-significant policy-attributable effect was found except for all-cause hospitalizations, which decreased substantially with an OR=0.54 (95%CI: 0.33-0.88, p=0.014). **CONCLUSIONS:** Implementation of the PA-policy did not negatively affect patient outcomes, and was shown to reduce the odds of hospitalization. The psychiatrist-exemption implemented by Ohio may represent a PA-design that reduces medication costs while preserving patient quality-of-care.

PMH66

COSTS OF ALCOHOL USE DISORDER AND RECOMMENDATIONS FROM AN EXPERT PANEL TO REDUCE COSTS OF RECIDIVISM

Gavaghan M[1], Pauer L[2]
[1]GfK, Wayland, MA, USA, [2]Independent Consultant, San Clemente, CA, USA

OBJECTIVES: The United States Surgeon General Report on alcohol, drugs, and health addresses one of the largest health crises we face in America and proposes changes to the way we approach and care for substance use disorders. This research sought to quantify and validate healthcare utilization and costs for patients diagnosed with alcohol use disorder (AUD) using a US health insurance claims database. **METHODS:** We identified AUD patients from Truven Health Analytics' MarketScan® Research Databases. Patients included had 12 months of continuous coverage in a health plan from January 1 - December 31, 2013. Data analyzed included demographics, resource utilization and costs from acute inpatient stays with the diagnoses of interest. Additional information from outpatient claims and electronic medical records (EMR) are reported. These data were reviewed by an expert panel of 10 clinicians and researchers who subsequently suggested solutions for reducing recidivism and costs. **RESULTS:** There were 51,889 patients aged 10 – 59 years with a diagnosis of alcoholism, of which 26,978 patients were admitted to a hospital for treatment. The average number of hospital visits was 3.1 per patient for the year with most returning to hospitalization within 45 days. The average cost of admission was more than $14,000 for males and slightly lower for females. The panel of clinicians validated these findings and suggested clinical monitoring to augment current treatments. **CONCLUSIONS:** As shown in this claims analysis, annual costs of AUD and recidivism in this population have substantial economic consequences. Proactive clinical monitoring and disease management, already used within general health care settings to address other potentially progressive illnesses, could be applied in emerging cases of substance misuse. Use of clinical monitoring and treatment management should be accompanied by informed clinical protocols to reduce the frequency and amount of substance use along with family education to support lifestyle changes.

PMH67

COST-EFFECTIVENESS OF LONG ACTING INJECTABLE BUPRENORPHINE VERSUS SUBLINGUAL BUPRENORPHINE TO TREAT OPIOID USE DISORDER IN SWEDEN AND THE UNITED KINGDOM

Carter JA[1], Dammerman R[2], Tiberg F[3], Jensen R[3]
[1]EPI-Q, Inc., Oak Brook, IL, USA, [2]Braeburn Pharmaceuticals, Princeton, NJ, USA, [3]Camurus AB, Lund, Sweden

OBJECTIVES: There is growing concern in Europe over heroin and prescription opioid abuse. Opioid-related overdose deaths have peaked historically at 7000 annually. Associated healthcare utilization, productivity loss, criminal justice and social welfare expenditures place a considerable burden on publicly-funded European systems. Medication assisted therapy (MAT) is effective, but limited by abuse/diversion, non-adherence, accidental poisoning and administrative burdens like supervised dosing. There has been an emphasis on introducing long-acting, abuse-deterrent MATs. Long-acting, injectable buprenorphine (LA-BPN) has demonstrated benefits versus sublingual buprenorphine (SL-BPN) in a 24-week Phase 3 clinical trial for opioid-dependent patients. This analysis sought to determine whether LA-BPN is cost-effective versus SL-BPN in Sweden and the UK. **METHODS:** We developed a Markov model to assess the cost of LA-BPN per QALY-gained versus SL-BPN. Cohorts were cycled weekly for 52 weeks among 5 states: on treatment (1) without or (2) with illicit opioid use, off treatment (3) without or (4) with illicit opioid use, and (5) death. Transitions were derived from the clinical trial. Event probabilities, costs, and utilities were literature-based and included diversion/misuse, infection, hospital/rehabilitation utilization, productivity loss, pediatric poisoning, and criminal justice. Separate Swedish and UK scenarios accommodated local costs and utilities. Uncertainty was assessed by univariate and probabilistic sensitivity analysis. **RESULTS:** The SL-BPN cohort encountered more relapses, 3% higher rates of serious adverse events, and approximately 400% greater risk of non-fatal overdose, which is consistent with trial outcomes. LA-BPN was associated with lower healthcare utilization, criminal justice, and lost productivity costs and more QALYs. These relationships were consistent in Sweden and the UK and demonstrates that under certain conditions LA-BPN is a dominant strategy. **CONCLUSIONS:** These estimates support LA-BPN as a cost-effective alternative to SL-BPN from Swedish and UK perspectives. Findings should be interpreted carefully as they are not based on direct observation in a real-world setting.

PMH68

TWO-YEAR HEALTHCARE UTILIZATION AND COST AMONG A MEDICAID SCHIZOPHRENIA POPULATION AT HIGHER RISK OF HOSPITALIZATION

McRae J[1], Williamson D[2], Song X[3], Tran O[3], Sedgley R[3], Durkin M[4]
[1]Thomas Jefferson University, Philadelphia, PA, USA, [2]Janssen Scientific Affairs, Titusville, NJ, USA, [3]Truven Health Analytics Inc. , an IBM Company, Ann Arbor, MI, USA, [4]Janssen Scientific Affairs, Titusville, QC, Canada

OBJECTIVES: The Quality Improvement and Risk Evaluation (QI-RE) model predicts 12-month risk of hospitalization for schizophrenia patients based on 12 months of medical and pharmacy data. We describe cost and utilization over 24 months for Medicaid patients with schizophrenia with higher risk (HR) of hospitalization (>50% predicted 12-month QI-RE risk of hospitalization). **METHODS:** Adult patients with schizophrenia (ICD-9 295.xx) and ≥2 claims for the same antipsychotic were selected from the Truven Health MarketScan Medicaid database, with the date of 2ndantipsychotic claim as index. Continuous enrollment in Medicaid for ≥12 months prior to and ≥24 months after the index date were required, as well as ≥1 pre-index claim for an antipsychotic other than the index drug. We evaluated annual and two-year healthcare resource utilization and reimbursed costs. We calculated means and standard deviations (SD) for continuous variables and frequencies for categorical variables. **RESULTS:** Of 7,430 study-qualified patients, 44.6% (n=3,317) were HR. The mean (SD) age of HR patients was 38.9 years (13.0), with 53.6% female. The most common comorbidities were depressive disorders (55.1%), lung disease (49.5%), hypertension (46.5%), and substance abuse (43.1%). In the two years post-index, 69.7% of HR patients had ≥1 hospitalization (57.1% in Year 1, 46.3% in Year 2). In Year 1, HR patients accounted for 74.3% of inpatient admissions and 63.1% of emergency department visits; in Year 2, those proportions were 71.5% and 63.3%, respectively. With mean annual healthcare costs per patient of $47,372 for Year 1 and $41,674 for Year 2, HR patients represented 54.4% of total healthcare costs for Year 1 and 53.6% for Year 2. **CONCLUSIONS:** Higher QI-RE risk is associated with a disproportionate share of inpatient utilization and total costs not only in the first year post-index, but also in the second year.

PMH69

STRESS PREDICTION MODEL OF UNDERGRADUATE BURAPHA UNIVERSITY STUDENT 2016

Meepradist Y, Sukpornsawan P, Towatana T, KerdsiriIce K, Dechasurawanit P
BURAPHA UNIVERSITY, CHOLBURI, Thailand

OBJECTIVES: 1. To evaluate stress level of Undergraduate Burapha University Student (UBUS). 2. To establish UBUS Stress Model. **METHODS:** Cross-sectional survey study was performed to investigate stress. Stress is operationalized into 6 dimensions namely: education, friendship, environment, activities, health, and expectation from the family. Population was all Burapha students in 2016. Sample was calculated according to Yamane 1973. It generated n=448. A non-probability quota sampling was performed. **RESULTS:** A 100% data collection was gathered. Burapha students were in the middle stress level. We found no significantly different of the stress means between students in 3 groups -pure sciences, health science and social sciences- ($p<0.05$ ANOVA). Hierarchical stepwise multiple regression generated stress equation prediction as: Stress = 14.834+ 1.733 Education*+ 1.710 Friendship*-0.707 Family Expectation*-0.109 Health+0.292 Activity -0.291 Environment **CONCLUSIONS:** Three significant stress predictors were education, friendship and family expectation. No significance differences stress among different major groups of student.

PMH70

NURSING HOME ANTIPSYCHOTIC PRESCRIBING PRACTICES AND RISK OF HOSPITALIZATION AND MORTALITY IN DEMENTIA PATIENTS

Sura SD[1], Holmes HM[2], Johnson ML[1], Chen H[1], Wenyaw C[2], Aparasu RR[1]
[1]University of Houston, Houston, TX, USA, [2]The University of Texas Health Science Center, Houston, TX, USA

OBJECTIVES: Antipsychotic drug use in dementia patients is considered suboptimal care. Nursing home level antipsychotic rate, a measure of nursing home quality of care, may lead to adverse outcomes. The study evaluated the association of nursing home level initiation of antipsychotics with 30-day all-cause hospitalization and mortality. **METHODS:** This retrospective cohort study used Medicare claims data, Minimum Data Set, and the Online Survey, Certification, ad Reporting data from 2007-2009. The cohort included short-stay (nursing home stay ≤ 100 days) elderly nursing home residents with dementia. The outcome measures were 30-day all-cause hospitalization and mortality. Multilevel Andersen Behavioral model was used to select patient and contextual level predisposing, enabling and need factors. Contextual level nursing home antipsychotic initiation rate was categorized into tertiles (low, medium, or high) based on proportion of dementia residents newly started on antipsychotics during the baseline period. Hierarchical logistic regression models were used to determine the association of nursing home antipsychotic rate with 30-day hospitalization and mortality, while controlling for patient and contextual level covariates. **RESULTS:** The cohort included 9.611 patients from 2,548 nursing homes. In the hierarchical logistic regression models, nursing home level antipsychotic rate was not associated with 30-day hospitalization (low, OR 1.01, 95% CI 0.89-1.15; medium, OR 0.97, 95% CI, 0.84-1.13; high, OR 1.11, 95% CI 0.97-1.28) or 30-day mortality (low, OR 0.98, 95% CI 0.79-1.23; medium, OR 0.87, 95% CI, 0.66-1.14; high, OR 0.90, 95% CI 0.70-1.16); compared to 0% initiation rate. Patient level antipsychotic use was associated with increased risk of 30-day hospitalization (OR 1.18, 95% CI 1.01-1.37) but not with 30-day mortality (OR 0.96, 95% CI 0.73-1.26). **CONCLUSIONS:** Nursing home level antipsychotic prescribing practices was not associated with short-term all-cause hospitalization or mortality. However, patient-level antipsychotic was associated with higher risk of 30-day hospitalization.

PMH71

PREDICTORS OF ANTIPSYCHOTIC INITIATION AMONG SHORT-STAY NURSING HOME DEMENTIA PATIENTS

Sura SD[1], Holmes HM[2], Johnson ML[1], Chen H[1], Wenyaw C[2], Aparasu RR[1]
[1]University of Houston, Houston, TX, USA, [2]The University of Texas Health Science Center, Houston, TX, USA

OBJECTIVES: Antipsychotic drugs are used to treat behavioral and psychological symptoms of dementia despite of their significant safety concerns. This study

examined patient and contextual factors associated with initiation of antipsychotics among nursing home residents with dementia. **METHODS:** This retrospective cohort study used Medicare claims, Minimum Data Set, and the Online Survey, Certification, and Reporting data from 2007-2009. The study sample consisted of short-stay (nursing home stay ≤100 days) elderly nursing home residents with dementia. Patient level antipsychotic initiation was the outcome measure. Multilevel Andersen Behavioral model was used to select patient and contextual level predisposing, enabling and need factors. Contextual level nursing home antipsychotic initiation rate was categorized into tertiles (low, medium, or high) based on proportion of dementia residents newly started on antipsychotics during the baseline period. The association of predisposing, enabling and need factors with initiation of antipsychotics was evaluated using hierarchical logistic regression model. **RESULTS:** A total of 9,611 patients was identified residing in 2,548 nursing homes. Overall antipsychotic initiation rate was 11.2%; nursing home level initiation rate was 0% in 890, <12.6% in 659 (low), 12.6%-16.7% in 465 (medium) and 16.8%-70% in 534 (high) nursing homes. Nursing home level antipsychotic initiation rate was associated with patient's increased likelihood of initiating antipsychotic (Medium: OR 1.36, 95% CI 1.09-1.71, High: OR 1.48, 95% CI 1.20-1.82). Among patient level factors, predisposing (female), enabling (dementia unit, mood indicators, mild and moderate/severe behavior, moderate and severe cognitive performance), and need (drug abuse, psychosis, antianxiety medication use) were associated with higher likelihood of antipsychotic initiation. **CONCLUSIONS:** Both patient and contextual level predisposing, enabling and need factors influenced initiation of antipsychotics among nursing home residents with dementia. The study revealed that antipsychotic prescribing practices play an important role in the use of antipsychotics in nursing home residents with dementia.

PMH72

A COMPARISON OF ANTIPSYCHOTIC DRUGS APPROVED BY THE U.S. FOOD AND DRUG ADMINISTRATION AND HEALTH CANADA (1950-2015)

Alyami F[1], Eguale T[1], Seoane-Vazquez E[2], Rodriguez-Monguio R[3]
[1]*MCPHS University, Boston, MA, USA,* [2]*Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA,* [3]*University of Massachusetts Amherst, Amherst, MA, USA*

OBJECTIVES: The use of antipsychotic drugs has been significantly increasing in the US and Canada, both agencies evaluate drug in similar ways. However, differences in approval processes and outcomes such as approved indication, contraindication, and limitation of use exist with other classes of drugs. The objective of this study was to provide a comprehensive and comparative analysis of antipsychotic drugs approved by the U.S. Food and Drug Administration (FDA) and Health Canada (HC). **METHODS:** A list of all antipsychotic drugs approved by both agencies from 1950 to 2015 was gathered. For each drug, the following data were extracted: indications, contraindications, dosage forms, routes of administration, strengths, market statuses and review statuses. Differences were identified and compared qualitatively and quantitatively. **RESULTS:** Out of the 68 antipsychotic drugs on the WHO ATC list, 29 had never been approved by or submitted to the FDA and HC. Of the 39 drugs that were approved by both agencies, 20 are currently on the market in both countries. For these 20 drugs, the average number of approved indications by FDA (2.85±1.96) was higher than HC (2.20±0.81), though not statistically significant. Qualitative analysis revealed differences in approved indication in 80% of the drugs. HC approved more contraindications than the FDA (6.25±4.96 vs. 3.90±3.18; p-value < 0.05). Moreover, differences were identified in limitation of use, restriction of indications, approval dates between the two agencies. **CONCLUSIONS:** There are significant differences in the antipsychotic drugs approved by both agencies. Additionally, differences in indications, contraindications, and other characteristics of drugs were identified. Harmonization of the drug regulatory process may help in decreasing these differences.

PMH73

SUICIDE IN LATIN AMERICAN INDIGENOUS POPULATION:A SYSTEMATIC REVIEW

Azuero AJ[1], Arreaza-Kaufman D[1], Coriat J[1], Tassinari S[1], Faria A[1], Castañeda-Cardona C[2], Rosselli D[1]
[1]*Pontificia Universidad Javeriana, Bogota, Colombia,* [2]*NeuroEconomix, Bogota, Colombia*

OBJECTIVES: High rates of suicide have been reported in different ethnic minorities. Some researchers suggest this sociological, anthropological and medical phenomenon is a major public health issue in Latin America. **METHODS:** We performed a systematic review of the literature in PubMed, Scopus, PsycNET and Scielo (the Latin American database). An additional search for "grey literature" was done in Scholar Google using suicide (and Spanish or Portuguese equivalents) associated with each Latin American country. The reference lists of all included articles were reviewed for any additional studies. Searches were carried out on March 2016. Articles were reviewed in full text. No language or publication date limits were applied. Only articles centered on or considering indigenous population were used for data extraction. Meta-analysis was not attempted due to heterogeneity of study characteristics, including study populations, study designs, and research methodology. Narrative synthesis was therefore used to analyze the extracted data. **RESULTS:** Initial searches identified 1862 potential references, of which 75 were selected for full-text review, 2 of which were not available. Data was extracted from 41 articles published between 1980 and 2015; 21 of them referred to Brazil, 13 to Colombia, 2 to Chile, 1 to Peru, while 4 additional articles included data from several Latin American countries. **CONCLUSIONS:** Suicide rates are high and have been apparently increasing over time, despite high underreporting and scarce scientific interest on the issue. Suicide mostly occurs in middle aged men, using hanging as most frequent method. Alcohol consumption is widely associated. Changes in lifestyles influenced by industrialization, environmental degradation, and cultural and religious invasion have affected indigenous groups, making them experience what has been described as "cultural death". Mental health disorders in Latin American indigenous groups have not been studied in depth. Interventions have to incorporate their own traditions and beliefs.

PMH74

TREATMENT PATTERNS AND CHARACTERISTICS OF ADULT PATIENTS WITH ATTENTION DEFICIT/HYPERACTIVITY DISORDER RECEIVING ATOMOXETINE IN JAPAN

Nagar SP[1], Sato M[2], Montgomery W[3], Nakamura T[4], Imagawa H[4], Davis KL[1]
[1]*RTI Health Solutions, Research Triangle Park, NC, USA,* [2]*Eli Lilly Japan, Kobe, Japan,* [3]*Eli Lilly Australia Pty Ltd., Sydney, Australia,* [4]*Eli Lilly Japan, Tokyo, Japan*

OBJECTIVES: To describe the characteristics and medication treatment patterns of adult patients with attention-deficit/hyperactivity disorder (ADHD) prescribed atomoxetine in Japan. **METHODS:** A retrospective analysis of insurance claims data was conducted using the Japan Medical Data Center database. Adults (≥18 years) with ADHD who had ≥1 atomoxetine claim from 1 January 2013, to 31 December 2014, and ≥180 days of follow-up were included. First atomoxetine claim defined the index date. Patient characteristics included age, gender, and comorbid conditions. Treatment patterns assessed included rates of atomoxetine discontinuation, switching, persistence, adherence (assessed via the medication possession ratio), and use of concomitant medications. **RESULTS:** A total of 457 adults met all inclusion criteria; mean (SD) age was 32.7 (10.4) years, and 61% of patients were male. Nearly 72% of the patients had at least one comorbid mental health condition in the baseline period; depression (43.8%) and insomnia (40.7%) were the most common mental comorbidities. Most common physical comorbidities were chronic obstructive pulmonary disease (14.4%) and diabetes (12.9%). Psychotropics were received by 59.7% of patients during baseline period and by 66.0% during follow-up period; however, only 6.6% received psychotropics concomitantly with atomoxetine. Overall, 40.0% of adults discontinued atomoxetine and 65.9% were persistent with atomoxetine therapy at 3 months post-index date. Mean (SD) atomoxetine medication possession ratio was 0.57 (0.25), and 25.4% switched to an alternative ADHD therapy; methylphenidate (22.4%) and psychotropics (77.6%) were the most common medications to switch to. Nearly 8% augmented atomoxetine with an alternative ADHD therapy. **CONCLUSIONS:** In this observational study, a majority of adults with ADHD treated with atomoxetine were still persistent with therapy at 3 months post-index date, with one-quarter switching to alternative ADHD therapy. Higher proportions of both mental and physical comorbidities, along with greater use of psychotropic medications in the baseline period, were observed among patients with ADHD prescribed atomoxetine.

PMH75

A SYSTEMATIC LITERATURE REVIEW OF CLINICAL PRACTICE GUIDELINES FOR THE TREATMENT OF BIPOLAR DISORDER TYPE I (BD-I)

Greene M[1], Clark OA[2], Paladini L[2], Hartry A[3]
[1]*Otsuka Pharmaceutical Development & Commercialization Inc., Princeton, NJ, USA,* [2]*Evidencias - Kantar Health, Campinas, Brazil,* [3]*Lundbeck Pharmaceuticals Services, LLC, Deerfield, IL, USA*

OBJECTIVES: To perform a systematic review (SR) of literature and present the most current and up-to-date treatment recommendations issued by clinical practice guidelines (CPG) around the world, as well as those from SR of randomized controlled clinical trials (RCT) regarding BD-I therapy strategies. **METHODS:** A set of questions was formulated on BD-I regarding current treatment options (and their efficacy and safety), non-pharmaceutical options, which guidelines are available and what strategies are recommended. A search string was formulated to retrieve CPGs and another to identify SR of Randomized Controlled Clinical Trials (RCT). We focused on therapies recommended by those CPG for treating manic or mixed episodes or for prevention of manic episodes in BD-I. We searched MEDLINE, EMBASE, CRD Database and National Guidelines Clearinghouse. **RESULTS:** We retrieved ten CPG from several countries and three SR of interest. Guidelines issued recommendations on indications for psychiatric admission, pharmacological interventions for the management of acute mania, acute depression, maintenance and long-term care and psychosocial and non-pharmacological interventions. The SR for treatment of acute mania included sixty-eight trials with 16,073 patients assigned to 14 different treatments. Most trials (79%) comprised two study groups, the mean duration was 3.4 weeks, and the mean sample size was 105.7 patients per group. The second SR was an update of the first, with 57 studies involving 95 comparisons with 14,256 patients. Treatments were found to be superior to placebo with small differences in efficacy. The last SR (33 trials with 6,846 patients) analyzed drugs for long-term/maintenance treatment. Most drugs were better than placebo for any mood episode relapse or recurrence. **CONCLUSIONS:** Good quality evidences about treatment options are available for almost every aspect of bipolar disorder. Detailed publications can help clinicians find the therapy that best suits each patient during mania, depression and for maintenance treatment.

URINARY/KIDNEY DISORDERS – Clinical Outcomes Studies

PUK1

EFFECT OF ALLOPURINOL IN THE ESTIMATED GLOMERULAR FILTRATION RATE IN PATIENTS OVER 50 YEARS

Miranda PA
Universidad Nacional de Colombia, Cartagena, Colombia

OBJECTIVES: To estimate the effect of allopurinol on hyperuricemia and estimated glomerular filtration rate (eGFR). **METHODS:** An observational non-concurrent prospective cohort study. Patients older than 50 years with hyperuricemia were included. All patients received allopurinol 100-300 mg day for 12 months. The levels of uric acid (UA) were determined and the glomerular filtration rate (GFR) was

estimated at baseline. Changes in AU and in GFR were observed after treatment. **RESULTS:** 50 patients diagnosed with hyperuricemia on treatment with allopurinol were eligible with a mean age of 71.6 + 11.1 years. 58% of the patients were male and 46% had diabetes mellitus. UA levels decreased significantly from 7.1 ± 1.1 mg / dl to 5.5 ± 1.2 mg / dl (p <0.001). The GFR increased from 46.3 ± 19.1 ml / min / 1.73 m2 to 49.0 ± 20.6 ml / min / 1.73 m2 but this increase was not significant (p 0.14). There were no reports of adverse reactions to allopurinol. **CONCLUSIONS:** In this study, allopurinol was effective and safe in the treatment of hyperuricemia but did not significantly increase GFR in patients older than 50 years.

PUK2

IMPACT OF INDIVIDUAL DIAGNOSIS CODES ON DATABASE ESTIMATES OF OVERACTIVE BLADDER

Espinosa R[1], Davis M[1], Johnson SJ[1], Walker D[2], Ng DB[2], Gooch K[2]
[1]Medicus Economics, LLC, Milton, MA, USA, [2]Astellas Pharma Global Development, Inc., Northbrook, IL, USA

OBJECTIVES: To assess the effect of individual International Classification of Disease, Ninth Revision, Clinical Modification (ICD-9-CM) diagnosis codes on database estimates of overactive bladder (OAB) in the absence of a specific OAB ICD-9-CM code. **METHODS:** ICD-9-CM codes used to define OAB were identified from a review of published claims database studies. OAB prevalence and patient characteristics were evaluated for each code using 2015 OptumHealth claims data. Prevalence was calculated among all subjects in the data with insurance eligibility. The share of patients with a medical claim for each code was counted overall, and compared between visits to urologists and all other healthcare providers. Patient clinical and demographic characteristics and oral OAB pharmacologic treatment rates were measured for each sample. **RESULTS:** Fourteen studies were reviewed, yielding 27 distinct ICD-9-CM codes used to identify OAB patients. A total of 206,527 patients had ≥1 claim with any of these codes (1.57% of all enrollees). The most commonly used ICD-9-CM code (788.31 - urge incontinence), identified only 12,472 patients (0.09%), while ICD-9-CM 788.41 (urinary frequency) accounted for the most patients (N=111,374, 0.84%) but was only used in 8 of 14 studies. Only 19% of patients with ICD-9-CM 788.41 were seen by urologists compared with 25% of all OAB patients identified. Relative to all other OAB patients identified, those with ICD-9-CM 788.41 had lower mean age (42.7 years vs. 45.9 years; p<0.0001), fewer males (33% vs. 46%; p<0.0001), and lower rate of oral pharmacologic treatment (3% vs. 6%; p<0.0001). Patients with ICD-9-CM 596.51 (hypertonicity of bladder) were most likely to receive treatment (21%). **CONCLUSIONS:** Due to the lack of a specific ICD-9-CM code for OAB, numerous combinations of codes have been used to identify OAB patients. This analysis shows the codes chosen have a significant impact on the patient population and treatment pattern estimates.

PUK3

EFFECTIVNESS OF LOSARTAN 50MG IN THE MANAGMENT OF POST DIALYSIS EUVOLEMIC HYPERTENSION: A SINGLE BLINDED RANDOMIZED CONTROL TRIAL

Aftab RA
Universiti Sains Malaysia, Pulau Pinang, Malaysia

OBJECTIVES: To assess the effectiveness of losartan 50 mg on Post dialysis euvolemic hypertensive patients against standard antihypertensive pharmacotherapy. **METHODS:** A multicentre, prospective, randomised, single blind trial was conducted at hospital university sains Malaysia, Kelantan Malaysia, to assess the effect of losartan 50mg once daily (OD) among post dialysis euvolumic hypertensive patients. Covariate Adaptive Randomization was used for allocation of participant to standard or treatment arm, and were followed up for eight weeks. Pre, intra and post dialysis session blood pressure measurements were recorded along with any adverse events. Wilcoxon statistical test was performed to note the difference in blood pressure from baseline. **RESULTS:** A total of 70 patients were randomised into standard (n=35) and treatment arm (n=35) and were followed for a period of 8 weeks. The mean baseline post dialysis systolic blood pressure of standard arm was 156.1(±14.3) mmHg as compared to treatment arm 157.7 (±13.3) mmHg. In the standard group, the mean post dialysis blood pressure dropped by 0.5 mmHg by the end of 4thweek but increased by 0.5 mmHg by the next four weeks. However the treatment arm reported a drop of 2.8 mmHg of BP drop during 8 week trial period. Analysis suggests that there was a significant difference in blood pressure readings at the end of 8 weeks among patients treated with losartan (P <0.001) however no such statistical association was observed in standard arm (P 0.17). **CONCLUSIONS:** A slow, steady significant decline in post dialysis BP was observed among euvolumic hypertensive patients that were treated with losartan 50mg.

PUK4

COMPARATIVE EFFECTIVENESS OF PERITONEAL DIALYSIS VERSUS HEMODIALYSIS FOR END-STAGE-RENAL DISEASE

Lee NR, Kim J, Son SK, Sul AR, Kim YJ
National Evidence-based Collaborating Agency, Seoul, South Korea

OBJECTIVES: To assess comparative effectiveness of peritoneal dialysis (PD) and hemodialysis (HD) in end-stage renal disease (ESRD) patients initiating dialysis therapy. **METHODS:** We constructed retrospective cohort with national administrative healthcare databases. The study population comprised patients with ESRD in Korea who newly treated kidney dialysis such as hemodialysis and peritoneal dialysis between January 1, 2004 and December 31, 2015. We excluded patients who received kidney transplant; lost follow-up; death; stop dialysis within three months from the initiation date. The primary outcome was all cause mortality, and the secondary outcome was incidence of major adverse cardiac and cerebrovascular events (MACCE). We analyzed that the comparative risks of primary and secondary outcomes were determined with the use of Cox regression. Propensity-score matching was used to assemble patient cohorts with similar baseline characteristics. **RESULTS:** A total of 96,626 eligible patients with ESRD were composed of 18,216 treated with PD, 78,410 treated with HD. The crude morality rates were 95.0 per 1000 patient-years (PY) in PD and 96.5/1000PY in HD. Compared with HD, PD was associated with increased risks of mortality (adjusted hazard ratio: 1.27, 95% CI: 1.24-1.31, p-value <0.0001) and MACCE rate (CVD, HR: 1.11, 95% CI: 1.06-1.16, p-value <0.0001). The results were similar in analysis of matching patients. However, in subgroup analysis, there was no statistical significant difference between HD and PD, especially in non-diabetic patients less than age 65. **CONCLUSIONS:** The results from this study show that patient treated with PD was associated with a high risk of mortality and MACCE. However, there was no statistical significant difference in group of non-diabetic patients less than age 65. Although we could not assess cost effectiveness, considering cost and time to spend dialysis, appropriate selection of dialysis modality according to baseline characteristics is needed.

PUK5

EFFECTIVENESS OF ANGIOTENSIN CONVERTING ENZYME INHIBITORS VERSUS ANGIOTENSIN RECEPTOR BLOCKERS AMONG CHRONIC KIDNEY DISEASE PATIENTS

Zullo AR[1], Dahabreh IJ[1], Nelson J[2], Kent DM[2], Crown WH[3], Inker LA[4]
[1]Brown University, Providence, RI, USA, [2]Tufts Medical Center/Tufts University School of Medicine, Boston, MA, USA, [3]Optum Labs, Cambridge, MA, USA, [4]Tufts University School of Medicine, Boston, MA, USA

OBJECTIVES: Meta-analyses of randomized controlled trials suggest angiotensin-converting enzyme inhibitors (ACEIs) may reduce the rate of kidney failure compared to angiotensin II receptor blockers (ARBs) among patients with chronic kidney disease (CKD). However, controlled trials have not enrolled enough patients to permit precise inferences for this important population. We examined the comparative effects of ACEIs and ARBs on renal and cardiovascular outcomes among CKD patients using insurance claims data. **METHODS:** We conducted a retrospective new-user cohort study using national U.S. data from OptumLabs on privately insured individuals and Medicare Advantage enrollees. We identified individuals ≥18 years old with CKD who initiated therapy with an ACEI or ARB between 2005 and 2015 after ≥6 months of nonuse. We used Cox proportional hazards models to estimate hazard ratios (HRs) and 95% confidence intervals (CIs) by inverse probability of treatment weighting to compare ACEIs versus ARBs for progression to end-stage renal disease (ESRD), myocardial infarction (MI), and ischemic stroke. **RESULTS:** The study cohort comprised 48,489 patients, with a total of 3,148 ESRD progression, 1,011 MI, and 741 stroke events. Mean follow-up was 2.2 years. Inverse probability weighting resulted in well-balanced treatment groups. HRs comparing patients treated with ACEIs to those treated with ARBs were 0.87 (95% CI, 0.80-0.94) for ESRD, 1.08 (95% CI, 0.93-1.25) for MI, 1.10 (95% CI 0.93-1.30) for stroke, and 1.10 (95% CI 0.98-1.23) for the composite of stroke or MI. Results were consistent across stability analyses using different outcome definitions, treatment washout periods, and continuous enrollment periods. **CONCLUSIONS:** Use of ACEIs among CKD patients was associated with a lower rate of ESRD and similar rates of cardiovascular outcomes compared with use of ARBs. Our results are consistent with the results of meta-analyses of CKD clinical trials, but are more precise, and suggest that ACEIs may be the preferred treatment to slow CKD progression.

PUK6

REAL WORLD CARDIOVASCULAR (CV) RISK PROFILE IN INDIVIDUALS TREATED FOR OVERACTIVE BLADDER (OAB)

Vonesh EF[1], Rumsfeld J[2], Gooch K[3], Szabo SM[4], Johnston KM[4], Khangulov VS[5], Schermer C[3]
[1]Northwestern University, Chicago, IL, USA, [2]University of Colorado, Denver, CO, USA, [3]Astellas Pharma Global Development, Inc., Northbrook, IL, USA, [4]Broadstreet Health Economics & Outcomes Research, Vancouver, BC, Canada, [5]Boston Strategic Partners, Inc., Boston, MA, USA

OBJECTIVES: Antimuscarinic (AM) and β3 adrenergic receptor agonist medications (mirabegron) are commonly used to treat symptoms associated with OAB. Mirabegron is typically prescribed as a second line agent to AMs. The objective was to describe baseline characteristics including CV risk in OAB patients initiating treatment with either mirabegron or an AM, or those who were untreated. **METHODS:** Integrated claims and electronic health records (EHR) of patients with OAB were examined. Index was the first date of treatment for AM or mirabegron between October 2012 and December 2014. Patients with12 months pre-index data, baseline blood pressure (BP) measurements, and no CV events within 30 days pre index were included. Untreated OAB cohort included patients without recorded OAB treatment. Index for untreated patients was the earliest date with their OAB related diagnosis within the same identification period. Unadjusted demographic and clinical characteristics, including CV risk factors, were compared across groups at index. **RESULTS:** The study groups included 54,187 untreated patients, 10,311 AM patients, and 408 mirabegron patients. Compared to AM and untreated patients, mirabegron patients were older (mean age 70 years vs. 67 years AM and 60 years untreated). Males comprised 33.6% of mirabegron patients, 26.8% of AM patients, and 39.6% of untreated patients. Mirabegron patients were more likely to have had prior CV events >30 days pre index (17.2% vs. 14.3% for AM and 12.3% for untreated), and were more likely to have diabetes mellitus (42.2% vs. 34.8% for AM and 26.3% for untreated). Baseline BP and cholesterol were similar across groups. Concomitant medication use was highest in AM patients. **CONCLUSIONS:** In a real world analysis, baseline CV risk differs between OAB patients receiving mirabegron versus antimuscarinics. Analysis using integrated claims and EHR data therefore require adequate bias reduction techniques for assessing CV risk in OAB populations.

PUK7

THE PREVALENCE, TREATMENT AND CHARACTERISTICS OF OVERACTIVE BLADDER PATIENTS IN THE MEDICARE FEE-FOR-SERVICE (FFS) POPULATION

Puckrein G[1], Walker D[2], Xu L[1], Gooch K[2]
[1]National Minority Quality Forum, Washington, DC, DC, USA, [2]Astellas Pharma Global Development, Inc., Northbrook, IL, USA

OBJECTIVES: To estimate the prevalence of Medicare FFS patients 65+ years receiving treatment in 2013 for OAB and to determine what patient characteristics were associated with higher prevalence. **METHODS:** The 2013 Medicare Beneficiary Part B Carrier Claims File (Carrier), the Part D Drug Event File (PDE), and the Medicare Beneficiary Annual Summary File (BASF) for patients over 65 years were used to calculate prevalence of OAB and the number of patients with OAB among the Medicare FFS population. OAB was defined as having an OAB related diagnosis and/or a Part D claim for an antimuscarinic or mirabegron and/or a CPT code (52287) for onabotulinumtoxinA injection of the bladder. The BASF was linked to the Carrier and PDE Files to determine patient age, gender, and race/ethnicity. **RESULTS:** The national prevalence rate of OAB among Medicare FFS patients was 7.17% (N= 2,278,865); the rate was 7.72% among males and 6.74% among females. By race/ethnicity subgroups, the prevalence rate was lower in Blacks (5.8%) and Hispanics (5.86%) compared with Whites (7.43%). Patients 75+ years have a significantly higher OAB prevalence rate of 9.32% ($p<0.01$) than those 65-74 years (5.44%). Nationally the prevalence of OAB in rural zip codes was 6.01% vs 7.49% in urban zip codes. Among OAB patients only 21.4% were being treated with mirabegron or an antimuscarinic. Treatment rates are higher in females (29% vs 13% in males), Hispanics (29.5% vs 22% and 21% in Blacks and Whites, respectively) and older populations (23% in $\geq$75 years vs 19% in 65-74 years). **CONCLUSIONS:** The prevalence rates are similar to older estimates of Medicare data but are much lower than studies based on self-reporting. However, overall treatment rates of only 21% is in line with findings from other studies. These results also show substantial differences in OAB prevalence rates in particular patient demographics.

PUK8

DIFFERENTIAL PRESCRIBING OF ANTIMUSCARINIC AGENTS IN OLDER ADULTS WITH COGNITIVE IMPAIRMENT

Vouri S[1], Olsen M[2], Schootman M[3], Strope S[4], Birge S[5]
[1]St. Louis College of Pharmacy, St. Louis, FL, USA, [2]Washington University in St. Louis, St. Louis, FL, USA, [3]St. Louis University - College for Public Health and Social Justice, St. Louis, FL, USA, [4]Baptist MD Anderson Cancer Center, Jacksonville, FL, USA, [5]Washington University in St. Louis, St. Louis, MO, USA

OBJECTIVES: To evaluate differential prescribing of newer vs. older antimuscarinics in older adults and determine if appropriate prescribing of a newer over an older antimuscarinic occurred in persons with preexisting cognitive impairment. **METHODS:** We performed a population-based retrospective analysis using the 5% random sample Medicare claims data linked with Part D data from 2007 to 2012. We identified new-users of older (e.g., oxybutynin) and newer (e.g., tolterodine, trospium, solifenacin, darifenacin, fesoterodine) antimuscarinic in adults aged 65.5 years and older, and conditions potentially associated with differential utilization of newer vs. older antimuscarinics in the 6 months prior to the first prescription using ICD-9-CM diagnosis and procedure codes and medication claims. Conditions analyzed included indicators of cognitive impairment (mild cognitive impairment, dementia, or antidementia medication), comorbid conditions (defined by Elixhauser), and other conditions common in the elderly. We used multivariate logistic regression with backward selection to assess the selection of newer vs. older antimuscarinics after adjusting for comorbid conditions. **RESULTS:** Of the 55,405 older adults with a new prescription for an antimuscarinic, 68% received a newer antimuscarinic as initial therapy. Overall, 7,314 patients were diagnosed or treated for dementia prior to initial therapy. Older adults diagnosed or treated for dementia were more likely (OR 1.14, 95% CI 1.07-1.20) to receive a newer compared to an older antimuscarinic. When diagnosis and treatment were considered separately in the multivariate analyses, patients treated for dementia were more likely to receive a newer antimuscarinic (OR 1.23, 95% CI 1.15-1.31). However, 29% of patients previously diagnosed or treated for dementia were initiated on an older antimuscarinic. Increased age, osteoporosis, and vertigo were associated prescription of a newer antimuscarinic. **CONCLUSIONS:** Older adults treated with anti-dementia medication(s) were appropriately treated with a newer antimuscarinic. Our results suggest there is still a need to improve the appropriateness of antimuscarinic prescribing.

URINARY/KIDNEY DISORDERS – Cost Studies

A BUDGET IMPACT ANALYSIS OF INCREASING PERITONEAL DIALYSIS (PD) IN JAPAN

Makhija D[1], Day L[2], Deenitchina S[3], Marshall MR[4]
[1]Baxter Healthcare Corporation, Deerfield, IL, USA, [2]Baxter Healthcare, Old Toongabbie, Australia, [3]Baxter Limited Toranomon Hills Office, Tokyo, Japan, [4]Baxter Healthcare (Asia) Pte. Ltd., Singapore, Singapore

OBJECTIVES: This study investigates the 5-year healthcare budget impact of variable distribution of adult patients treated with peritoneal dialysis (PD) and in-center hemodialysis (ICHD) in Japan. **METHODS:** An Excel-based budget impact model was constructed to assess dialysis-associated costs when changing dialysis modalities between PD and ICHD from the Japan payer perspective. The model incorporates the current modality distribution of PD (3%), ICHD (83%) and hemodiafiltration (14%) as per the Japanese Society of Dialysis Therapy (JSDT) registry data at the end of 2015. Epidemiological data including dialysis prevalence, incidence, and mortality from the JSDT registry reports were used to estimate the dialysis patient population for the next 5 years. Costs were estimated from claims of patient data collected by Medical Data Vision (MDV) Ltd, a well-established data source for epidemiological and pharmacoeconomic studies from Japan. Alternative scenarios included the prevalence of PD increasing by 5%, 7.5%, and decreasing 0.5% yearly over 5 years. All 3 scenarios were accompanied with commensurate changes in ICHD. **RESULTS:** An increase in the prevalent PD population from 3% in 2016 to 23%, or 33% in 2020 is predicted to result in 5-year cumulative savings of ¥160,888,039,711, and ¥241,332,059,567, respectively, for the Japanese government. If the prevalent PD population were to decrease from 3% in 2016 to 1% by 2020, the total expenditure for dialysis treatments would increase by ¥16,088,803,971 over the next 5 years. **CONCLUSIONS:** This analysis shows that increasing the uptake of peritoneal dialysis regimen could potentially reduce dialysis-associated costs in Japan.

PUK11

ASSESSMENT OF CLINICAL EFFICACY AND COST COMPARISON OF ERYTHROPOIETIN ALPHA AND DARBEPOETIN ALPHA IN HEMODIALYSIS PATIENTS

Nagaraju SP[1], Mateti UV[2], Attur RP[1], Rangaswamy D[1], Kaza S[1], Prasad Rao S[1], Shenoy S[1], Saraf K[1], Bhojaraja M[1], Ramaswamy A[1], Koulmane Laxminarayana SL[3]
[1]KASTURBA MEDICAL COLLEGE, MANIPAL UNIVERSITY, MANIPAL, India, [2]THE NITTE GULABI SHETTY MEMORIAL INSTITUTE OF PHARMACEUTICAL SCIENCES, Mangalore, India, [3]KASTURBA MEDICAL COLLEGE,MANIPAL UNIVERSITY, Manipal, India

OBJECTIVES: Administration of erythropoiesis stimulating agent (Epoetin alpha or Darbepoietin alpha) is the standard of care for treatment of anemia in hemodialysis (CKD5D) patients. The Pharmacoeconomics of this therapy is important in developing countries since most of the patients are on self-funding for medications. This study was conducted to compare cost per patient and clinical efficacy of these agents in CKD5D patients **METHODS:** A retrospective study was conducted for a period of one year (January – December 2016) on stable CKD5D patients receiving regular erythropoietin treatment (Epoetin alpha or Darbepoietin alpha) at a tertiary care hemodialysis center in India. Patients with gastrointestinal bleeding, cancer, iron deficiency, pure red aplasia, hemolytic anemias and non-compliant were excluded. The baseline characteristics were compared between the Erythropoietin alpha (E) and Darbepoietin (D) groups. The E group received 4000 Units subcutaneous (S.C) Epoetin alpha and the (D) group received Darbepoietin 40 units S.C once weekly. The maintenance dose and intravenous iron were continued as per clinician discretion. At the end of one year the mean hemoglobin levels (HgB) and cost per patient for drug were compared between the groups. The statistical analysis was done using SPSS version 15. **RESULTS:** There were 29 patients in E group and 23 in D group. The baseline characteristics were comparable. The average HgB level over one year was the 9.71 $\pm$ 1.43 g/dl in E group and 9.73 $\pm$ 0.98 g/dl in D group (p=0.942) suggestive of similar efficacy. There was a significant difference in the mean costs per patient per year for Erythropoietin alpha (30075.86 $\pm$ 2392.04 INR) and Darbepoetin (69843.47 $\pm$ 6660.31 INR) (p=0.001). **CONCLUSIONS:** Epoetin alfa has a better pharmacoeconomic value compared to Darbepoietin in maintaining Hemoglobin levels in CKD5D patients with similar clinical efficacy. It needs large prospective randomized trials to obtain more definitive data.

PUK12

ASSESSING THE ECONOMIC BURDEN AND 30-DAY READMISSION RATES AMONG PATIENTS WITH URINARY TRACT INFECTION IN THE US VETERANS HEALTH ADMINISTRATION POPULATION

Borra S[1], Cao Y[1], Wang L[1], Baser O[2]
[1]STATinMED Research, Plano, TX, USA, [2]Columbia University and STATinMED Research, New York, NY, USA

OBJECTIVES: To assess the health care costs, 30-day readmission rates, and predictors of 30-day readmission among patients with urinary tract infection (UTI) in the US Veterans Health Administration (VHA) population (01OCT2010-30SEP2015). **METHODS:** Patients diagnosed with UTI (International Classification of Disease, 9th Revision, Clinical Modification codes 590, 595, 597, and 599) were identified from the VHA dataset for the identification period (01OCT2011-30SEPT2014). The initial diagnosis date was designated as the index date. Patients with the same age, race, and sex as the study UTI patients, but without a UTI diagnosis, were identified for comparison. An index date was selected randomly to minimize bias. Adult patients were required to have continuous medical and pharmacy benefits for 1 year pre- and post-index date. Health care costs and 30-day readmission rates were compared among 1:1 matched patients with and without UTI during the follow-up period. Logistic regression was used to examine the predictors of 30-day readmission. **RESULTS:** After matching, 468,883 patients were included in each group. Compared to patients without UTI, those with UTI incurred significantly higher inpatient ($13,240 vs $682; $p<0.0001$), outpatient ($6,019 vs $1,786; $p<0.0001$), and total costs ($19,260 vs $2,469; $p<0.0001$) as well as a higher 30-day readmission rate (9.3% vs 0.5%; $p<0.0001$). The likelihood of 30-day readmission was lower among patients aged 18-64 years versus $\geq$65 years (odds ratio [OR]: 0.4-0.9; $p<0.0001$) and higher among male (OR: 1.3; $p<0.0001$), black (OR: 1.2; $p<0.0001$), and white patients (OR: 1.1; $p<0.0001$) compared to those of other races and those with higher Charlson comorbidity index (CCI) scores (OR: 1.2; $p<0.0001$). **CONCLUSIONS:** Patients diagnosed with UTI had significantly higher 30-day readmission rates and economic burden than those without UTI. Age, gender, race, and CCI score were significant predictors of 30-day readmission.

PUK13

OPTIMIZING SURVIVAL AND QUALITY OF LIFE USING BAYESIAN NETWORK MODELING IN KIDNEY TRANSPLANTATION

Zia A[1], Jones CA[2], Weimersheimer P[3], Mesa OA[4]
[1]University of Vermont, Burlington, VT, USA, [2]ForMyOdds LLC, Burlington, VT, USA, [3]University of Vermont College of Medicine, Burlington, VT, USA, [4]Therakos, Inc., a Mallinckrodt Corporation, Wokingham, Berkshire, UK

OBJECTIVES: Existing solid organ transplant models are based upon organ availability, donor compatibility and general measures of severity but they lack the ability to fully capture the personalized context of treatments that certain instances can avoid the need for transplantation and re-transplantation. In this study, we propose supervised and unsupervised Bayesian Network Models to predict the most personalized pathways that minimize the disease progression conditional upon patient needs and access to the most suitable technology. Furthermore, in addition to prediction, we will also test how well patients would perform if given access to technology that can slow the progression of illness and assess the impact of these interventions on likely rate of transplant and downstream costs. **METHODS:** Using the United Network for Organ Sharing (UNOS) National Organ Procurement and Transplantation Network (OPTN) dataset from 2000-2015, we developed a Bayesian Network Model to estimate the joint probability distribution bilaterally, between donor and recipient, to predict transplant survival rates conditional upon defined biological, clinical and treatment variables. **RESULTS:** Preliminary results in kidney transplantation show that increases in survival rates are correlated not only with host characteristics or donor characteristics, but also treatment characteristics. A k-fold validation of the Bayesian Network Model shows more than 60% predictive power for survival rates. Such models can be made available graphically to transplant teams to assist in optimizing donor characteristics and treatments to the precise needs of kidney patients. **CONCLUSIONS:** The precision medicine movement of today not only requires access to life saving technologies, but also access to pre-emptive information on donors, hosts and treatment options that can be personalized to unique biological and behavioral variables.

PUK14

COST-EFFECTIVENSS OF ANGIOTENSIN-CONVERTING ENZYME INHIBITORS VS. ANGIOTENSIN II RECEPTOR BLOCKERS AS FIRST-LINE TREATMENT IN AUTOSOMAL DOMINANT POLYCYSTIC KIDNEY DISEASE

Clark LA[1], Whitmire SM[1], Patton S[1], Clark CA[1], Blanchette CM[2]
[1]*University of North Carolina at Charlotte, Charlotte, NC, USA,* [2]*University of North Carolina, Charlotte, NC, USA*

OBJECTIVES: ADPKD is a rare monogenic renal disorder impacting approximately 1:2500 individuals among the general US population. Cardiovascular Disease is the most common cause of mortality among ADPKD patients. Hypertension has been documented as a predictor of disease progression and severity. Few intervention studies have examined the role of antihypertensive therapies in ADPKD and therefore a need to synthesize the literature exists. The objective is to determine if novel Angiotensin II Receptor Blockers(ARBs) are more cost-effective than Angiotensin-Converting Enzymes(ACE) Inhibitors as first line treatment in ADPKD. **METHODS:** A Markov-state decision model was constructed for estimation of cost and outcome benefits in hypertensive ADPKD patients. Transition probabilities were extrapolated from a retrospective cohort study comparing Chronic Kidney Disease(CKD) stage transitions in ADPKD patients. Annual pharmaceutical costs pending average daily dose per CKD stage was extracted from a large US healthcare claims database. Median total health care costs per CKD stage or transplant were extracted from published data. Time horizon was set to 30 years with 1-year duration to cycle shift. Cost-effectiveness analysis was conducted to estimate the incremental cost-effectiveness ratio(ICER) of ACE-I vs. ARB per additional year of prevented transplant and/or death. Sensitivity analysis was conducted using a one-way probabilistic analysis with 10% variation in transition/mortality probabilities and cost. **RESULTS:** Total annual health care costs accrued after 30 years among ADPKD patients taking ACE-I was estimated to be approximately $3,505,028.41 compared to ARB at $3,644,327.65. Life expectancy was increased by 1.39 years among patients taking ACE-I. Approximate 10-year survival in patients taking ACE-I was 47% compared to ARB at 34%. **CONCLUSIONS:** ACE-I dominated ARB and displayed greater cost-effectiveness due to lower cost and increased capacity to prolong years of life without transplant or death among hypertensive ADPKD patients. This model validates the use of ACE-I as first line treatment for hypertension management in ADPKD patients.

PUK15

COST-EFFECTIVENESS OF TWO PREVENTIVE STRATEGIES FOR CYTOMEGALOVIRUS INFECTION IN INTERMEDIATE RISK COLOMBIAN RENAL TRANSPLANT PATIENTS

Contreras K[1], González C[1], García P[1], Rodríguez MP[1], Vargas MJ[1], Castañeda-Cardona C[2], Rosselli D[1]
[1]*Pontificia Universidad Javeriana, Bogota, Colombia,* [2]*NeuroEconomix, Bogota, Colombia*

OBJECTIVES: Our objective was to compare the cost-effectiveness of the two most used valganciclovir-based cytomegalovirus (CMV) prophylaxis strategies, in intermediate risk renal transplant patients in Colombia. The two alternatives are "universal prophylaxis" strategy, which uses valganciclovir for the first 90 days post-transplantation, and "anticipated therapy", which requires weekly viral load surveillance, warranting therapy only when positive. **METHODS:** We designed a TreeAge-based third party payer perspective (Colombian healthcare system) decision tree, considering only direct medical costs, in 2014 Colombian pesos (1 USD = 2000 COP) and a time horizon of one year. Target population was intermediate CMV risk patients (positive receptor). Transition probabilities were extracted from clinical studies, validated with a Delphi expert panel method; procedural costs were obtained from the official tariff manual (ISS 2001) with a 33% adjustment based on the health component of the Colombian Consumer Price Index for the year 2014. Medication costs were obtained from the official Ministry of Health information system (SISMED). **RESULTS:** Universal prophylaxis with valganciclovir was dominant, with lower costs and less probability of infection. The average cost of the first year in anticipated therapy would be US$ 15,481, whereas in the case of universal therapy the cost would be slightly lower US$ 14,984 (incremental cost of US$ 497). Results did not change significantly with deterministic and probabilistic sensitivity analyses. **CONCLUSIONS:** For Colombian renal transplant patients with an intermediate risk of CMV infections, universal prophylaxis strategy should be the best option.

PUK16

COST-EFFECTIVENESS OF THYMOGLOBULINE VS. ATG-FRESENIUS FOR INDUCTION IMMUNOSUPPRESSION IN KIDNEY TRANSPLANTATION IN CHINA

Xuan D[1], Chen G[2], Yao X[3], Yin H[4], Zhang L[5], Xuan J[6], Chen L[2]
[1]*University of North Carolina Gillings School of Public Health, Durham, NC, USA,* [2]*The First-Affiliated Hospital of Sun Yat-sen University, Guangzhou, China,* [3]*Health economic and outcome research, Sanofi, Shanghai, China,* [4]*Shanghai Centennial Scientific Ltd., Alpharetta, GA, USA,* [5]*Shanghai Centennial Scientific Ltd., Shanghai, China,* [6]*Sun Yat-Sen University, Guangzhou, China*

OBJECTIVES: Induction immunosuppression therapy is used to support optimal outcomes in kidney transplantation. This study was to assess the cost-effectiveness of Thymoglobuline (Rabbit Anti-human Thymocyte Immunoglobulin) versus ATG-Fresenius (Anti-T lymphocyte globulin) in kidney transplantation in the Chinese setting. **METHODS:** A two-part survival model was developed consisting of a "short-term" part and a "long-term" part. The "short-term" part analyzed the first-year using decision tree and consisted of the "functioning transplant", "acute rejection (AR)", "delayed graft function (DGF)", "dialysis", and "death" health states. The "long-term" part analyzed the two to five-year using Markov model and consisted of the "functioning transplant", "chronic dysfunction", "recurring primary disease", "dialysis", and "death" health states, with capture of the association between DGF and graft loss. Costs including drug acquisition and other direct medical costs were derived from GBI SOURCE CHINA database, chart review and expert panels. Clinical outcomes and utility were retrieved from published literature. The model calculated quality-adjusted life years (QALYs) and total costs per patient. Costs and QALYs were discounted at an annual rate of 3.5%. Sensitivity analyses will be conducted in this ongoing study. **RESULTS:** Patients receiving Thymoglobuline observed more clinical effectiveness than patients receiving ATG-Fresenius mainly due to less AR, DGF and dialysis. The incremental QALY was 0.0297 over a 1-year horizon and 0.0392 over a 5-year horizon. Thymoglobuline and ATG-Fresenius drug cost were ¥15,602 and ¥11,580, respectively. However, the total treatment costs of the Thymoglobuline arm were lower than the ATG-Fresenius arm due to lower costs related to DGF, AR, dialysis and adverse events. In total, Thymoglobuline saves ¥4,407 and ¥11,490 over the 1-year and 5-year horizon, respectively. Thymoglobuline was dominant compared with ATG-Fresenius. **CONCLUSIONS:** Despite higher drug acquisition costs, thymoglobuline-treated patients achieve better short and long term outcomes, resulting in cost savings by avoidance of graft failure and long-term dialysis costs.

PUK17

CHANGES IN EFFICIENCY OF U.S. DIALYSIS CENTERS AMID REGULATORY AND PAYMENT REFORM

Stephens JM[1], Barrus D[2], Ma M[2], Cotter D[3], Thamer M[3], Wish JB[4]
[1]*Prima Health Analytics, Weymouth, MA, USA,* [2]*Brigham Young University-Idaho, Rexburg, ID, USA,* [3]*Medical Technology & Practice Patterns Institute, Bethesda, MD, USA,* [4]*Indiana University School of Medicine, Indianapolis, IN, USA*

OBJECTIVES: To evaluate the impact of a new prospective payment system (PPS) on the relative efficiency of U.S. Medicare-certified dialysis providers after implementation of this major payment reform in 2011. **METHODS:** In a longitudinal, facility-level retrospective analysis using national data from Medicare Renal Facility Cost Reports, a data envelopment analysis (DEA) was performed to model the technical efficiency of free-standing dialysis centers for the years 2010-2012. DEA uses a linear programming technique to convert multiple inputs (costs, staffing levels) and an output measure (number of dialysis sessions) to a relative efficiency score between 0 and 1, where scores are proportional to the efficiency frontier (score of 1.0). The DEA-based Malmquist Productivity Index was used to assess dynamic efficiency year over year. Results were stratified by industry segment and geographic and environmental covariates. **RESULTS:** 4234 free-standing dialysis centers with data from all three years were included in the analysis. About 33% of facilities were functioning efficiently (efficiency scores $\geq .90$) in 2010, dropping to only 26% in 2011 and 23% in 2012. Overall technical efficiency declined by 3.2% from 2010 to 2011 and by 7.7% from 2011 to 2012. Modest efficiency gains in 2011 but not in 2012 were seen in facilities that were members of medium-sized or non-profit chains. Sub-analyses showed that efficiency gains in drug-related costs were offset by less efficient clinical staffing after 2010. **CONCLUSIONS:** Contrary to expectations, the US dialysis industry did not appear to realize any short-term gains in technical efficiency in response to the 2011 Medicare payment reforms, as compared to the period just prior to reform. Some facilities may have anticipated PPS reforms by implementing efficiency measures prior to 2011. Our future work in this field will incorporate quality of care dimensions and case-mix adjustment in the measurement of efficiency over a longer timeframe.

PUK18

ADHERENCE AND *DE NOVO* DONOR-SPECIFIC ANTIBODY FORMATION IN RENAL TRANSPLANT RECIPIENTS: IMPLICATIONS FOR CLINICAL AND ECONOMIC OUTCOMES ASSOCIATED WITH PROLONGED-RELEASE AND IMMEDIATE-RELEASE TACROLIMUS IN CANADA

Pollock RF[1], Schwartz J[2], Howell J[3]
[1]*Ossian Health Economics and Communications GmbH, Basel, Switzerland,* [2]*Astellas Pharma Global Development, Inc., Northbrook, IL, USA,* [3]*Astellas Pharma Global Development, Inc., Markham, ON, Canada*

OBJECTIVES: While advances in immunosuppression have resulted in substantial improvements in short-term renal allograft survival, improvements in longer-

term graft survival rates have been less marked. This may be due, in part, to antibody-mediated rejection driven by formation of de novo donor-specific antibodies (dnDSA). Because of its association with non-adherence, dnDSA has emerged as an important factor in longer-term graft loss. Long-term data on adherence, dnDSA formation, and graft failure were used to model clinical outcomes and costs associated with prolonged-release (PR) versus immediate-release (IR) tacrolimus (TAC) in renal transplant recipients in Canada. **METHODS:** A decision tree developed to capture differences in adherence between IR-TAC and PR-TAC was combined with a five-state Markov model of dnDSA formation, graft failure, and patient survival. Transition probabilities were determined by a series of Weibull, logistic, and least squares regression models. Adherence, quality of life, patient and graft survival, and drug costs were derived from Canada-specific sources. Analyses were run over a 25-year time horizon. Costs were reported in 2016 Canadian dollars, inflated where necessary. **RESULTS:** The proportion of patients experiencing dnDSA was reduced from 22.1% with IR-TAC to 20.5% with PR-TAC, reflecting a 7.2% relative reduction in dnDSA, and a number needed to treat of 63 to avoid dnDSA onset. In patients experiencing dnDSA, mean time to onset increased by 0.24 years to 7.9 years with PR-TAC relative to IR-TAC. At a willingness-to-pay threshold of CAD 50,000 per quality-adjusted life year gained, PR-TAC would be considered cost-effective at a price 13.5% higher than that of IR-TAC. **CONCLUSIONS:** Based on modern clinical data on the incidence of dnDSA in adherent versus non-adherent patients, improved adherence associated with PR-TAC would delay the onset and reduce the incidence of dnDSA, and PR-TAC would remain cost-effective at a 13.5% higher per-milligram price when compared to IR-TAC in Canada.

PUK19

HEALTH ECONOMIC ASSESSMENT OF TREATMENT SEQUENCES FOR THE MANAGEMENT OF PATIENTS WITH METASTATIC RENAL CELL CARCINOMA IN THE UNITED STATES

Doleh Y[1], Deniz B[2], Ambavane A[3], Rao S[4], Pagé V[5], Michaelson MD[6]
[1]Bristol-Myers Squibb, Plainsboro, NJ, USA, [2]Evidera, Bethesda, MD, USA, [3]Evidera, London, UK, [4]Bristol-Myers Squibb, Princeton, NJ, USA, [5]Evidera, St-Laurent, QC, Canada, [6]Massachusetts General Hospital Cancer Center, Boston, MA, USA

OBJECTIVES: Estimate the overall cost and health outcomes associated with commonly used treatment sequences in patients with metastatic renal cell carcinoma in the United States. **METHODS:** A patient-level simulation using discretely integrated condition event modeling method was developed to estimate the survival and costs accrued on treatment sequences. The model assessed sequences that started with either pazopanib or sunitinib, which are commonly used first-line agents, followed by nivolumab, cabozantinib, axitinib, everolimus, or lenvatinib+everolimus as second-line agents. Patients received best subsequent care after the second line of treatment, with the assumption that it did not impact estimated survival. Efficacy data for pazopanib and sunitinib were obtained from published literature. For nivolumab and everolimus, underlying risk equations for disease progression, treatment discontinuation, and survival were developed using patient-level data from the CheckMate 025 trial. The equations accounted for the baseline patient characteristics (Memorial Sloan Kettering Cancer Center score) and key predictive clinical events, such as response achievement and duration of response, with each individual treatments. Efficacy of cabozantinib, axitinib, and lenvatinib+everolimus was incorporated based on a network meta-analysis. Adverse event rates were obtained from published literature for all therapies. Treatment, administration, adverse event management, and monitoring costs were obtained from published literature and publicly available sources. **RESULTS:** The model-estimated cost/life-years gained were $314,914/4.2 years for nivolumab, $324,251/4.0 years for cabozantinib, $264,776/3.2 years for axitinib, $270,726/2.8 years for everolimus, and $684,626/5.1 years for lenvatinib+everolimus–containing sequences. The model suggested that treatment sequences with nivolumab as the second-line therapy had the lowest cost per life-year gained ($74,589/life-year) versus treatment algorithms with other targeted agents as second-line therapy (range, $81,378–$134,496/life-years). **CONCLUSIONS:** Treatment sequences that utilize sequential therapy with sunitinib or pazopanib followed by nivolumab may offer improved life expectancy at a lower cost versus the sequences that utilize second-line agents other than nivolumab.

URINARY/KIDNEY DISORDERS – Patient-Reported Outcomes & Patient Preference Studies

PUK20

QUALITY OF LIFE IN END STAGE RENAL DISEASE PATIENTS

Kim J, Lee NR, Son SK, Sul AR, Kim YJ
National Evidence-based Collaborating Agency, Seoul, South Korea

OBJECTIVES: To evaluate health-related quality of life (HRQoL) in patients in vintages of end stage renal disease (ESRD). **METHODS:** The health states related with dialysis intervention was surveyed by face-to-face interview. We assessed HRQoL in terms of the state of health after dialysis. The HRQoL of 301 patients was measured mainly using EQ-5D. HRQoL was assessed using Korean version of the EQ-5D health questionnaire. We defined 3 vintages by treatment: Group 1: from diagnosis to 1year, Group 2: from 1 year to 5 year, Group 3: 5 year over. **RESULTS:** According to a study that analyzed a target of 154 peritoneal dialysis (PD) and 147 hemodialysis (HD) for the survey, the utility values are as follows. First, HRQoL showed that the mean value reduced greatly in patients who PD than HD. PD value is 0.86, HD value is 0.80. Second, the mean values were arranged in order from Group 1 to Group 3; PD Group 1 0.88, Group 2 0.87, Group 3 0.82; HD Group 1 0.82, Group 2 0.79, Group 3 0.80. **CONCLUSIONS:** The results shown that HRQoL has improved with peritoneal dialysis as compared to hemodialysis treatment. The treatment vintage has a negative impact on HRQol. HRQoL in end stage renal disease patients is an important outcome measure. Culture and disease specific QOL instruments that assess patients' objective and subjective experiences covering most aspects of QOL are urgently needed.

PUK21

"FEELING IT THE NEXT DAY": A QUALITATIVE STUDY OF PATIENTS' LIVED EXPERIENCES OF NOCTURIA BEYOND THE NIGHT

Kitchen H[1], Bliwise DL[2], Andersson FL[3], Aldhouse NV[1], Trigg A[1]
[1]DRG Abacus, Manchester, UK, [2]Emory University, Atlanta, GA, USA, [3]Ferring Pharmaceuticals A/S, Copenhagen, Denmark

OBJECTIVES: Nocturia, waking to urinate ≥ 2 times during the night, is a chronic condition typically present in >50% of men and women over 60 years old and associated with significant patient burden due to sleep disruption. This study explored the lived experiences of patients with nocturia including disruptions to their lives during the night and day. **METHODS:** We interviewed patients diagnosed with nocturia who had experienced symptoms in the past two weeks. Open-ended questions and follow-up probes were employed to explore patient experiences at all times of the day. Qualitative analysis of patients' narratives formed a summary of their experiences, including any apparent contrasts between patients. **RESULTS:** Twenty patients were interviewed (n=10 male, n=10 female), with a mean age of 64 (range 39–80) and an average time since diagnosis of 26 months (range 7 – 69 months). Most patients reported 3 nightly voids; the frequency of voids influenced nocturia's impact on sleep quality and quantity. In addition to night-time phenomena, patients faced difficulties 'the next day'. These included day-time tiredness and lack of energy, and concerns related to emotional wellbeing (e.g. feeling irritable), social functioning (e.g. avoidance of sleeping away from home) and cognitive functioning (e.g. concentration); all of these limited patients' capacity to work, perform daily activities or fulfil role responsibilities. Experiences were largely dictated by patients' lifestyles; younger patients in employment more readily emphasised the day-time physical and psychosocial burdens. Patients attempted to lessen the severity of nocturia and its impact, through coping behaviours which were physician-led (e.g. avoidance of caffeine) or self-taught (e.g. daytime napping). **CONCLUSIONS:** While the symptom of nocturia only occurs during the night, the impact on patients is longer lasting, affecting functioning and wellbeing throughout the following day. Patients' circumstances can affect the extent of their burden; recognising this can help improve effective management and patient-centred care.

NEW APPROACHES FOR ENHANCING QUALITY OF LIFE AND RESOURCE UTILIZATION FOR CKD PATIENTS

Abotaleb A
World health organization (WHO), cairo, Egypt

OBJECTIVES: Chronic kidney disease (CKD) and its complications is one of the biggest challenges facing public health care sector in Egypt. Anemia is one of the major complications of (CKD) it was recognized as dominant factors for mortality and morbidity rates in cardio vascular disease (CVD). It's prevalence among pre end stage renal disease patients. (52% males, age mean ±SD 51±14 years), 67.8% were anemic. Which lead to increase economic burden for public payer. The objective of this study to evaluate impact of new treatment strategies using Erythropoietin on quality of life and resources utilization. **METHODS:** QOL Survey conducted for 600 patients on dialyses at 8 centers for 8 governorates. Pre end stage renal disease patients were selected. (SF-36) questioner used history of anemia was collected and included. NKF-KDQOI guidelines used for Anemia definition as Hb level low (9-10 g/dl), intermediate (11-12 g/dl), high <13.5 g/dl among males and <12 g/dl among females. Among females. Maintenance, early detecting & prevention for anemia was included for patient's criteria. Results were in terms of QALY total costs of management of anemia & complications were local one. **RESULTS:** For 600 patients Quality of life increased by 70% for CKD anemia patients who early detected or prevented than patients corrected. For Hb level low (9-10 g/dl) QALY gained was 1.1 QALY versus (.6) for not treated. Level high (<13.5 g/dl) QALY gained was 1.9 QALY versus (.5) for not treated with EPO. Median medical cost for anemia and complications reduced by 58%. **CONCLUSIONS:** Early detection and using EPO as a line of treatment for CKD Patients might have a positive impact on patient's quality of and cost saving. It should thus be considered in the treatment guidelines.

VALIDATION OF THE ADPKD OUTCOMES MODEL TO A SPANISH SETTING AND AN EVALUATION OF THE IMPACT OF TREATMENT ON THE BURDEN OF ESRD

Bennett H[1], McEwan P[1], Robinson P[2], O'Reilly K[2]
[1]Health Economics and Outcomes Research Ltd, Cardiff, UK, [2]Otsuka Pharmaceutical Europe Ltd, Wexham, UK

OBJECTIVES: Autosomal dominant polycystic kidney disease (ADPKD) affects 3.96/10,000 population in Europe and is the leading inheritable cause of end-stage renal disease (ESRD). Robust models of ADPKD progression, characterised by increased total kidney volume (TKV) and declining renal function, are important to inform patient management and treatment decisions. This study aimed to assess the validity of the ADPKD Outcomes Model (ADPKD-OM) from a Spanish perspective and evaluate the impact of slowing disease progression via treatment in terms of ESRD incidence and renal replacement therapy (RRT) requirements. **METHODS:** The ADPKD-OM is a patient-level lifetime simulation relating baseline and time-

dependent age, TKV and estimated glomerular filtration rate to ESRD. The model's clinical face and operational validity were assessed by external Spanish experts (clinical/modelling). Life expectancy, ESRD incidence and time on RRT were predicted for patients with/without tolvaptan therapy. Published Spanish data informed ESRD model inputs; patient characteristics and treatment effect on renal function decline (31.6% reduction) were taken from the TEMPO3:4 study. **RESULTS:** The validation exercise concluded the model adequately estimated ADPKD disease progression and further highlighted the historically limited availability of TKV in clinical practice and differences in patterns of organ availability and dialysis in Spain. The model estimated 95% of TEMPO3:4 patients reached ESRD at mean age 53 years and spent six years on dialysis, with one transplant performed for every 2–3 patients. Treatment was estimated to prevent 4% of ESRD cases, delay mean time to ESRD by 4.5 years, avoid 5% of transplants, and reduce dialysis time by five months per patient. **CONCLUSIONS:** The validation of the ADPKD-OM supports the model's use to inform health outcomes decision-making in Spain. This study indicates that treatment that slows ADPKD progression may alleviate the burden of ESRD for patients and offer meaningful reductions in healthcare resource use, with positive implications for service delivery in Spain.

PUK24

IMPACT OF FDA SAFETY WARNINGS ON ERYTHROPOIESIS STIMULATING AGENTS (ESA) PRESCRIBING AMONG NON-DIALYSIS CHRONIC KIDNEY DISEASE PATIENTS

Park H, Liu X
University of Florida, Gainesville, FL, USA

OBJECTIVES: In June 2011, the US FDA issued modified recommendations for more conservative dosing of erythropoiesis-stimulating agents (ESA) in patients with chronic kidney disease (CKD). To evaluate the effect of FDA safety warnings on anemia treatment in non-dialysis CKD patients. **METHODS:** A retrospective analysis (2008-2014) of Truven MarketScan Commercial and Medicare administrative claims data was conducted for patients with CKD stages 3-5. Monthly rates of anemia treatment including ESA, intravenous iron, and blood transfusions were estimated for years after the FDA safety warnings (Jun2011- Dec2014), compared with rates from pre-FDA warnings (Jan2009 – May 2011). An interrupted time series analysis and generalized estimating equations were used to quantify the impact of the safety warnings. **RESULTS:** We identified 24970 patients during the pre-warnings and 29465 patients during the post-warnings. Among Medicare patients, ESA prescribing rates decreased steadily from 2009 to 2011, followed by slower decreases from 2011 to 2014. Overall ESA prescribing prevalence was 90.7 per 1,000 patients in 2009, and decreased at a rate of 1.2 prescriptions per 1000 patients per month until the end of the pre-warning period. During the post-warning period, ESA prescribing continuously decreased by 0.5 prescriptions per 1000 patients per month. After adjusting for covariates, the probability of prescribing ESAs was 28% lower (relative risk (RR),0.72; 95% confidence interval (CI),0.70-0.74) but the probability of prescribing intravenous iron and blood transfusions were 20% (RR,1.20; 95% CI,1.12-1.29) and 34% (RR,1.34; 95% CI,1.21-1.48) higher, respectively, during the post- compared to pre-warning period. Similar trends of outcomes were observed in commercially insured CKD patients. Characteristics associated with increased ESA prescribing included CKD stage 4 (RR,2.05), CKD stage 5(RR,2.90), female(RR,1.19), and involvement of a nephrologist(RR,1.18). **CONCLUSIONS:** The FDA safety warnings were associated with steady decreases in ESA prescribing but increases in intravenous iron and blood transfusions in CKD patients.

PUK25

HOW CAN A LOW COST ECONOMIC PERSPECTIVE BE INCLUDED TO A SYSTEMATIC REVIEW: A CASE STUDY OF SYSTEMATIC REVIEW OF SURGICAL TREATMENTS FOR WOMEN WITH STRESS URINARY INCONTINENCE

Aluko PO[1], Vale L[1], Craig D[1], Shemilt I[2], On behalf of the Campbell and Cochrane Economic methods Group .[1]
[1]*Newcastle University, Newcastle upon Tyne, UK,* [2]*University College London, London, UK*

OBJECTIVES: Extending the scope of Cochrane Intervention Reviews (CIRs) to incorporate economic evidence, alongside evidence for health effects, can increase their usefulness for decision-making. However, the primary methodology for incorporating economic evidence into a CIR – an integrated full systematic review of economic evidence – is time consuming and requires specialist input from a health economist. The Brief Economic Commentary (BEC) methodology is especially designed to support inclusion of economic evidence in CIRs, without placing large additional workload on review teams or requiring specialist input. We demonstrated this framework by applying it in Cochrane reviews investigating the effectiveness and cost-effectiveness of surgical treatments for women with stress urinary incontinence. **METHODS:** NHS Economic Evaluation Database and MEDLINE were searched to identify eligible cost-of-illness and economic evaluation studies conducted between 1994 and 2016. A short description of the economic burden of the health condition was developed based on the findings of selected cost-of-illness studies and integrated into the background section of the CIR. Basic details of the characteristics and principal findings of included economic evaluations were extracted and summarised in the discussion section. **RESULTS:** Eligible economic evaluations studies included a systematic review covering various countries and three primary studies from the UK, Finland and Spain. Of the surgeries considered, all of these studies found Tension-free Vaginal Tape (TVT) to be more cost-effective compared with Laparoscopic mesh colposuspension and open colposuspension. However, two studies reported Mid-Urethral Sling procedure (MUS), a much recent surgery, to be less costly and as effective as TVT. **CONCLUSIONS:** This work confirmed that BECs can summarise relevant economic information for decision-makers without large additional workload. Development of BECs represents a low cost method for inclusion of economic evidence in systematic reviews when a full integrated systematic review of economic evidence, or modelling economic evidence is beyond scope.

EVALUATING PARTITIONED SURVIVAL MODEL AND MARKOV DECISION-ANALYTIC MODEL APPROACHES FOR USE IN COST-EFFECTIVENESS ANALYSIS: ESTIMATING AND VALIDATING SURVIVAL OUTCOMES

Smare C[1], Lakhdari K[2], Doan J[3], Johal S[4]
[1]*PAREXEL International, London, UK,* [2]*Bristol-Myers Squibb Canada, Montréal, QC, Canada,* [3]*Bristol-Myers Squibb, Princeton, NJ, USA,* [4]*Parexel International, London, UK*

OBJECTIVES: To assess long-term survival outcomes for nivolumab in renal cell carcinoma (RCC) predicted by three model structures: a partitioned survival model (PSM) and two variations of a semi-Markov model (SMM). **METHODS:** Three economic model structures were developed and populated using parametric curves fit to patient-level data from the CheckMate 025 trial, a phase 3 study comparing nivolumab with everolimus in previously treated patients with RCC. All models consisted of three health states: progression-free survival (PFS), progressed disease, and death. The PSM estimates stated occupancy using an "area under the curve" approach from overall survival (OS) and PFS curves, whereas the SMMs explicitly derived transition probabilities to calculate patient flow between health states. One SMM assumed that post-progression survival (PPS) was independent of PFS duration (PPS Markov); the second SMM assumed differences in PPS based on PFS duration (PFS-PPS Markov). **RESULTS:** In CheckMate 025, the 2-year OS rate was 51.7%; the PSM, PPS Markov, and PFS-PPS Markov predicted 2-year OS rates of 52.9%, 55.0%, and 54.2%, respectively. OS curves derived in the PSM provided the closest fit to the trial data. The five year survival, conditional upon surviving one year, was 18.2%, 10.0%, and 22.1% for the PSM, PPS Markov, and PFS-PPS Markov, respectively. The mean OS for nivolumab estimated by the PSM, PPS Markov, and PPS-PFS Markov was 41.1, 36.2, and 45.2 months, respectively. **CONCLUSIONS:** All three model structures provided a good fit to the trial data, but different long-term survival was predicted by each model. This would likely lead to differences in estimated cost-effectiveness results if used in economic evaluations, which has particular implications for health technology assessment bodies. In the absence of long-term survival follow-up data, the use of external datasets and clinical opinion to validate survival predictions become important to justify choice of model structure.

PRM2

EFFECT OF ICD-10 TRANSITION ON PATIENT IDENTIFICATION AFTER ONE YEAR IN A US MANAGED CARE DATABASE

Hull M[1], Blauer-Peterson C[1], Seare J[2], Chastek B[1], Brekke L[1]
[1]*Optum, Eden Prairie, MN, USA,* [2]*Optum, St. George, UT, USA*

OBJECTIVES: The transition from ICD-9-CM to ICD-10-CM in October 2015 raised potential concerns due to differences in diagnosis code specificity across some conditions. Counts and percentages of patients with each of nine conditions in September 2015, October 2015, and October 2016 were compared in a large US managed care database. **METHODS:** This retrospective analysis used medical claims data for commercial and Medicare Advantage enrollees in September 2015, October 2015, and October 2016. Patients with >1 medical claim for type 2 diabetes mellitus (T2DM), depression, lung cancer, rheumatoid arthritis (RA), atherosclerotic cardiovascular disease (ASCVD), chronic obstructive pulmonary disease (COPD), hepatitis C, asthma, or heart failure were retained. ICD-9-CM and ICD-10-CM code lists were constructed by an MD coding specialist. Monthly patient counts for each condition were determined and the percentage of patients with each condition was calculated relative to the entire database. **RESULTS:** In 2015 and 2016, data were available for 12.45 million and 13.84 million patients, respectively. For 6 of the 9 conditions, the absolute percentage of patients increased after one year (September 2015, October 2015, October 2016): T2DM, 3.15%, 3.11%, 3.47%; depression, 2.00%, 1.86%, 1.89%; lung cancer, 0.11%, 0.11%, 0.12%; RA, 0.26%, 0.26%, 0.27%; ASCVD, 1.18%, 1.68%, 1.84%; COPD, 1.13%, 1.15%, 1.30%; hepatitis C, 0.08%, 0.08%, 0.07%; asthma, 0.87%, 0.82%, 0.85%; heart failure, 0.57%, 0.58%, 0.66%. Possible reasons for these variations included differences in code representations and the use of generalized codes early in the transition. **CONCLUSIONS:** In this large US managed care database analysis, the transition from ICD-9-CM to ICD-10-CM codes was associated with absolute percentage increases in 6 of 9 conditions after one year, requiring further analysis of the reasons for these increases. These findings indicate the importance of careful review of code lists for analyses bridging the transition period and the need for investigation of the reasons for inconsistencies.

PRM3

A METHODOLOGY FOR EVALUATING PRIMARY NONADHERENCE USING ANNONOMIZED RETROSPECTIVE ELECTRONIC MEDICAL RECORDS AND PRESCRIPTION CLAIMS DATABASES

Wade RL[1], Rane PB[2], Hill JW[1], Hines DM[1], Patel J[2], Harrison DJ[2]
[1]*QuintilesIMS, Plymouth Meeting, PA, USA,* [2]*Amgen Inc., Thousand Oaks, CA, USA*

OBJECTIVES: Primary medication nonadherence (PMN) occurs when a medication is prescribed but the patient fails to obtain the medication. A challenge in measuring PMN is linking written prescriptions to prescription claims. We

describe a method for measuring PMN by linking an electronic medical record (EMR) database to a longitudinal prescription claims database (LRx). **METHODS:** Patients with new prescription orders (180 days washout) for statins, ezetimibe, or statin combinations were identified in a large US EMR database between 7/1/2013 - 7/31/2015 (first order date was index). These patients were linked deterministically to LRx. Patients were required to have ≥180 days of stability in both databases pre and post-index and ≥1 low-density lipoprotein cholesterol (LDL-C) value in the 180 days pre-index. PMN was determined by the proportion of patients with a new EMR prescription order for a therapy of interest and no claim for that therapy in LRx by 30-180 days post-index. Demographic and clinical characteristics of the adherent and PMN populations were compared using descriptive statistics. **RESULTS:** Of the patients indexed in EMR, 90.6% linked to LRx. A total of 69,227 patients met study criteria. PMN was observed in 38.6% of the population at 30 days, and in 34.3% at 180 days. Significant age and gender differences were found between adherent and PMN patients. Patients with PMN had a higher prevalence of diabetes (28.4% vs 25.7%), and hypertension (56.0% vs 50.0%), and had a lower mean LDL-C level (101.3 vs 137.2). **CONCLUSIONS:** This study demonstrates an ability to link a large EMR population to a prescription database to evaluate PMN. The finding suggest that if a prescription fill is not seen by day 30 it is likely abandoned, making PMN an important consideration in adherence assessments. This research forms a strong basis for evaluating the predictors of PMN, such as LDL-C level.

PRM4

EVALUATION OF A CUSTOMIZED COMPLIANCE PROGRAM FOR ORAL ONCOLYTIC THERAPY FOR LEUKEMIA

Northcutt L[1], Drenning J[2], Ping CB[1], Milks K[1]
[1]*Sonexus Health, Lewisville, TX, USA,* [2]*Cardinal Health, Dublin, OH, USA*

OBJECTIVES: The pursuit of precision medicine and development of targeted therapies has led to a rapid increase in oral oncolytics. Self-administration can pose compliance challenges for drugs with narrow toxic/therapeutic ratios resulting in lower treatment efficacy and increased adverse events. The purpose of the study was to evaluate a medication therapy management (MTM) program with drug- and disease-specific customized clinical services. **METHODS:** The MTM program was designed and developed for patients with chronic myeloid leukemia (CML) and Philadelphia chromosome positive acute lymphoblastic leukemia (Ph+ ALL), taking an oral tyrosine kinase inhibitor TKI. MTM was administered by nurse specialists who provided education, referrals to agencies to assist with housing, food, transportation, and housekeeping costs, as well as coping strategies for both patients and their caregivers. Program effectiveness was assessed by medication possession ratio MPR defined as the sum of the days' supply of the drug during a defined period of time divided by the number of days elapsed during the period. The MPR difference between program participants and non-participants was tested using Chi square tests with alpha=0.05. **RESULTS:** A total of 201 patients were analyzed to assess the impact of the MTM initiative, 144 patients who participated in the program and 57 who did not. All patients had MPRs >40%. MPRs >90% were calculated for 46% of MTM patients versus 28% of non-MTM patients (P=0.0209). MPRs above the customary target of 80% were found calculated for 62% (n=89) of MTM patients versus 42% (n=24) of Non-MTM patients (P=0.0112). **CONCLUSIONS:** Costly and potentially toxic oral treatments of life threatening illnesses pose problems for patients, their providers and payers. Optimizing compliance and persistence can maximize the clinical outcomes and cost effectiveness of intervention. Novel programs that directly engage patients may be one solution.

PRM5

REAL-WORLD EVALUATION SCREENING STUDY AND REGISTRY OF DYSKINESIA IN PATIENTS TAKING ANTIPSYCHOTIC AGENTS: THE RE-KINECT STUDY

Yeomans K[1], Lenderking WR[2], Ross L[3], Shalhoub H[2], Yonan C[4]
[1]*Evidera, Montreal, QC, Canada,* [2]*Evidera, Waltham, MA, USA,* [3]*PPD, Waltham, MA, USA,* [4]*Neurocrine Biosciences, Inc., San Diego, CA, USA*

OBJECTIVES: Tardive dyskinesia (TD) is an involuntary movement disorder that is associated with exposure to antipsychotic medications. Scant evidence exists regarding the burden of TD symptoms and even less has been published, recently, regarding the role of TD in the overall health status of patients. A prospective registry study, RE-KINECT, was designed to document the presence and impact of abnormal, involuntary movements (possible TD) in a real-world cohort of outpatients taking antipsychotics. **METHODS:** Approximately 1000 adults from 70 outpatient US psychiatry practices will be included. Patients with ≥3 months lifetime exposure to antipsychotic(s) and ≥1 psychiatric disorder will be eligible for screening. TD symptom estimation involves a two-tiered approach: (1) visual observation of involuntary movements by an intake staff member (2) independent clinician assessment and confirmation of possible TD symptoms in general body regions (head/face, neck/trunk, upper/lower limbs). Assignment to Cohort 1 or 2 (without or with visible signs of involuntary movements, respectively) is based on clinician assessment. To measure the possible impact of psychiatric illness (both Cohorts), baseline data include: clinician assessment, patient HRQOL and burden/disability questionnaires; and 12-month retrospective chart review (medical and treatment history). Cohort 2 will participate in a 12-month longitudinal evaluation period with baseline caregiver questionnaire (optional); clinician assessments of significant recent changes in TD symptoms or psychiatric condition and patient-reported outcomes (e.g., overall health status, awareness of involuntary movements, disease burden, health related quality of life [EQ5D], functional impact/disability [Sheehan Disability Scale]) at each visit; and final retrospective chart review. **RESULTS:** Recruitment is ongoing; interim baseline data will be presented at meeting. **CONCLUSIONS:** This novel registry aims to evaluate the real world potential impact/burden of TD compared to similar patients (with psychiatric illness) without TD. Prevalence of possible TD based on non-clinician and clinician screening and functional impacts of the condition will be described.

PRM6

ESTIMATION OF SURVIVAL OUTCOMES FOR USE IN ONCOLOGY VALUE FRAMEWORKS

Liu S, Ruiz K, Colby JA
Xcenda, LLC, Palm Harbor, FL, USA

OBJECTIVES: Hazard ratios (HRs) are commonly preferred as inputs to calculate clinical benefit across oncology value frameworks. However, these data are not consistently reported in publications, and individual patient data are not readily available. Therefore, we present a practical method for estimating the HR of survival data. **METHODS:** We selected a published phase 3, multicenter trial (NCT00482833) in which investigators compared all-trans retinoic acid (ATRA) plus chemotherapy with ATRA plus arsenic trioxide (ATO) in the treatment of patients with low-to-intermediate risk acute promyelocytic leukemia (APL). The median follow-up was 34.4 months. At the time of the study publication, only 2-year overall survival (OS) and event free survival (EFS) were reported; HRs for both OS and EFS were not reported, and median OS and EFS had not been reached. To derive the HRs, we first obtained the number of patients at risk for each time point (12-month intervals until 48 months). Then, using a graphic tool, we extracted survival probabilities from the published Kaplan-Meier (K-M) curves for each treatment arm. Patient counts with censoring at each time point were not reported; thus we assumed a constant censoring rate within each 12-month interval. **RESULTS:** Using the K-M curve from the published trial, the calculated HRs of OS and EFS were 0.21 and 0.23, respectively, suggesting patients with ATRA combined with ATO and chemotherapy had better survival outcomes compared with patients receiving ATRA plus chemotherapy. This result is consistent with reported outcomes from a recent meta-analysis, estimating the HRs of OS and EFS to be 0.44 and 0.38, which included data from the same published trial. **CONCLUSIONS:** Despite potential biases associated with relying on published data to derive median survival, the present analysis presents a practical method to estimate key survival inputs for application in oncology value frameworks.

PRM7

INSULIN IS MOST APPROPRIATE COMPARATOR TO GLP-1 RECEPTOR AGONISTS AND DPP-4 INHIBITORS IN REAL-WORLD CARDIOVASCULAR OUTCOME STUDIES

Ali AK, Motsko SP
Eli Lilly and Company, Indianapolis, IN, USA

OBJECTIVES: To illustrate selection bias when choosing inappropriate anti-diabetes medications (ADM) as comparison to incretin enhancers in cardiovascular outcome studies using real-world data. **METHODS:** Adults with type 2 diabetes (T2D) who initiated ADM between 2006 and 2012 and enrolled in Humedica HER database were included in this retrospective cohort study. Initiators of incretin enhancers were compared to initiators of insulin, metformin, sulfonylureas, and thiazolidinediones (TZD). Incretin enhancers included glucagon-like peptide-1-receptor agonists (GLP-1-RA) and dipeptidyl peptidase-4-inhibitors (DPP-4-I). In order to describe the effect of T2D severity progression on future treatment choices, study follow-up was divided into two 12-month periods prior to ADM initiation date (index date), outcome period (12 months closest to index date), and baseline period (12 months farthest from index date). T2D severity and complications were measured during the baseline period, and incident hospital-related myocardial infarction (MI) events were measured during the outcome period. Stepwise proportional hazards regression was used to estimate the pre-exposure risk of MI between ADM groups, with 95%CI upper limit ≥1.0 as selection bias indicator. **RESULTS:** 61,262 GLP-1-RA/DPP-4-I enhancer initiators were compared to 80,465 insulin; 184,655 metformin; 104,905 sulfonylureas; and 47,812 TZD initiators. On average, initiators of GLP-1-RA/DPP-4-I had T2D severity and complication history comparable to insulin initiators, but significantly different from other ADM initiators (poorly controlled T2D—HbA1c>7.5% and microvascular complications, respectively: GLP-1-RA/DPP-4-I, 11.2% and 6.2%; insulin, 10.8% and 7.9%; metformin, 2.6% and 1.8%; sulfonylureas, 5.3% and 3.4%; and TZD, 5.9% and 3.0%). Unlike other ADM, compared to insulin initiators, GLP-1-RA/DPP-4-I initiators didn't have pre-exposure risk of MI (95%CI upper limit <1.0): insulin HR=0.5, 95%CI=0.42-0.6; metformin HR=0.97, 95%CI=0.81-1.16; sulfonylureas HR=1.24, 95%CI=1.03-1.5; and TZD HR=0.76, 95%CI=0.56-1.04. **CONCLUSIONS:** To minimize selection bias in real-world cardiovascular outcome studies, GLP-1-RA and DPP-4-I should be compared to insulin rather than to other ADM.

PRM8

AN INDIRECT TREATMENT COMPARISON OF UNAPPROVED TREATMENT OPTIONS OF ALZHEIMER'S DISEASE FOR RESEARCH PRIORITIZATION

Pandey R[1], Jha D[2], Pandey P[1], Gupta P[3], Shah V[1]
[1]*SIRO Clinpharm Pvt Ltd, Maharashtra, India,* [2]*Birla Institute of Technology, Ranchi, India,* [3]*All India Institute of Medical Sciences, Patna, India*

OBJECTIVES: There are several potential investigational therapies for Alzheimer's disease with inconclusive evidence of efficacy. This network meta-analysis was conducted to compare these treatments indirectly and prioritize future research directions. **METHODS:** Indirect comparison of MMSE scores was conducted using STATA-13. The probability of each treatment for being most efficacious regimen was calculated using the difference against placebo, and counting the proportion of iterations of the Markov chain. **RESULTS:** A total of twenty-two studies were included. Overall 2,974 individuals were randomized to vitamins (cyanocobalamin, folic-acid, tocopherol), NSAIDs (indomethacin, piroxicam, ibuprofen, diclofenac+misoprostol), statins (atorvastatin, pravastatin, simvastatin), omega-3 fatty acids, sertraline, PBT2, xanthenes derivatives (denbufylline, propentofylline) or

placebo. Results showed that simvastatin was the most efficacious regimen with a difference (95% prediction interval) of 0.91 (-3.26, 5.09) against denbufylline; 2.44 (-1.69, 6.57) against omega-3 fatty acid; 1.21 (-4.13, 6.55) against PBT2; 1.71 (-2.44, 5.86) against propentofylline; 0.58 (-3.82, 4.98) against atorvastatin; 2.76 (-1.27, 6.79) against cyanocobalamin; 3.48 (-1.31, 8.28) against diclofenac+misoprostol; 2.30 (-1.48, 6.08) against folic acid; 2.81 (-1.20, 6.82) against ibuprofen; 4.83 (-0.53, 10.20) against indomethacin; 2.21 (-0.98, 5.40) against placebo; 2.71 (-2.02, 7.44) against sertraline; and 2.61 (-0.89, 6.12) against tocopherol. The cumulative probabilities for being the best treatment were: simvastatin (39.4%), atorvastatin (23.0%), PBT2 (17.2%), denbufylline (12.9%), propentofylline (3.5%) sertraline (1.6%), other treatments (<1%). **CONCLUSIONS:** Of all the unapproved potential treatments of Alzheimer's, statins and PBT2 showed a superior efficacy. Therefore, future further clinical investigations should consider statins and PBT2 as preferred candidates.

PRM9

THE POTENTIAL OF ELECTRONIC HEALTH RECORD DATA TO OPTIMIZE RECRUITMENT EFFICIENCY IN CARDIOVASCULAR OUTCOME TRIALS

Nichols GA[1], Reynolds K[2], Philip S[3], Granowitz C[3], Fazio S[4]
[1]*Kaiser Permanente Northwest, Portland, OR, USA,* [2]*Kaiser Permanente Southern California, Pasadena, CA, USA,* [3]*Amarin Pharma, Inc, Bedminster, NJ, USA,* [4]*Oregon Health and Science University, Portland, OR, USA*

OBJECTIVES: To demonstrate the potential value of electronic health records (EHR) from an integrated healthcare system in the USA to enroll research subjects by simulating the inclusion/exclusion criteria of an ongoing cardiovascular (CV) outcomes trial with high dose eicosapentaenoic acid (EPA), a prescription omega-3 fatty acid. **METHODS:** Reduction of Cardiovascular Events with EPA - Intervention Trial (REDUCE-IT) is a Phase III trial evaluating the safety and efficacy of 4 grams daily of high dose EPA (Vascepa®) in reducing first major CV events in a high-risk patient population. Enrolled adults have LDLc levels 40-100 mg/dL on statin therapy and high triglyceride (TG) levels (150-499 mg/dL). Inclusion criteria included established atherosclerotic CV disease (ASCVD) (risk group 1; RG1) and treated diabetes plus one or more ASCVD risk factors (risk group 2; RG2). We used the comprehensive EHR from the Northwest and Southern California regions of Kaiser Permanente to identify patients who met inclusion criteria for RG1 and RG2. We applied exclusion criteria from REDUCE-IT (heart failure, malignant cancer, surgery, and liver, kidney, or thyroid function abnormalities) to better identify a target population. **RESULTS:** Of 25,432 subjects who met inclusion criteria, 12,097 were assigned to RG1 and 13,335 to RG2. A total of 57.8% (n=6,996) and 45.2% (n=6,030) in RG1 and RG2 met at least one exclusion criterion. The most common exclusion criteria for RG1 included: heart failure (28%), cancer (25%), and planned surgery (15%); and for RG2: low renal function (16%) and cancer (15%). **CONCLUSIONS:** Our results demonstrate that EHRs from large integrated healthcare systems may be an efficient tool to screen and enroll populations of interest in a CV outcome trial. Pre-screening with EHR data has the potential for substantive reductions in clinical trial recruitment time and cost by pre-excluding subjects that will not qualify.

PRM10

USE OF INTERMEDIATE CLINICAL ENDPOINTS (ICE) AS A PRIMARY EFFICACY ENDPOINT IN MALIGNANT MELANOMA

Narayanan S, Shah A, Shao D, Ramesh V
Market Access Solutions LLC, Raritan, NJ, USA

OBJECTIVES: To assess the use of intermediate clinical endpoints (ICE) as the primary endpoint(s) to demonstrate efficacy of therapies targeting for non-metastatic/early stage malignant melanoma. **METHODS:** A systematic review was conducted in PubMed to identify clinical trials using ICE as a primary endpoint in early stage (non-metastatic, stage I or II) malignant melanoma (to assess ICE use today). An additional search was conducted in clinicaltrials.gov to identify the use of ICE as a primary endpoint in on-going malignant melanoma trials (to assess future ICE reporting). Searches were limited to studies in the English language, and restricted to between November 2011 and October 2016. Studies reporting only overall survival (OS) as the primary endpoint, or studies that were not clinical trials were excluded. **RESULTS:** Of 226 titles and abstracts screened from PubMed, seven trials were included in the analysis. Of 440 records screened from www.clinicaltrials.gov, one was included in the analysis, resulting in an inclusion of eight studies. All were randomized phase 3 trials. Relapse-free survival (RFS) and disease-free survival (DFS) were reported in 3 trials each, representing the most frequently reported ICE as a primary endpoint (38% each). RFS/DFS is defined as the time from randomization to recurrence of disease or death, and combined, encompass 75% of reported ICE. Other reported ICE were distant metastasis free interval (DMFI, 1 trial) and lymphnode field relapse (1 trial). One trial reported OS as a co-primary endpoint. **CONCLUSIONS:** The definitions of the most observed ICE in malignant melanoma, namely, RFS and DFS, appear to overlap, warranting better delineation of definition for future standardization of endpoints. However, the overall literature indicates a growing body of clinical evidence in malignant melanoma that report ICE as a primary endpoint, bringing focus to prevention or delay of disease progression to alleviate patient burden.

PRM11

EFFECT OF EDUCATIONAL INTERVENTION TOOL IN KAP SCORE DIFFERENCES AMONG ADULT RESPONDENTS AT THREE TIME POINTS

Ali AN[1], Sarriff A[2], Tahir M[3]
[1]*Aimst University, Sungai Petani, Malaysia,* [2]*Universiti Sains Malaysia, Pulau Pinang, Malaysia,* [3]*University of Veterinary and Animal Sciences, Lahore Pakistan, Lahore, Pakistan*

OBJECTIVES: Healthcare provider recommendation is critical to increase the human papillomavirus (HPV) vaccine uptake among the un-vaccinated adult population aged 18 to 26 years. Our aim was to estimate the effect of educational intervention tool in KAP score differences among adult respondents at three time points. **METHODS:** The educational intervention consisted of an educational pamphlet or Fact sheet which contained information regarding HPV infection and HPV vaccination. The knowledge gained was assessed at baseline and post one to three weeks, whereas knowledge retained was assessed between baseline and post 3 to six months. McNemar test was used to compare knowledge scores between pre-test and post-test, and the proportion of correct responses for each question, respectively based on binomial distribution and Wilcoxon signed ranks test was used to estimate the precise differences in KAP scores between the three time points. **RESULTS:** A total of 942 participants, responded to all the three phases of the study conducted in rural and urban areas. The pre-test and post-test KAP score differences shows a statistically significant difference in KAP scores ($p < .001$) for all the 16 knowledge based items. Participants who received the educational intervention had a significantly higher knowledge about HPV infection and HPV vaccination ($p < .001$). **CONCLUSIONS:** Educational intervention promotes an increase in knowledge about HPV and HPV vaccination. Further investigation should be conducted to determine if this intervention can be sustained beyond the short term and influence vaccination and pap screening behavior in women. Key: HPV infection, Knowledge, Attitude, Perception, Practice, HPV Vaccine, Educational intervention

PRM12

INSULIN SHOULD BE COMPARED TO INCRETIN ENHANCERS INSTEAD OF OTHER ANTI-DIABETES MEDICATIONS IN SAFETY AND OUTCOMES STUDIES

Ali AK
Eli Lilly and Company, Indianapolis, IN, USA

OBJECTIVES: To describe prognostic characteristics of patients with type-2-diabetes (T2D) prior to initiating anti-diabetes medications (ADM). **METHODS:** Humedica EHR database was used to describe characteristics of adult ADM initiators between 2006 and 2012. ADM classes included metformin, sulfonylureas, thiazolidinediones (TZD), incretin enhancers (incretins), and insulin. Study follow-up was divided into two 12-month periods prior to ADM initiation date (index date). T2D characteristics were measured during the 12-month period farthest from index date to reflect disease progression latency and impact on future treatment choices. T2D severity and complications included diabetes duration, HbA1c, micro/macrovascular complications, and healthcare utilization indices. **RESULTS:** 479,099 ADM initiators were studied (mean age 58 years, SD=12; mean T2D duration 2.7 years, SD=1.5), corresponding to 38% metformin; 22% sulfonylureas; 10% TZD; 13% incretins; and 17% insulin initiators. There were significant differences between ADM groups (p value ≤ 0.001). Initiators of incretins and insulin had worse T2D compared to other ADM initiators. Mean HbA1c (SD) for incretins and insulin users were 6.7% (1.8) and 6.6% (2.4), respectively; compared to metformin 6.4% (1.6) and other ADM users 6.6% (2.0). 11% of incretins and insulin users had poorly controlled diabetes, compared to 3% metformin, 5% sulfonylureas, and 6% TZD users. Micro/macrovascular complications were more in incretins and insulin initiators (retinopathy, 1.7% and 2.4%; neuropathy, 2.7% and 3%; nephropathy, 1.9% and 2.4%; heart failure, 2% and 2.8%; coronary artery disease, 2.5% and 2.4%) than other ADM initiators, e.g. metformin (0.6%; 0.8%; 0.4%; 0.9%; and 1.4%, respectively). General and diabetes-related healthcare utilization was higher in incretins and insulin users. **CONCLUSIONS:** History of diabetes severity and complications should be taken into account when selecting comparison groups. Comparing insulin to incretins is more appropriate than to other ADM.

PRM13

BURDEN OF ANEMIA AMONG EVER-MARRIED WOMEN IN BANGLADESH: DOES HOUSEHOLD ECONOMIC INEQUALITY MATTER? HOW DEMOGRAPHICS, DIABETES, MATERNITY AND BMI DECOMPOSE ON THE ANXIETY?

Islam G
Tokyo Medical and Dental University, Tokyo, Japan

OBJECTIVES: The purpose of this study was to explore the strength and form of association between household economic inequalities, along with other confounders' inference prevalence of anemia among ever married women in Bangladesh. **METHODS:** Data from a 2011 Bangladesh Demographic Health Survey (BDHS) were used for this study. The ordered logistic regression or proportional odds model was used to test the association between anemia and explanatory variables in the form of four models: Model 1: household economic status, Model 2: Model 1 plus sociodemographic factors, Model 3: Model 2 plus diabetes & maternity factors; Model 4: Model 3 plus nutritional status or BMI. **RESULTS:** It was revealed that respondents in the low socioeconomic status (SES) group were around two times more likely to suffer from anemia as compared to the respondents in the richest SES group ($p<0.01$; model 1). Respondents who had completed secondary or higher education were better equipped to protect themselves from anemia as compared to those who were illiterate ($p<0.01$; model 2). Model 3 and 4 revealed that individuals suffering from diabetes appeared to be around two times more affected by anemia (OR: 1.67 & 1.74; $p<0.05$ respectively) as compared to individuals having a normal fasting blood plasma glucose level. Women who were neither lactating nor pregnant were at lesser risk for developing anemia as compared to those that were. In addition, it was seen that BMI appears to function as a protective factor for controlling anemia in the full model (Model 4). **CONCLUSIONS:** BMI, maternity status, and diabetes mellitus were observed significantly associated with anemia and reducing the significance of the SES, thus it may be claimed that standard of SES is inferring these variables, which in turn affects the benchmark hemoglobin level in women.

PRM14

USING ITERATIVE USER EXPERIENCE DESIGN TO IMPROVE ELECTRONIC CLINICAL OUTCOMES ASSESSMENT DATA QUALITY

Butler A[1], Feaster T[2], Miller DS[2], Barbone JM[2]
[1]Bracket, Wayne, PA, USA, [2]Bracket, wayne, PA, USA

OBJECTIVES: Electronic Clinical Outcome Assessments (eCOA) are increasingly utilized for clinician-rated outcomes in clinical trials. Obstacles to effective implementation of eClinRO include poorly functioning electronic tools and interfaces. In earlier research, we described a method for incorporating User Experience design in the development of an eCOA tool. This new research examines the impact of this design process on COA data quality in ongoing trials.**METHODS:** Based on the User Experience review, enhancements to the eCOA tools were made. These included employing internal logic, automated scoring, standardized instructions and scoring conventions. The user interface was modified to better accommodate a clinical setting. These enhancements were intended to decrease error rates. An older version of the tool, "Version 1", was utilized in a global RCT. Following the design process, the tool was revised and "Version 2" was utilized in a subsequent RCT that used the same clinical outcomes, the ADAS-Cog and the MMSE. The clinicians who utilized the system in trials had their data evaluated by a clinical reviewer at the Screening visit. **RESULTS:** Of the 475 ADAS-Cog administrations using Version 2 reviewed at Screening, 34 (7.2%), required a contact with the clinician due to an error in scoring. This represents a significant reduction ($p < 0.05$) in error rates compared to the previously reported 11.3% with version 1 of the ADAS-Cog eCOA tool. Similarly, 558 new versions of the MMSE were reviewed at screening of which 35 (6.3%) required a contact with the rater. Compared to the 10.8% error rate previously reported utilizing Version 1 of the eMMSE, a significant reduction ($p < 0.01$) in error rates was observed. **CONCLUSIONS:** Compared to the original version, the improvements made in the COA's implemented in the electronic system significantly improved data quality by reducing error and ensuring standardized administration and scoring.

PRM15

ASSESSMENT OF REAL-WORLD DATA SURROGATE FOR THE RESPONSE EVALUATION CRITERIA IN SOLID TUMORS (RECIST)

Feinberg BA[1], Klink AJ[1], Ernst FR[1], Weltz M[2], Nabhan C[1]
[1]Cardinal Health, Dublin, OH, USA, [2]Alvin and Lois Lapidus Cancer Institute, Baltimore, MD, USA

OBJECTIVES: The 21stCentury Cures Act calls for the incorporation of real-world evidence (RWE) into the drug labeling process. Critics cite deficiencies of RWE as compared to randomized controlled trials (RCT). We aimed to assess whether subjectively reported best response to treatment differed from responses based on radiographic measurements of target lesions. **METHODS:** Electronic case report forms (eCRF) were fielded to assess clinical response to systemic therapy in a rare malignancy. A comparison of subjectively reported best response with radiographic measurements of target lesions was performed to assess responses. **RESULTS:** Fifteen physicians with experience treating this malignancy participated in a CRF-based analysis of patterns of care. Treatment response for each line of therapy was collected for each of the 59 patients via CRF. For 9 patients (15%) with reported partial remission (PR), CRFs were augmented with bidimensional measurements of sentinel tumors from pre-treatment and best response radiographs (reports). Treatment response was calculated using sum of diameters according to RECIST and compared to the corresponding physician-reported response. Measurement-based response revealed 4 PR, 2 stable disease, and 3 progressive disease, and a concordance of 44.4% (95% CI: 15.3%, 77.4%) between response assessment methods. Reasons cited for variance include availability of previous scans for comparison, inconsistency in target lesions imaged, bone metastases difficult to follow, and use of diameter vs SUV (standardized uptake value) on positron emission topography (PET) scans. **CONCLUSIONS:** Subjective assessments of response collected via manual chart extraction, electronic medical record (EMR) review via natural language processing, or CRF may be problematic and limit the potential role of RWE in drug label expansion. The collection of target lesion measurements by CRF presents an attractive alternative to elevate the quality and accuracy of clinical response assessment in oncologic patients, but limitations exist.

PRM16

ESTIMATING COSTS ASSOCIATED WITH EXACERBATIONS OF CHRONIC OBSTRUCTIVE PULMONARY DISEASE (COPD) – A RANGE OF ALGORITHMS

Buikema AR[1], Fox KM[2], DePietro M[2], McPheeters JT[1], Fang Y[1], Cao F[1], Elliott C[1], Bengtson LG[1]
[1]Optum, Eden Prairie, MN, USA, [2]AstraZeneca, Wilmington, DE, USA

OBJECTIVES: To examine various algorithms for estimating costs from claims data associated with chronic obstructive pulmonary disease (COPD) exacerbations. **METHODS:** The sample included COPD patients aged ≥40 years from a large US claims database who initiated long-acting bronchodilator monotherapy between 1/1/2008 and 1/31/2015. COPD exacerbations, associated costs, and all-cause costs (2015 consumer price index-adjusted) were ascertained in the one year prior to treatment initiation. Exacerbation events were defined as a COPD-related inpatient stay; emergency department (ED) visit; or an ambulatory visit followed by systemic corticosteroid or antibiotic use within 10 days. Exacerbation episodes consisted of multiple events, and continued until 14 days without an event. Exacerbation costs were defined by four algorithms: 1) COPD-related costs between episode start and end dates; 2) including COPD-related costs within 7 days following the end date; 3) including COPD-related costs within 14 days following the end date; 4) algorithm 3 plus costs for diagnostic work-up procedures (e.g. pulmonary imaging, spirometry) and breathing assistance (e.g., oxygen, ventilation). **RESULTS:** The analysis included 27,394 patients; mean±SD age 68±10 years; 50% female; and 60% on Medicare. During the observation period, 43% of patients experienced ≥1 exacerbation and 15% had ≥1 exacerbation leading to an inpatient stay. All-cause and COPD-related mean±SD monthly costs were $1543±$2695 and $592±$1831, respectively. Mean±SD monthly COPD-exacerbation costs according to each algorithm were: 1) $190±$735; 2) $207±$800; 3) $216±$828; 4) $245±$1116. Mean±SD monthly severe-exacerbation (inpatient or ED) costs were: 1) $151±$703; 2) $157±$725; 3) $162±$745; 4) $187±$1040. **CONCLUSIONS:** Depending on the algorithm, COPD exacerbations accounted for 32% to 41% of COPD-related costs and 12% to 16% of all-cause costs. COPD-related exacerbation costs were estimated to be nearly 30% higher with the broadest algorithm compared with the most conservative algorithm. Severe exacerbations accounted for 75% to 80% of COPD-related exacerbation costs.

PRM17

ESTIMATING GLOMERULAR FILTRATION RATE IN PRIMARY CARE ELECTRONIC MEDICAL RECORD DATABASES IN EUROPE

Jouaville SL[1], Bizouard G[1], Boutmy E[1], Keja J[2]
[1]QuintilesIMS, Boulogne Billancourt, France, [2]QuintilesIMS, Rotterdam, The Netherlands

OBJECTIVES: Chronic kidney disease (CKD) prevalence is increasing, partially as a consequence of the increasing diabetes prevalence, and is rightly increasingly watched by health authorities. The estimated glomerular filtration rate (eGFR) is used to monitor kidney status. It is a calculation based on the results of a blood creatinine test along with other variables such as age, sex, and race, depending on the equation used. The aim of this study was to compare eGFR values calculated with the use of Cockcroft & Gault formula (CG) and Simplified Modification of Diet in Renal Diseases (sMDRD) in European electronic medical record (EMR)-databases **METHODS:** This study used data from QuintilesIMS EMR-databases which are EMR and prescribing databases of primary care physicians in community-based, fee for-service practices in the UK and Germany. Frequency of renal impairment based on eGFR was estimated using both CG and sMDRD equations on a cohort patients with type 2 diabetes (T2D) receiving a glifozin treatment. Diagnoses for renal failure were also retrieved. **RESULTS:** A cohort of over 8000 and 1700 of glifozin-treated T2D patients in the UK and Germany respectively were assessed for kidney status. Creatinine serum test were available for 95% and 75% of patients in the UK and Germany respectively. eGFR with CG formula could be calculated for 90% and 30% of patients in the UK and Germany respectively, while it was available for 95% (UK) and 75% (Germany) of patients using sMDRD. The eGFR values varied depending on the formula used. A higher proportion of patients with moderate and severe renal impairment were retrieved using sMDRD. **CONCLUSIONS:** In agreement with previous works we found that CG formula tends to overestimate eGFR value. We recommend the use of SMDRD in European EMR- databases for calculation of eGFR.

PRM18

TOWARDS OPTIMIZED ONCOLOGY CLINICAL TRIAL DESIGN: A PLATFORM TO ASSESS THE SENSITIVITY OF CLINICAL ENDPOINTS TO MAXIMIZE DRUG VALUE

Chawla A[1], Cho Y[2], MacKenzie A[1]
[1]Precision for Value, Boston, MA, USA, [2]Precision for Value, New York, NY, USA

OBJECTIVES: Recent value-based frameworks, such as ASCO, provide algorithms to compute the relative value of oncology therapies. Such algorithms are typically based on a weighted combination of endpoint scores that provide an avenue to optimize the value outcome. As such, this study aims to: 1) propose a platform to incorporate ASCO's evolved methodology to compute net health benefit (NHB), 2) assess sensitivity of underlying clinical endpoints, and 3) provide real world examples of how the platform may be employed. **METHODS:** A Monte Carlo simulation-based platform was developed to compute a baseline distribution of NHB scores of the advanced disease setting, and conduct sensitivity analysis of endpoints. The endpoints spanned three key drug attributes: Clinical Benefits including Hazard Ratio (HR), median Overall Survival (mOS), HR for Disease progression (HR DP), median Progression-free Survival (mPFS), Response Rate (RR)), Drug Toxicity (T), and bonus attributes including Tail of the curve (ToC), Palliation (P), QoL (Q), and Treatment-free Interval (TFI). Further for each endpoint combinations, associated clinical trial costs were estimated. NHB scores were then compared against those costs to determine optimal endpoint combinations for clinical trials of three example oncology drugs. **RESULTS:** While the NHB scores trace a bell curve with a maximum score of 140, the median scores across all endpoints were in the 17-70 range. The levers with the highest sensitivity were HR and mOS. Most importantly, holding clinical benefit score constant, Toxicity has higher sensitivity vs Palliation or Treatment-free Interval. **CONCLUSIONS:** While clinical benefit is the primary driver for the NHB score, multiple combinations of clinical endpoints were possible to achieve the same NHB score, suggesting that if the criteria of success includes optimizing NHB, certain clinical endpoints may be prioritized to achieve relatively lower oncology trial costs. This platform may be extended to additional value-based frameworks such as ICER in future studies.

PRM19

QUANTIFYING THE HEALTH OUTCOMES OF MARKET ACCESS POLICIES – USING SIMULATION MODELING TO COMPARE ACCESS TO CANCER MEDICINES ACROSS GLOBAL MARKETS

Su W[1], Lockwood C[2], Chui C[3], Vandigo J[4], Haninger K[4]
[1]IHS Markit, Washington, DC, USA, [2]IHS Markit, Santa Clara, CA, USA, [3]IHS Markit, London, UK, [4]Pharmaceutical Research and Manufacturers of America (PhRMA), Washington, DC, USA

OBJECTIVES: To design a simulation model that can quantitatively project and compare the health outcomes of varying market access policies on cancer medicines across global markets. **METHODS:** Using Non-Small Cell Lung Cancer (NSCLC) as an example, we conducted a literature review on health economics and market access models in the therapeutic area. Though the cost effectiveness of cancer medicines among various patient subpopulations has been well studied, research on how market access policies can lead to differential health outcomes has been primarily qualitative. We designed a de novo simulation model with 4 submodules – epidemiology,

medicine, access policy, and disease pathway - to quantify the health outcomes of access policies. The model base case simulated the access landscape to NSCLC medicines in the United States (US) with 6 additional scenarios that replaced the US access policy with that of Australia, Canada, France, Germany, South Korea, and United Kingdom. **RESULTS:** The epidemiology module generated NSCLC patients based on real world 2006-2016 statistics on stage, genetic mutation, subtypes, and performance status. The medicine module includes chemotherapy, medicines targeting tumor blood vessel growth and various genetic mutations, and immunotherapies. The access policy module introduced the aforementioned medicines to patients per each country's unique access landscape, such as dates of market authorization, reimbursement status, market share, indication expansion, early access schemes, dedicated cancer drug fund, and accounted for prescribing outside of the approved indication. Based on the efficacy of each drug and patient access status, the disease pathway module then projected overall survival, progression free survival, and mortality. The difference in health outcomes between the scenarios quantified how market access policies can impact the collective health outcomes of NSCLC patients in the US. **CONCLUSIONS:** Simulation models can provide quantitative evidence to evaluate the impact of country-level market access policies on patient health outcomes.

PRM20

TO RE-CENSOR, OR NOT TO RE-CENSOR, THAT IS THE QUESTION: CRITICAL CONSIDERATIONS WHEN APPLYING STATISTICAL METHODS TO ADJUST FOR TREATMENT SWITCHING IN CLINICAL TRIALS

Latimer N[1], Abrams KR[2]
[1]University of Sheffield, Sheffield, UK, [2]University of Leicester, Leicester, UK

OBJECTIVES: To determine when re-censoring should be incorporated in statistical analyses undertaken to adjust for treatment switching in randomised controlled trials, and to demonstrate the utility of inverse probability weighting (IPW) as an alternative to re-censoring. Treatment switching often has a crucial impact on estimates of the effectiveness and cost-effectiveness of new oncology treatments. Switching adjustment methods such as rank preserving structural failure time models (RPSFTM) and two-stage estimation estimate 'counterfactual' (i.e. in the absence of switching) survival times and incorporate re-censoring to guard against informative censoring in the counterfactual dataset. However, re-censoring often involves a loss of longer term survival information which is problematic when estimates of long-term survival effects are required. **METHODS:** A simulation study was conducted, testing RPSFTM and two-stage adjustment methods with and without re-censoring, and with IPW in place of re-censoring, across scenarios with various switch proportions and sizes and time dependencies of the treatment effect. Methods were assessed according to their estimation of true restricted mean survival (in the absence of switching) at the end of trial follow-up. **RESULTS:** RPSFTM analyses that incorporated re-censoring were prone to bias when the treatment effect decreased over time – over-estimating the treatment effect by approximately 3-11% in these scenarios, compared to bias of approximately 0-2% for RPSFTM and two-stage analyses that did not incorporate re-censoring. Two-stage analyses usually over-estimated the treatment effect when re-censoring was incorporated and consistently under-estimated the treatment effect when re-censoring was not incorporated. Using IPW in place of re-censoring resulted in low levels of bias when the censoring proportion and switching proportion were relatively low (both approximately 25%). **CONCLUSIONS:** Re-censoring should not always be incorporated in adjustment analyses when the objective is to estimate the long-term treatment effect. Conducting analyses with and without re-censoring may provide useful information on the size of the true treatment effect.

PRM21

OPTIMAL DESIGN OF PRE-AUTHORIZATION TRIALS FOR EFFECTIVENESS EVALUATION IN SCHIZOPHRENIA

Karcher H[1], Fu S[2], Zöllner Ankarfeldt M[3], Haro JM[4], Nordon C[5]
[1]LASER Analytica, London, UK, [2]LASER Analytica, Loerrach, Germany, [3]Copenhagen University Hospital, Hvidovre, Denmark, [4]Parc Sanitari Sant Joan de Déu, Sant Boi de Llobregat, Spain, [5]LASER Analytica, Paris, France

OBJECTIVES: Randomized-controlled trials (RCT) often use strict eligibility criteria on patient characteristics, thereby weakening generalizability of results in the real world (RW). This study aimed at analyzing the differences between RW and typical schizophrenia Phase 3 RCT populations and predicting the impact of relaxing exclusion criteria on estimates of antipsychotic drug effect. **METHODS:** The data source was the observational SOHO cohort, which included 10,218 schizophrenia patients (characteristics and symptom evolution measured by the Clinical Global Impression-Severity score, CGI-S, at 3 months after antipsychotic drug switch). The cohort was assumed to represent RW schizophrenia patients. The "RCT population" was defined as a cohort subgroup after applying typical RCT exclusion criteria. The impact of re-including each of the following excluded patients was simulated: (1) disease chronicity (1-3 years), (2) history of suicide attempt, (3) alcohol abuse, (4) substance abuse, and (5) care only in private practices. Patients with one or two of these characteristics were re-included by replacement into the "RCT population" to define "enriched RCT populations", while keeping the sample size identical. Ordered probit regression models were built to predict the effect (change in CGI-S score) of the two most prevalent antipsychotic drugs based on different "enriched RCT populations", and compared with drug effects in the RW population. **RESULTS:** RCTs with enriched populations enabled a more accurate prediction of the effect observed in the RW population than RCTs designed with typical Phase 3 exclusion criteria. The impact of enrichment differed depending on which exclusion criterion was relaxed, and the simulations provided a guide to rationally open schizophrenia trials to certain types of RW patients. **CONCLUSIONS:** Simulating the inclusion of "RW patients" before running a Phase 3 RCT may help designing the trial so as to select the most relevant exclusion criteria to be relaxed, and in turn, allow a better prediction of RW drug effectiveness.

PRM22

APPLICABILITY OF APPLE RESEARCH KIT TO DELIVER COGNITIVE TESTING IN CLINICAL TRIALS: RESULTS OF A PILOT STUDY

Byrom B[1], Simpson L[2], Lee J[3], Flood E[4], Cassedy C[4], Gadala-Maria A[3], Muehlhausen W[5], McCarthy M[5], Skerritt B[5]
[1]ICON Clinical Research, Marlow, UK, [2]University of Nottingham, Nottingham, UK, [3]mProve Health, Arlington, VA, USA, [4]ICON Clinical Research, Gaithersburg, MD, USA, [5]ICON Clinical Research, Dublin, Ireland

OBJECTIVES: To evaluate the use of Apple Research Kit (ARK) to deliver a Paced Visual Serial Addition Test (PVSAT) in a controlled environment and provide preliminary acceptability evidence for this approach. **METHODS:** Subjects with chronic pain conditions completed the PVSAT, a measure of attention and visual processing speed in which subjects are asked to add consecutive digits. The test was developed using ARK and deployed on an iPad Mini. Subjects provided written informed consent, and ethical approval was obtained. Associations between PVSAT performance and participant characteristics were assessed (ANOVA). **RESULTS:** 124 subjects (57 male, 67 female) aged 19-69 years (mean 48.3 ± 13.0) entered the single-center study. Correct additions ranged from 3 to 59 out of a possible 60 (mean: 40.6 ± 16.3); number of dyads (sequences of correct answers) ranged from 2 to 29 (mean 9.2 ± 6.4); and maximum dyad length ranged from 1 to 57 responses (mean: 18.2 ± 15.4). Response speed (correct additions) was normally distributed, ranging from 1.32 to 3.36 s (mean: 2.12 ± 0.43). There was no evidence of gender or age effects, but PVSAT performance was related to education level. The number correct and maximum dyad length were significantly lower among those with a bachelor's degree or less versus those with a master's/doctoral degree (p=0.030 and p=0.029, respectively). **CONCLUSIONS:** The PASAT has been used to study working memory and attention in indications including traumatic brain injury and multiple sclerosis, and to provide a means of introducing stress while studying other constructs. Studies have shown performance to be related to intellect and mathematical ability which may be related to education as identified in our study. ARK provided a straightforward approach to app development, resulting in a solution with good participant acceptance. ARK shows promise to enable cognitive testing on mobile devices in clinical trials.

PRM23

PATIENT ATTITUDES AND ACCEPTABILITY TOWARDS USING THEIR OWN MOBILE DEVICE TO RECORD PATIENT REPORTED OUTCOMES DATA IN CLINICAL TRIALS

Byrom B[1], Muehlhausen W[1], Flood E[2], Cassedy C[2], Skerritt B[3], McCarthy M[1]
[1]ICON Clinical Research, Marlow, UK, [2]ICON Clinical Research, Gaithersburg, MD, USA, [3]ICON Clinical Research, Dublin, Ireland

OBJECTIVES: To evaluate patient attitudes towards the use of "bring your own device" (BYOD) to record patient reported outcomes (PRO) data in clinical trials. **METHODS:** Subjects entering a health questionnaire study using BYOD and a provisioned device were asked to complete a questionnaire assessing their attitudes towards BYOD use in clinical trials. **RESULTS:** 155 subjects (72 male, 83 female) aged 19-69 years (mean 48.6 ± 13.1) suffering from a range of conditions resulting in chronic pain entered the single-center study. 149/155 (96%) were familiar with downloading and using apps on their mobile device, and 92% (142/155) felt that they could definitely or probably download the study app without assistance. Ninety-four percent (146/155) stated they would definitely or probably be willing to download an app on their own mobile device for a forthcoming clinical trial; and 135 (87%) reported no concerns doing so. Common concerns volunteered included uncertainties on the use of personal data (7/20) and the effect on available device storage capacity (4/20). When considering BYOD, 115 subjects (74%) identified reimbursement for data charges as important, very important or essential; with 78%, 90% and 97% reporting ensuring data privacy, ease of installation and use, and no interference with other device functions as important or greater respectively. Forty-five percent of subjects felt using their own device would be more convenient compared to 15% preferring a provisioned device (40% had no preference). **CONCLUSIONS:** Amongst the sample in this study there was good acceptance for the use of BYOD in clinical trials. Some concerns could be mitigated by training, information and appropriate app design. This study required subjects to use their own mobile device and the authors acknowledge that attitudes in the wider population may differ. However, this study provides a favorable indication that BYOD may be acceptable to participants in clinical trials.

PRM24

REAL WORLD EVIDENCE AND NETWORK META-ANALYSES: A SYSTEMATIC LITERATURE REVIEW OF EVIDENCE SYNTHESIS METHODS COMBINING DIFFERENT STUDY DESIGNS

Mesana L[1], Pacou M[2], Gauthier A[1]
[1]Amaris, London, UK, [2]Amaris, Paris, France

OBJECTIVES: Bayesian network meta-analysis (NMA) has become standard practice in evidence synthesis. NMAs typically only include randomized clinical trials (RCT) based on the hierarchy of evidence. Real world evidence (RWE) is increasingly used in health economics and outcomes research. The objective of this research was to review methods combining different levels of evidence and to compare their benefits and drawbacks. **METHODS:** A systematic literature review was conducted to identify methodological papers and published NMAs combining different study designs. Searches were conducted in PubMed and Embase. Extensive hand searches were also conducted and consisted of reviewing citations found in included publications and searching conference proceedings, health technology agencies' websites, and methodological guidelines. **RESULTS:** Four main methods for combining evidence from different study designs were identified: naïve pooling of all types of evidence, conducting a design-adjusted analysis, using non-randomized evidence as prior information, and running a three level hierarchical model. These methods were

associated with advantages such as optimizing precision and network connection through the inclusion of more evidence, modelling bias directly by accounting for between-study type variability, understanding the bias non-randomized data may introduce into the analysis, and generating more generalizable NMA outputs. These methods were also associated with the following drawbacks: introduction of bias by including non-randomized trials, challenges associated with evaluating the bias associated with RWE studies. **CONCLUSIONS:** Given the lack of published guidance in this research area, the methods reviewed are considered exploratory and their perception by health technology assessment agencies is uncertain. While the three level hierarchical modelling approach seems to best allow for bias adjustment, further research remains to be conducted to address the bias inherent to pooling data from different sources. Refining these methods would help develop tools for a more generalizable comparative effectiveness assessment of health technologies.

PRM25

SURVIVAL TREND AND IMPACT OF ADVERSE DRUG REACTIONS DURING HAART ON SURVIVAL FUNCTION IN HIV/AIDS PATIENTS

Khan K[1], Khan AH[2], Sulaiman SA[2], Soo CT[3], Ahmad SI[4]
[1]Universiti Sains Malaysia, Pulau Pinang, Malaysia, [2]Universiti Sains Malaysia, Penang, Malaysia, [3]General Hospital Penang, Pulau Pinang, Malaysia, [4]International Medical University, Kuala Lampur, Malaysia

OBJECTIVES: Current study is aimed to observe survival trend in HIV/AIDS patients and to explore the impact of ADRs experienced during HAART on survival trends of the patients. **METHODS:** An observational retrospective study of all patients diagnosed of HIV infection and on HAART therapy from Jan 2007 to Dec 2012 was conducted at infectious disease department of Hospital Pulau Pinang, Malaysia. The survival function was observed on Kaplan-Meir survival analysis and Cox-regression for survival function. Data was descriptively analyzed by using statistical package for social sciences (SPSS 20). **RESULTS:** Out of 792 patients that underwent HAART therapy, 607 (76.6%) were male and 185 (23.3%) were female patients. The probability of 6 years survival was compared where the overall median follow up time of all patients was 36 months or 3 years (inter-quartile range 33.5-38.4). On Kaplan-Meir survival function analysis, better survival probability were observed among non-smokers (p 0.194), non-alcoholics (p 0.002), and non-drug abusers (p <0.001). Overall 338 (42.6%) patients had experienced adverse drug reactions where a total number of 449 (56.7%) adverse drug reactions were reported among which 329 (73.2%) occurred in males and 120 (26.8%) in female patients. The survival probability with significant association (p <0.001) among patients with absence of ADR were reported higher on Kaplan-Meir survival. On Cox-regression survival analysis, Alcoholic patients (HR 1.14, p 0.02), drug abusers (HR 1.38, p 0.01) and patients with ADRs (HR 0.65, p <0.001) shows a higher risk for death with higher Hazard ratio. **CONCLUSIONS:** The study indicates that a patient's life-style and occurrence of ADRs has a direct impact on survival probability in HIV/AIDS patients which shows a greater risk to death and poor survival. However, a multicenter study with a large sample size may provide us with better understanding of this relationship.

PRM26

EVALUATION OF PHARMACIST'S EDUCATIONAL AND COUNSELING IMPACT ON PATIENTS' CLINICAL OUTCOMES IN A DIABETIC SETTING

Ojieabu WA[1], Bello SI[2], Saka AS[1]
[1]Olabisi Onabanjo University, Sagamu, Nigeria, [2]University of Ilorin, Ilorin, Nigeria

OBJECTIVES: The study aimed to evaluate pharmacist's educational and counseling impact including adherence to instructions of diabetic patients' outcomes in the endocrinology clinic of Olabisi Onabanjo University Teaching Hospital, Sagamu, Ogun State, Nigeria **METHODS:** This was a 6 Month randomized controlled study involving 150 consented elderly type 2 diabetic patients. Patients who met the inclusion criteria were randomly assigned into both control and intervention groups (75 patients each). The 75 patients on our intervention group were educated by the Pharmacist on diabetes and hypertension, their complications, risks, preventive measures and management. This was done at least six times during the study period unlike the control group who received no such education. In particular, they were counseled on the need for medication and treatment adherence such as clinic visits, and life style modifications including diet and exercise. Outcome measure included changes in fasting blood sugar (FBS), blood pressure (BP), body mass index (BMI) and adherence to instructions. **RESULTS:** There were no statistical differences between the baseline and 6 months data of the control group as mean fasting blood sugar were 162.2 ± 69.1 and 159.9 ±57.2 (P= 0.825) and mean systolic blood pressure of 144.7 ± 23.8 and 145.5±18.6 (P= 0.819) respectively. The intervention group had mean fasting blood sugar of 156.7 ± 30.5 and 131.8± 40.4 (P< 0.001) and mean systolic blood pressure of 146.4 ± 13.9 and 133.8 ± 18.5 (P< 0.001) respectively. Adherence levels to medication taking in the groups were 42.7% : 94.7% respectively (P=0.001). **CONCLUSIONS:** In diabetes management, patient education and counseling have become key tools in achieving both glycaemic and blood pressure control.

PRM27

DEVELOPING AN ICD-10-CM VERSION OF CHARLSON COMORBIDITIES FOR UNITED STATES REAL-WORLD HEALTHCARE DATA

Beyrer J, Nolot S, Haldane DC, Johnston J
Eli Lilly and Company, Indianapolis, IN, USA

OBJECTIVES: Charlson comorbidities are frequently used to describe populations and for risk adjustment in observational studies and are often identified using International Classification of Diseases, Clinical Modification (ICD-9/10-CM) codes. To date, no ICD-10-CM Charlson code list has been published for United States (US) healthcare data, although a code list was published for the Canadian adaptation of ICD-10 (Quan et al. Med Care 2005;43:1130-9). The objective was to develop a code list for the US. **METHODS:** ICD-9/10-CM crosswalks (CMS GEMs, Optum360® Encoder Pro) were used to identify ICD-10-CM codes (effective 01-Oct-2015 through 30-Sep-2016) for Charlson enhanced ICD-9-CM codes in Quan et al. Coding experts also conducted 'native searches,' but medical experts used the concepts from Quan et al. to determine a code/concept's relevance for inclusion. The Deyo ICD-9-CM code list was also considered. **RESULTS:** Comparison with Quan et al., ICD-9/10-CM crosswalks, and expert review identified ICD-9-CM deletions/additions (4/29 unique codes/ranges) and ICD-10-CM deletions/additions (30/73 codes/ranges). The most common reason for deletions was a code existed in Canada but not US. The most common reason for additions is unknown; the added codes/ranges may not exist in Canadian ICD-10 but a list of all codes was unavailable. Comorbidities with the most code deletions/additions were mild (30) and moderate or severe liver disease (22) and renal disease (30). Additionally, 13 codes/ranges were re-categorized between mild versus moderate or severe liver disease and 6 codes/ranges between diabetes with versus without chronic complications. **CONCLUSIONS:** We developed an ICD-9/10-CM code list for Charlson comorbidities for the US. The differences between US and Canadian codes highlight the importance of considering cross-country ICD differences when adapting code lists. Additionally, using ICD-9/10-CM mapping tools alone was not sufficient; native code searching and expert review were critical inputs. Codes should be revised with future ICD-10-CM changes and validated in real-world datasets.

RESEARCH ON METHODS – Cost Methods

PRM28

THE APPLICATION OF RECOMBINANT HUMAN THROMBOPOIETIN (RHTPO) IN SECONDARY PREVENTION OF CHEMOTHERAPY INDUCED THROMBOCYTOPENIA PATIENTS IN CHINA

Yang F[1], Li L[2], Xuan J[3]
[1]Shanghai Centennial Scientific Ltd, Shanghai, China, [2]Fudan University, Shanghai, China, [3]Sun Yat-Sen University, Guangzhou, China

OBJECTIVES: Chemotherapy induced thrombocytopenia (CIT) is a common symptom in patients after various cycle of chemotherapy. Recombinant human thrombopoietin was approved in China Food and Drug Administration for CIT treatment. Secondary prevention for patients experienced CIT for the subsequent chemotherpy cycles are important considerations in clinical practice. In this study, we aim to investigate the fact of the usage of predosing of rhTPO in secondary prevention of CIT through a physician insight survey. **METHODS:** An expert questionnaire was designed to collect information of rhTPO in predosing of CIT patients. Major questions include tumor types of predosing application and the rate of predosing in CIT patients. 51 oncologists from 21 tertiary 3 hospitals in Beijing, Shanghai, Guangzhou, Jinan, Chengdu, Wuhan completed the questionnaire. **RESULTS:** 32 of 51 (62.75%) clinicians who completed the questionnaire. 16 kinds of cancer were mentioned in the questionnaire. The most frequent cancer of clinicians referred is lung cancer mentioned by 15 physicians. The overall rate of predosing of rhTPO is 15.7%; the predosing rate in CIT patients with ovarian cancer, breast cancer and esophageal cancer is 11.3%, 12.5% and 12.5% respectively. 6 clinicians reported used rhTPO of predosing in ovarian cancer, breast cancer and esophageal cancer in real world.**CONCLUSIONS:** Clinically, the different proportion of predosing of rhTPO was used in CIT patients in different tumors. The overall application rate is still relatively low and the potential clinical and economic benefit of rhTPO in secondary prevention of CIT is not fully realized. Further study to fully explore rhTPO clinical and economic benefits is needed to identify the criterion of predosing of rhTPO.

PRM29

A METHOD FOR IDENTIFYING LONG-TERM CARE USE IN CLAIMS DATA

Hanna ML[1], Kim D[1], Albrecht J[2], Perfetto EM[3]
[1]University of Maryland, School of Pharmacy, Baltimore, MD, USA, [2]University of Maryland, School of Medicine, Baltimore, MD, USA, [3]University of Maryland School of Pharmacy, Baltimore, MD, USA

OBJECTIVES: Medicare and commercial insurance plans provide limited long-term care (LTC) coverage, resulting in potential underestimation of total care costs when using insurance claims. The objective of this study was to test a method using place-of-services codes (POS) to identify and categorize LTC transitions for a cohort of dementia patients. **METHODS:** Analyses used de-identified administrative claims (2011 to 2015) from the OptumLabsTM Data Warehouse, a database which includes retrospective administrative claims data on more than 150M U.S. commercially-insured and Medicare Advantage enrollees. Using diagnosis codes and prescription claims, a dementia cohort was created with 36 months continuous coverage pre and 6 months post diagnosis. Hospice patients were excluded. POS codes were used to identify LTC use for nursing (31, 32, 33, 54), intermediate-care (55, 56, 61) and assisted-living (13) facilities. Current Procedural Terminology (CPT) codes (99304-99310, 99315-99318, 99324-99340) also indicated LTC use. Each month for each individual was coded as LTC or community (1/0). Hospitalization during any <3-month LTC-stay gap was coded an LTC month. To categorize community-LTC transitions, a 12-month rolling average of LTC-months was calculated. Months with an average >=0.5, received an LTC code. Based on monthly indicators, individuals were categorized into six care-transition groups: (1) Continuously community; (2) Community to LTC; (3) Continuously LTC; (4) LTC to community; (5) Community to mixed months of LTC; (6) LTC to mixed months of community. **RESULTS:** Out of 41,179 dementia cohort beneficiaries, 16,862 (41%) had a LTC use. Of those, 10,641 (63.1%) were categorized as continuously community; 3,754 (22.3%) transitioned,

community to LTC; 1,671 (9.9%) were continuously LTC; 53 (0.3%) transitioned LTC to community; 499 (3.0%) transitioned community to mixed LTC; and 244 (1.4%) transitioned LTC to mixed community. **CONCLUSIONS:** Use of POS and CPT codes related to claims is a viable method to identify LTC use and care transitions using claims data.

PRM30

CONSIDERATIONS IN THE ECONOMIC EVALUATION OF NURSE PRACTITIONERS AND CLINICAL NURSE SPECIALISTS ROLES

Lopatina E[1], Donald F[2], DiCenso A[3], Martin-Misener R[4], Kilpatrick K[5], Bryant-Lukosius D[3], Carter N[3], Reid K[6], Marshall DA[7]

[1]University of Calgary, Calgary, AB, Canada, [2]Ryerson University, Toronto, ON, Canada, [3]McMaster University, Hamilton, ON, Canada, [4]Dalhousie University, Halifax, NS, Canada, [5]Université de Montréal, Montréal, QC, Canada, [6]KJResearch, Rosemere, QC, Canada, [7]and Director, Health Technology Assessment, Alberta Bone and Joint Health Institute, Calgary, AB, Canada

OBJECTIVES: Advanced practice nurses (nurse practitioners (NPs) and clinical nurse specialists (CNSs)) have been introduced internationally to increase access to high quality care and to tackle increasing health care expenditures. The poor quality of economic evaluations (EEs) of advanced practice nursing roles to date raises the question of whether current EE guidelines are adequate when examining their cost-effectiveness of such a complex intervention as advanced practice nursing roles. **METHODS:** Our assessment of appropriateness of current EE guidelines for evaluations of NP&CNS roles was informed by a qualitative synthesis of: 1) narrative review of discussion papers on EE of advanced practice nursing roles; 2) quality assessment of EE of NP&CNS roles alongside randomised controlled trials; 3) review of guidelines for EE; and, 4) input from an expert panel. **RESULTS:** The narrative review revealed several challenges in EEs of advanced practice nursing roles (e.g., complexity of the roles, variability in models and practice settings where the roles are implemented, and impact on outcomes that are difficult to measure). The quality assessment of EEs of NP&CNS roles identified methodological limitations of these studies. When we applied the Guidelines for the EE of Health Technologies: Canada to the identified challenges and limitations, discussed those with experts and qualitatively synthesized all findings we concluded that standard guidelines for EE are generally appropriate for evaluation of NP&CNS roles and should be followed routinely. However, seven out of 15 current guideline sections (describing a decision problem, choosing type of EE, selecting comparators, determining the study perspective, estimating effectiveness, measuring and valuing health, and assessing resource use and costs) may require additional role-specific considerations to fully capture costs and effects of these roles. **CONCLUSIONS:** The proposed role-specific considerations, which clarify application of standard guidelines sections to EE of NP&CNS roles, may strengthen the quality and comprehensiveness of future EEs of these roles.

PRM31

THE IMPACT OF NON-DIVISIBILITY, DIMINISHING MARGINAL RETURNS TO SCALE AND NON-MARGINAL BUDGET IMPACT ON THE COST-EFFECTIVENESS THRESHOLD

Paulden M, McCabe C

University of Alberta, Edmonton, AB, Canada

OBJECTIVES: The optimal cost-effectiveness threshold has been subject to much debate. In the standard model, technologies are assumed to be divisible and exhibit constant returns to scale. The threshold is plotted as a linear function through the origin of the cost-effectiveness (CE) plane. We consider the implications of departures from these assumptions, including the possibility of of technologies. **METHODS:** We conducted simulations using a model of a hypothetical health care system comprising three stages: allocation of an initial budget among a pool of initial technologies, consideration of a new technology, and reallocation of resources if the new technology is adopted. The optimal threshold ensures that new technologies are adopted only if the net incremental benefit of adoption and reallocation is positive. Three scenarios were considered: divisible technologies exhibiting constant returns; divisible technologies exhibiting diminishing returns; and non-divisible technologies. For each scenario we estimated the optimal thresholds for net investments and net disinvestments across a range of possible budget impacts and different initial budgets. **RESULTS:** The standard exposition of the threshold holds if: (a) technologies are divisible and exhibit constant returns to scale; (b) one technology remains partially adopted following initial allocation; and (c) the budget impact of each new technology is sufficiently small that reallocation involves expanding or contracting only the partially adopted technology. In all other cases, the threshold depends upon whether the new technology is a net investment or net disinvestment and the magnitude of the budget impact. The threshold curve is a piecewise linear function under divisibility and constant returns, a concave function under divisibility and diminishing returns, or a step function under non-divisibility. **CONCLUSIONS:** The standard exposition of the threshold is a special case that holds only under specific conditions. Under other conditions, threshold curves take a different functional form that reduces the scope for new technologies to appear cost-effective.

PRM32

A STATISTICAL ANALYSIS PLAN TO UNDERSTAND OSTEOARTHRITIS PATIENT JOURNEY BY LINKING MEDICARE CLAIMS ACROSS CARE DELIVERY SETTINGS

Su W[1], Chen F[1], Iacobucci W[1], Bedenbaugh A[2], Bair N[2], Oruc A[2]

[1]IHS Markit, Washington, DC, USA, [2]Samumed, San Diego, CA, USA

OBJECTIVES: To design a statistical approach to understand the journey of knee osteoarthritis (OA) patients through different care delivery settings, how resource use patterns shift over time, and key drivers of disease burden. **METHODS:** We conducted extensive literature research on relevant health economics and cost publications. Most studies were conducted cross-sectionally under one specific care delivery setting. Complete patient journey and associated resource use across different settings such as primary care and outpatient remain unclear. Medicare Limited Data Sets (LDS) included deidentified patient-level claims data. We reviewed data dictionaries of LDS and designed a statistical analysis plan to derive resource utilization of knee OA patients in primary care, home health, inpatient, outpatient, and skilled nursing facility settings. **RESULTS:** All LDS files share the same patient ID that can be used to pool all claims data into a master resource use dataset. Knee OA patients are identified through relevant ICD-9 codes in diagnosis records. A control population with comparable demographics to the OA population is generated through propensity matching algorithm. Resource utilization is estimated on both claim level and patient level. On the claim level, the analysis derives hospital charge amount, reimbursed amount, length of stay, surgeries, referrals, and diagnosis-related group information. On the patient level, the resource use by the OA population when compared to the control group is calculated. A regression analysis uses demographics, comorbidities, provider, and treatment as independent variables and disease burden as the dependent variable. The aforementioned analyses is to be conducted on 2 sets of data files that are 5 years apart to account for any shifts in care delivery patterns over time. **CONCLUSIONS:** Assessing linked Medicare claims across delivery settings can help produce quantitative evidence for payers to better understand, prepare for and manage the journey in knee OA treatment among Medicare beneficiaries.

PRM33

COST SAVINGS FROM REDUCED PROLONGED AIR LEAK DUE TO THE APPLICATION OF POWERED ENDOCUTTERS IN VIDEO-ASSISTED THORACOSCOPIC LUNG RESECTION PROCEDURES: A REAL-WORLD EVIDENCE STUDY IN CHINA

Kong L[1], Kong W[1], Liu Q[2], Xuan J[3]

[1]Johnson & Johnson's (CHINA), Shanghai, China, [2]Beijing Brainpower Pharma Consulting Co. Ltd, Beijing, China, [3]Sun Yat-Sen University, Guangzhou, China

OBJECTIVES: To evaluate the impact of powered endocutters on the overall hospitalization costs in video-assisted thoracoscopic surgery (VATS) in China. **METHODS:** Powered staplers reduce the occurrence of Prolonged Air Leak (PAL) in VATS, which is a common complication associated with increased Length Of Stay (LOS) and hospitalization costs. A decision tree was built simulating health state transitions after VATS, in order to estimate and compare the total hospitalization costs per patient between powered and manual endocutter groups. PAL rates associated with powered stapler and manual endocutter were collected from a clinical trial conducted in China (NCT02338583) in 2015 and the published literature. The average index hospitalization costs, re-hospitalization costs, and health state transition rates were sourced from the China Health Insurance Research Association(CHIRA) whose original data source was China National Insurance Claim Database. Patients with PAL were defined as those experiencing continuous air leak for more than 5 days from post-op tube drawing. **RESULTS:** Although powered staplers command a price premium upfront (Average price difference, 1,670.5 RMB), they significantly reduce PAL occurrence compared with manual staplers (Powered: 1.1%, Manual: 16.8%, $p<0.05$), while each PAL contributes to significantly higher index hospitalization costs (PAL: 61,442 RMB; No PAL: 50,949.8 RMB, $p<0.05$), longer LOS (PAL: 23.2 days, No PAL: 15 days, $p<0.05$), higher re-hospitalization rates (PAL: 0.55, No PAL: 0.374, $p<0.05$), and higher re-hospitalization costs per patient (PAL: 25,097.3 RMB, No PAL: 12,445.1 RMB, $p<0.05$). Consequently, the overall hospitalization costs per patient were lower for powered stapler patients relative to manual staplers (Powered: 57,487.2 RMB, Manual: 58,900.9 RMB)*. **CONCLUSIONS:** Based on study outcomes, we conclude that the application of powered staplers is associated with overall cost savings in addition to numerous clinical benefits. It can be recommended in clinical use. *6.283119 Chinese Yuan Renminbi per 1 US Dollar - 2015 Yearly Average based on x-rates data, http://www.x-rates.com/average/?from=USD&to=CNY&amount=1&year=2015, Accessed on January 16th, 2017

ECONOMIC VALUATION OF AVOIDABLE MORTALITY IN THE CARIBBEAN REGION OF COLOMBIA

Arrieta Arrieta A[1], Florez Tanus A[2], Correa Reyes J[1], Alvis Guzman N[3]

[1]Universidad de Cartagena. Alzak Foundation, Cartagena de Indias, Colombia, [2]Universidad de Cartagena. Centro de Investigación y Docencia. Hospital Infantil Napoleón Franco Pareja. Centro de Investigación e Innovación en salud, Cartagena de Indias, Colombia, [3]ALZAK Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia

OBJECTIVES: to value the economic cost of losing human capital induced by preventable causes of death in the Caribbean Region of Colombia in the period 1999-2013 **METHODS:** two methods were applied . First, life tables were constructed by performing hypothetical scenarios of elimination of death causes for five-years, five-year periods and for each department. Allowing to know the impact of different avoidable causes of death on the mortality patterns of this population (probability of death, survival and life expectancy). The second method was the human capital valuation model, which consists in estimating the economic value of Years of Potential Life Lost (YPLL) and Years of Productive Potential Life Lost (YPPLL). **RESULTS:** if deaths from external and circulatory system causes were avoided in the period of study, the probability of dying in men would decrease by 37,2% and 15,8%, and the life expectancy would increase by 5 and 7,8 years respectively. In women case, these odds would decrease by 19,7% and 10,4% if deaths from circulatory and respiratory systems causes were avoided, and the life expectancy would increase by 10 and 4,3 years respectively. The economic value generated of losing human capital by preventable causes of

death, adjusted for unemployment was US$13,48 billion (PPP), of which 72,4% is due to avoidable deaths in men and 27,6% in women. This amount corresponds to 15,7% of Caribbean Region production, to 9,31% of Bogota GDP and to 2,3% of the national production for 2013. **CONCLUSIONS:** the economic burden of loss of human capital from preventable causes of death is significant and represent an important part of the region's economic resources. furthermore, these causes of death could be avoided by public policies of prevention and promotion of low-budget, contributing to the economic growth and development of this Region.

PRM35

MODELING COMPETING RISKS IN DISCRETE EVENT SIMULATION MODELS: ILLUSTRATING AND COMPARING DIFFERENT APPROACHES

Degeling K, Koffijberg H, IJzerman MJ
University of Twente, Enschede, The Netherlands

OBJECTIVES: To close the guidance-gap on modeling competing risks in discrete event simulation, by illustrating suitable approaches and comparing their impact on time-to-event and health economic outcomes and the uncertainty surrounding these outcomes. **METHODS:** Based on the ISPOR Good Modeling Practices Guidelines, three approaches were applied in a simulation study and a case study: (1) select the time-to-event first and the event second, (2) select the event first and the time-to-event second, and (3) select the event first to occur. The approaches were compared based on how well time-to-event data and cost-effectiveness outcomes were replicated, in terms of the prevalence of events, time-to-event distributions, cost-effectiveness point-estimates, and uncertainty surrounding these point-estimates. To assess sample size impact on the approaches' performance, sample size was varied in the simulation study and subgroup analyses were performed for the case study. **RESULTS:** In both the simulation and case study, the second approach represented the original data better in terms of the event prevalence and time-to-event distributions. For the case study, this difference in performance did not result in substantial differences between the approaches regarding the cost-effectiveness point-estimates and uncertainty surrounding them. However, the simulation study did show substantial differences in health economic outcomes, e.g. for one of the hypothetical trials the probability of being cost-effective was 74%, 93%, and 81%, for the first, second, and third approach, respectively. **CONCLUSIONS:** The illustrated approaches perform differently with regard to the simulated time-to-event outcomes. Although the magnitude of this difference and the extent to which it impacts cost-effectiveness point-estimates and their uncertainty depends on the data's and models' structures, these health economic outcomes may be impacted and thereby potentially influence resource allocation decisions. Based on the results of this study, the second approach selecting the event first and the time until this event second, seems to be preferred.

PRM36

UNCERTAINTY IN TIME-TO-EVENT DISTRIBUTIONS' PARAMETERS ESTIMATES IN DISCRETE EVENT SIMULATION MODELS

Degeling K[1], IJzerman MJ[1], Koopman M[2], Koffijberg H[1]
[1]*University of Twente, Enschede, The Netherlands,* [2]*University Medical Center, Utrecht, The Netherlands*

OBJECTIVES: Patient-level simulation models, e.g. discrete event simulations, are increasingly being used to describe variation (first-order uncertainty) in time-to-event data using statistical distributions. However, the uncertainty in these distributions' parameter estimates (second-order uncertainty) is typically being ignored in probabilistic sensitivity analyses. To highlight the need for incorporating the uncertainty in estimated parameters of distributions used to describe patient-level variation, different approaches are illustrated and compared. **METHODS:** Two approaches, (1) based on bootstrapping and (2) using multivariate Normal distributions, were applied in a simulation study and a case study. The approaches were compared regarding time-to-event outcomes and health economic outcomes, such as parameter point-estimates, time-to-event distributions, cost-effectiveness point-estimates, and the uncertainty surrounding them. To assess sample size impact on the uncertainty in distributions' parameter estimates, sample size was varied in the simulation study and subgroup analyses were performed for the case study. **RESULTS:** Incorporating uncertainty in time-to-event distributions' parameter estimates resulted in a substantial amount of additional uncertainty surrounding the health economic outcomes, illustrated by larger 95%-confidence ellipses surrounding the Incremental Cost-Effectiveness Ratio and different Cost-Effectiveness Acceptability Curves. Both approaches performed similar for large sample sizes (e.g. n=500). However, the approach using multivariate Normal distributions was more sensitive to extreme values for small sample sizes (e.g. n=25), resulting in unrealistic health economic outcomes. **CONCLUSIONS:** It is important to account for uncertainty in time-to-event distributions' parameter estimates to avoid underestimation of the total uncertainty surrounding health economic outcomes, and subsequent sub-optimal resource allocation decisions. To do so, the bootstrap-based approach is preferable, as no assumptions about underlying distributions are required, the correlation in the complete dataset is maintained, and this approach is less sensitive to extreme values. This study is particularly relevant to the field of personalized medicine, which is characterized by large uncertainty induced by evidence gaps or subgroup stratification.

PRM37

COMPARISON OF PREDICTIVE MODELING OF COST AND HCU BY CROSS-VALIDATION

Zhang L[1], Lin X[2], Wang J[3], Li G[1], Wang G[2], Lee K[2]
[1]*Janssen Pharmaceuticals Inc., Titusville, NJ, NJ, USA,* [2]*Janssen Pharmaceuticals Inc., Spring House, PA, USA,* [3]*Janssen Pharmaceuticals Inc., Raritan, NJ, USA*

OBJECTIVES: Many important variables in health economic studies are usually heavily skewed or with many zeros. Therefore validity of ordinary least squares (OLS) model is of concern for some analysts. To address the concern, alternative methods are proposed to analyze these data. In this study, we applied several methods to a sample data to evaluate the performances of these methods for the analysis of cost data or length of stay (LOS) data. **METHODS:** The sample data was from a study to assess the health economic burden of patients with treatment resistant depression (TRD) in comparison to non-TRD patients among major depressive disorder (MDD) patients. Patient's demographic information, payment type, and other baseline characteristics were accessed. By using OLS, generalized linear models with different distributional assumptions (Gamma, Poisson or negative binomial (NB), etc.) in one or two-part models, the differences of mean of medical cost or LOS from two subgroups were estimated and compared. Simulations were also conducted to compare the performance of different statistical models. **RESULTS:** Among 57090 patients in the cohort, there were 5824 TRD vs. 51266 non TRD patients. Cost variables were heavily right skewed. For instance, the skewness for medical cost was 20.93. The results showed the differences of mean medical cost estimation were $4948.00 by OLS, $5809.34 by Gamma regression with LOG link function and $1884.03 by LOG transformed OLS model. Another outcome LOS, which contained 89.6% observations with zeros, was also tested. The results indicated that difference of mean LOS estimation were 1.93 days by OLS, 1.86 days by NB regression and 1.76 days by Poisson regression. **CONCLUSIONS:** When dealing with cost or LOS, different statistic models or methods could have big impact on the results or interpretation. Carefully selecting models that reflect or better fit the possible data distribution may be more appropriate practice.

PRM39

INCLUSION OF LEARNING CURVE EFFECTS IN ECONOMIC EVALUATIONS OF MEDICAL DEVICES: EMPIRICAL EVIDENCE FOR HTA

Armeni P[1], Federici C[1], Costa F[1], Tarricone R[2], Torbica A[2], Callea G[2]
[1]*SDA-Bocconi School of Management, Centre for Research in Healthcare Management (CERGAS), Milano, Italy,* [2]*Bocconi University, Milan, Italy*

OBJECTIVES: To empirically assess the consequences of the inclusion of the learning curve (LC) in the HTA of medical devices by evaluating its potential impact on i) the evaluation of procedural outcomes of medical devices (MD), ii) the evaluation of rising and avoided costs; iii) the estimation of ICER; iv) the interpretation of economic evaluations in the light of planning the delivery of specific services. **METHODS:** A systematic review was conducted to identify the current state of knowledge about the LC in the economic evaluation of MDs and its inclusion in HTA processes. Based on the findings, the authors empirically estimated the LC for three MDs using real world data. Multivariate trend analysis assuming different parametric models both at the operator and institutional level was applied. Economic evaluation was performed with the inclusion of the LC to compare the effects. Additional analyses: comparison of LC parameters across different MDs; test of the persistence of the LC from procedural outcomes to final endpoint. **RESULTS:** LC effects are particularly evident for devices with high degree of complexity of use and high discontinuity with the previous technology. The learning effects are more evident on procedural outcomes and tend to gradually loose significance once final endpoints are considered. As a consequence, the LC has a more measurable impact on costs, even though in some cases also effectiveness is impacted. **CONCLUSIONS:** The inclusion of an observed LC could be extremely useful for HTA bodies. First, the initial "inefficiencies" could be identified, assessed, and considered as costs for the system. Second, the ICER evaluated after the learning plateau is reached could be different from the one including the learning phase, but both are needed for a fully informed HTA and for an optimal planning aimed at balancing local access and minimization of learning phase-related costs.

PRM40

IMPACT OF CHRONIC OBSTRUCTIVE PULMONARY DISEASE (COPD) CODING DIFFERENCES ON HEALTH CARE UTILIZATION AND COST OUTCOMES FOR RESEARCH SPANNING THE ICD-9 TO ICD-10 TRANSITION

Bengtson LG[1], McPheeters JT[1], Fang Y[1], Cao F[1], Elliott C[1], Fox KM[2], Buikema AR[1], DePietro M[2]
[1]*Optum, Eden Prairie, MN, USA,* [2]*AstraZeneca, Wilmington, DE, USA*

OBJECTIVES: Generally, coding specificity increased with International Classification of Diseases, 10thEdition (ICD-10). However, for chronic obstructive pulmonary disease (COPD), the opposite is true. COPD is no longer easily differentiated from chronic obstructive asthma (COA), which is now included within the COPD ICD-10 code range (J41-J44). This analysis examined the impact of this coding difference on COPD-related healthcare utilization (HCU) and costs measurement, and determined appropriate ICD-9 codes to ensure consistency in COPD studies spanning the ICD-9/10 transition. **METHODS:** The sample included COPD patients aged ≥40 years from a large US claims database who initiated long-acting bronchodilator monotherapy between 1/1/2008 and 1/31/2015. Patients had ≥1 year of continuous enrollment pre- and post-treatment initiation. Monthly COPD-related HCU and costs (2015 consumer price index-adjusted) were ascertained while patients remained on long-acting bronchodilator monotherapy. Claims were considered COPD-related if there was a COPD diagnosis in any position according to two different coding definitions: 1) COPD (ICD-9 [491.xx, 492.x, or 496] or ICD-10 [J410, J411, J418, J42, J430, J431, J432, J438, J439, J440, J441, J449]); and 2) COPD+COA (ICD-9 493.2x). **RESULTS:** Analysis included 27,394 patients; mean±SD age 68±10 years; 50% female; and 60% on Medicare. During a mean±SD post-index period of 192.7±308.0 days, 69.0%, 9.3%, and 12.0% of patients had ≥1 COPD-related ambulatory visit, emergency department visit, or inpatient admission, respectively, according to definition 1; and 69.6%, 9.5%, and 12.2% per definition 2. Mean±SD monthly COPD-related costs were $1,205.5±$4,063.1 and $1,222.0±$4,093.0, according to definitions 1 and 2, respectively. **CONCLUSIONS:** Among COPD patients initiating long-acting bronchodilator monotherapy, the impact of including ICD-9 codes for COA when ascertaining COPD-related HCU and costs was minimal. Therefore, inclusion of ICD-9 codes for COA is unnecessary to maintain coding consistency in studies spanning the ICD-9/10 transition. This analysis should be replicated in other COPD populations to confirm these findings.

PRM41
PAYING FOR YEARS OF LIFE LOST: A PROPOSAL TO ESTIMATE TOBACCO TAXATION IN COLOMBIA

Gil-Tamayo S, Rosselli D
Pontificia Universidad Javeriana, Bogota, Colombia

OBJECTIVES: Taxes are the most effective way to reduce tobacco consumption, but always meet with resistance, and are difficult to justify. We propose a new method to estimate tobacco taxation based on the economic value of the years of life lost due to smoking. **METHODS:** We performed a literature review to estimate the reduction of life expectancy of a smoker, and adjusted it based on the average cigarette consumption of a smoker in Colombia. The threshold value of life used in cost-effectiveness studies, i.e. three times the per capita gross domestic product (GDP), which was $16.6 million Colombian pesos (COP) in 2015, equivalent to USD 6,056, (exchange rate 1 USD = 2,743 COP), was applied to each year of life lost. Based on the average years of cigarette smoking and the number of packs consumed during that life span, the tax that each cigarette pack should have was calculated so that, with a 3% interest annual rate, the smoker would have paid the amount corresponding to the years of life lost by the time of his or her death. **RESULTS:** Given an estimated (conservative) 6 years life expectancy reduction, each smoker should contribute to the health system COP 299 million (USD 109,008). Assuming an average consumption of 166 annual packs of cigarettes for 50 years, COP 2.7 million (USD 969) should be raised every year, and each pack should have a tax of COP 16,022 (USD 5.84). **CONCLUSIONS:** The three times per capita GDP threshold has been used to approve new interventions that gain healthy years of life. We believe it could also de applied to products that are associated with health decrements.

PRM42
COMPARISON OF THE CMS CHRONIC CONDITIONS DATA WAREHOUSE (CCW) ALGORITHMS AND THE CONDITION-BASED AND PRESCRIPTION-BASED COMORBIDITY SCORES AS PREDICTORS OF AMBULATORY HEALTHCARE UTILIZATION

Bhattacharya K[1], Banahan III B[2]
[1]*University of Mississippi, University, MS, USA,* [2]*Center for Pharmaceutical Marketing and Management, University of Mississippi, University, MS, USA*

OBJECTIVES: It is a common practice in observational studies using administrative claims data to control for confounding using comorbidity scores. The Charlson Comorbidity Index (CCI) is perhaps one of the most widely used measures. However, the CCI was developed for predicting inpatient deaths. The Centers for Medicare and Medicaid Services Chronic Condition Warehouse (CCW) algorithms for identifying 27 chronic conditions and the RxRisk prescription-based comorbidity score offer alternative measures that may be more suitable for studies of outpatient utilization. This study examined the ability of all three comorbidity measures to predict outpatient healthcare utilization. **METHODS:** A retrospective analysis was conducted using Mississippi Medicaid administrative claims data for all beneficiaries continuously enrolled from January 1, 2014 to December 31, 2016. For each beneficiary, the first outpatient visit in 2015 was considered as the index date. CCI, RxRisk, and CCW scores were calculated for each beneficiary from medical and pharmacy data for the 12-month period prior to the index date. Outpatient healthcare utilization was calculated as the number of outpatient care visits occurring during the 12 months post index date. Three separate prediction models were run for each of the three comorbidity scoring techniques. All three models had gender, age, and race as covariates. Model performance was assessed using the R2 for the models. **RESULTS:** The model with using CMS CCW measure had an R2 of 17.6% when predicting outpatient healthcare utilization. This model had better predictive power than the CCI model (R2 = 14.6%) and the RxRisk model (R2 = 15.6%). **CONCLUSIONS:** Both the CMS CCW and the RxRisk comorbidity measures were better at predicting outpatient healthcare utilization. When conducting observational studies on outpatient healthcare events researchers should consider using comorbidity measures that better capture chronic conditions that predict outpatient healthcare utilization rather than the CCI measure.

PRM43
PATIENT-LEVEL SIMULATION-BASED SENSITIVITY ANALYSIS TO EVALUATE THE IMPACT OF UNDER-RECORDING OF UNDERLYING COMORBIDITIES IN A RETROSPECTIVE CLAIMS DATABASE ANALYSIS

Zorina O[1], Ferreira A[1], Korn JR[2], Bezlyak V[1], Sagkriotis A[1], Skelly A[1], Zangvil E[1], Snow H[1], Zuurman L[1], Holekamp N[3]
[1]*Novartis Pharma AG, Basel, Switzerland,* [2]*IMS Health, Waltham, MA, USA,* [3]*Pepose Vision Institute, Chesterfield, MO, USA*

OBJECTIVES: To evaluate the impact of under-recording of comorbidities in a retrospective claims database analysis of patients with claims for neovascular age-related macular degeneration (nAMD) treated with ranibizumab or unlicensed bevacizumab. **METHODS:** A retrospective analysis was conducted in the QuintilesIMS Integrated Data Warehouse (IDW) database to compare reported incidence of stroke between ranibizumab (n=44949) and unlicensed bevacizumab (n=131718). Event rates were compared using rate ratios (RR) within a multivariate Poisson regression, adjusted for baseline demographics and comorbidities. Frequencies of reported comorbidities were much lower than those reported in similar studies of nAMD populations (Curtis 2010; Gower 2011), potentially due to the open nature of the IDW database, which may not integrate all patient-level medical encounters. Over 40% of patients did not have any comorbidity recorded. This finding was unexpected owing to the typical age profile of nAMD patients. A patient-level sensitivity analysis was conducted to adjust for under-recording of medical history in the IDW database. Comorbidity records from the patients with at least one recorded comorbidity were randomly sampled with replacement and used to substitute records for the patients without recorded comorbidities, stratified by index drug, age group, gender and stroke event. **RESULTS:** The adjusted RR for the reported rate of prevalent stroke for ranibizumab was comparable with unlicensed bevacizumab (0.993 (95% CI: 0.961, 1.025)). Following the simulation-based sensitivity analysis, the adjusted RR for the reported rate of prevalent stroke was 0.964 (95% CI: 0.932, 0.997). A similar effect was observed for incident stroke. **CONCLUSIONS:** Under-recording of potential confounding factors may lead to biased estimates even if non-differential between groups. With large sample size resulting in narrow confidence intervals, even small magnitude of resulting bias may affect the statistical interpretation of the study results. Therefore, it is important to utilize appropriate statistical methods to detect and correct for comorbidity under-recording.

PRM44
CORE CLINICAL DATA ELEMENTS FOR CANCER GENOMIC REPOSITORIES: A MULTI-STAKEHOLDER CONSENSUS

Conley RB[1], Dickson DJ[2], Zenklusen JC[3], Al Naber J[1], Messner DA[1]
[1]*Center for Medical Technology Policy, Baltimore, MD, USA,* [2]*Molecular Evidence Development Consortium, Rexburg, ID, USA,* [3]*National Cancer Institute, Bethesda, MD, USA*

OBJECTIVES: A 2016 report from the Institute of Medicine concluded that one of the barriers to achieving the full potential of precision medicine was the inability to track outcomes for patients treated with molecularly targeted therapies. This inability was due both to the lack of critical information in health records and databases as well as the lack of data structure that would allow integration of data from diverse sources. CMTP and MED-C undertook this project to identify a core set of data elements and values essential to understanding the clinical utility of molecularly targeted therapies in oncology. **METHODS:** A diverse group of more than 50 experts and stakeholders, including researchers, clinicians, patients, medical societies, life sciences companies, public and private payers, and regulators was engaged over 9-10 months. Seven organizations with prominent existing or planned oncology databases (AACR, ASCO, EORTC, Genentech, Genomics England, NCI, ORIEN) shared their cancer and genomic data dictionaries. A master file of data elements was developed and categorized along with a proposed set of core data elements. The draft set was discussed in depth at an in-person stakeholder conference on April 27, 2016 in Baltimore, MD. Based on that discussion, the set was revised and provided electronically to conference participants for final comment. **RESULTS:** A consensus set of 49 data elements with value domain types and specific values was developed. Data element categories included demographics (6 data elements), medical history (6), physical examination at diagnosis (6), initial diagnosis (16), treatment episode(s) (6), and outcomes (9). Drop-down menus of values were utilized wherever possible to avoid referencing external coding systems and provide ease of use. A manuscript for publication submission is being finalized. **CONCLUSIONS:** Cancer genomic repositories' adoption of these core clinical data elements will facilitate achieving the potential of precision medicine.

PRM45
BIG DATA ANALYTICS FOR EARLY DIAGNOSIS OF AMYOTROPHIC LATERAL SCLEROSIS (ALS)

Grabowsky T[1], Shukla O[1], Kasoji M[1], Merrill C[2], Agnese W[2], Atassi N[3]
[1]*HVH Patient Precision Analytics, LLC, King of Prussia, PA, USA,* [2]*MT Pharma America, Inc., Jersey City, NJ, USA,* [3]*Neurological Clinical Research Institute (NCRI), Massachusetts General Hospital, Boston, MA, USA*

OBJECTIVES: Analyze a large claims database to explore if early predictors of ALS can be identified and potentially shorten the diagnosis timeline. The average delay in ALS diagnosis is one year after the appearance of first symptom, which can be detrimental as it delays initiating approved treatments and may preclude patients from enrolling in clinical trials. **METHODS:** The Truven MarketScan® database, containing patient-level claims for 170+ million patients, was used without any code pre-selection for this analysis. A mutual information (MI) measure was used to quantify the statistical relevance of every code in MarketScan to a future ALS diagnosis in four US states. Codes included: diagnosis codes, procedure codes, medications, provider types, and care facility types. An ensemble of classifiers developed employing machine learning techniques was applied to optimize the selection and ranking of ALS diagnosis predictors. We looked for predictors within the following time brackets: 3,6,9,12,18,24,36,48, and 60 months before the initial ALS diagnosis. **RESULTS:** The ALS ICD-9 diagnosis code identified 12,332 ALS patients with an average of 4.4 years of claims history. ALS patients: average age 60 years ± 14 years; 58% male, and 25% had a prescription claim for riluzole. The top differentiating diagnoses more common in ALS group compared to overall population were: non- traumatic joint disorders (-60 months), connective tissue diseases (-60 months), skin disorders (-48 months), fatigue (-36 months), lower respiratory diseases (-24 months), gastrointestinal disorders (-18 months) and other nervous system disorders (-12 months). **CONCLUSIONS:** This study suggests 5 years before ALS diagnosis, patients may be presenting with symptoms suggestive of connective tissue disorders, skin disorders, and nonspecific neurological complaints. Next steps of this project are to validate these findings in national dataset, optimize the algorithm differentiating ALS patients prior to diagnosis, and further characterize early predictors of ALS.

PRM46
SIMILARITIES AND DIFFERENCES BETWEEN REAL WORLD PATIENT DATA SOURCES: A GLOBAL CASE STUDY

Jaffe DH[1], Haskell T[2], Feldman B[3], Bramlett J[4], Bachrach A[3], Hyunjung A[5], Kamauu AW[6], Friedel H[7], Pignot M[8]
[1]*Kantar Health, Ramat-Gan, Israel,* [2]*Kantar Health, Horsham, PA, USA,* [3]*Clalit Health Services, Tel Aviv, Israel,* [4]*Kantar Health, St Louis, MO, USA,* [5]*Kantar Health Korea, Seoul, South Korea,*

[6]Anolinx LLC, Salt Lake City, UT, USA, [7]Team Gesundheit, Essen, Germany, [8]Kantar Health, Munich, Germany

OBJECTIVES: To assess and highlight variations in patients' demographic and clinical characteristics, disease management and healthcare utilization across geographies and data sources using patients with gout as an example. **METHODS:** A cross-sectional study of gout patients ages 18+ years was conducted using electronic health records (EHRs) from US (a healthcare system from the Anolinx eResearch Network, Anolinx, and Kantar Health Ambulatory EHR, KH) and Israel (Clalit Health Services, CHS); healthcare claims from Germany (BKK) and South Korea (Health Insurance Review & Assessment, HIRA); and patient-reported survey data from the National Health and Wellness Survey (NHWS) from US, Japan, and from five European Union (EU5) countries (France, Germany, Italy, Spain, and UK). Gout patients were identified as having at least one gout diagnosis or healthcare encounter for a single year for each data source, during 2014-2016. Patients from EHR data were required to have an additional diagnosis or gout medication purchase to insure an 'active' (non-historic) gout patient. Demographics, clinical characteristics, disease management and healthcare resource utilization data were examined. **RESULTS:** 109,975 adult gout patients were identified using EHR (Anolinx n=2148; KH n=51,722; CHS n=10,234), claims (BKK n=31,162; HIRA n=7696), and patient-reported survey data (NHWS-US n=3457; NHWS-Japan n=1172; NHWS-EU5 n=2384). Patient characteristics and healthcare use varied by data source and geography. For example, the proportion of patients 65+ years was similar between EHR datasets (Anolinx=53.9%; KH=51.7%; CHS=51.9%), but varied by data source and geography for claims (BKK=65.1%; HIRA=24.6%) and patient-reported survey data (NHWS-US=42.9%; NHWS-Japan=61.2%; NHWS-EU5=54.2%). Allopurinol use (≥1 prescription/purchase during the study year) was higher in EHR (KH and CHS~66%) compared to patient-reported survey (NHWS-Japan and -EU5 ~22%) cohorts. **CONCLUSIONS:** Collecting and analyzing data from diverse patient populations across geographies, healthcare systems, data sources, and cultures is essential for providing informative real-world evidence of disease management and progression and health outcomes.

PRM47

VALIDATION OF A WEIGHTED HEALTH STATE INDEX FOR DEPRESSED PATIENTS IN HEALTHCARE DATABASES: A SURVEY OF UK GENERAL PRACTITIONERS AND PSYCHATRISTS

Touya M[1], Wade AG[2], Cloitre P[3], Falissard B[4], Lancon C[5], Llorca PM[6], Francois C[7], Saragoussi D[3]
[1]Lundbeck LLC, Deerfield, IL, USA, [2]Patients Direct, Glasgow, UK, [3]Lundbeck SAS, Issy-les-Moulineaux, France, [4]INSERM UMR-S 1178 (Mental Health and Public Health), Paris, France, [5]Marseille University Hospital, Marseille, France, [6]CMP B CHU Clermont-Ferrand, Universite d'Auvergne EA 7280, Clermont-Ferrand, France, [7]Lundbeck, LLC, Deerfield, IL, USA

OBJECTIVES: A health state index (HSI) was developed to reflect the health state of depressed patients initiating antidepressants in a UK medical records database. The HSI includes 29 weighted parameters available in the database, considered relevant to depression by a group of experts. Polarity of weights are positive if parameters indicate better health status and negative if they indicate worse health status; weight values range from 1 to 9. Here we present an online survey aiming to confirm the weighting (polarity and value) of HSI parameters by a sample of UK physicians. **METHODS:** The survey was launched in 2015 aiming to recruit 100 GPs and psychiatrists. Participants were presented with the list of HSI parameters and asked for each to indicate whether it would have a positive or negative impact on a depressed patient's health state. Participants were then required to rate each parameter from 1 to 9: 1 for lowest impact on the patient's health state, 9 for highest impact. **RESULTS:** A total of 42 GPs and 32 psychiatrists participated. Among the 10 parameters with positive HSI weights, 8 were rated positive by >75% of physicians. Average differences between values of positive HSI weights and physician-rated weights ranged from 2.0 to 6.3 (median=3.6). All 19 negative HSI parameters were rated negative by >75% of physicians. Average differences between values of negative HSI weights and physician-rated weights ranged from 1.0 to 5.6 (median=1.8). Differences between HSI and physician-rated weights were larger for smallest values of HSI weights. **CONCLUSIONS:** While physicians agreed on the polarity of most parameters included in the HSI, agreement on weight values was poor. Results tend to indicate the HSI should only take into account direction of the parameters' impact (positive, negative) and not intensity (weight value): a new index based on these findings should be tested.

PRM48

USING REAL-WORLD DATA TO SUPPORT PROTOCOL OPTIMIZATION: A MULTI-COUNTRY APPROACH IN ULCERATIVE COLITIS

Brinkley E[1], Midha Y[2], Lobeck F[1], Dreyer NA[3], Lang K[4], Christian JB[1]
[1]QuintilesIMS, Durham, NC, USA, [2]QuintilesIMS, Morisville, NC, USA, [3]QuintilesIMS, Cambridge, MA, USA, [4]QuintilesIMS, New York, NY, USA

OBJECTIVES: Real-world data are increasingly used to support innovative study designs. In addition to supplementing or replacing primary data collection, EMR and claims can be used to assess feasibility of patient selection criteria. By supporting improved study design, analysis of these data may reduce likelihood of protocol amendments and accelerate recruitment. The objective of this study was to assess the ability of EMR and claims from 11 countries to support evaluation of patient selection criteria. **METHODS:** Real-world data sources in 11 countries were used to assess patient selection criteria for an ulcerative colitis (UC) case study. Patient selection criteria included diagnosis of UC, UC severity (defined as prescription for biologic or corticosteroid), and absence of exclusionary diagnoses including Crohn's disease and megacolon. Attrition tables were created for each country based on application of selection criteria. **RESULTS:** The data asset best suited to support protocol feasibility greatly depends on the underlying healthcare delivery system, database characteristics, and data use restrictions within each country. In the UC case study, linked EMR and claims data were used in the US and provided the most robust assessment, with 24% of adult UC patients meeting applied criteria. General Practitioner (GP) EMR data were used in Canada, the UK, Spain, Germany, and Italy, while hospital claims were used in France and Japan to better capture the target patient population. Application of criteria in GP EMR identified 3.4–37% of UC patients as potentially eligible; 9-46% of UC patients met applied criteria in hospital claims. Differences were a combination of country-specific practice patterns and source of data which impacts the generalizability of the data. **CONCLUSIONS:** Real-world data provide a rich resource within which to assess the impact of patient selection criteria on protocol feasibility. Local knowledge and data expertise are critical to correctly analyze and interpret country-level results for global study planning.

PRM49

CASE STUDIES ON THE IMPACT OF ICD-9-CM TO ICD-10-CM CODING TRANSITION ON STUDIES USING REAL-WORLD DATA IN THE UNITED STATES

Ali AK[1], Beyrer JK[1], Shroeder KM[1], Wu J[1], Haldane DC[1], Mitchell L[2]
[1]Eli Lilly and Company, Indianapolis, IN, USA, [2]Eli Lilly and company, Erl Wood, UK

OBJECTIVES: On October 1, 2015 payers in US required all medical claims to be submitted using ICD-10-CM instead of ICD-9-CM. Increased quantity and specificity of codes in ICD-10-CM will likely enhance misclassification in claims data during transition. This study describes real-world ICD-10-CM coding patterns for several diseases during ICD-10-CM transition. **METHODS:** Adjudicated claims in Truven Health MarketScan®Commercial and Medicare Supplemental databases for adult patients were used. Patients with ICD-9-CM and ICD-10-CM codes spanning the transition through January 31, 2016 were selected for: lung cancer (LC), pleural mesothelioma (PM), Alzheimer's disease (AD), and diabetes mellitus (DM). LC was identified using ICD-9-CM=162.2-162.9 and ICD-10-CM=C34.*; PM using ICD-9-CM=163.* and ICD-10-CM=C45.0; AD using ICD-9-CM=331.0 and ICD-10-CM=G30.0, G30.1, G30.8, and G30.9; and DM using ICD-9-CM=250.* and ICD-10-CM=E10.*-E14.*. **RESULTS:** Clinically relevant ICD-10-CM associated with ICD-9-CM LC (in ≥1% of ICD-9-CM cohort and rate ratio ≥2x versus matched other cancer controls) were C34.*. Clinically relevant ICD-10-CM associated with ICD-9-CM PM were C34.*, C38.4, C45.0, C45.7, C45.9, C76.1, C80.0, and C80.1. Of patients receiving an AD ICD-9-CM 331.0, 66% received one of the 4 G30.* ICD-10-CM, other clinically relevant codes observed at a frequency of at ≥10% included dementia and altered mental status (F03.90, F02.80, F02.81, and R41.82). Depending on DM type, ICD-10-CM yielded high sensitivity (97.6%-100%) for type 2 diabetes (T2D), when additional age restriction and treatment criteria were used. Corresponding values for type 1 diabetes (T1D) were 77.4%-86.8%. Clinically relevant ICD-10-CM associated with ICD-9-CM codes were E10.9 and E10.65 for T1D, and E11.9 and E11.65 for T2D. **CONCLUSIONS:** We were able to identify real-world coding patterns in claims data during the transition. As providers gain greater familiarity with ICD-10-CM, coding practice will likely evolve over time. Researchers should continue to look for similar descriptive or validation studies of cohort algorithms relevant to the study period.

PRM50

CHALLENGES OF IDENTIFYING TREATMENT PATTERNS OF PATIENTS WITH ADVANCED SOFT TISSUE SARCOMA USING CLAIMS DATA IN THE UNITED STATES

Zhu YE[1], Fang Y[2], Nicol S[1], Beyrer JK[1], Hess LM[1]
[1]Eli Lilly and Company, Indianapolis, IN, USA, [2]inVentiv Health, Indianapolis, IN, USA

OBJECTIVES: Soft tissue sarcoma (STS) is a heterogeneous group of rare solid tumors that arise from soft tissues, such as muscle, fat, nerves and blood vessels. The objective of this study is to describe the treatment patterns among patients diagnosed with advanced STS. **METHODS:** Newly diagnosed STS patients with at least two ICD-9-CM codes of 171.x on two different days between July 1, 2004 and March 30, 2014 were identified from the Truven MarketScan claims database. The first ICD-9 code was considered the index diagnosis. Due to the absence of disease stage and other clinical variables, patients were assumed to have advanced disease if they had no claims for excision or resection surgery from 30 days prior to the index diagnosis through the end of first-line chemotherapy. **RESULTS:** Of 17,009 patients eligible for the study, 4159 (24.5%) received first-line chemotherapy, of whom 1589 (38.2%) patients were advanced STS patients (mean age of 57.9,SD=14.5), 47.8% male and a mean Charlson Comorbidity Score (excluding cancer codes) of 0.6 (SD=1.2). Although there are a limited number of regimens for STS in treatment guidelines, 214 unique first-line treatment regimens were identified in claims data. The most frequently used regimen included unclassified drugs (211(13.3%)). Despite being the standard of care, only 47(2.96%) patients had claims for doxorubicin monotherapy and 99 (6.23%) had claims for doxorubicin combination therapy; 118 (7.43%) patients had claims for docetaxel+gemcitabine and 32(2.01%) for gemcitabine monotherapy. **CONCLUSIONS:** The chemotherapy regimens used to treat STS patients were heterogeneous and not consistent with prior research. The proportion of patients who received standard-of-care doxorubicin was considerably lower than anticipated. These findings are likely due to the high number of unclassified drug codes and lack of specific ICD-9 codes for STS. These limitations should be considered prior to using claims alone to identify or study STS patients.

PRM51

USABILITY EVALUATION OF CLINICAL AND OPERATIONAL POPULATION MANAGEMENT TOOLS IN VISN 21

Bena JM[1], Taylor J[1], Carmichael J[1], Meier J[2], Robinson A[3]
[1]VA Sierra Pacific Network (VISN 21), Reno, NV, USA, [2]VA Sierra Pacific Network (VISN 21), Martinez, CA, USA, [3]VA Patient Education Resource Center, Palo Alto, CA, USA

OBJECTIVES: Veteran Integrated Service Network (VISN) 21 Pharmacy Benefits Management (PBM) pharmacists utilize electronic health record data to create and

maintain over 300 real-time clinical and operational population management dashboards and reports. These tools allow for a comprehensive and interactive view and analysis of pharmacotherapeutic and performance data. Clinicians and managers use this data to more efficiently monitor patient populations and staff for quality, safety, and value. While anecdotal feedback has been solicited and use of these tools has been widely adopted in VISN 21, utility has never been formally assessed. This project will evaluate the current usability of these tools. **METHODS:** A survey based on the validated System Usability Scale (SUS) to objectively measure usability was developed. The instrument gathers demographic and use information from current users, opinions on data accuracy, ease, and applicability of the current tools and was sent to staff that had accessed a dashboard in the prior year. Following this survey, an in-depth heuristic evaluation will be done by external dashboard developers. Changes will be made to dashboards based on feedback and the SUS survey instrument re-sent to assess any change in usability. **RESULTS:** For the first SUS survey we received 207 responses out of 1653 surveyed (12.5 % response rate), with 73 pharmacists (35%), 72 nurses (35%), and 26 physicians (13%), 36 others (17%) responding. SUS average scores for the 5 most used dashboards were 61.1±14.84 (N=151). On a scale of 1-5, with 1 being strongly disagree and 5 being strongly agree, user confidence that data matches the medical record was 3.43±1.00, accurate and correct 2.62±1.15, and most current 3.71±1.07. **CONCLUSIONS:** Respondents considered dashboard usability marginally acceptable by SUS grading scale. Users agreed that the dashboard and report data matches the medical record and is up-to-date. Next steps are to complete the heuristic evaluation, make changes, and re-survey.

PRM52

DEVELOPMENT OF EPISODE-BASED PAYMENT MODELS FOR CHRONIC MYELOGENOUS LEUKEMIA (CML), LUNG CANCER, MELANOMA, AND BREAST CANCER

Kangethe A[1], Polson M[1], Lord T[1], Evangelatos T[1], Speicher LC[1], Barrientos S[1], Zacker C[2]
[1]*Magellan Rx Management, Newport, RI, USA,* [2]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA*

OBJECTIVES: Innovative healthcare reimbursement models are gaining attention and have been implemented by several payers, including the Centers for Medicare & Medicaid Services (CMS) Innovation Center with the Oncology Care model (OCM). A common alternative payment model is the episode-based payment. This study aimed to develop an episode-based payment model for a commercial insurance plan for various types of cancer. **METHODS:** Administrative claims databases from 3 regional commercial health plans were used to identify continually eligible patients (Age ≥ 18) with various cancer diagnoses. Episode triggers were identified using CMS' OCM methodology. In calculating the episode based payments, we found many adjustments to the OCM methodology were necessary to implement the methodology in a commercial population. For example, OCM uses generalized linear model based on national Medicare data to calculate adjustment factors. This isn't applicable to regional commercial health plans, so instead a model using age, gender, and comorbidity burden data was used. **RESULTS:** The adapted OCM model was applied to data from 5,764 patients, representing 9,511 episodes, meeting the analysis criteria. Actual expenditures for these patients were found to be $435M, while the episode-eligible calculated target amount for the same population was $251M. **CONCLUSIONS:** This exercise led to several learnings that may be of interest to commercial payers looking to implement an oncology payment model based on OCM. Many adjustments must be made to the OCM methodology to be applicable to populations beyond Medicare. Care must be taken to ensure adjustments are made in an actuarially sound way. Not all oncology expenditures are eligible for inclusion in this episode-based model. Episodes are triggered for patients undergoing active chemotherapy meeting other inclusion criteria. Some patients, i.e. those in remission, may be utilizing oncology services for monitoring and follow-up, but these services are not eligible for inclusion in OCM episodes.

PRM53

THE IMPACT OF CARE DISCONTINUITY ON RECORDING PATIENT CHARACTERISTICS CRITICAL FOR COMPARATIVE EFFECTIVENESS AND SAFETY RESEARCH WHEN USING ELECTRONIC HEALTH RECORDS

Lin KJ[1], Glynn RJ[1], Singer DE[2], Schneeweiss S[1]
[1]*Brigham and Women's Hospital and Harvard Medical School, Boston, MA, USA,* [2]*Massachusetts General Hospital and Harvard Medical School, Boston, MA, USA*

OBJECTIVES: Electronic health records (EHR) have been increasingly used for comparative effectiveness research. It is unclear how care-discontinuity, defined as receiving care outside of an EHR system, may affect data completeness and study validity using EHR. We aimed to quantify care-continuity of an EHR system and compare the misclassification of key variables in patients with high vs. low care-continuity. **METHODS:** Study cohort comprised all patients ≥ 65 in EHR from two large US provider networks linked with Medicare insurance claims data from 2007/1/1 to 2014/12/31. By comparing EHR and claims data, we quantified care-continuity by the **M**ean **P**roportion of **E**ncounters **C**aptured (**MPEC**) by the EHR system. Within levels of care-continuity, we quantified misclassification by **M**ean **S**tandardized **D**ifferences between the proportions of 40 key variables based on EHR alone vs. linked claims-EHR data (**MSD**_40_variables, <0.1 was used to indicate satisfactory variable classification). We compared patient characteristics in those with high vs. low EHR continuity. **RESULTS:** Based on 104,403 patients in EHR system 1 and 79,336 in EHR system 2, the mean capture proportions of all records were 24% and 18% in system 1 and 2, respectively. The misclassification of key variables (MSD_40_variables) based on EHR alone was 11.5-19.6 fold greater in those with lowest level of care-continuity (MPEC< 10%) than that in those with highest level of care-continuity (MPEC >= 80%), across EHR systems and years during follow-up. In both systems, capturing at least 60% of the encounters in an EHR was required to have satisfactory variable classification. The patient characteristics in those with high and low care-continuity were found to be comparable. **CONCLUSIONS:** Care-discontinuity may lead to substantial misclassification in key variables. Researchers may consider restriction to those with high care-continuity to improve study validity when relying exclusively on EHR data.

PRM54

INTEREST IN REAL-WORLD RESEARCH AMONG PHYSICIANS IN SMALL PRACTICE SETTINGS ACCESSED VIA AN ELECTRONIC MEDICAL RECORDS SYSTEM

Thompson D[1], Levy D[2]
[1]*inVentivHealth, Manchester, MA, USA,* [2]*Amazing Charts, LLC, Boston, MA, USA*

OBJECTIVES: Although a great deal of real-world physician-patient interaction occurs in small practice settings, not a great deal of real-world research has been performed in these settings. Use of EMR systems facilitates outreach to small practice settings—the objective of this study was to assess interest in participating in real-world research among physicians in these settings. **METHODS:** We fielded a 15-item survey to physicians from small practice settings, with items devoted to professional characteristics, interests in particular research methodologies and therapeutic areas, as well as motivations to get involved in research and concerns that might limit involvement. Likert scales ranging from 1 ("not at all") to 7 ("extremely") were used in all ratings. Physicians from small practice settings across all fifty states were accessed through their EMR system. **RESULTS:** A total of 264 physicians completed the survey, of whom 73.4% were sole practitioners and 87.9% in a 1-2 physician practice. Approximately three-quarters (72.3%) were male and on average they were in practice for two decades (21.6 years); fewer than one-half (46.2%) had ever functioned as a clinical investigator. Highest levels of interest were expressed in physician and patient surveys (4.57 and 4.02 average ratings) and phase IV real-world clinical trials (4.17), and lowest interest levels in phase II-III trials (3.41). Preferences for research in specific therapeutic areas did not differ markedly (3.40-3.95), except for oncology (2.60). Highest ranking motivations for participating in research were to help their patients (5.63) and advance science/medicine (4.82). Highest ranking concerns included devoting time to research and allowing data collection instruments into the EMR (both at 4.27). Three in five physicians (60.5%) indicated interest in being contacted for future research projects. **CONCLUSIONS:** Physicians in small practice settings are interested in participating in real-world research. EMR systems can be used to access these physicians and, by extension, the patients they treat.

PRM55

PHARMACEUTICAL STRATEGIC PRICING: AN ANALYSIS OF GLOBAL CROSS-SKU PRICING APPROACHES

Sogokon P[1], Bustamante MM[2], Park S[2], Bastian A[3]
[1]*formerly CBPartners, London, UK,* [2]*CBPartners, New York, NY, USA,* [3]*INCYTE CORPORATION, Wilmington, DE, USA*

OBJECTIVES: To evaluate the pricing approach of all oncology products that have received FDA and EMA approval between 2011-2016 to understand the existence of flat, curvilinear, and linear pricing in the USA, EU5 (Germany, France, Italy, Spain, Great Britain), Canada, Australia, and Japan. **METHODS:** Oncology drugs approved by the FDA and EMA between 12/01/2011 and 12/01/2016 were obtained from the official regulatory websites. Topical and transdermal preparations were excluded from the analysis. The ex-manufacturer prices for individual SKUs of each of these drugs were sourced from the IHS PharmaOnline International database. Pricing linearity was assessed by two methods. (1) B. Jönsson methodology which analyzed the highest and lowest SKU prices, strengths and prices/milligram. This method, however, was found to have deficiencies in recognition of curvilinear pricing strategies, therefore, a novel (2) CBPartners methodology was devised to analyze the price of all available SKUs, apply strict category definitions of "flat", "linear", and "curvilinear" pricing and utilize a process of elimination to ensure accurate categorization. **RESULTS:** Between 12/01/2011 and 12/01/2016 84 oncology products received FDA or EMA licenses. Of these, 70 products (83%) qualified for further analysis as per exclusion criteria. A total of 39 (56%) oral and 31 (44%) injectable drugs remained for analysis. Of the injectable products, only one product exhibited flat pricing and none had curvilinear pricing, resulting in linear pricing being almost exclusively employed. Oral products presented much more variance. Flat pricing was used in at least one market by 16 products, linear by 14 and curvilinear by 5. **CONCLUSIONS:** There is a clear difference in how different SKUs of oral and IV oncology products are priced, with IV products almost always pursuing a linear pricing strategy and orals varying between flat and linear pricing. Pricing trends demonstrate the existence of region-specific strategies employed and devised by manufacturers.

PRM56

THE VALUE OF REAL-WORLD DATABASES IN RARE DISEASES: UTILITY AND APPLICATIONS IN FABRY DISEASE

Avetisyan R, Greene N, Hamed A
Sanofi Genzyme, Cambridge, MA, USA

OBJECTIVES: Rare diseases research presents with many challenges. Real-world databases have been increasingly utilized in rare diseases, to understand diseases and evaluate treatment impacts. A review of published database studies in Fabry disease has been performed, to assess the landscape, utility and application of different types of databases in various regions and countries. **METHODS:** A targeted literature review was conducted in PubMed and Embase for years 1980–2016, to identify studies utilizing data from various real-world databases, including medical, claims, pharmacy, hospital and other sources; registry studies were not included. **RESULTS:** The search yielded a total of 42 studies conducted in various regions globally. The majority of the studies were published after 2007. A larger proportion was based on health care databases in Europe (n=33). Germany represented the country with the largest number of publications (n=9). Among the types of the data collection methods used, the majority were medical chart or EMR reviews (n=40). Most often these studies were done in specialized Fabry referral centers located in tertiary care hospitals. The

majority were single center studies (n=27), while others were multi-center, and one of the studies was based on a home infusion database. The research questions evaluated ranged from understating disease manifestations and natural history, to assessing disease management and treatment impact. Many studies (62%) included long-term follow-up period, to understand natural history and/or long-term treatment outcomes. **CONCLUSIONS:** During the last decade there has been an increasing use of real-world databases in rare diseases, including Fabry disease. The review of Fabry database studies showed the value of these approaches. Many studies included relatively large number of patients and long-term follow-ups, and richness of data that are otherwise hard and time consuming to achieve with other research approaches. Real-world databases offer an opportunity of providing needed data and answering research questions in rare diseases space.

PRM57

BRAZILIAN HEALTHCARE RECORD LINKAGE (BRHC-RLK) – A RECORD LINKAGE METHODOLOGY FOR BRAZILIAN MEDICAL CLAIMS DATASETS (DATASUS)

Campos DF, Rosim RP, Duva AS, Ballalai Ferraz AF
QuintilesIMS, Sao Paulo, Brazil

OBJECTIVES: Develop a reliable methodology to correlate records from medical claims databases within the Brazilian public health care system (SUS). **METHODS:** Two medical claim databases from the Brazilian Ministry of Health information system (DataSUS) were considered for this study: Ambulatory (SIA) and Hospital (SIH) - both databases are made publicly available in separate without deterministic record keys for record linkage. A record linkage algorithm was developed to craft a broad real world longitudinal patient dataset. A set of parameters such as patient ZIP code, municipality, age or birth date, race, nationality, gender, and ICD were assessed to create a de-identified patient key, as well as to link SIA and SIH datasets. The record linkage methodology consists of a set of eighteen steps based on deterministic and probabilistic connections between de-identified patient keys from both databases; variables are banded into different combinations at each step to maximize the number of connections. Results are considered valid only if no inconsistencies of birth date and gender are found for the same de-identified patient key. Finally, additional variables available were set aside from validation due to reporting inconsistences and volatility. **RESULTS:** Linkage outcomes vary depending on disease and health care setting dynamics (e.g. in or out patient) as well as epidemiologic characteristics (e.g. prevalence and age group concentration). As an illustration, within a hepatocellular carcinoma cohort, 1.189 patients were independently found at SIA and 5.140 at SIH as well. Finally, 2.763 patients were linked over the intersection, resulting in a total cohort of 9.092 patients in 2015. **CONCLUSIONS:** Both cohort size and the distribution between hospital and ambulatory setting are aligned to published literature providing initial evidences on the potential of the methodology. Such approach promises advances in the development of analysis such as health care resource utilization, hospital admissions, diagnosis and treatment dynamics based on patient-centric real world evidence.

PRM58

CLINICAL EFFICACY AND COST EFFICIENCY ASSESSMENT OF CADAVERIC ALLOGRAFT SKIN GRAFTING IN THE MANAGEMENT OF EXTENSIVE BURNS AND SEVERE WOUNDS

Sassykova A[1], Gurtskaya G[2]
[1]*Republican Center for Health Development, Astana, Kazakhstan,* [2]*Astana medical university, Astana, Kazakhstan*

OBJECTIVES: The problem of treatment of extensive burns remains one of acute problem of medicine. In the Republic of Kazakhstan burns are between 3.5% and 5% of all injuries. When wound is too deep the extensive wound surface becomes a cause of metabolic imbalance and homeostasis. Because of short of donor resources long-term existance of burn surface leads to consumption, multiple organ dysfunction syndrome and to fatality that brings significant economic losses to society. Despite existing of various types of synthetic and biological coatings the allogeneic skin up to date is "gold standard" in management of extensive burn wounds. The best way to solve problem of shortage of allogeneic skin is development of cadaveric donation. Objective: authors evaluated clinical efficacy and cost efficiency of cadaveric allograft skin grafting in management of extensive burns according to data of researches available in database of evidence-based medicine. **METHODS:** Review of literature was conducted on safety and efficacy of cadaveric allograft skin grafting in databases PubMED, Cochrane Library, NICE, Clinical Trials, TripDatabase etc. according to research issues (PICOs) and key words. **RESULTS:** After literature review of 17928 sources, relevant for criteria PICOS reports were selected for study, 19 of which were taken for final analysis. The remaining publications were excluded due to noncompliance with criteria of research questions. **CONCLUSIONS:** Results of 19 studies demonstrate clinical efficacy and cost efficiency of technology. Main way of cadaveric allograft skin application is temporary wounds closure after necrectomy when own donor resources is not available. According to foreign burn centers data cadaver skin application after escharotomy in management of extensive burns can reduce mortality rate and hospital stay duration. Compared with currently available synthetically temporary provisional bandages cadaveric allograft skin is more cost-effective. Recommendations based on this study to establish skin bank for cadaveric donation development were given to health policy makers.

PRM59

EVALUATING THE EFFECT OF PRESCRIPTION MONITORING PROGRAM CASH PRESCRIPTIONS ON THE PQA MEASURE: USE OF OPIOIDS FROM MULTIPLE PROVIDERS IN PERSONS WITHOUT CANCER

Ramachandran S[1], Inguva S[2], Banahan III B[2], Noble S[3], Kirby T[3]
[1]*University of Mississippi, University, MS, USA,* [2]*Center for Pharmaceutical Marketing and Management, University of Mississippi, University, MS, USA,* [3]*Office of the Governor, Mississippi Division of Medicaid, Jackson, MS, USA*

OBJECTIVES: Prescription Drug Monitoring Programs (PDMPs) are state-run electronic databases used to track the prescribing and dispensing of controlled prescription drugs to patients. The PDMP is accessible to providers and pharmacies across the state as a measure to combat abuse of controlled substances such as prescription opioids. Mississippi's Division of Medicaid (DOM) and the State Pharmacy Board implemented an agreement to receive PMP data for all beneficiaries. The objectives of this project were to conduct a descriptive review of cash payments for controlled substances and to assess how cash paid for opioid prescriptions impact performance on the Pharmacy Quality Alliance (PQA) quality measure: Use of opioids from multiple providers in persons without cancer. **METHODS:** A retrospective analysis was conducted using DOM's pharmacy claims linked with PMP data for the period July 1, 2015-June 30, 2016. The PQA measure was calculated according to the measure specifications with and without the inclusion of cash prescription data from the PMP. **RESULTS:** 13,574 Mississippi DOM beneficiaries were present in the PMP data accounting for approximately 76,000 prescriptions for cash-paid controlled substances. The most commonly prescribed cash-paid prescriptions included acetaminophen-hydrocodone, alprazolam, tramadol, and oxycodone. The total number of individuals flagged by the Provider Shopping measure increased slightly from 3,033 (8.95%) to 3,071 (9.05%) upon inclusion of cash prescriptions ($p < 0.001$). Similarly, the average number of unique pharmacies and physicians visited by Medicaid beneficiaries increased slightly from 5.36 to 5.43 ($p < 0.001$) upon inclusion of cash prescriptions. **CONCLUSIONS:** Inclusion of cash prescriptions resulted in a slight increase in cases identified as "provider shopping". Although the difference was statistically significant, the increased percentage and actual number of beneficiaries may not be meaningful from a quality measure perspective. However, identifying beneficiaries using cash to pay for narcotics should improve efforts to identify beneficiaries at high risk of abuse or diversion.

PRM60

MACHINE LEARNING INTEGRATION WITH MOLECULAR DIAGNOSTICS: PROGRESS AND POTENTIAL PITFALLS

Ringo M, Faulkner E
Evidera, Raleigh, NC, USA

OBJECTIVES: The use of machine learning interfaces that sift through massive and sometimes unrelated data to identify trends and provide insight for healthcare decision-making is relatively new. One promising application is clarifying the link between individual patient diagnostic test results, treatments, and outcomes, along with longitudinal and population data sources and peer-reviewed literature. Early machine learning approaches have the potential to leverage scenario learning to more accurately inform business and health care decisions. In this study, we aim to survey the current applications of machine learning to optimize the intersection between test use and treatment selection, patient management, and outcomes to understand implications for the future of health economics and outcomes research. **METHODS:** We conducted a targeted review of the peer reviewed and grey literature to identify studies describing machine learning applications in healthcare diagnostics, with a special emphasis on integration with molecular diagnostic testing that informs treatment selection and care management decisions. This review included both academic healthcare and commercial research, and academic/commercial collaborations. **RESULTS:** The application of machine learning to medical imaging is well-described in the literature. By contrast, fewer than 50 published reports of machine learning interfaces with molecular diagnostics, mostly in infectious diseases and oncology, were identified. Results are considered in the context of disease and health decision focus, level of maturity and acceptance, linkage with patient management and health outcomes, and implications for evidence-based health decision making. **CONCLUSIONS:** As our knowledge of biomarker configurations evolves along with machine learning approaches, we have the potential to alter patient management approaches, as well as our conventional definitions of evidence-based medicine. While in its infancy, the implications of machine learning for health decision making, including in areas like precision medicine and in vivo imaging are discussed, as well as considerations for HEOR best practices leveraging these applications.

PRM61

CREATING A LARGE-SCALE PHYSICALLY INTEGRATED ELECTRONIC HEALTH RECORD DATA SYSTEM TO SUPPORT A LEARNING HEALTHCARE SYSTEM

Dore DD[1], Ciofani D[2], Davis S[2], Nunes AP[1], Bradley JM[1], Seeger JD[3], Berger M[4]
[1]*Optum, Boston, MA, USA,* [2]*Optum-Humedica, Boston, MA, USA,* [3]*Optum, Waltham, MA, USA,* [4]*Pfizer, Inc., New York, NY, USA*

OBJECTIVES: The promise of electronic health records (EHR) for population health analytics has not been fulfilled in the US partially due to a lack of interoperability across different systems. Distributed data networks (DDN) represent one approach to addressing this limitation, but require complex governance and coordination among participants. We describe an alternative based on a large-scale, centralized, and physically-integrated EHR data. **METHODS:** Patient-level data from multiple different electronic medical records systems were staged and standardized within multiple health systems to create Optum's EHR Database, (Optum, Eden Prairie, MN). Patient identifiers were de-duplicated and clinical data mapped across information systems before being de-identified. We assessed completeness of select variables among 3 groups: (1) All adults ($\geq$ 18 years), (2) Adults with a chronic disease diagnosis, and (3) Adults who have $\geq$ 12 months of data preceding index diagnosis that includes at least one prescription order, one laboratory result, and one encounter with a general practitioner. **RESULTS:** From 2007-2016, there were data relating to 69 million patients (58% women) from 52 health systems. There were, on average, 3.2 record identifiers from different data sources within or across health systems for each unique patient. There were 4 million

adults in Group 1 (36% 18-39 years, 34% 40-59 years, and 30% 60+ years). There were 1.9 million patients in Group 2, and 670,926 in Group 3. The median follow-up span was respectively 26, 48, and 56 months. The median number of medical encounters was 2 in Group 1 and 10 in Group 3. In Group 3, BMI, blood pressure, complete blood count, and basic metabolic panel information was available for ≥ 95% of patients. **CONCLUSIONS:** A physically integrated EHR system that spans multiple healthcare systems feasibly overcomes issues of interoperability. Advantages for linkage to claims and mining of free-text notes will be discussed.

PRM62

A FITRADEOFF APPROACH FOR ASSESSMENT AND UNDERSTANDING OF PATIENT ADHERENCE BEHAVIOR

Shukla S
IIM Lucknow, Lucknow, India

OBJECTIVES: Pharmaceutical industry faces a mighty challenge of low Patient adherence to their drugs which effect their economic prosperity and peace. Patient as Decision Maker intrinsically decides to carry forward with a treatment scope based on multiple attributes associated with that treatment. These attributes can be ranging from his experience to actual benefit from treatment. We present a methodology that complies with following objectives: Extracting intrinsic information from Patient as a Decision Maker Presenting a framework for evaluation of different treatment scopes for understanding Adherence behaviour **METHODS:** We present a framework of Flexible and Interactive Tradeoff (FITradeoff) approach that helps to extract partial information from patient based on a set of alternatives as per the additive model of Multi-Attribute Value Theory (MAVT). This gives an overall value to each treatment plan as assessed by a Patient as a Decision Maker. This value will be an approximation to their adherence behaviour as well. **RESULTS:** We tested our method on Data with patient treatment alternatives. Results generated provided an assessment and understanding mechanism for patient adherence behaviour. **CONCLUSIONS:** This method provides a unique decision support system which involves interaction with patients to better understand their adherence behaviour. A further extension to this wok can be optimizing the sets of questions that has to be asked to the Decision Maker.

USING PROPENSITY MATCHING AND IMPUTATION METHODS TO INTEGRATE PATIENT-REPORTED SURVEY DATA WITH ELECTRONIC HEALTH RECORDS IN TYPE 2 DIABETES

Lee LK[1], Liebert R[2], Gupta S[2], Flores NM[1], Haskell T[3]
[1]*Kantar Health, San Mateo, CA, USA,* [2]*Kantar Health, New York, NY, USA,* [3]*Kantar Health, Horsham, PA, USA*

OBJECTIVES: Electronic Health Records (EHR) data and patient-reported survey data have their own strengths and limitations. This study aimed to develop a method to integrate disparate datasets—patient-reported survey data with EHR data—to provide a more complete view of disease characteristics and health outcomes among patients with type 2 diabetes (T2D). **METHODS:** The two sets of data sources included: 1) data (2012 to current) from a large nationally representative US ambulatory EHR database and 2) data from the 2016 US National Health and Wellness Survey (NHWS), a nationally representative, self-administered, internet-based survey of adults (≥18 years). T2D patients were identified from NHWS if they self-reported a physician diagnosis of T2D. Adult T2D patients were identified in the EHR using diagnosis codes (ICD-9, ICD-10 and SNOMED codes), or text strings indicating T2D in the diagnosis field, or patients who had two or more prescriptions of oral antidiabetic medications or GLP-1 injections. Common variables between the two data sources included demographics (e.g., age, gender, ethnicity) and comorbidities (e.g., Charlson Comorbidity Index). A matching algorithm based on propensity to be in the NHWS data set was used to match patients from NHWS to those in the EHR, where predictors were the common variables. With the matched dataset, imputation was utilized to impute values of interest (e.g., HbA1c, health-related quality of life) where missing. **RESULTS:** A total of 3,347,750 patients with T2D were identified in the EHR and 4,113 patients with T2D were identified in NHWS. The mean age of the EHR sample was 64 years old and 58 years for the NHWS sample. The final matched sample included 12,399 patients with T2D (1:2 match). **CONCLUSIONS:** Using propensity matching and imputation methods, disparate datasets could be combined to provide a more informative dataset of patient and disease characteristics.

PRM64

EARLY ANALYSES OF NEWLY APPROVED DRUGS MAY PRODUCE BIASED CONCLUSIONS

Hess LM[1], Grabner M[2], Wang L[3], Liepa A[1], Cui ZL[1], Schelman W[1], Bowman L[1]
[1]*Eli Lilly and Company, Indianapolis, IN, USA,* [2]*HealthCore Inc, Wilmington, DE, USA,* [3]*HealthCore Inc., Wilmington, DE, USA*

OBJECTIVES: Real-world health care data are increasingly used to study the effectiveness of interventions in large, heterogeneous patient populations. It is important to understand what biases could arise in the analysis of real-world data collected shortly after a new treatment is introduced, especially in the design of comparative effectiveness research. **METHODS:** This retrospective cohort study used pharmacy and medical claims from the HealthCore Integrated Research Database. Eligible patients were age 18 years or older with a diagnosis of gastric or gastroesophageal junction cancer (GC) (ICD-9-CM code 151.xx) who received trastuzumab between January 1, 2010 and March 31, 2014. Patients were followed until censoring, death, or end of the data stream (July 31, 2014). Descriptive statistics were used to summarize trastuzumab use. Differences by year were evaluated using F-tests for continuous variables and $\chi 2$ tests for categorical variables. **RESULTS:** The 188 eligible patients had a mean age of 60 years; 81% were male; 52% received radiation therapy, and 34% had a resection or gastrectomy. These factors were not significantly different by year of trastuzumab initiation. However, there were statistically significant differences ($p<0.05$) in time between GC diagnosis and initiation of trastuzumab [e.g. mean (SD) 2010: 174 (128.2) days vs. 2013: 91 (96.4)] and trastuzumab line of treatment [e.g. n (%) first-line 2010: 10 (44%) vs. 2013: 45 (83%)]. **CONCLUSIONS:** Over time, trastuzumab, which was approved in 2010 for previously untreated HER2+ GC, migrated from later to earlier lines of therapy despite consistent patient demographic characteristics. Since treatment effectiveness may change across lines of treatment, bias may arise when comparing treatments used in a specific line of therapy. This potential bias associated with introductory clinical use in GC should be addressed via appropriate study design, statistical adjustments and careful interpretation of results.

USING RANDOM FOREST FOR RISK PREDICTION MODEL OF HOSPITALIZATION ASSOCIATED WITH CHRONIC OBSTRUCTIVE PULMONARY DISEASE

Nguyen T[1], Carlson AM[2], Heins-Nesvold J[3]
[1]*University of Minnesota, Minneapolis, MN, USA,* [2]*Data Intelligence Consultants, LLC, Eden Prairie, MN, USA,* [3]*American Lung Association of the Upper Midwest, St.Paul, MN, USA*

OBJECTIVES: Chronic obstructive pulmonary disease (COPD) is a progressive disease negatively impacting quality of life. It is highly associated with increased risk of hospitalization; however, this risk has not been extensively studied. This study proposes a model to predict risk of hospitalization and identifies important factors contributing to hospitalizations for COPD. **METHODS:** This study used a longitudinal retrospective cohort. Health care claims from a single, large self-insured employer group was used. The database included claims for more than 10,000 employees and their dependents from January, 2010 through December, 2012. Insured persons with COPD were identified using ICD-9 diagnosis codes defined by the Center for Disease Control and Prevention (CDC). Hospitalized patients were matched by gender with non-hospitalized patients at a ratio of 1:3. Classification Random Forest (RF), a machine learning technique, was used to predict risk of COPD hospitalization and determine associated risk factors. The RF model was run 10 times (total of 10,000 trees) with 31 variables identified from literature. **RESULTS:** 252 persons ≥18 years of age were identified with COPD. For the final RF analysis, 48 COPD patients with hospitalizations and 144 without hospitalizations were included. There were 100 (52.1%) men; average age was 46.9 years (SD=12.4); average Charlson comorbidity score was 2.5 (SD=1.4). The analytic group was randomly divided into training (80%) and validating (20%) data set. Probability of hospitalization was 0.26003. The mean AUC was 0.94, sensitivity of 0.73, and specificity of 0.96. Kappa statistic was 0.73. Outpatient visit, comorbidity status, age, and number of prescription claims were important factors for risk of hospitalization. **CONCLUSIONS:** This study used an innovative technique to identify risk factors associated with hospitalization for COPD. These findings suggest the use of early intervention and goal-directed therapy to improve patient outcome and patient management by reducing potentially preventable hospitalizations.

PRM66

META-ANALYZING TIME-SPECIFIC EVENTS USING COMPOUND POISSON PROCESS: THE CASE FOR POST-STROKE SEIZURES

Wang W, Devine B, Basu A
University of Washington, Seattle, WA, USA

OBJECTIVES: When number of events are reported over varying duration of times, meta-analyzing these data using a compound Poisson process can help generate a survival curve for these events with time-varying hazard. We identify the structural assumptions underlying these methods, determine the number of knots possible given the data, where hazard changes, and apply these methods to group-level data from the literature on incident seizures following stroke. **METHODS:** We searched PubMed and EMBASE for observational studies of post-stroke seizures from 1997 to 2016. We built a likelihood function based on a compound Poisson process that used different Poisson distribution across multiple overlapping intervals to model the counts of events. We divided 5 years into 3 intervals: within 7 days, from 8 days to 1 year, and from 1 year to 5 years after stroke. We compare this time classification to alternatives, which also include a constant hazard model over time using a single Poisson process or an exponential parametric model. Goodness-of-fit was demonstrated using AIC and BIC criteria. **RESULTS:** Our preliminary results, based on 12 studies published in the past 20 years suggest that the compound Poisson process with time varying hazard is the best model based on the lowest AIC and BIC, and the Poisson process with constant hazard is also better fitting than using a parametric survival approach. We found that hazard rate of seizures is 0.014, 0.023, and 0.173 for 3 intervals respectively: first 7 days, from 8 days to 1 year, and from 1 year to 5 years after stroke, indicating that the risk of seizure after stroke changes over time. **CONCLUSIONS:** The compound Poisson process could be a better way to meta-analyze count-data over different exposure periods, present the summary as survival curves that are readily interpretable by applied researcher and clinicians, and can spur meaningful clinical action.

PRM67

AN ACTIVE LEARNING ALGORITHM FOR EFFICIENT DEVELOPMENT OF EMULATORS OF COMPLEX MODELS, WITH AN APPLICATION IN PROSTATE CANCER SCREENING

Ellis AG, Trikalinos TA
Brown University, Providence, RI, USA

OBJECTIVES: Emulators are fast-to-evaluate statistical approximations of (typically computationally expensive) mathematical models (simulators). Using

emulators in lieu of simulators can speed up computationally expensive analyses. Emulators are developed using the output of simulators at specified input parameter values (design points). Developing well-performing emulators can require many design points, which becomes computationally expensive. We describe an iterative active learning (AL) algorithm to efficiently develop emulators. We explicate by developing emulators for a prostate cancer screening simulator (PSAPC). **METHODS:** The AL algorithm starts with a seeding set of design points and sequentially chooses additional design points in regions where (1) the simulator output is fast-changing and (2) the emulator predictions' variance is maximized. We developed one- and two-dimensional Gaussian Process-based emulators of the PSAPC using the AL algorithm versus using current standards (Latin Hypercube Sampling [LHS]). The simulator output was mean life-years saved with prostate-specific antigen based screening versus no screening. We compared the accuracy of emulators' predictions by calculating the maximum difference between the emulator prediction and the PSAPC (lower is better) and the emulator's 95% prediction volume (lower is better). **RESULTS:** The median maximum deviation in life-days saved between emulator predictions and the PSAPC were comparable between the AL emulators (one dimension: 0.008 [range: 0.006-0.024]; two dimensions: 0.217 [range: 0.171-0.234]) and LHS emulators (0.012 [range: 0.002-0.038], 0.201 [range: 0.079-0.441], respectively). Compared with LHS, performance results with AL had smaller variance. Furthermore, the AL algorithm improved the emulators' accuracy 25% faster per additional design point. Results were comparable with the other metric. **CONCLUSIONS:** In the example, compared with emulators trained with LHS, emulators trained with AL (1) attain comparable accuracy; (2) have smaller variance in their performance; (3) improve their performance faster per additional design point. Efficiency gains may be greater in (well-behaved) larger-dimensional problems.

PRM68

VALIDATION OF A TYPE 2 DIABETES MONTE CARLO MICRO-SIMULATION MODEL USING REAL-WORLD DATA

Murphy DR[1], Saundankar V[2], Perk S[1], Nair R[2], Yu X[1], Curtis BH[3], Tzeel A[4]
[1]Medical Decision Modeling Inc., Indianapolis, IN, USA, [2]Comprehensive Health Insights, Louisville, KY, USA, [3]Eli Lilly and Company, Sydney, Australia, [4]Humana Inc, Jacksonville, FL, USA

OBJECTIVES: To validate the Treatment Transitions Model (TTM) using real-world data **METHODS:** Patients with at least one medical claim for type 2 diabetes mellitus (T2DM) and one pharmacy claim for a non-insulin antidiabetic medication during the index period (January 2008 - August 2013) were identified from a large health plan claims database. The first claim for T2DM was set as the index date. Patients enrolled a year prior to the index date, and at least two years post-index, were included in this study. Based on treatment guidelines recommended by American Diabetes Association and European Association for the Study of Diabetes, four treatment escalation pathways were chosen. Baseline population characteristics including demographics and complication history were collected from the database retrospectively. These characteristics and trial-based treatment efficacies were used by the TTM to predict the incidence of diabetes-related complications during the post-index period, which was then compared to the incidence in claims data. **RESULTS:** Only one pathway – patients starting on one oral antidiabetic medication and escalating to three oral antidiabetic medications had a sufficient base sample size (n=296) to include in the analysis. Comparing the 2-year prevalence of diabetes-related complications predicted by TTM to those observed in the claims database revealed (respectively): retinopathy (11.5% vs. 18.9%), microalbuminuria (5.6% vs. 21.6%), peripheral neuropathy (33.4% vs. 38.5%), angina (20.0% vs. 36.8%), and stroke (13.8% vs. 19.3%). **CONCLUSIONS:** A key finding was that the treatment pathways recommended by the guidelines were not observed in real-world settings. The higher prevalence of complications in claims data than what was predicted by the model may indicate issues in interpreting diagnosis codes, or underlying issues in the population not originally observed in the baseline characteristics. Work is ongoing to refine the model and investigate gaps between real-world data and model predictions.

PRM69

APPROACHES TO STANDARDISING CARDIOVASCULAR RISK EQUATION END-POINTS IN ORDER TO FACILITATE THEIR INCLUSION WITHIN A TYPE 2 DIABETES MODEL

McEwan P[1], Foos V[2], Lamotte M[2]
[1]Health Economics and Outcomes Research Ltd, Cardiff, UK, [2]IMS Health, Zaventem, Belgium

OBJECTIVES: There are a number of published cardiovascular (CV) risk equations (RE) suitable for use in type 2 diabetes mellitus (T2DM) cost effectiveness (CE) models. Their inclusion is complicated due to the inconsistency of CV endpoints for which risk is estimated. The QuintilesIMS CORE Diabetes Model (CDM) applies a United Kingdom Prospective Diabetes Study (UKPDS) weighting algorithm to five CV risk equations to enable consistency in modelled CV events. The objective of this study was to describe the impact of the weighting algorithm on predicted total and incremental CV risk for a number of CV RE. **METHODS:** This study used the T2DM CV risk equations available in the CDM to estimate five-year risk of myocardial infarction (MI), stroke, ischemic heart disease (IHD) and congestive heart failure (CHF). The following risk equations were included: Swedish-National Diabetes Registry (S-NDR); ADVANCE (Global); FREMANTLE (Australian); ARIC (US) and PROCAM (Germany). A dynamic risk factor related weighting algorithm based on the five-year risk of MI, stroke, IHD and CHF derived from the UKPDS 68 RE was applied to standardize endpoints. Results were illustrated using a UKPDS baseline cohort profile. **RESULTS:** Predicted five-year cumulative CV risk using UKPDS 68 RE was 0.075 (52.3% of this risk was attributable to MI; 5.8% to stroke; 39.1% to IHD and 2.8% to CHF). Five-year CV risk for S-NDR was 0.038; ADVANCE 0.028; FREMANTLE 0.071; ARIC 0.212 and PROCAM 0.08. A 1% increase in HbA1c was associated with an increase in cumulative CV risk of 12.8% (UKPDS 68); 11.6% (S-NDR); 10.8% (ADVANCE); 12.3% (FREMANTLE); 0.5% (ARIC) and 0.5% (PROCAM). **CONCLUSIONS:** Approaches to standardizing endpoints predicted across CV RE facilitates their inclusion within T2DM economic models. This is particularly relevant given the appetite amongst health technology assessment groups to evaluate the sensitivity of predicted CE output to choice of RE.

PRM70

CAN IRELAND'S COLORECTAL SCREENING PROGRAMME SAVE MORE LIVES, SAVE MONEY AND LIVE WITHIN EXISTING COLONOSCOPY CAPACITY LIMITS? FINDINGS FROM THE MISCAN MICROSIMULATION MODEL

McFerran E[1], O'Mahony JF[2]
[1]Queens University Belfast, BELFAST, UK, [2]Trinity College Dublin, Dublin, Ireland

OBJECTIVES: Ireland's colorectal cancer screening programme, BowelScreen, offers biennial faecal immunochemical testing (FIT) for 60-69 year-olds. Screening sensitivity and specificity of FIT are adjusted by varying the test positivity threshold. BowelScreen uses a FIT cut-off of 225ng/ml of haemoglobin. Existing literature indicates that a lower cut-off of 50ng/ml would cost less and be more effective, but require more colonoscopies for positive screen findings, which is a key capacity constraint. The objective of this study was to determine if a more effective, less costly screening strategy exists within BowelScreen's current colonoscopy capacity requirements. **METHODS:** The MISCAN cancer screening model was used to simulate 144 strategies of varying screening intervals, age ranges and FIT cut-offs. Outputs estimated were net costs, quality-adjusted life-years (QALYs) and number of colonoscopies required. **RESULTS:** A combination of a reduction in the FIT cut-off to 50ng/ml, an extended screening interval of 3 years and a reduced screening start age of 55 saves 20% more QALYs, reduces costs by 7%, and yields a 17% reduction in colonoscopy requirements. **CONCLUSIONS:** Simple changes to BowelScreen could save lives, reduce costs and relieve pressure on colonoscopy capacity.

PRM71

DEVELOPMENT OF A DEPENDENCE SCALE-BASED COST-EFFECTIVENESS FRAMEWORK TO ASSESS THE VALUE OF ALZHEIMER'S DISEASE TREATMENTS

Roth JA[1], Cohen JT[2], Neumann PJ[2], Zhu CW[3], Stern Y[4], Sullivan SD[5]
[1]Fred Hutchinson Cancer Research Center, Seattle, WA, USA, [2]Tufts Medical Center, Boston, MA, USA, [3]Icahn School of Medicine at Mount Sinai, Bronx, NY, USA, [4]Columbia University, New York, NY, USA, [5]University of Washington, Seattle, WA, USA

OBJECTIVES: Healthcare payers must compare the value of alternative Alzheimer's Disease (AD) treatments, but existing modeling frameworks are limited and focus primarily on delay to institutionalization. The Dependence Scale (DS) reflects the level of assistance AD patients require and is associated with AD progression (across cognitive, functional and behavioral domains), health-related quality of life (HRQOL), and direct medical and non-medical expenditures. Nonetheless, there are no established DS-based cost-effectiveness analysis (CEA) frameworks. We endeavored to fill this gap. **METHODS:** We developed a probabilistic state-transition simulation model that projects long-term cost-effectiveness based on DS changes. The model relates DS to HRQOL and cost using findings from Guo (2014) and Zhu (2015), respectively. The relationship between DS and mortality can be toggled, facilitating analysis of indirect treatment effects on survival. Outcomes include AD progression, life years, quality-adjusted life years (QALYs), and costs related to medication, inpatient and outpatient care, and informal caregiver time. To illustrate a model application, we evaluated a hypothetical oral agent for mild AD (baseline DS=3) that halves the DS progression rate while taken, is discontinued at a DS$\geq$10, costs \$500/month, and doesn't impact mortality. Additional scenarios will be explored. **RESULTS:** Over a lifetime, monthly AD progression averaged 0.022 DS points (new treatment) and 0.045 DS points (standard care). The new treatment added 0.25 QALYs and increased costs by \$19,200. Most of this cost increase reflects the new drug (\$36,400); the biggest cost offsets were reduced caregiver time (-\$12,300) and inpatient care (-\$2,900). The hypothetical treatment was cost-effective in 14%, 52%, and 83% of simulation runs at willingness-to-pay thresholds of \$50,000, \$75,000, and \$100,000 per QALY gained. **CONCLUSIONS:** Our DS-based modeling framework provides a new approach to evaluate the long-term comparative-effectiveness and cost-effectiveness of alternative AD strategies using an increasingly common trial endpoint associated with HRQOL and cost.

PRM72

COMPARISON OF COST-EFFECTIVENESS ACCEPTABILITY CURVES (CEAC) IN MODELED ANALYSES WITH AND WITHOUT ESTABLISHED HETEROGENEITY OF PATIENT CHARACTERISTICS

Foos V[1], McEwan P[2], Lamotte M[1]
[1]IMS Health, Zaventem, Belgium, [2]Health Economics and Outcomes Research Ltd, Cardiff, UK

OBJECTIVES: The analysis of cost-effectiveness acceptability curves (CEAC) represents a method to describe the uncertainty around incremental cost-effectiveness ratios (ICERs) in cost effectiveness analyses (CEA). CEAC are derived from the distribution of simulated incremental cost and effect pairs on the ICER plane (scatter plot). Modeled CEA are commonly conducted by projecting mean patient profiles. However, real life populations are heterogeneous which should be reflected in the modeling. This is especially relevant since patient heterogeneity considerably impacts on the distribution of cost effectiveness pairs in the ICER scatter plot and consequently on CEAC predictions. The objective of our study was to quantify differences in CEAC predictions with and without established patient heterogeneity within a hypothetical CE scenario. **METHODS:** Lifetime analyses comparing the CE of metformin+sulphonylurea (M+S) versus metformin + DPP-4 (M+D) was undertaken using the QuintilesIMS-CORE-Diabetes-Model (CDM). Patient baseline characteristics were obtained from NHANES and applied in the model in terms of mean inputs (ignoring heterogeneity) (A), random sampling of baseline characteristics (B) and via projection of individual NHANES patient level

data (PLD) profiles (C). Efficacy data for dual therapy was sourced from a published mixed treatment comparison; HbA1c and BMI change of -0.8% and 0.199kg/m2 (M+D) and -0.79% and 0.707kg/m2 (M+S), respectively, were applied. Discounting was applied at 3.0%. **RESULTS:** CEAC from mean projections (A) demonstrated an 8.2%, 26.2%, 37.4% and 42.4% cost-effectiveness likelihood for M+D vs. M+S for willingness-to-pay thresholds of $25,000, $50,000, $75,000 and $100,000 USD, respectively. This compared to 18.7%, 26.8%, 33.2% and 38.4% in analyses that applied random sampling of patient baseline characteristics (B) and 9.3%, 14.3%, 21.1% and 26.6% in analyses that projected individual PLD profiles (C). **CONCLUSIONS:** Failure to accommodate patient heterogeneity in CEA can significantly distort CEAC and may lead to erroneous interpretations of cost effectiveness.

PRM73

PREDICTION OF HYPOGLYCEMIA RISK AMONG PATIENTS WITH TYPE 2 DIABETES (T2D) USING AN ENSEMBLE-BASED, HYPOTHESIS-FREE PROCEDURE

Thai N[1], Wei LJ[2], Alas V[1], Khalil I[1], Berhanu P[3], Dalal MR[4], Sung J[3]
[1]GNS Healthcare, Cambridge, MA, USA, [2]Harvard School of Public Health, Boston, MA, USA, [3]Sanofi U.S., Inc., Bridgewater, NJ, USA, [4]Millennium Pharmaceuticals, Inc., a wholly owned subsidiary of Takeda Pharmaceutical Company limited, Cambridge, MA, USA

OBJECTIVES: To develop and validate a predictive model for 12-month hypoglycemia risk in adults with T2D using an ensemble-based, hypothesis-free, predictive-modeling approach. **METHODS:** Data were collected retrospectively for the period January 2008-December 2013 from the Truven Health MarketScan® Commercial, Medicare Supplemental, and Laboratory databases. Eligible participants were ≥18 years with T2D, and had a first pharmacy claim for an antidiabetes medication (index date) and continuous 18-month enrollment (6 months pre- and 12 months post-index). Baseline patient characteristics were collected during the pre-index period. Hypoglycemia events in the post-index period were identified via ICD-9 diagnosis codes or a blood glucose measure ≤70 mg/dL (Level 1 hypoglycemia according to 2016 ADA/EASD guidelines). Bayesian model averaging was via Markov Chain Monte Carlo sampling across the posterior distribution of model probabilities. This results in an ensemble of predictive models to examine the association of patients' baseline characteristics and hypoglycemia risk. **RESULTS:** An ensemble of 128 predictive models for 12-month hypoglycemia risk was sampled from the posterior distribution of model probabilities based on data from 558,963 eligible participants. Overall, 5,823 patients (1.0%) had ≥1 hypoglycemia event captured during 12-months' follow-up. The most probable predictors of hypoglycemia included prior hypoglycemia, older age (≥75 years), insulin use, sulfonylurea use, mood disorders, and high baseline healthcare utilization and costs. C-statistics were used to select the most accurate logistic regression model in a validation dataset (C-statistic=0.73). In a held-out sample that was used to test the likely accuracy of the model, participants were classified into two annual hypoglycemia-risk groups: ≤5.0% or >5.0%. The mean estimated hypoglycemia risk of the ≤5.0% group was 1.3% (95% CI 1.2-1.4%); the mean risk estimate of the >5.0% group was 14.0% (95% CI 12.5-15.6%). **CONCLUSIONS:** Predictive modeling was successfully used to identify 12-month hypoglycemia risk and predictors of hypoglycemia in adults with T2D.

PRM74

EFFECT OF DURATION OF FOLLOW-UP ON CALCULATING MULTIPLE MYELOMA TREATMENT PROBABILITIES USING INCIDENCE DENSITY RATIOS

Kozma CM[1], Slaton T[1], Maiese EM[2]
[1]CK Consulting Associates, LLC, Saint Helena Island, SC, USA, [2]Janssen Scientific Affairs, LLC, Horsham, PA, USA

OBJECTIVES: To evaluate how variation in duration of follow-up affects the predicted probability of initiating multiple myeloma (MM) lines of therapy (LOTs) when using incidence density ratios (IDRs). **METHODS:** A U.S. administrative claims database was used to identify adult patients with ≥2 MM diagnoses who received ≥1 MM treatment ≤90 days of their MM diagnosis (first MM treatment = index) with insurance eligibility 24-months pre-and ≥3-months post-index. Patients were excluded if they had MM treatment pre-index, non-MM chemotherapy, pregnancy-related codes or an HIV diagnosis. LOTs were defined as each occurrence of: stem cell transplant, a ≥60-day gap in treatment, retreatment, or change in MM therapy. Generalized linear Poisson models were used to estimate IDRs (per person-year of observation), predicting the percentage of patients with 2, 3 and 4 LOTs at 6-month observation intervals for 5 years. **RESULTS:** A total of 4,987 MM patients were included in this analysis. At six months of observation, the estimated percentage of patients (i.e. the IDRs) with 2, 3 and 4 LOTs per person-year of observation was 40.4%, 4.6% and 0.5%, respectively. At five years of observation, the IDRs for patients with 2, 3 and 4 LOTs per person-year of observation were 19.9%, 9.4% and 4.5%, respectively. If only 6-months of observation is used to calculate IDRs, the probability of having a second LOT is 203% (40.4%/19.9%) greater than calculation using 5-years of observation. Stability of estimates did not occur until approximately 3.5 years after initiation of LOT 1. **CONCLUSIONS:** Economic models using treatment probabilities based on IDRs should be evaluated to ensure the duration of time over which the values are calculated is consistent with the characteristics of the disease and population being modeled. Failure to utilize an appropriate length of follow-up may result in significant estimation error.

PRM75

USE OF RELATIVE RISK RATIOS TO PRESENT UNCERTAINTY IN MICROSIMULATION MODELS WITH MULTIPLE COMPARATORS: AN APPLICATION TO BREAST CANCER SCREENING STRATEGIES

Shih YT, Doug W, Xu Y, Yu S
The University of Texas MD Anderson Cancer Center, Houston, TX, USA

OBJECTIVES: Microsimulation is the preferred modeling approach to assess comparative effectiveness and cost-effectiveness of cancer screening strategies. These models often involve multiple comparators from strategies formed by a combination of initiation/cessation age and screening intervals. Using probabilistic analysis to present findings in models with multiple comparators is challenging because the probability of cost-effectiveness not only depends on the relative costs and screening effectiveness among alternative strategies but also is sensitive to the number of comparators in the model. **METHODS:** We developed a microsimulation model to compare the cost-effectiveness mammography screening strategies for average-risk women. Scenario A includes 10 strategies covering guidelines from three professional societies with three cessation ages (75/80/none), plus the no-screening option. Scenario B expands to 28 strategies by varying initiation (40/45/50), cessation (75/80/none) age, screening intervals (annual/biennial), and hybrid strategies that transition from annual to biennial. We obtained clinical parameters from the literature or statistical modeling (e.g., age-dependent sojourn time) and cost inputs from Medicare fee schedule and analyzing SEER-Medicare data. To address uncertainties, we ran 100 repetitions of the model, each simulating individual woman's lifetime natural history for a birth cohort of 100,000. Simulation results were converted to relative risk ratios (RRR) using multinomial logistic regressions. **RESULTS:** At $100,000/QALY willingness-to-pay, Scenario A showed the most cost-effective strategy (annual 45-54, biennial 55-75) had 31% chance to yield the highest net benefit, whereas the probability reduced to 19% for the most cost-effective strategy (biennial 40-75) in Scenario B. Using the next-best strategy as the base category, multinomial model showed that the most cost-effective strategy was 1.15 and 1.36 times more likely to yield the highest net benefit in Scenario A and B, respectively. **CONCLUSIONS:** Presenting uncertainty in RRR can mitigate trends toward a lower probability for the most cost-effective strategy in models with a larger number of comparators.

PRM76

PREDICTING THE RISK OF DIABETIC RETINOPATHY USING ARTIFICIAL NEURAL NETWORK AND BIG DATA IN HEALTHCARE

Wang B[1], Shi R[2]
[1]Ivy Analytics LLC, Garnet Valley, PA, USA, [2]Kang Chiao International School, Shanghai, China

OBJECTIVES: In this study, we used artificial neural network—a popular data mining tool, to build a predictive model for risk of diabetic retinopathy. We compared its performance with Logistic regression in terms of their discrimination capacity. **METHODS:** National Health and Nutrition Examination Survey (NHANES) data was used in this study. Participants with a diabetes diagnosis and a known retinopathy status (yes/no) were included. Two models were built using training sample: artificial neural network and logistic regression. We used these two models to predict the risk of diabetic retinopathy in the testing sample. Receiver operating characteristic (ROC) were calculated and compared for these two models for their discrimination capability. **RESULTS:** A total of 757 patients were recruited and 21.5 % had retinopathy. A random sample of 400 was chosen as the testing sample and the rest was used as the training sample. The Area Under the Curve (AUC) is about 0.75 for training sample according to above logistic regression, meaning that a randomly selected individual from the positive group has a test value larger than that for a randomly chosen individual from the negative group 75 percent of the time. After logistic regression and network analysis were conducted in the training sample, we used the outputs from both models to predict the likelihood in the testing sample (N=400). The areas under the receiver operating characteristic curves were 0.72 and 0.73 for the logistic model and the neural network, respectively. There were no significant differences in predictive ability between the approaches. **CONCLUSIONS:** This study suggests that it is possible to develop a reproducible and transportable predictive instrument for diabetes patients with retinopathy complication. In our research, both logistic regression and neural network models did a good job of predicting the risk for retinopathy complication.

PRM77

FORECASTING DRUG DIFFUSION IN THE US COMMERCIAL INSURANCE MARKET

Rosen MM
University of Washington, Seattle, WA, USA

OBJECTIVES: The aim of this research was to develop a model that consistently predicts diffusion patterns for oral prescription drugs used to treat cardiovascular conditions. **METHODS:** This study used 2007-2014 the MarketScan Commercial Claims and Encounters Database, which includes claims from privately insured individuals. Additional information related to characteristics of eight drugs with indications for either hyperlipidemia, diabetes mellitus, type 2, hypertension or DVT/pulmonary embolism treatment was collected from the U.S. Food and Drug Administration (FDA) and the Pharmaprojects Citeline Database. The analysis was restricted to new molecular entities that were launched during the study period of 2008-2013 and patients over the age of 18 who were prescribed at least one of these medications. Limited dependent variable regressions were used to model the diffusion of selected drugs with cardiovascular indications as measured by patient utilization over time. Drug-related covariates and patient-level demographic characteristics were used to estimate the number of patients who receive a drug. Covariates included measures related to the strength of clinical evidence and risk/benefit recommendation for a treatment, the number of competitors at launch, and how innovative a drug was at launch. **RESULTS:** Findings suggest that the number of patients with an indicated diagnosis is the most significant overall predictor of diffusion in a commercially insured population regardless of therapy. However, models predicting diffusion at different points in time show that some factors are more significant than others depending on whether diffusion is forecasted from launch or at six, 12, or 24 months. **CONCLUSIONS:** Demand-based forecasting of the expected market share for new products is a common internal practice within the pharmaceutical industry. However, little information is publically available about the models used to estimate diffusion. Understanding the rate at which drugs diffuse could help to inform healthcare budgets.

PRM78

NON-PROPORTIONAL HAZARDS. EXTRAPOLATING RELATIVE TREATMENT EFFECTS BEYOND OBSERVED DATA WITH CANCER IMMUNOTHERAPIES

Bryden P, Paracha N, Gsteiger S
F. Hoffman-La Roche, Basel, Switzerland

OBJECTIVES: The use of extrapolation in cost-effectiveness analysis (CEA) is essential to estimate costs and benefits of treatments over a lifetime. Typically, parametric equations are used to extrapolate a 'baseline' comparator with relative treatment effects applied to obtain absolute values for all interventions. An assumption of proportional hazards (PH) is common in oncology, but may fail with cancer immunotherapies. **METHODS:** We conducted a systematic literature review and a fractional polynomial (FP) network meta-analysis (NMA) of second-line metastatic non-small cell lung cancer randomised controlled trials. We used a log-logistic distribution to model atezolizumab overall survival data and applied time varying hazard ratios (HR) from the FP NMA. While FPs can be estimated over an observed period, polynomials may not extrapolate well. Naïve extrapolation to a lifetime horizon could be difficult to justify without clinical evidence. We explored the effects on five comparators; nivolumab (3mg/kg), pembrolizumab (2mg/kg), atezolizumab (1,200mg), docetaxel and nintedanib plus docetaxel with three scenarios: increasing HRs without capping, capping HRs at 12 months and using the PH NMA HR estimate from 12 months onwards. **RESULTS:** A first order FP model with P1=0 (Weibull) was selected. The HRs for docetaxel and nintedanib plus docetaxel versus atezolizumab increased over the time scale of one week to 12 months; 0.81 to 1.57 and 0.79 to 1.44, respectively. Nivolumab and pembrolizumab did not show evidence to dismiss a PH model over time compared to atezolizumab. The mean overall survival for docetaxel was 1.24, 1.36 and 1.48 years for the increasing HR, capped at 12 months and using the PH NMA estimate (1.39) from 12 months, respectively. **CONCLUSIONS:** Incorporating time varying HRs into a CEA needs care and involves considerations beyond simple statistical measures of fit. This example demonstrates using PH HRs over extrapolated data may not be reasonable between immunotherapies and chemotherapies.

PRM79

EVIDENCE SYNTHESIS FOR DIAGNOSTIC TESTS WITH PARTIALLY ORDERED PERFORMANCE AND NO REFERENCE TEST

Forbes SP[1], Di M[1], Salomon J[2], Linas BP[3], Trikalinos TA[1]
[1]Brown University, Providence, RI, USA, [2]Harvard University, Boston, MA, USA, [3]Boston Medical Center, Boston, MA, USA

OBJECTIVES: We develop evidence synthesis models for obtaining sensitivity and specificity of diagnostic tests from independent studies, when the true disease status is unknown. To explicate, we estimate the performance of tuberculin skin test (TST) and interferon-gamma release assays (IGRA) to diagnose Latent Tuberculosis Infection (LTBI) for a cost-effectiveness analysis of screening of immigrants for LTBI. **METHODS:** We develop a Bayesian hierarchical random effects model that (1) treats the unobserved disease status (LTBI) as a latent variable; (2) allows for between-study heterogeneity in disease prevalence and in the sensitivities and specificities of tests (TST, IGRA); (3) accounts for threshold effects across studies; (4) accommodates covariates; (5) allows test results to be correlated conditional on disease status. The model also (6) allows for partial ordering of test performance, because information elicited from nine context experts, suggests that IGRA cannot have worse specificity that TST. While for each study the model has more parameters than independent data points, identification is attained and estimation becomes possible through "borrowing of strength" across studies, and from the expert-provided ordering of the specificities. **RESULTS:** We obtain estimates for LTBI prevalence and the sensitivities and specificities of TST and IGRA for 12 scenarios defined by whether immigrants come from a country with high tuberculosis incidence; have had BCG vaccination; have chronic diseases; have HIV infection; or are 30 versus 50 years old. For an example scenario of 30-year-old immigrants not from a high-incidence country, without history of BCG vaccination, without TB case contact, or diseases, the median of the posterior densities for the sensitivities of TST and IGRA are 0.75 and 0.85, respectively. **CONCLUSIONS:** We developed a meta-analysis model that estimates test performance measures in the absence of a gold standard, which is a very common situation in decision and economic analyses of test-and-treat strategies.

PRM80

MODELING THE IMPACT OF EXOGENOUS BOOSTING ON HERPES ZOSTER: AN UPDATED METHODOLOGICAL REVIEW OF THE VARICELLA ZOSTER VIRUS LITERATURE

Talbird SE[1], La EM[1], Mauskopf J[1], Krueger WS[1], Altland A[2], Daniels VJ[3], Pillsbury M[2], Wolfson LJ[2]
[1]RTI Health Solutions, Research Triangle Park, NC, USA, [2]Merck & Co. Inc., Kenilworth, NJ, USA, [3]Merck & Co., Inc., Kenilworth, NJ, USA

OBJECTIVES: Historically, mathematical models of the impact of universal childhood varicella vaccination (UVV) have used limited data to capture effects of exogenous boosting (EB). EB posits that cell-mediated immunity (CMI) is boosted for individuals re-exposed to varicella zoster virus (VZV), leading models to often conclude that UVV will cause a temporary herpes zoster (HZ) increase. Our objective was to update a previous literature review (Ogunjimi et al., 2013) to summarize any new evidence from observational or modeling studies related to EB and its parameterization. **METHODS:** Electronic searches of two databases and seven congresses were performed using the previous review's published search strategies. Identified studies were screened to determine inclusion eligibility and to identify additional sources. Data on observational study designs and mathematical model structures, EB frameworks, and HZ-related parameter values were abstracted, with results synthesized. **RESULTS:** The updated review identified 29 additional studies. Among 17 observational studies, 8 analyses included both pre- and post-UVV data in 4 countries. Most analyses (n=6) reported pre-UVV increases in HZ incidence, making it difficult to attribute post-UVV increases to UVV versus other causes. Among 12 modeling studies, various EB frameworks were considered, ranging from no EB to full permanent immunity; the progressive immunity framework (i.e., CMI increases for a proportion of VZV exposures and accumulates after each exposure) best captured EB based on statistical fit to real-world pre-UVV data. HZ-related parameter values varied widely by study/country, even for biologically-based parameters (e.g., CMI duration); assumed HZ-related parameter values for vaccinated individuals were similar. Other key factors affecting post-UVV HZ incidence included population contact patterns, demographic changes over time, and pre-UVV HZ incidence. **CONCLUSIONS:** New methods for incorporating EB into mathematical models may better capture EB than previous approaches, although further research on the biological processes and resulting effects of EB on HZ incidence is needed.

PRM81

ESTIMATION OF INJECTABLE DRUG STRENGTH FROM INSURANCE CLAIMS DATABASE

Wang G[1], Wang J[2], Wu X[3], Lorie J[4], Lee E[3]
[1]Janssen IT, Spring House, PA, USA, [2]Janssen Pharmaceuticals Inc., Titusville, NJ, NJ, USA, [3]Janssen IT, Titusville, NJ, USA, [4]Janssen Pharmaceutical Inc, Raritan, NJ, USA

OBJECTIVES: Drug strength for injectable drugs is not commonly captured in Medical or Pharmacy claims database but an important factor for understanding drug compliance, persistency and length of therapy. This study is to build a model to estimate the injectable drug strength from Insurance Claims Database. **METHODS:** Total ~700k Lupron scripts from 6117 Prostate Cancer patients from the Truven MarketScan Commercial Claims and Encounters (CCAE) and Medicare Claims (MDCR) from 2000 to 2016 were used in the analysis. 35,058 scripts with drug strength information are used to build the prediction model. Both Logistic Regression and General Linear Regression model were tested. Physician specialty, type of benefit plan, geographic region of employee residence and employment status and employee classification, total drug cost and treated year are evaluated in the model. Model performance is evaluated by error rate from 10-fold cross validation. The predicted Lupron strength was also compared with the simple imputation based on total drug cost in the context of compliance rate and length of therapy. **RESULTS:** Among 6117 patients treated with Lupron, 22.5mg regiment is most scripted. General Linear Regression model perform better with an error rate of 0.09. By comparing the results from no imputation, simple imputation and model based imputation, the results revealed that simple imputation is over estimating in drug strength and model based imputation is close to the actual observed data. Calculated mean of compliace rate and length of therapy for non-imputation,simple imputation and model based imputation is 89% and 18.59 months, 94% and 20.17 months, 86% and 18.38 months, respectively. **CONCLUSIONS:** Many injectable scripts are missing drug strength information from Insurance Claims database, using model-based prediction, drug strength can be estimated more accurately using factor such as drug total cost, treated year and other associated factors.

PRM82

ESTIMATING THE IMPACT OF CHANNELING BIAS ON REAL-WORLD SURVIVAL IN ADVANCED CANCER

Wiecek W[1], Amzal B[2], Casciano R[3], Karcher H[1]
[1]LASER Analytica, London, UK, [2]LASER ANALYTICA, London, UK, [3]LASER Analytica, New York, NY, USA

OBJECTIVES: To estimate the comparative effectiveness in terms of overall survival (OS) of an advanced cancer treatment (immuno-therapy A) against established comparators B and C. Medical experts expected a channeling bias for product A at launch, towards patients with the worst OS prognostics. **METHODS:** Phase 3 clinical trials reported OS hazard ratio (HR) of 1.6 [1.4, 1.9] for A vs B and 2.1 [1.9, 3.2] for A vs C. The distributions of OS prognostic in the real-world population at treatment initiation for the active comparators, and how they would differ for product A at launch, were elicited from experts as proportions of patients with favorable, intermediate or unfavorable prognostic. A Bayesian model was built in HOPE, a new tool for predicting real-life comparative effectiveness. The model was based on patient-level Phase 3 clinical results on OS and trial patient characteristics, including their survival prognostic at treatment initiation. It accounted for competing risks of biological progression and toxicity events on the risk of death over time. Two scenarios, with and without channeling effect, were simulated. **RESULTS:** The model with channeling bias returned mean estimates of median survivals that were almost equal: 15.7, 15.0, 15.6 months for treatments A, B and C, respectively, whereas the medians in the absence of channeling were 16.8, 14.6 and 13.4 months, respectively. The impact of channeling at launch of A for the three products was estimated as the difference between these means. **CONCLUSIONS:** The HOPE software allowed for rapid prediction and visualisation of real-life survival outcomes by automatically combining clinical trial data and expert opinions on patient distributions in a single model. The simulation allowed for estimating the magnitude of post-launch channeling effects of a new cancer treatment.

PRM83

A CRITICAL APPRAISAL OF THE USE OF MARKOV MODELLING APPROACHES IN ECONOMIC MODELS OF ANXIETY

Olariu E, Mbanya Z, Fox D, Ratcliffe M, Longworth L
PHMR Ltd, London, UK

OBJECTIVES: To assess the strengths and limitations of Markov modelling approaches for assessing the cost-effectiveness of treatments for anxiety based

on a review of the published literature. Anxiety disorders have a high rate of chronicity with a recurrence rate of almost 23.5% in patients who have remitted. The effectiveness of treatment is highly dependent on patients' previous history and characteristics. Even though Markov models are among the most established and accepted approaches for decision modelling in Health Technology Assessments (HTAs), it is unclear whether they are adequate for modelling the complexities of anxiety disorders. **METHODS:** We performed a targeted literature search for published Markov models designed to assess the cost-effectiveness of treatments for anxiety disorders in the following databases: NHS Economic Evaluations Database, Medline and Medline In-process and Embase. One reviewer assessed articles for eligibility and included only studies that reported results for Markov models developed for adults with anxiety disorders. Anxiety disorders were defined using DSM-V criteria. Models were critically appraised according to standard checklists and de novo criteria developed to assess their applicability to anxiety. **RESULTS:** Our searches retrieved 164 hits. 23 articles were reviewed at full-text and four articles met the inclusion and exclusion criteria. The models assessed the cost-effectiveness of specific drugs (two studies), psychotherapy (one study) or combinations of both (one study) in generalized anxiety disorders, panic disorder and social anxiety disorder. The results of the quality assessment were mixed. Most of the identified Markov models did not adequately reflect the increased risk of recurrence based on patients' history of prior relapse and sociodemographic characteristics. **CONCLUSIONS:** Most of the identified Markov models for anxiety disorders have a limited ability to capture the increased risk of recurrence associated with previous anxiety experience.

PRM84

HERPES ZOSTER VACCINE EFFECTIVENESS AND WANING OF EFFECTIVENESS

Johnson KD[1], Jiang Y[2], Weiss T[1], Graham J[3]
[1]Merck & Co., Inc., Kenilworth, NJ, USA, [2]Merck Sharp & Dohme Limited, Hoddesdon, UK, [3]RTI Health Solutions, Durham, NC, USA

OBJECTIVES: Synthesize all available clinical data on the herpes zoster (HZ) vaccine, and determine the best model from which to predict the vaccine effectiveness and waning of effectiveness for the HZ vaccine based on age and time since vaccination. **METHODS:** A targeted search of PubMed and Google was performed. The search was limited to literature between January 2006 and December 2016. Literature eligible for inclusion were peer-reviewed papers in scientific journals, conference abstracts and posters. **RESULTS:** Six models for the HZ vaccine were produced to estimate the waning of effectiveness. All studies used HZ incidence among vaccinated vs. unvaccinated populations as measures of effectiveness. Four are based on the models presented in Li et al. (2015) clinical study data. One is based on the Long-Term Persistence Study (LTPS) clinical data in Morrison et al. (2015) as modeled by Le and Rothberg (2015). The sixth model is based on the findings of Baxter et al. (2015), real world data from Kaiser Permanente Northern California. These data represent up to 8 years of patient follow up and includes over 400,000 vaccinated patients. One model from Li et al. predicted a drop in effectiveness in year 2 but with slower waning in subsequent years. A second model from Li et al. predicted that vaccine effectiveness over time is similar in all 60+ age groups. Both of these models are consistent with the model based on data from Baxter et al. **CONCLUSIONS:** Cost-effectiveness results for herpes zoster prevention is highly dependent on age at vaccination and the waning of effectiveness for the HZ vaccine. Based on the evidence for real world effectiveness against zoster for the HZ vaccine, we recommend utilizing the data from Baxter et al. to predict effectiveness and waning for individuals being vaccinated with the HZ vaccine.

PRM85

USE OF MUTUAL INFORMATION THEORY IN BUILDING A PREDICTIVE MODEL FOR ANKYLOSING SPONDYLITIS DIAGNOSIS

Garges C[1], Shukla O[2], DeFreitas F[1], Park Y[3], Deodhar A[4]
[1]HVH Precision Analytics, King of Prussia, PA, USA, [2]HVH Patient Precision Analytics, LLC, King of Prussia, PA, USA, [3]Novartis Pharmaceuticals, East Hanover, NJ, USA, [4]Oregon Health & Science University, Portland, OR, USA

OBJECTIVES: Mutual Information (MI) metrics can be utilized to identify predictive patterns obscured by the volume of data in claims databases. MI measures shared content between two data samples and quantifies the relevance of each predictor to a diagnosis. Predictors are classified by predictive ability and reliability, and analysis repeated. Each iteration eliminates predictors and changes ranking. Iterative optimization eventually defines the most effective predictive model. Many US patients with ankylosing spondylitis (AS) experience a 7 to 13-year delay before correct diagnosis. Delayed diagnosis and treatment contribute to considerable economic, physical, and psychological burdens on patients, caregivers, physicians, and society. Thus, we aim to develop a predictive model for AS based on sequence and timing of diagnostic, procedure, prescription, and provider (DPPP) codes observed in histories of patients with AS diagnosis to aid in earlier identification of AS patients. **METHODS:** Data for this retrospective cohort study were extracted from de-identified US claims from over 182 million people from January 1, 2006 through September, 2015. Study population comprised patients with AS diagnosis (ICD-9-CM 720.0). For each AS patient, a minimum of 10 patients without AS matched by age, gender, enrollment period, and geographic region were randomly selected from the same database. MI was applied to identify DPPP codes that differentiate AS from the matched-control population. Combinations of DPPP codes were ranked by MI value (high MI indicates higher relevance to AS diagnosis) to determine predictors. **RESULTS:** Claims histories of 12,162 AS diagnosed patients and 121,620 matched-controls were analyzed to build a proof of concept predictive risk model that separates AS patients from matched-controls. A total of 12,678 features were analyzed and 150 classifiers were built (with 3-fold cross-validation). **CONCLUSIONS:** Additional modifications and vigorous validation of the proof of concept predictive model will be made to enhance clinical relevance and practicality.

PRM86

RATIONAL COMPUTER ASSISTED DESIGN FOR THE STUDY OF ACUTE TOXICITY OF LOCAL ANESTHETICS

Amirkulova M[1], Seitaliyeva A[1], Satbayeva E[1], Ananyeva L[1], Tilekeeva U[2]
[1]Asfendiyarov Kazakh National Medical University, Almaty, Kazakhstan, [2]Kyrgyz State Medical Academy, Bishkek, Kyrgyzstan

OBJECTIVES: Comparing study of acute toxicity of new synthesized piperidine derivative after a single dose and by the use of Computer Assisted Design. Nowadays the use of traditional methods of study of acute toxicity is severely limited, according to the humanization of experimental studies. In these conditions, Computer Assisted Design/CAD is more applicable, when computer recreates the structure of the chemical in a three-dimensional image. **METHODS:** in the Institute of Chemical Sciences synthesized new derivatives of piperidine under laboratory code MAB118, MAB121, MAB124, MAB129, MAB130, MAB131, MAB134. Acute toxicity was studied by traditional methods: intraperitoneal, subcutaneous injection of 4% water solutions of local anesthetics to white mice of both sexes where used. Toxicity assessment was carried out on the base of LD50 rate. The calculation of quantum chemical parameters was carried out by semiempirical Hartree-Fock method with the assistance of a calculation program MOPAC 6. **RESULTS:** The results of the calculations of LD50 allow to select group of low toxicity (MAV 121, 129 MAV, MAV, 130, MAB134) and moderate toxicity (MAV 118, MAV, 124, MAB131) compounds. Analysis of the relation between the toxicity and quantum-chemical characteristics was performed using Computer Assisted Design. Low-toxic compounds were characterized by: high level of stability in the form of neutral molecules, due to the negative values of heat of formation and full of energy, combined with a relatively low reactivity, evidenced by the positive dipole moment. Compaund with moderate toxicity form a neutral molecule and H-cation, with H-cation significantly less stable than H-cation of low-toxicity compounds, as well as lower dipole moment. Compaund with moderate toxicity are less reactive than low toxicity ones. **CONCLUSIONS:** The results indicate the possibility of applying the parameters of quantum chemistry and molecular mechanics to predict the toxicity of derivatives of piperidine and optimization of primary screening

PRM87

EXPLORING PYTHON FOR USE IN MODELING: DECREASING RUN-TIMES FOR PROBABILISTIC SENSITIVITY ANALYSIS

Stokes ME[1], Quon P[2]
[1]Evidera, St-Laurent, QC, Canada, [2]Evidera, Bethesda, MD, USA

OBJECTIVES: Python was released in 1991 as a general-purpose programming language. Its use for scientific computing in industry and academic research has increased significantly in recent years. We discuss using Python in health economic modelling and, in particular, the advantages associated with its powerful multi-dimensional array object through various practical examples including a probabilistic sensitivity analysis (PSA). **METHODS:** A fictional model was explored comparing two drugs for prevention of moderate and severe manifestations of a hypothetical disease. The model and PSA were implemented in NumPy, a fundamental package which extends the Python core language for scientific computing. The algorithm stores data in a 3-dimensional (d) array with the first two axes corresponding to model health states and cycles, respectively. The third axis represents a unique simulation where input parameters are varied randomly according to appropriate probability distributions. The 3-d nature of the array allows for simultaneous calculation and storage of many different versions of the model. **RESULTS:** In this fictional model with 5 disease states and 40 cycles, a PSA with 1,000 simulations in Python has a run-time of 50 milliseconds and 450 milliseconds for a PSA with 10,000 simulations. The PSA was much slower in Excel with run-times of approximately 45 seconds and 8 minutes for 1,000 and 10,000 simulations, respectively. **CONCLUSIONS:** The implementation of the PSA using NumPy were many orders of magnitude faster compared to Excel. Faster execution, especially with complex models, improves the feasibility to explore many scenarios and test structural validity. There is recognition that the complexity of many diseases are not accurately captured in Excel cohort models; thus there is a shift towards more sophisticated modeling such as individual simulation. Coupled with the requirement for PSA, the adoption of software platforms that can manage computationally expensive algorithms will become increasingly more important.

PRM88

HEALTH STATES UTILITY VALUES IN NICE MULTIPLE TECHNOLOGY APPRAISALS: ADHERENCE TO THE NICE REFERENCE CASE IN THE AREA OF CANCER

Lucherini S, Mujica-Mota RE, Medina-Lara A
University of Exeter, Exeter, UK

OBJECTIVES: The National Institute of Health and Care Excellence (NICE), routinely considers evidence on the cost-effectiveness of health technologies in formulating its recommendations on treatments for use in the English National Health Service. NICE periodically publishes methodological guidelines, known as the `reference case', to ensure technology appraisals meet good quality standards. In spite of this, previous reviews of NICE appraisals have shown high levels of heterogeneity in the methods used to obtain health state utility values for decision analytical models.The aim of this paper was to investigate the level of adherence to the 2013 NICE reference case with respect to the health state utility values employed in recent Multiple Technology Appraisals (MTAs) in the area of cancer. **METHODS:** The level of adherence to the reference case in all MTAs conducted by Assessment Groups between 2008 and 2016 was assessed using a checklist that aims to evaluate the extent of decision uncertainty originating from

evidence on utility values. **RESULTS:** Thirty-five technology appraisals in the area of cancer were reviewed. Adherence heterogeneity to the NICE reference case was identified mainly due to unsystematic search for evidence on utility values, lack of utility values derived from the EQ-5D, and limited amount of data on generic and disease specific patient-reported Health-Related Quality of Life (HRQoL) outcomes. **CONCLUSIONS:** Adherence to the NICE reference case may be increased by stricter requirements for the systematic identification, validation and reporting of evidence on health states utility values used in economic evaluation and the development of mapping algorithms suitable to synthesise summary data from disease specific or generic HRQoL tools commonly reported in cancer trials.

PRM89

MODELING WITH VERY BIG DATA: A PILOT STUDY USING LARGE-SCALE MACHINE LEARNING IN A CLUSTER COMPUTING FRAMEWORK TO PREDICT EMERGENCY ROOM (ER) VISITS

Xu Y[1], Yao W[1], Dusenberry MW[2], Pohlman M[1]
[1]IBM, Cleveland, OH, USA, [2]IBM, San Francisco, CA, USA

OBJECTIVES: To develop and demonstrate the feasibility and limitations of predictive modeling methods adapted for a very large and heterogeneous dataset containing longitudinal data spanning up to 10 years for more than 50 million unique patients. **METHODS:** We retrospectively studied predictive factors associated with ER visits using an EHR-based database (IBM Explorys) containing broader clinical information for a larger patient population than earlier research on this topic. After filtering to exclude inactive patients, the remainder were counted as positive for the primary outcome if they had visited the ER between January 2014 and December 2015, with risk factor data extracted from January 2004 forward. In the initial exploratory phase, we calculated odds ratios for 543 factors from major categories including demographics/socioeconomic status (n=5), healthcare utilization and drug usage (n=9), past diagnoses (n=285), and past procedures (n=244). For modeling, the filtered dataset was randomly divided 80%/20% into training and testing subsets. Declarative large-scale machine learning software (SystemML) was used to train a logistic regression model with L2-regulation on a 6-node computing cluster. **RESULTS:** After filtering, the study population consisted of 35 million active patients, with 11% visiting the ER during the reference period. Training was completed in 1.3 hours, generating a model that achieved an AUC of 83.27% on the testing subset. Strong predictors identified by the model included poverty (percentage of families below poverty level within a zip code), race, history of substance abuse and mental illness, sprains and strains, and abdominal pain. **CONCLUSIONS:** This pilot confirms the feasibility of and provides a roadmap for predictive modeling with very large datasets containing a rich spectrum of clinical data, with the potential to uncover previously unknown risk factors. Improved models might be generated by using more granular diagnostic groupings and detailed drug information, and including more interactions between variables.

PRM90

THE PATIENT VOICE INCLUDES EMOJIS: A CASE STUDY IN THE USE OF PROBABILISTIC TOPIC MODELING TO CHARACTERIZE PATIENT CONVERSATIONS IN AN ONLINE COMMUNITY OF PTSD PATIENTS

Eaneff SD
PatientsLikeMe, Cambridge, MA, USA

OBJECTIVES: To identify and respond to patient-defined priorities in care delivery and drug development, it is important to understand what is important to patients. Increasingly, patients share large volumes of free-text data over social media and within online communities. The text generated in these ways is often too massive to allow for complete human review and summarization, making approaches using natural language processing particularly valuable. This case study demonstrates the use of probabilistic topic modeling, with attention to the preservation of emojis, to characterize over 200,000 free-text posts from post-traumatic stress disorder (PTSD) patients in the online patient community PatientsLikeMe (PLM). **METHODS:** Approximately 54% of PLM patients contribute free-text posts to the platform through user bios, forum conversations, or as annotations associated with structured data. Posts contributed by PTSD patients were pre-processed to remove html and stopwords, and to map emojis to text-based descriptions. Latent Dirichlet allocation (LDA), a form of probabilistic topic modeling, was performed to identify topics discussed among patients. Model parameters were selected on the basis of perplexity as measured on a 10% holdout group. **RESULTS:** A total of 224,997 free-text posts were contributed by 8,518 unique PTSD patients between 3/1/2012 and 3/1/2016. Fifty topics were identified, including topics related to quality of life (family, religion, music, literature, pets/service animals), exposure to trauma (military combat, abuse), symptoms (pain, depression, anxiety, insomnia, anger), and treatments (medical marijuana, supplements, side effects). **CONCLUSIONS:** Computational methods to summarize large volumes of free-text data are a valuable tool for characterizing the patient experience. One such method, LDA, can be used to provide a high-level overview of topics discussed by patients. In combination with structured data sources, patient generated free-text data may provide insight into the ways in which patients live with their condition and take steps to maximize their quality of life.

PRM91

LONGITUDINAL DETERMINANTS OF DYNAMIC STATIN ADHERENCE: A RETROSPECTIVE COHORT STUDY

Dave C, Park H, Winterstein A, Hartzema A
University of Florida, Gainesville, FL, USA

OBJECTIVES: To model the baseline and time-varying determinants of longitudinal statin adherence, and to identify and characterize the heterogeneity in statin adherence patterns over time. **METHODS:** We used Marketscan commercial claims data from 2008-2013. Adults newly initiating a statin, with at least 3 years of continuous eligibility after statin initiation were included. The 3 year follow-up period was divided into 12 periods of 90 days; a period was considered an adherent one if the patient was exposed to statins for 80% of the days. Baseline covariates included age, sex, and history of congestive heart failure (CHF), hypertension (HTN), stroke, asthma, chronic obstructive pulmonary disease (COPD), depression, and diabetes (DM). Time varying covariates included new onset of clinical conditions (same conditions as baseline plus liver dysfunction and myopathy) and average non-statin daily pill burden in a period (<1, 1-2, or >2 pills/day). Generalized estimating equations (GEE) were used as primary analysis. We estimated Group Based Trajectory Models (GBTM) while adjusting for all baseline and time-varying covariates as secondary analysis. **RESULTS:** 252,272 patients met the inclusion criteria. For the GEE analysis, patients having a history of COPD (odds ratio [OR] 0.88, $p<0.05$) or new onset of depression (OR 0.78, $p<0.05$) were most likely to be non-adherent to statin therapy. For GBTM analysis, the 5 group model was identified as the best model. We found significant interactions between the covariates and the identified subgroups of adherence in the GBTM. For instance, in the highest adherence subgroup, new onset of myopathy was associated with highest decrease in adherence (OR 0.73, $p<0.05$), while for the non-adherent groups, new onset of stroke was associated with highest increase in adherence (OR 2.25, $p<0.05$). **CONCLUSIONS:** Compared to baseline covariates, time varying covariates had greater magnitudes of effect and therefore may be more important in determining longitudinal medication adherence.

PRM92

ASSESSMENT OF PROPORTIONAL HAZARDS IN NICE SUBMISSIONS: A REVIEW OF RECENT NICE APPRAISALS IN CANCER

Padhiar A, Quigley JM, Ward K, Callen H, Scott DA
ICON Health Economics & Epidemiology, Abingdon, UK

OBJECTIVES: Conducting a network meta-analysis (NMA) of hazard ratios (HRs) for time-to-event outcomes, when the proportional hazards (PH) assumption is violated, could lead to biased treatment effect estimates. Published algorithms exist to reconstruct individual patient data from digitised plots making formal testing of PHs possible. In the UK, NICE has stressed the importance of using an appropriate scale, thus Health Technology Assessment (HTA) groups may expect justification for the choice of scale in reimbursement submissions given the accessibility of formal diagnostic testing techniques. Taking the UK as a case study we aimed to identify whether this was the case in recent NICE appraisals. **METHODS:** We searched the NICE website for Technology Appraisal (TA) guidance documents in cancer published in the last three years. Searches were run in December 2016. We reviewed the TAs to identify whether manufacturers had assessed the PH assumption and justified the choice of scale when synthesising time-to-event endpoints for a NMA. HTA groups' comments on these assessments were also identified. **RESULTS:** A total of 45 TA submissions in oncology were identified. 27 included an NMA of survival endpoints, of which only 6 manufacturers assessed PHs using established methods on trials included in the NMA. In an additional 10 submissions the HTA group noted that PHs does not hold in one or more of included trials and should have been considered in determining the analysis methods. Methods used to address non-proportional hazards included; independent modelling of treatment arms, fractional polynomial models, and piecewise modelling. **CONCLUSIONS:** Choice of scale is important to avoid bias in an NMA. HTA groups have criticised submissions that have not justified or formally tested the PHs assumption for NMAs synthesising HRs. Manufacturers should justify choice of scale used in NMAs for reimbursement submissions and conduct formal assessment of PHs when synthesising HRs for time-to-event outcomes.

PRM93

WHEN DOUBLY ROBUST IS NOT ROBUST ENOUGH: NONPARAMETRIC MATCHING METHODS UNDER TREATMENT HETEROGENEITY

Shao H, Stoecker C, Shi L
Tulane University School of Public Health and Tropical Medicine, NEW ORLEANS, LA, USA

OBJECTIVES: Recent technological advances have increased the ability to deliver precision-targeted individualized treatment plans. This approach concentrates treatments among patients most likely to benefit from a particular therapy. This presents methodological challenges for evaluators as the average treatment on the treated (ATT) is likely to be substantially larger than the average treatment effect (ATE) considered across the entire population. This study aimed to explore the most accurate non-parametric matching methods for estimating the ATT among a population with treatment heterogeneity. **METHODS:** Both Monte Carlo simulation and semi-simulation using actual data from the Medical Expenditure Panel Survey (MEPS) 2012 were conducted. We simulated three propensity score distributions each with three treatment heterogeneity correlations. Within each of these nine scenarios, we created 1000 datasets each with 500 patients. Mean squared predicted error for OLS, one-to-one matching, k-nearest-neighbor matching, propensity score weighting, kernel matching, and local linear matching were calculated and compared to known truth. For each matching estimator, the ATT was estimated with both direct mean comparison and weighted OLS using the propensity scores in a weighting function. **RESULTS:** All matching methods showed improvement (14%~69%) compared to using an estimator based on OLS alone. Kernel matching provided the best theoretical improvement over OLS (69%). Because the efficiency of kernel matching relies on the choice of bandwidth, we applied leaving-one-out algorithm to identify the bandwidth. Kernel matching with optimized bandwidth yielded a 61% improvement over OLS, and outperformed the other matching methods. In addition, our simulated results suggested that applying OLS after matching yielded worse results than a direct mean comparison after matching. **CONCLUSIONS:** Kernel matching was identified as the most accurate methods in estimating ATT, and the leaving-one-out algorithm

was a reliable method in selecting bandwidth. Matching provides improvement over OLS, but caution should be exercised when combining matching with regression techniques.

PRM94

SIMULATING MULTIVARIATE DISTRIBUTIONS WITH ARBITRARY MARGINAL DISTRIBUTIONS AND DEPENDENCE STRUCTURES

Iskandar R, Trikalinos TA
Brown University, Providence, RI, USA

OBJECTIVES: Researchers often need to generate random samples from multivariate distributions (MVDs) with specific univariate marginal distributions (MDs) and dependence structure. Applications include propagating uncertainty via forward-Monte-Carlo simulation for a set of variables in a mathematical model, or creating synthetic datasets that are "similar" to a target population. Typically, information exists about (1) the form, mean, and variance of the marginal distribution (MD) for each dimension, and (2) the empirical correlation matrix. **METHODS:** We propose to approximate MVDs using Gaussian copulas, which factor an MVD into a product of arbitrary MDs times a dependence structure. For the MDs, we select from common distributional forms (e.g., normal, beta, Bernoulli) and specify their parameters with moment matching. For the dependence structure, which is parameterized by a correlation matrix, we use an empirical correlation matrix. As an example, we create a synthetic cohort that is "similar" to a target cohort of patients with coronary artery disease from the American College of Cardiology-National Cardiovascular Data Registry (ACC-NCDR). We use a parametric survival model and compare the predicted survival curves in the synthetic population and in the original cohort. **RESULTS:** We approximate the MVD of 13 continuous variables (e.g., age, heart rate) and 20 categorical variables, some of which are dichotomous (e.g., sex) or ordinal (e.g., number of disease vessels), using the Gaussian copula and demonstrate that multivariate random sampled preserve the first-order (means) and second-order moments (variances and covariances) of the MVD and the MDs of all variables. Predicted survival curves agreed well between the synthetic data and the original data **CONCLUSIONS:** In the application, the synthetic sample appears to emulate the original data in terms of model predictions. More generally, this approach can serve as a flexible and robust approach for approximating an MVD using only estimates of first and second moments

EVALUATING THREE MARKOV MATRIX SOFTWARE MODELS FOR HIV TREATMENT COST EFFECTIVENESS ANALYSIS

Chaudhari V, Parmar A, Maniar A, McGhan WF
University of the Sciences, Philadelphia, PA, USA

OBJECTIVES: Three decision models were to compare that calculate the cost-effectiveness of HIV treatment options using Markov multi-state, transition probabilities, along with corresponding transition state costs and utilities. The first HIV calculator was a, publicly available, spreadsheet model described in the textbook "Decision Modeling for Health Economic Evaluation" edited by Briggs et al. A second basic freeware Markov cost-effectiveness calculator is available online through www.healthstrategy.com. The third program is a recently developed health economic evaluation modeling package, Heemod that has been made available for free on cran.r-project.org, the open-source R repository. The objective of our study was to evaluate the results from these three HIV model approaches. **METHODS:** For this evaluation, we modified the original Excel HIV spreadsheet structure and data using mono therapy versus combo therapy for all cycles. Using two treatment option matrices, the variable inputs that can be modified in these applications include state transition probabilities, number of cycles, cost per state, and utility per state. **RESULTS:** We considered four transition states for each therapy option, and 20 cycles with no discounting. The MS Excel spreadsheet model versus the online JavaScript software versus the Heemod R model compared very well with results respectively as follows: average incremental costs in British pounds: (67701 vs 67853 vs 66977), average incremental utility: (5.89 vs 5.90 vs 5.74) and average incremental cost-effectiveness ratio: (11500 vs 11494 vs 11678). **CONCLUSIONS:** The browser-based, online calculator has potential benefit as a basic educational tool for students and health professionals interested in exploring these analytical approaches. The Heemod package requires R software installation but has many positive features, and is likely to be expanded in capabilities and treatment model examples in the future.

PRM96

CAUSALITY WITH REAL WORLD EVIDENCE: BURDEN OF PROOF, PROOF OF PRINCIPLE

Simons WR
Global HTA, NORMANDY BEACHJ, NJ, USA

OBJECTIVES: To establish and evaluate whether replicating and reconciling surrogate markers in epidemiological studies can establish causal relationships. **METHODS:** Multiple longitudinal and panel data sources from different countries quantify the conditional probabilities of surrogate endpoints (e.g., heart rate, treatment(s), etc.) and established biological outcomes (e.g., all-cause mortality, HbA1c and diabetic-complications, etc.). Therapeutic or biological models consist of all-cause mortality and heart rate; diabetic-complications/ HbA1c and treatment; adverse events and pain management; and mortality and HDL-C.Countries include the UK, Germany, U.S., Canada and Australia. Estimation methods include survival analyses and generalized estimating equations (GEE). Pairwise results from those analyses were compared (reconciled) to all previous RCTs and epidemiological studies identified by comprehensive and systematic reviews of published studies where odds-ratios served as measures in common. **RESULTS:** Heart rate predicted mortality trice with survival and/or GEE analyses, 0.00694 ($P<0.001$) in Canada, 0.00683 ($P<0.001$) in Copenhagen panel data (1981-1983) and 0.00717 (1991-1993) with the Weibull. With GEE, the coefficients were 0.0268 (P=0.006) in Australia, 0.0249 (P=0.008) in the meta-regression of 16 controlled clinical trials. All three reproduced clinical trials with odd-ratios within 1/100ths. In diabetes, longitudinal analyses of treatment trice reproduced HbA1c reductions by 0.99% (UK), 0.92% (Germany) and 0.89% (US) with complication risks reduced by 0.388%, 0.414% and 0.436% per 1% HbA1c reduction. In pain management, 9 of 10 adverse events are statistically the same in two datasets. GEE analyses from Australia data reproduced 25 epidemiological studies for mortality and HDL-C. **CONCLUSIONS:** Precise reproductions of conditional probabilities across multiple datasets and their numeric reconciliations with other established clinical and epidemiological evidence establish causality. Real World epidemiological studies support clinicaql findings in larger, more general populations and when replicated and reconciled among one provide proof of principle for casual inferences.

PRM97

IDENTIFING ADMISSION CHARACTERSITCS THAT ARE CORELATED WITH THE COST OF A COPD-RELATED HOSPITALIZATION – A REGRESSION ANLAYSIS OF THE 2012 HCUP-NIS SURVEY DATA SET

Belviso N
University of Rhode Island: College of Pharmacy, Kingston, RI, USA

OBJECTIVES: To quantify the association between hospital admission characteristics and cost of a chronic obstructive pulmonary disease (COPD)-related hospitalization to understand which admission factors have the greatest impact on costs of a COPD hospitalization. **METHODS:** A regression analysis was adapted to the 2012 HCUP National Inpatient Survey database (nT = 7,161,567 total admissions, nC = 71,410 COPD-related) to determine if there was an association between admission characteristics and the cost of a COPD hospitalization. After flagging each COPD-related hospitalization based on the reported diagnosis related group (DRG), a multiple linear regression model was implemented to investigate the extent to which the inputs follow the assumptions of linear regression. This led to the log-normal transformation of the dependent variable and exclusion of non-significant inputs. The statistically significant variables were then incorporated into a complex regression model taking into consideration the sample-survey design which included stratification, unequal weighting, and domain subgrouping of the DRGs identified as COPD-related. Estimates for the regression coefficients were computed in SAS 9.3 and included the following variables: length of stay, number of chronic diagnoses at admission, age at discharge, gender, death during hospitalization, elective admission, major OR procedure, and admission during weekends. **RESULTS:** The final model identified the presence of a major OR procedure (Estimated Reg. Coeff. = 0.4965) and the length of stay (Estimated Reg. Coeff. = 0.1505) as the variables that had the greatest impact on cost (log-cost) of a COPD admission. However, the regression calculated a line of best fit that approximated only half of the variance within the observed admission costs (R-Square = 0.5217). **CONCLUSIONS:** Further investigation is needed to identify other factors that impact the correlation between the cost of a COPD hospital stay and admission characteristics.

PRM98

WHY ISN'T IT THE NORM TO USE NORMAL IN PSA?

Oguz M, Roiz J
Evidera, London, UK

OBJECTIVES: Probabilistic Sensitivity Analysis (PSA) investigates the impact of uncertainty around parameter estimates on model results. Many health economics models wrongly use the distribution of the underlying parameters to model the mean estimates in PSA, such as gamma for costs, log-normal for rates and beta for probabilities. However the appropriate distribution to sample mean values is independent of the type of parameter and is always the normal distribution given sufficient sample size. We advocate modeling guidelines should recommend the use of normal distribution when sampling means, when the sample size is large enough. We demonstrate how the PSA results change when the underlying distribution is used rather than the normal distribution. **METHODS:** We used simulation methods to produce several histograms of means, each calculated from samples of increasing size, and compared the distribution of these means against the distributions that are frequently used instead of the normal distribution. We then proceeded to assess the impact of the choice of distribution on the cost-effectiveness results when the means are sampled with a normal distribution vs. the underlying distribution. **RESULTS:** Histograms show that as the sample size increases, the distribution of means calculated using the underlying distribution deviates more from the distribution of the sampled means, which converge in distribution to normal. The model results suggest that using normal distribution instead of the underlying distribution changes the probability of being cost effective. **CONCLUSIONS:** Sampling means from a normal distribution is a more accurate way of representing uncertainty around mean estimates. The use of the underlying distribution to sample from the means leads to inaccurate PSA results. Given the importance of PSA results in making reimbursement recommendations, researchers should be careful to use the appropriate distribution to simulate the means, which is the normal distribution.

PRM99

BAYESIAN ANALYSIS OF FLEXIBLE PARAMETRIC FRAILTY MODELS FOR THE EVALUATION OF REPEAT TREATMENT IN PATIENTS WITH INTERVAL CENSORED DATA: APPLICATION TO A LARGE RANDOMISED CONTROLLED TRIAL IN OVER-ACTIVE BLADDER SYNDROME

Owen RK, Tincello DG, Abrams KR
University of Leicester, Leicester, UK

OBJECTIVES: Recurrent events are common in clinical trials of chronic diseases. Due to the ongoing nature of chronic conditions, and consequently clinical trials,

patient follow-up can be intermittent and information regarding the time of symptom development is often unreported or poorly reported. Motivated by a large randomised trial in overactive bladder (OAB) syndrome, interest lies in evaluating the duration of treatment effect defined as the time to patient-reported return of symptoms following repeat injection of botulinum toxin in patients with interval censored data. **METHODS:** Poly-Weibull models were fitted in a Bayesian framework in order to obtain posterior predictive distributions from which to sample unreported event times for interval censored data. To further account for the correlation between repeated events within the same individual, we incorporate a shared frailty term. We applied this methodology to a clinical trial of patients receiving a maximum of 3 repeated injections of botulinum toxin for OAB over a 5 year follow-up period. To compare repeated injection, restricted mean survival time (RMST) was calculated. Performance of Bayesian prediction models were assessed for varying proportions of missing data, and misspecification of distributional form using simulation studies. **RESULTS:** Bayesian flexible parametric frailty models found that there may be a small cumulative effect of botulinum toxin in patients with OAB (RMST1: 0.93, 95%CrI: 0.81,1.05; RMST2: 0.97, 95%CrI: 0.83,1.13; and RMST3: 0.98, 95%CrI: 0.75, 1.24 for active injection 1, 2 and 3 respectively) but this difference was not of clinical or patient importance. Simulation studies found that Bayesian prediction models generally perform well with up to 50% of interval censored data, but care should be taken when selecting distributional form. **CONCLUSIONS:** With an increasing need to assess the time to symptom recurrence in chronic conditions, and the difficulties faced with intermittent follow-up, the use of a flexible Bayesian framework would appear to be advantageous.

PRM100

MODELING MIGRAINE DAY FREQUENCY USING THE BETA-BINOMIAL DISTRIBUTION: A CASE STUDY OF ERENUMAB AS MIGRAINE PROPHYLAXIS

Porter JK[1], Brennan A[2], Palmer S[3], Sapra S[4], Shah N[4], Desai P[4], Villa G[1], Lipton RB[5]
[1]Amgen (Europe) GmbH, Zug, Switzerland, [2]University of Sheffield, Sheffield, UK, [3]University of York, Heslington, York, UK, [4]Amgen Inc, Thousand Oaks, CA, USA, [5]Albert Einstein College of Medicine, Bronx, NY, USA

OBJECTIVES: Current measures of clinical effectiveness of migraine prophylaxis are predominantly based on the reduction in frequency of migraine days (MDs) per 28 days. It is therefore important to accurately link economic and quality of life outcomes to reductions in MD frequency to model the cost-effectiveness of migraine prophylactics. Traditionally, headache day frequency has been characterized by Poisson, binomial and negative binomial distributions, and zero-inflated variants of these. All of these distributions are associated with theoretical and practical limitations. The beta-binomial distribution has been applied in other fields to model this type of count data. This analysis aims to compare the beta-binomial distribution to Poisson, binomial, negative binomial and zero-inflated negative binomial distributions in modeling MD frequency, using data from a phase II study of erenumab (NCT01952574). **METHODS:** The study compared erenumab 70mg against placebo in patients with episodic migraine. Data on the frequency of MDs per 28 days were used to fit Poisson, binomial, negative binomial, zero-inflated negative binomial and beta-binomial distributions. The average root mean squared errors (RMSE) across all 28-day observation periods was used to quantify the deviation of each distribution from the trial observations. **RESULTS:** Data from 257 patients were available from the study, with a maximum follow-up of 64 weeks. The average RMSEs were 0.239, 0.257, 0.104, 0.081 and 0.098 for the Poisson, binomial, negative binomial, zero-inflated negative binomial and beta-binomial distributions, respectively, for the erenumab group, and 0.201, 0.221, 0.089, 0.081 and 0.089 for the placebo group. **CONCLUSIONS:** Based on the RMSE estimates, the negative binomial, zero-inflated negative binomial and beta-binomial provide comparable fits to the trial observations, and fit better than the Poisson and binomial fits. This was observed in both the erenumab and placebo groups. The results suggest that the beta-binomial may be an alternative choice of distribution for modeling MD frequency in migraine populations.

PRM101

PERFORMANCE OF MACHINE LEARNING ALGORITHMS IN PREDICTING 30 DAY HEART FAILURE READMISSIONS RISK USING AN ADMINISTRATIVE CLAIMS DATABASE

Dave C, Park H, Hartzema A
University of Florida, Gainesville, FL, USA

OBJECTIVES: To evaluate machine learning algorithms in modelling the risk of 30-day heart failure (HF) readmissions in a cohort of commercially insured patients in the US. **METHODS:** We used Marketscan commercial claims data (2012-14) to identify a cohort of patients >=18 years admitted with a primary diagnosis of heart failure. Heart failure index admissions and 30 day readmissions were defined using the Centers for Medicare and Medicaid Services (CMS) definitions. Using a combination of CMS defined predictors and empirical analysis, we identified 146 predictors of hospital readmission. Predictors were assessed in the one year period prior to the index heart failure hospitalization. Study data were split into the training set (75%) and the test set (25%). We compared four commonly used machine learning algorithms for binary classification: elastic net regularized generalized linear models, random forests, gradient boosted machines, and support vector machines. We employed 10 fold cross validation on the training set to train each algorithm; predictive performance for each algorithm was assessed using the c-statistic [AUC] on the test set. **RESULTS:** In a cohort of 17,631 patients with a qualifying index admission for heart failure, 2,830 patients had a readmission within 30 days. The mean age of the patients in the cohort was 55 years, and 60.2% were males. Based on the c-statistic on the test set, gradient boosted machines performed the best (AUC 0.66), followed by elastic net regularized logistic regression (AUC 0.65), random forests (AUC 0.65), and support vector machines (AUC 0.63). **CONCLUSIONS:** Compared to previous models which report an AUC of 0.60, we were able to increase the AUC by 0.06, representing a 12% increase in predictive ability. However, this increase in AUC was largely driven by an increase in the number of predictors rather than any differences in performance between the machine learning algorithms themselves.

PRM102

CALIBRATION OF DISEASE MODELS FOR HEALTH SYSTEMS EVALUATION

Semochkina D[1], Walsh C[1], White A[2]
[1]University of Limerick, Limerick, Ireland, [2]Trinity College Dublin, Dublin, Ireland

OBJECTIVES: This project examines approaches to the calibration of natural history models from a Bayesian perspective. The result of the calibration is a joint probability distribution of parameters which can be used in a probabilistic analysis (PSA) using a predictive model to compare different interventions. Two diseases are examined. The two models have important differences in terms of the calibration strategies that are employed. The interventions considered for each disease are different too; this affects the choice of model structure. The first disease is HPV, which uses a patient level simulation to account for the transmission dynamic nature of the disease, which is important in considering the impact of herd immunity from vaccination. The second is Hepatitis C, and the purpose of this model is to examine progression of disease and the impact of different strategies for the screen-detected and symptomatic populations. **METHODS:** Markov Chain Monte Carlo (MCMC) sampling was used to obtain samples from the joint distribution for the unobservable parameters and compared with Monte Carlo approach. **RESULTS:** The biggest challenge with HPV model calibration was the extensive unparallelisable computational time (20 days of computing time per chain per processor) that was significantly slowing down the calibration process. The non-identifiability of the parameter space had also a great impact on convergence of chains. A solution to the problem was to impose a structural prior on the joint parameter space. The Hepatitis C model calibration was an easier problem. The convergence was quicker, computational time was acceptable and some sensible predictions were achieved. Adaptive MCMC was used for calibrating this model. **CONCLUSIONS:** Advantages of MCMC: for HPV — a better fit comparing to simple Monte Carlo method; for Hepatitis C — good exploration of the parameter space. Disadvantages of MCMC: poor mixing and convergence for HPV model; additional computational time for Hepatitis C model.

PRM103

MODELING LONGITUDINAL CHANGE IN PATIENT REPORTED OUTCOMES USING LATENT CURVE MODELS

McGinley JS, Wirth R
Vector Psychometric Group, LLC, Chapel Hill, NC, USA

OBJECTIVES: Latent curve models (LCMs) offer a flexible method for analyzing change over time in patient reported outcomes (PROs). In this presentation, we demonstrate how LCMs can be used to understand within- and between-patient variability and to test a wide array of PRO-focused research hypotheses. **METHODS:** The current study used a simulated data example consistent with data obtained in PRO research to illustrate how a series of LCMs can be applied and interpreted in practice. The outcomes were based on PRO domains of fatigue and physical functioning. We begin by describing independent univariate LCMs for fatigue and physical functioning and then expand these models to the bivariate case (i.e., modeling the longitudinal relationship between fatigue and physical functioning simultaneously). **RESULTS:** The univariate fatigue and physical functioning LCMs showed that patients varied in their baseline levels and rates of change over time in both PRO domains. On average, fatigue increased through the course of the study whereas physical functioning decreased over time. The bivariate LCM, which jointly modeled fatigue and physical functioning, showed that patients with more fatigue at baseline tended to have decreased physical functioning at baseline and patients with greater increases in fatigue over time had faster declines in physical functioning. Further, there was evidence of a negative within-person autoregressive effect of fatigue on physical functioning. More precisely, when a patient was more fatigue than usual on a given day, they had worse physical functioning than usual on the following assessment day. **CONCLUSIONS:** Researchers are often interested in assessing hypotheses concerning longitudinal change in PROs over time. While many traditional statistical methods for repeated measures have limitations (e.g., highly restrictive, no insights on individual differences, disconnect from theoretical models), LCMs offer a dynamic framework for testing many hypotheses relating to between- and within-person change in one or more constructs over time.

PRM104

HOPE, "HEALTH OUTCOMES PERFORMANCE ESTIMATOR": A NEW TOOL TO PREDICT REAL-LIFE OUTCOMES

Karcher H[1], Wiecek W[1], Gultyaev D[2], Casciano R[3], Amzal B[4]
[1]LASER Analytica, London, UK, [2]LA-SER Analytica, Lorrach, Germany, [3]LASER Analytica, New York, NY, USA, [4]LASER ANALYTICA, London, UK

OBJECTIVES: A growing number of decision makers are embracing performance-based contracts as the avenue to shift the pharmaceutical business paradigm from selling drugs to selling outcomes. Meaningful performance-based contracts require anticipating clinical outcomes under usual circumstances of care at a time when little evidence exists outside of clinical trials for the new intervention. A novel tool based on bridging-to-effectiveness modeling was developed to anticipate the real-world performance of new drugs. **METHODS:** The tool was built as an R/Shiny-based web interface. The user selects a therapeutic area with a set of outcomes, interventions and real-world practice scenarios to be evaluated. Data

on key patient and drug usage characteristics (effectiveness drivers) and drug efficacy can then be entered either as patient-level datasets or via summary statistics. Real-world outcomes for the selected interventions are predicted over time using a longitudinal Bayesian model with default prior parameter distributions. The tool then jointly simulates the dynamics of outcomes, exposure and effectiveness drivers for any user-defined virtual cohort. Results in terms of comparative effectiveness are displayed along with confidence intervals. **RESULTS:** Two case examples were run with the tool to predict real-world outcomes under various scenarios: prediction of survival in renal-cell carcinoma patients and of hospitalization rates in schizophrenic patients with anexposure first channeled to most severe patients after launch [1]. **CONCLUSIONS:** The tool allows for rapid prediction and visualisation of real-life outcomes with confidence intervals, accounting for all evidence available to the user. This tool could save months of modeling time, e.g., in the context of fast-paced performance-based contract negotiations. 1. Schneeweiss S et al. Clin Pharmacol Ther. 2011 Dec;90 (6):777-90. https://www.ncbi.nlm.nih.gov/pubmed/22048230

VALIDATION OF HOSPITAL MANAGEMENT EVALUATING METHODS IN CHINA

Cui Y[1], Zhao H[2], Liu GG[1], He Y[2], Yang M[2], Wang M[1]
[1]National School of Development, Peking University, Beijing, China, [2]China Center for Health Economic Research, Peking University, Beijing, China

OBJECTIVES: Little is known about the current management practices of the hospitals in China. To address this gap, we developed a comprehensive survey instrument of Chinese Hospital Management Survey (CHMS) following the well-adapted methodology of World Management Survey (WMS). **METHODS:** The Chinese version of CHMS includes questions on 20 management practices covering four major management domains: operation, monitoring, targeting, and incentives. Based on the CHMS setting, four-dimension and twenty-item management models are analyzed with construct validity test, which is performed by confirmatory factor analysis (CFA). **RESULTS:** 810 middle level managers (department directors and head nurses) were recruited from over 400 nationally representative Chinese hospitals and interviewed for the CFA test. The chi-square statistic for the model is 396 with 164 degrees of freedom (p value = 0.000) while CMIN/DF: 2.4, RMSEA: 0.042, indicating a good model fitting. The further indications of model fit, NFI, RFI, IFI, and CFI are all above 0.9 which is the typical benchmark for model acceptance. Our research provides evidence for correspondence between conceptual and empirical hospital management and the insight of model fitting on the current data. **CONCLUSIONS:** Our results conclude that CHMS has satisfied validation in Chinese hospital management practices, providing efficient methods of survey to assess hospital management in China.

A META-EPIDEMIOLOGICAL SURVEY OF THE REPORTING OF EFFECT MODIFICATION IN NETWORK META-ANALYSES

Kovic B[1], Zoratti M[1], Michalopoulos S[2], Silvestre C[3], Thorlund K[1], Thabane L[1]
[1]McMaster University, Hamilton, ON, Canada, [2]Precision Health Economics, Vancouver, BC, Canada, [3]University of Waterloo, Milton, ON, Canada

OBJECTIVES: To evaluate the current state of reporting and handling of effect modification in network meta-analyses (NMAs), as well as perform exploratory analyses to identify factors that are potentially associated with incomplete reporting of effect modifiers in NMAs. **METHODS:** We conducted a meta-epidemiological survey utilizing a systematic review of NMAs published in 2013 and identified through MEDLINE and Embase databases. We extracted information and reported descriptive statistics on effect modifiers analyzed, adjustment methods used, study outcomes, and potential independent factors for incomplete reporting. We evaluated three study outcomes: the reported statistical analysis plan, the reported analyses results, and complete reporting (i.e. reporting of both plan and analyses results). We performed univariate logistic regression analyses exploring potential associations between factors and outcomes. **RESULTS:** The review identified 77 NMAs. The most common effect modifier explored was study design (15.4% or 30/195), and most common adjustment method used was sensitivity analysis (40.3% or 31/77). Over 45% (35/77) of studies did not describe a plan, nearly 40% (30/77) did not report the results of analyses, and approximately 47% (36/77) of studies had incomplete reporting. Exploratory univariate regression analyses yielded a statistically significant association for the factors of journal impact factor, ratio of randomized controlled trials to number of comparisons, and total number of randomized controlled trials. **CONCLUSIONS:** Current reporting practices are largely deficient, given that almost half of identified published NMAs do not explore or report effect modification. Journal impact factor and amount of available information in a network were associated with completeness of reporting. This study highlights the need for readers to be aware of whether statistical analysis plans include steps that report and address potential effect modifiers due to the impact they may have on analyses.

STATISTICAL MAPPING OF UTILITY SCORES FROM THE REVISED FIBROMYALGIA IMPACT QUESTIONNAIRE

AlAujan S[1], Elliott RA[2], Knaggs RD[1], Luciano JV[3]
[1]University of Nottingham, Nottingham, UK, [2]Manchester Centre for Health Economics, Manchester, UK, [3]Parc Sanitari Sant Joan de Déu, Barcelona, Spain

OBJECTIVES: To perform an economic evaluation, mapping from a disease specific measure onto a generic preference-based measure is essential when utility values of health states are not available in the same sample. In fibromyalgia (FM), no mapping studies have estimated the EQ-5D-3L from the Revised Fibromyalgia Impact Questionnaire (FIQR). This study aimed to predict an EQ-5D-3L utility score from the FIQR. **METHODS:** Data for 160 Spanish adults with confirmed FM according to the American College of Rheumatology 1990 criteria were used. Econometric models investigated were ordinary least square (OLS), censored least absolute deviations (CLAD) and multinomial logistic (MNL) models in ten alternative specifications. Choice of model was based on the 'Best' performance which was defined as: the lowest absolute difference (AD), mean absolute error (MAE), and root mean squared error (RMSE), and the highest R2statistics. **RESULTS:** The majority of the sample were females (n=156, 97.5%), with mean (SD) age of 57.3 (8.8) years. Patients had a mean (SD) FIQR total score of 68.9 (18.87) and a mean (SD) EQ-5D-3L utility value of 0.47 (0.22). The predicted mean utilities in all OLS models were identical (up to four decimals) to the observed means. The OLS model performed best compared with CLAD and MNL with the lowest error statistics (AD = 0.0000; MAE = 0.1279; MSE = 0.1576; R2= 0.4675). The best performing mapping function, defined by the OLS, is able to predict the EQ-5D-3L tariff score using the 21 FIQR collapsed items in a discrete form, age and educational level. **CONCLUSIONS:** It was feasible to map from the FIQR to the EQ-5D-3L. Over the ten model approaches tested, the OLS was the best performing model which predicted the tariff score of the EQ-5D-3L. Further research is required to verify the mapping function between these two measures.

MEASUREMENT PROPERTIES OF THE RASCH-BUILT OVERALL DISABILITY SCALE IN PATIENTS WITH HEREDITARY ATTR AMYLOIDOSIS WITH POLYNEUROPATHY

Regnault A[1], Denoncourt RN[2], Strahs A[2], Agarwal S[2], Marquis P[3], Cano S[4]
[1]Modus Outcomes, Lyon, France, [2]Alnylam Pharmaceuticals, Cambridge, MA, USA, [3]Modus Outcomes, Newton, MA, USA, [4]Modus Outcomes, Stotfold, UK

OBJECTIVES: The Rasch-built Overall Disability Scale (R-ODS) was initially designed and validated to measure activity and social participation limitations in patients with immune-mediated peripheral neuropathy. The objective of this research was to generate evidence on the measurement properties of the R-ODS in patients with symptomatic hereditary ATTR amyloidosis (hATTR amyloidosis) with polyneuropathy. **METHODS:** Assessments (n=359) of the 24 R-ODS items were collected in the patisiran phase 2 open-label extension (OLE, NCT01961921) and the APOLLO phase 3 placebo-controlled trials (NCT01960348). Trial participants were symptomatic hATTR patients with polyneuropathy, including a broad range of disease severity as measured by mobility impairment and broad range of underlying genetic mutations. The data underwent a comprehensive psychometric analysis based on Rasch Measurement Theory. **RESULTS:** R-ODS items covered a wide spectrum of activity and social participation limitations that essentially captured the significant breadth of limitations observed in the patient sample (96% of the range covered). However, the coverage of the part of the continuum corresponding to the lowest levels of limitation (i.e. the most "difficult" activities) could be improved. The 3-point response scale of the R-ODS was appropriate, as all response options for all items were correctly ordered. Most items showed acceptable fit to the Rasch model. The reliability of the R-ODS measure was good (Person Separation Index: 0.95). Item responses were stable between subgroups (age, gender, global region, genotype), with a very small number of items showing Differential Item Functioning, mostly between global regions. **CONCLUSIONS:** Overall, the R-ODS is an appropriate measure of activity and social participation limitations in hATTR patients with polyneuropathy. Further research is needed to understand and assess the tool's sensitivity to detect changes in these limitations over time.

[1]Pharmerit International, Bethesda, MD, USA, [2]University of Mississippi, University, MS, USA, [3]Center for Pharmaceutical Marketing and Management, University of Mississippi, University, MS, USA, [4]Medical Marketing Economics, Oxford, MS, USA, [5]Johnson & Johnson, New Brunswick, NJ, USA

OBJECTIVES: This study examined the psychometric properties of version 2 of the SF-12 Health Survey (SF-12v2) among adults with hemophilia in the United States. **METHODS:** A cross-sectional design using web-based and paper-based self-administered surveys was utilized. Patients were recruited using an online panel, a Facebook community of hemophilia patients, and a hemophilia treatment clinic. The psychometric properties of the SF-12v2 were assessed for construct validity, internal consistency reliability, and presence of floor and ceiling effects. **RESULTS:** A total of 218 respondents completed the survey, with most recruited via the online panel (n = 197). Confirmatory factor analysis using the WLSMV estimator in Mplus supported a two-factor model for the SF-12v2 where the physical functioning, role physical, bodily pain, and general health items loaded onto a latent physical factor (LPF) while the role emotional, mental health, social functioning, and vitality items loaded onto a latent mental factor (LMF). Correlated residuals for items belonging to similar domains were estimated and there was a significant correlation between LPF and LMF. All standardized factor loadings were strong and statistically significant, indicating adequate convergent validity. Item-to-other scale correlations were lower than item-to-hypothesized scale correlations and model testing revealed that LPF and LMF were not perfectly correlated, suggesting good item and construct discriminant validity. Significant decreases in physical component summary (PCS) and mental component summary (MCS) scores were associated with increasing symptom severity, supporting known-groups validity. Internal consistency reliability was satisfactory, with Cronbach's alpha of 0.848 for the LPF and 0.785 for the LMF items. None of the participants received the least or maximum possible PCS or MCS score,

indicating the absence of floor and ceiling effects. **CONCLUSIONS:** Overall, the SF-12v2 was found to be psychometrically valid. These results provide a basis for its use in future studies designed to measure the health-related quality of life of adults with hemophilia.

PRM111

QUALITATIVE RESEARCH TO EXPLORE THE PATIENT EXPERIENCE OF X-LINKED HYPOPHOSPHATAEMIA (XLH) AND TO EVALUATE THE CONTENT VALIDITY OF THE BPI-SF AND WOMAC® FOR USE AS CLINICAL TRIAL ENDPOINTS

Theodore-Oklota C[1], Arbuckle R[2], Bonner N[2], Spencer H[2]
[1]Ultragenyx, Brisbane, CA, USA, [2]Adelphi Values Ltd, Bollington, UK

OBJECTIVES: XLH is a rare genetic disorder in which low serum phosphorus levels lead to defective bone mineralization and consequently to rickets in children and osteomalacia in adults. Research concerning the patient experience of XLH is lacking. This qualitative interview study was conducted to address this gap in published literature and to evaluate the face and content validity of the Western Ontario McMaster Universities Osteoarthritis Inventory (WOMAC®) and Brief Pain Inventory–Short Form (BPI-SF) for use as endpoints in adult XLH clinical trials. **METHODS:** Face-to-face, semi-structured interviews were conducted with 18 adults with XLH in the US. Open-ended questioning was used to elicit spontaneous concepts relevant to the patient experience of XLH, focusing on the symptoms and functional limitations associated with the disease. Cognitive debriefing of the WOMAC® and BPI-SF was also conducted to assess the relevance of items and patient understanding of item wording, recall period, and response options. **RESULTS:** Thirty-two distinct symptom concepts were elicited including pain symptoms, systemic symptoms, sensory symptoms, tiredness/fatigue symptoms, and musculoskeletal symptoms. Participants reported experiencing significant bone and joint pain, stiffness, mobility limitations, and an impact on their ability to work due to symptoms. A conceptual mapping exercise indicated that the key symptom and impact concepts reported by patients are assessed by the BPI-SF and WOMAC®, confirming their relevance to XLH patients. This was supported by the cognitive interviewing which found both instruments to be relevant and well understood by the majority of patients. **CONCLUSIONS:** These interviews generated rich, qualitative insight into the patient experience of XLH. There was strong support for the face and content validity of the BPI-SF and WOMAC®, suggesting both instruments are suitable as XLH clinical trial endpoints with respect to these aspects of validity. Psychometric evaluation is recommended to establish the reliability, validity, and ability to detect change of these instruments.

PRM112

CONTENT VALIDITY OF QUESTIONNAIRES ASSESSING INJECTION REGIMEN BURDEN IN GROWTH HORMONE DEFICIENT (GHD) ADULTS AND CHILDREN TREATED WITH GROWTH HORMONE

Turner-Bowker DM[1], Shields A[1], Yaworksy A[1], Lamoureux RE[1], Morrissey L[1], Kelly M[1], Love E[1], Pleil A[2], Hart G[3], Hershkovitz O[3], Loftus J[4]
[1]Adelphi Values, Boston, MA, USA, [2]Pfizer, Inc, San Diego, CA, USA, [3]OPKO Biologics, Ness Ziona, Israel, [4]Pfizer Ltd, Tadworth, UK

OBJECTIVES: To understand the burden of GHD injection regimen and evaluate patient understanding of and ability to respond to newly developed questionnaires assessing human growth hormone (hGH) injection regimen burden. **METHODS:** A review of the empirical literature identified concepts relevant to hGH injection burden, with a focus on treatment regimen. Results informed the conceptual framework and two questionnaire batteries were designed to assess aspects of the treatment burden relating to using hGH injection in adult and pediatric patients. Expert advice meetings were conducted to confirm key measurement concepts and gather feedback on the questionnaires. Individual hybrid concept elicitation (CE) and cognitive debriefing (CD) interviews were conducted with patients (and caregivers of pediatric patients) to explore and confirm injection treatment burden concepts important to patients and caregivers, and to evaluate comprehensiveness of the questionnaires and respondents' ability to understand and respond to the questionnaire instructions and items. **RESULTS:** Results from the literature review (N=30 articles) and input from US (n=3) and European (n=3) experts facilitated the generation of questionnaire content assessing: (1) pen ease of use; (2) regimen convenience; (3) patient, caregiver, and family life interference due to regimen; (4) benefit/satisfaction/willingness to continue treatment; (5) regimen choice/preference; (6) intent to comply with regimen; (7) injection-related signs/symptoms; and (8) reasons for missed injections. Hybrid interviews with 21 patients (adults [n=6] and child/parent dyads [n=15]) confirmed that the questionnaires comprehensively capture their hGH injection-related treatment regimen experience (including key concepts), and are easily understood. Minor wording revisions improved question clarity and understanding of the concept. **CONCLUSIONS:** Findings from this research support the content validity of the questionnaires; resulting in new clinical outcome assessment measures to assess hGH injection regimen burden for adults, children and their caregivers.

PRM113

PREDICTORS OF UTILITY OVER TIME AMONG PATIENTS WITH TREATMENT-NAIVE ADVANCED MELANOMA FROM THE PHASE 3 CHECKMATE 067 TRIAL: 28-MONTH UPDATE

Paly VF[1], Colby C[2], Sabater J[3], Kotapati S[3]
[1]ICON Health Economics & Epidemiology, Morristown, NJ, USA, [2]ICON Health Economics & Epidemiology, San Francisco, CA, USA, [3]Bristol-Myers Squibb, Princeton, NJ, USA

OBJECTIVES: The aim was to update previous analyses of predictors of health-related quality of life over time to estimate utilities for patients with treatment-naive advanced melanoma using the 28-month data cut from the randomized CheckMate 067 trial comparing nivolumab + ipilimumab, nivolumab monotherapy, and ipilimumab monotherapy for use in a cost-effectiveness model (CEM). **METHODS:** The EQ-5D was administered at baseline and every 6 weeks in CheckMate 067 and was used to generate index utility scores using the UK time trade-off method. Covariates were based on a combination of prior analyses of large trial data sets, including patient demographic and clinical characteristics, quantitative metrics of fit, qualitative/clinical plausibility, and relevance to the CEM. Several longitudinal mixed linear models were explored using different covariate sets. **RESULTS:** This analysis included 916 patients and 7735 visits where the EQ-5D was administered. Mean baseline utility score was 0.774 for nivolumab + ipilimumab patients, 0.779 for nivolumab patients, 0.773 for ipilimumab patients, and 0.775 across all patients. The final model selected included baseline utility (to adjust for imbalance between treatment arms), progression status (pre/post), and treatment arm. Parameter estimates in the model were 0.418 for baseline utility ($p<0.001$), -0.035 for progression status ($p<0.001$), and -0.028 ($p=0.042$) and -0.026 ($p=0.064$) for ipilimumab and nivolumab + ipilimumab (vs. nivolumab), respectively. Additional models including time before death or end of follow-up were tested, but the selected model was found to be a better fit to the data. When implemented in the CEM, the utility estimates for the preprogression and postprogression states were 0.792 and 0.758, respectively (applying nivolumab as the reference treatment arm). **CONCLUSIONS:** Results showed that baseline utility, progression, and treatment were predictors of utility over time, which is consistent with prior analyses of this trial as well as other nivolumab monotherapy and ipilimumab monotherapy trials.

PRM114

EQ-5D-3L UTILITIES TARIFFS: DIFFERENCES IN GERMAN AND UK UTILITIES AND QALYS IN PATIENTS WITH MODERATE TO SEVERE PSORIASIS

Sherif B[1], Graham CN[1], Neidhardt K[2], Gilloteau I[3], O'Neill CB[4], McBride D[5], Augustin M[6]
[1]RTI Health Solutions, Research Triangle Park, NC, USA, [2]Novartis Pharma GmbH, Nuernberg, Germany, [3]Novartis Pharma AG, Basel, Switzerland, [4]Novartis Ireland Ltd, Elm Park, Ireland, [5]RTI Health Solutions, Manchester, UK, [6]University Clinics of Hamburg, Hamburg, Germany

OBJECTIVES: Health utilities needed for quality-adjusted life-years (QALYs) are often measured by instruments such as the EQ-5D-3L, with utility weights calculated by country-specific algorithms. This analysis explored the differences in utilities and QALYs when applying two different national EQ-5D-3L algorithms. **METHODS:** EQ-5D-3L data came from CLEAR, a phase 3b, 52-week, head-to-head study comparing the efficacy and safety of secukinumab versus ustekinumab in adults with moderate to severe plaque psoriasis. EQ-5D-3L was assessed at baseline and weeks 4, 8, 12, 16, 28, 48, and 52. Utilities were calculated from observed data, using algorithms from Germany and the United Kingdom (UK). Treatment response was defined as Psoriasis Area Severity Index (PASI) reduction of < 50% (i.e., PASI 50), 50-74, 75-89, and 90-100. A linear mixed model evaluated the relationship between EQ-5D-3L utility score and PASI, with the baseline utility score used as a covariate. QALYs were calculated in an existing cost-effectiveness Markov model evaluating biologic psoriasis treatments over 10 years. **RESULTS:** Utility estimates derived from the German algorithm were higher than those derived from the UK algorithm. Differences decreased with higher PASI response. The mean baseline utility scores (0.8039 and 0.6812 for Germany and UK, respectively) were included in the Markov model to estimate the utility scores by PASI response. Estimated utility weights using German and UK algorithms were 0.888 and 0.801 for PASI 50; 0.924 and 0.850 for PASI 50-74; 0.937 and 0.880 for PASI 75-89; 0.951 and 0.908 for PASI 90-100, respectively. This resulted in lower incremental QALYs with German utilities than with UK utilities (0.068 vs. 0.095, respectively). **CONCLUSIONS:** Applying different country-specific utility algorithms to EQ-5D-3L clinical trial data provided substantially different utility weights, affecting incremental QALY estimates in moderate to severe psoriasis. This variance should be considered when interpreting the results of cost-effectiveness analyses.

PRM115

ARE PATIENT'S RESPONSES TO FIVE POINT VERBAL DESCRIPTOR SCALES AND VISUAL ANALOGUE SCALES REPLICATE MEASURES? AN EXPERIMENTAL MANIPULATION

Evans C[1], Serrano D[1], Witherspoon B[1], Khurana L[2], Dallabrida SM[2]
[1]Endpoint Outcomes, Boston, MA, USA, [2]ERT, Boston, MA, USA

OBJECTIVES: To determine if verbal descriptor scale (VDS) categories are equidistant from each other, represent unique response choices in patient-reported outcome measures and are equivalent to visual analogue scales **METHODS:** 400 subjects were sampled 1:1:1:1 across four disease areas: type-2 diabetes, chronic obstructive pulmonary disease (COPD), depression, and osteoarthritis. Recruitment employed population sampling methods in Boston, MA. Enrolled subjects participated in an experimental design assessing general health rating styles. Subjects mapped VDS categories (none, very mild, moderate, severe, and very severe; the mild category was omitted by design) to the corresponding locations on a vertically-oriented VAS (unanchored and scored 0-100 in ascending order from bottom to top of VAS) The association between VAS score and VDS was examined. **RESULTS:** 419 subjects were enrolled from each of the four disease areas, with n=104 for all except depression (n=107). Four VAS responder-profiles were detected: ascending, descending, mis-ordered, and missing data. Ascending subjects (n=55) mapped the VDS ratings from the bottom to top of the VAS (none=0 : very severe=100). Descending subjects (n=187) ordered VDS ratings from top to bottom of the VAS (none=100 : very severe=0). Mis-ordered subjects (n=75) mirrored descending subjects without monotonic ordering. Missing subjects (n=102) were missing at least one VDS rating, and generally mirrored the descending pattern. Whether subjects employed an ascending or descending VAS response-profile, average VAS scores corresponding to each VDS category were proportionately ordered. **CONCLUSIONS:** Comparing VAS

and VDS response-profiles, subjects inconsistently interpreted the unanchored VAS. In spite of interpretation heterogeneity, when VDS ratings were mapped to a VAS, average VAS scores were approximately equidistant and ordered monotonically. Therefore, the expected VDS scores appear to satisfy the proportional odds assumption for the VAS.

PRM116

MODE COMPARISON IN ELICITING PREFERENCES FOR CARE-RELATED QUALITY OF LIFE: EVIDENCE FROM ENGLAND USING THE ASCOT SERVICE USER MEASURE

Saloniki E[1], Batchelder L[1], Malley J[2], Burge P[3], Lu H[3], Forder J[1]
[1]University of Kent, Canterbury, UK, [2]London School of Economics and Political Science, London, UK, [3]RAND Europe, Cambridge, UK

OBJECTIVES: Traditionally, researchers relied on eliciting preferences through face-to-face interviews. Recently, there has been a shift towards using alternative modes, such as the internet, to gather such data. These different modes may be a source of variation in the results. In health services research, preferences are important as they provide an estimate of the value of each quality of life state, and can be used as weights to reflect the differential utility of each state. In this study, we compare the preferences elicited from two modes of administration (internet versus face-to-face) for the best-worst scaling (BWS) technique using the Adult Social Care Outcomes Toolkit service user measure (ASCOT-S). **METHODS:** Data were collected from a representative sample of the general population in England. The respondents (face-to-face: n=500; online: n=1,001) completed a survey which included the BWS experiment involving the ASCOT-S, consisted of 32 tasks which were blocked into 4 segments. Multinomial logistic regressions were undertaken to analyse the data. To allow for direct comparisons between the modes, model coefficients were standardised. **RESULTS:** Respondents in the face-to-face survey placed lower value on the lower levels of all ASCOT-S domains, except social participation, than those in the internet survey. The highest point difference of 0.12 was observed in Level 2 of the occupation domain. For the highest level of all ASCOT-S domains, except social participation, preference weights were higher in the face-to-face survey than the internet with point differences of up to 0.10. **CONCLUSIONS:** This study compared utility weights obtained from a BWS exercise using two modes of administration for the ASCOT-S. The findings showed variation of responses between the two modes. Most differences were not significant and were low in absolute value. This suggests that preference weights are similar across the different modes of administration. We reflect on the implications of these findings for cost-effectiveness research.

PRM117

PSYCHOMETRIC VALIDATION OF THE ATOPIC DERMATITIS IMPACT QUESTIONNAIRE (ADIQ)

Boruvka A[1], Curry C[2], Lin C[2], Omachi TA[2], Olsson J[2], DeBusk K[2]
[1]Roche, Missassagua, ON, Canada, [2]Genentech, South San Francisco, CA, USA

OBJECTIVES: Atopic dermatitis (AD) is associated with substantial impairment of patients' health-related quality of life (HRQoL). A new instrument, the AD Impact Questionnaire (ADIQ), was developed following FDA PRO Guidance (2009) to assess impact of AD on patients' lives. The ADIQ was included in a Ph2 clinical trial and data from that trial was used to assess measurement properties. **METHODS:** In a Ph2 clinical trial 209 patients aged 18–75y with moderate-to-severe AD (after initial screening and a 2-week topical corticosteroid [TCS] run-in period), were randomized to receive lebrikizumab 125mg Q4W, 250mg single dose (SD), 125mg SD, or placebo (PBO) plus twice-daily medium-potency TCS to all lesional skin for 12 weeks. Secondary analyses of screening, run-in, and Week 12 data, were used to evaluate item-level statistics, scaling structure, reliability and validity. Data from all arms were pooled to assess measurement properties of the ADIQ. Data from patients with stable disease, i.e. less than a meaningful change (6.6pts) on the Eczema Disease Severity Index (EASI), was used for analyses with multiple time-points, e.g. test-retest. **RESULTS:** 203 (97%) patients completed the ADIQ at screening. It showed evidence of adequate reliability (α=0.76); reproducibility (ICC = 0.95); and validity, with the latter including moderate correlations with the Dermatology Life Quality Index (DLQI; r=0.84), and patient-reported components of SCORing Atopic Dermatitis [SCORAD; r=0.41 (pruritus) and 0.46 (sleep loss)] at screening. Concurrent correlation between the ADIQ and indices of disease severity, [overall SCORAD, EASI and Investigator Global Assessment (IGA)] was relatively low. However, change in ADIQ from screening to Week 12 readily detected minimal important differences in disease severity over the same time period, with SCORAD, EASI and IGA concordance indices ranging from 0.76 to 0.81. **CONCLUSIONS:** Results suggest the ADIQ is a reliable and valid measure to assess treatment benefit on AD patients and can complement disease severity assessments.

PRM118

A SYSTEMATIC REVIEW OF QUALITY OF LIFE DOMAINS AND ITEMS RELEVANT TO QUALITY OF LIFE TO PATIENTS WITH SPONDYLOARTHRITIS

Kwan YH[1], Fong W[2], Tan VI[2], Lui NL[2], Malhotra R[1], Ostbye T[1], Thumboo J[2]
[1]Duke-NUS Medical School, Singapore, Singapore, [2]Singapore General Hospital, Singapore, Singapore

OBJECTIVES: To summarize, from the literature, Quality of Life (QoL) domains and items relevant to patients with Spondyloarthritis (SpA), and to determine if commonly used SpA Patient-Reported Outcome (PRO) instruments include the identified domains. **METHODS:** We used PRISMA criteria for systematic review and searched Medline® Embase® and PsycInfo® using relevant keywords. In addition, hand searches of references of the included articles were conducted. All articles were reviewed for inclusion by 2 independent reviewers. Articles were included if they contained information on domains and/or items of relevance to QoL of patients with SpA derived from patients' own perceptions or reports. QoL domains and items relevant to patients with axial or peripheral SpA were extracted and presented using the adapted World Health Organization Quality of Life (WHOQOL) domain framework. SpA PROs were assessed to determine if they included the domains identified. **RESULTS:** We retrieved 14,343 articles, of which 34 articles fulfilled inclusion criteria for review. 25 articles were conducted in the European population. Domains such as negative feelings and activities of daily living were found to be present in 28 and 27 articles respectively. SpA impacted QoL in all domains of the adapted WHOQOL framework. Domains that differed between types of SpA were financial resources, general levels of independence and medication side effects. Embarrassment, self-image and premature ageing were items that differed by geographical setting. PROs to capture domains for peripheral SpA were similar for axial SpA. **CONCLUSIONS:** We found that a wide range of domains and items of QoL were relevant to patients with SpA with minimal differences between patients with axial and peripheral SpA. Clinicians may consider using peripheral SpA PROs to measure QoL of patients with axial SpA.

PRM119

LINGUISTIC VALIDATION OF THE NEUROGENIC BOWEL DYSFUNCTION SCORE IN JAPANESE

Crane AL[1], Gallo Santacruz B[2], Popielnicki A[3], Sweeney E[1], Sørensen J[2], Stahlin K[1]
[1]TransPerfect, New York, NY, USA, [2]Coloplast A/S, Humlebæk, Denmark, [3]TransPerfect, Boston, MA, USA

OBJECTIVES: The Neurogenic Bowel Dysfunction score (NBD score) is a self-reported symptom-based score for neurogenic bowel dysfunction that takes into account both constipation and fecal incontinence, and weighs each symptom of NBD according to its impact on self- reported quality of life (QoL). It is used for the clinical assessment of colorectal and anal dysfunction in persons with spinal cord injury (SCI). Our objective was to perform a cultural adaption/linguistic validation of the questionnaire into Japanese for use in Japan by following FDA PRO Guidance- and ISPOR-compliant methodology. **METHODS:** The NBD Score was translated into Japanese utilizing the following process: two forward translations, reconciliation of the forward translations, back translation, and resolution of the back translation with the forward translation. The project team reviewed the translated version before the instrument was evaluated in cognitive interviews (CIs) with a sample of five Japanese individuals with neurogenic bowel dysfunction. **RESULTS:** Conceptual issues related to the English source text were identified by the Sponsor during review of the final, validated translation. For example, the first item does not include "once a week" as a response option. While this was noted by the respondents during cognitive interviewing, it did not impact their comprehension of the question or the instrument. Any update to the Japanese translation to include this response choice would require an amendment to the original English text. **CONCLUSIONS:** Through the rigorous translation/adaptation and review process, as well as verification through cognitive interviews, the translation of the NBD score questionnaire into Japanese is considered to be conceptually equivalent and culturally appropriate for the target population. The Japanese version is now linguistically validated for use in clinical trials.

PRM120

DERIVING MAPPED HEALTH STATE UTILITY VALUES FOR ECONOMIC EVALUATION USING SUMMARY HEALTH RELATED QUALITY OF LIFE MEASURES AS SUFFICIENT STATISTICS

Mujica-Mota RE, Medina-Lara A
University of Exeter, Exeter, UK

OBJECTIVES: Health state utility values (HSUV) required for pharmacoeconomic evaluations are often unavailable from randomised controlled trials (RCTs). Instead some RCTs collect health related quality of life (HRQoL) data and mapping methods have been developed to derive utilities from such data for pharmaeconomic evaluations. Published mapping algorithms are either linear functions of detailed HRQoL item level data or nonlinear functions of domain scores, which require individual patient data as inputs. Researchers often do not have access to item scores or individual patient data, but are more likely to have summary domain score data available to them. The objective of this study was to propose methods to obtain HSUV from nonlinear mapping algorithms using summary HRQoL domain scores. **METHODS:** We used a linear Taylor approximation to a nonlinear mapping algorithmic function of summary HRQoL domain scores centred at the midpoint of a clinically important difference. We illustrate this for estimating utility values before and after disease progression, using summary domain scores of the FACT-G from an RCT of a targeted therapy for advanced cancer, as inputs to the response mapping algorithm estimated by Longworth. We compare our results with mapped utilities obtained from the best fitting (linear) item-level algorithm using individual patient data. **RESULTS:** We found that the utility of stable disease was 0.783 with the linearised algorithm and 0.779 (95% CI: 0.763 - 0.796) with the best-fitting algorithm using IPD; utility post-progression was 0.747 and 0.725 (95% CI: 0.706 – 0.744), respectively. **CONCLUSIONS:** Linearisation of existing non-linear mapping algorithms may be used to obtain reliable HSUV for informing healthcare decisions, in the common situations where only summary HRQoL domain score data are available for research.

PRM121

PSYCHOMETRIC EVALUATION OF THE BRIEF PAIN INVENTORY - SHORT FORM (BPI-SF) AND WESTERN ONTARIO AND MCMASTER UNIVERSITIES OSTEOARTHRITIS INDEX (WOMAC®) FOR USE IN X-LINKED HYPOPHOSPHATAEMIA (XLH), A RARE GENETIC DISORDER

Theodore-Oklota C[1], Brohan E[2], Marshall C[2], Tritton T[2]
[1]Ultragenyx, Brisbane, CA, USA, [2]Adelphi Values Ltd, Bollington, UK

OBJECTIVES: XLH is a rare genetic disorder in which adults typically experience significant symptoms including skeletal pain, stiffness, and impaired mobility. To

date, no validated measures exist to quantify these symptoms from the patient's perspective. The current study evaluated the psychometric properties of the BPI-SF and WOMAC® to assess their suitability for use as clinical trial endpoints to measure pain, stiffness, and physical functioning in adults with XLH. **METHODS:** Data from an online burden of illness (BOI) study (n=201) and data from an open-label phase 2b clinical trial (n=20) were used to evaluate the psychometric properties of the BPI-SF and WOMAC in adult patients with XLH. Psychometric analyses included construct validity (confirmatory factor analysis, known groups method, convergent and discriminant validity), reliability (inter-rater, test-retest reliability) and ability to detect change. Exploratory analyses were also conducted to define meaningful change on the BPI-SF and WOMAC. **RESULTS:** Confirmatory Factor Analysis demonstrated appropriate item-score groupings for both the BPI-SF and WOMAC with the majority of model fit statistics surpassing a-priori thresholds. BPI-SF and WOMAC scores were able to significantly differentiate between groups of patients defined according to a range of clinical and demographic characteristics. BPI-SF and WOMAC scores were positively and strongly correlated with measures of similar concepts in the BOI sample. Strong reliability (internal consistency ($\alpha = 0.81$-0.96), test-retest (= 0.43-0.82)) was also established for both instruments. The responsiveness analysis was limited due to the small sample size in the trial population. MID values (anchor and distribution-based) were most consistent for the BPI-SF pain severity (0.91-1.62), BPI-SF pain interference (0.59-1.86), and WOMAC Pain scores (7.24-11.28). **CONCLUSIONS:** These findings provide evidence that the BPI-SF and WOMAC are valid and reliable measures of pain, stiffness, and physical functioning impairments in XLH.

PRM122

HOW WELL DOES THE EQ-5D-5L SCREEN FOR MENTAL HEALTH COMPARED TO THE SF-12?

Al Sayah F, Ohinmaa A, Johnson JA
School of Public Health, University of Alberta, Edmonton, AB, Canada

OBJECTIVES: To examine the performance of EQ-5D-5L (index score; anxiety/depression dimension), and the SF-12 version 2 (feeling downhearted/depressed item, mental health (MH) domain, and the Mental Composite Summary (MCS) score) in identifying individuals with depressive symptoms. **METHODS:** Baseline data from a cohort study of adults with type 2 diabetes in Alberta, Canada were used. The EQ-5D-5L index score and MCS were categorized into quintiles, and the MH domain into quartiles. Both EQ-5D-5L anxiety/depression dimension and SF-12 feeling downhearted/ depressed item have five levels. Depressive symptoms "DS" (using the Patient Health Questionnaire 8 items, PHQ) were categorized into two severity levels: any DS (PHQ$\geq$10) vs. absent DS (PHQ$<$10); moderate-severe DS (PHQ$\geq$15) vs. absent moderate-severe DS (PHQ$<$ 15). We calculated sensitivity (Sn), specificity (Sp), and area under receiver operator curve (AUROC) for each of the measures' elements for each DS level. **RESULTS:** For any level of DS: optimal performance was at quintile 4 for EQ-5D-5L index score (Sn=83%; Sp=69%, AUROC=0.76), level 2 for anxiety/depression dimension (Sn=92%; Sp=64%; AUROC=0.78), level 3 for feeling downhearted/depressed item (Sn=72%; Sp=81%; AUROC=0.76), quartile 3 for MH domain (Sn=85%; Sp =71%; AUROC=0.78), and quintile 4 for MCS (Sn=90%; Sp=72%; AUROC=0.81). Overall AUROC were highest for MCS (0.90) and EQ-5D-5L anxiety/ depression (0.87). For moderate-severe DS: optimal performance was at quintile 4 for EQ-5D-5L index score (Sn=93%; Sp=64%; AUROC=0.79), level 3 for anxiety/depression dimension (Sn=77%; Sp=89%; AUROC=0.83), level 3 for feeling downhearted/depressed item (Sn=84%; Sp=76%; AUROC=0.80), quartile 3 for MH domain (Sn=96%; Sp=65%; AUROC=0.80), and quintile 5 for MCS (Sn=88%; Sp=86%; AUROC=0.87). Overall AUROC were highest for MCS (0.90) and EQ-5D-5L anxiety/depression (0.90). **CONCLUSIONS:** The EQ-5D-5L performed very well as a screen for mental health in this population. The anxiety/depression dimension performed similarly to the SF-12 MCS and slightly better than the SF-12 MH domain in identifying depressive symptoms.

PRM123

A TALE OF TWO SURVEYS: PATIENT SURVEY RECRUITMENT VIA EMAILS AND LETTERS

Stephenson JJ, Marshall AR, Dinh J, Merkh RD, Paullin M
HealthCore Inc., Wilmington, DE, USA

OBJECTIVES: To compare and contrast patient survey recruitment via pre-notification emails and mailed letters. **METHODS:** Patients were recruited for two survey studies using pre-notification emails and mailed letters. Study A's target population consisted of survey-eligible, commercially-insured patients with cardiac arrhythmia and Study B consisted of survey-eligible, commercially-insured type-2 diabetic insulin users. Patients for both studies were identified from administrative claims in the HealthCore Integrated Research Database. Study participation consisted of completing a one-time survey either via the internet or over the telephone. The protocols and all survey materials were approved by the New England Institutional Review Board. The recruitment pre-notification e-mails and letters contained information regarding the purpose of the survey, who was conducting the survey, participation criteria, a link to complete the survey via the internet and a phone number to complete the survey over the telephone. Patients who did not respond to the e-mails or letters were contacted by telephone and consenting patients completed the survey over the telephone. Summary sample dispositions, survey metrics and rates were calculated by study and type of recruitment and a descriptive analysis was conducted. **RESULTS:** Of Study A's 2,657 emails, 353 responded, 118 consented, 91 qualified and 80 completed the survey; of Study A's 3,638 letters, 447 responded, 268 consented, 230 qualified, and 224 completed the survey. Study A's email and letter list completion rates were 3.0% and 6.2%; cooperation rates were 24.5% and 54.8%. Of Study B's 4,624 emails, 376 responded, 251 consented, 207 qualified and 164 completed the survey; of Study B's 5,132 letters, 419 responded, 298 consented, 253 qualified, and 236 completed the survey. Study B's email and letter list completion rates were 3.5% and 4.6%; cooperation rates were 49.4% and 63.1%. **CONCLUSIONS:** More research is necessary to determine the impact of these recruitment methods in other therapeutic areas and study designs.

PRM124

ADAPTING THE MEDICATION ADHERENCE REASONS SCALE (MAR-SCALE) FOR ONLINE ADMINISTRATION ACROSS MULTIPLE COMORBID CONDITIONS, MODES OF ADMINISTRATION, AND FREQUENCIES OF USE

Goren A[1], Annunziata K[1], Unni E[2]
[1]*Kantar Health, New York, NY, USA,* [2]*Roseman University of Health Sciences, South Jordan, UT, USA*

OBJECTIVES: Medication non-adherence can limit the full realization of treatment benefits for patients. Numerous factors account for non-adherence, including various reasons reported by patients via the Medication Adherence Reasons Scale (MAR-Scale). The current objective was to revise the MAR-Scale to extend its scope to various comorbid conditions across modes and frequencies of administration. **METHODS:** The MAR-Scale items and presentation were adapted in collaboration with input from patients, healthcare professionals, researchers, and survey programmers, to accommodate different modes and frequencies of administration and up to 17 comorbid condition groups (including arthritis, diabetes, and pain). The presentation and programming were modified with the intention of engaging respondents and minimizing fatigue/burden, while encompassing the broader scope. **RESULTS:** The original MAR-Scale was reorganized into an online grid format where each item is answered across conditions (adjacent columns). Respondents enter a number within a valid range for each item within a condition, instead of selecting among predetermined response option boxes. Respondents are asked about any prescription medication(s) taken per condition, albeit broken out by administration mode (oral, topical, self-injection) and frequency (daily, weekly). MAR-Scale items were revised to accommodate the different modes; similarly, response options were adapted with respect to past 0-7 days for daily use (as per the original) or 0-4 weeks for weekly use. Mode (3) by Frequency (2) combinations result in up to six MAR-Scale grids completed separately. Introductory instructions were modified to highlight the focus of each version. The modified MAR-Scale will be administered to approximately 20,000 participants for further testing, revision, and validation. **CONCLUSIONS:** The original, treatment-specific MAR-Scale was adapted to provide real-world data across various conditions and modes and frequencies of administration (for each patient). This revised measure allows for a broader assessment of patients' treatment experiences and challenges, thereby helping inform more programmatic interventions intended to improve adherence within and across conditions.

PRM125

INVESTIGATING THE RELATIVE VALUE OF HEALTH AND SOCIAL CARE RELATED QUALITY OF LIFE USING DISCRETE CHOICE

Mulhern B[1], Norman R[2], DeAbreu Lourenco R[1], Viney R[1]
[1]*University of Technology Sydney, Sydney, Australia,* [2]*Curtin University, Perth, Australia*

OBJECTIVES: A key outcome in the economic evaluation of health interventions is the Quality Adjusted Life Year (QALY). The quality of life (QoL) weights used to estimate QALYs are generally provided by preference-based measures of health such as the EQ-5D. However, interventions can also result in improvements in non-health related QoL (e.g. social care), but currently these effects are only partially captured. The aim was to investigate the feasibility of using Discrete Choice Experiment (DCE) methods to understand the relative relationship between, and derive preferences for, health and social determinants of QoL (described using EQ-5D-5L and ASCOT). **METHODS:** An online DCE was carried out in Australia. Respondents were presented with choice sets including two profiles with attributes from both the EQ-5D-5L and ASCOT. Each respondent completed 15 tasks from an underlying design of 300 choice sets. Analysis used standard approaches to analyzing DCE data, employing conditional logit modelling to estimate coefficient decrements for each level of each attribute to examine the relative importance of each. **RESULTS:** The results suggest that the levels of the majority of the dimensions are monotonic. There is clear trading between health and social care, indicated by differences in the magnitude of the coefficients across the different aspects of QoL included in the DCE tasks. Respondents reported being able to conceptualise the states presented and complete the tasks, but there was some incomplete surveys. **CONCLUSIONS:** We have tested a possible choice based approach that will allow us to make inferences about QoL based on data obtained from different preference based instruments. DCE is a feasible method to improve our understanding of how aspects of health related and social care related QoL are traded against other, and the relative importance of each. The data also provide a basis for stimulating further research in this area.

PRM126

PAIN ASSESSMENT: A MYRIAD OF TECHNIQUES TO MEASURE PAIN SEVERITY – DOES IT MATTER WHICH ONE IS USED?

Evans C[1], Serrano D[1], Witherspoon B[1], Khurana L[2], Dallabrida SM[2]
[1]*Endpoint Outcomes, Boston, MA, USA,* [2]*ERT, Boston, MA, USA*

OBJECTIVES: A variety of methods have been developed to assess pain severity. This study was conducted to determine if there are meaningful differences in responses across the different techniques. **METHODS:** 400 subjects were sampled 1:1:1:1 across four disease areas: Type-2 Diabetes, Chronic Obstructive Pulmonary Disease, Depression, and osteoarthritis. Recruitment employed free-media-advertising-based population sampling methods in Boston, MA. Eligible adult

subjects were screened to confirm diagnosis and disease severity. As part of a larger study, enrolled subjects completed multiple single-item pain assessments: a horizontal and vertical polar-anchored visual analog scale (VAS; scored 0-100), two 11-point numerical rating scales (NRS; polar-anchored and box-plot), and a single six-point verbal descriptor scale (VDS; no, mild, moderate, intense, very intense, and excruciating pain). Responses on all pain items were compared to determine subject consistency in response across modes of assessment. **RESULTS:** 419 subjects were enrolled from each of the four disease areas, with n=104 for all except Depression (n=107). Vertical and horizontal VAS scores were not perfectly correlated, but nearly (r=0.9). VAS scores correlated strongly with both NRS and the VDS item: r=0.9, r=0.9, and r=0.8, respectively. Average VAS scores were monotonically and proportionately ordered across VDS levels: 5.9, 23.4, 49.4, 68.9, 77.1, and 94.2, respectively. However, substantial heterogeneity was noted for each VDS level: range of 0-63, 3-93, 10-88, 0-97, 10-100, and 81-99, respectively. N=159 (39%) subjects preferred the polar-anchored NRS to other methods of assessment. The main reason for preferring the polar-anchored NRS was ease of use. The second most preferred method was the six-point VDS, preferred by n=143 (35%). **CONCLUSIONS:** Single-item pain assessments are myriad. Subjects do not respond identically across administration forms. However, forms are strongly correlated. Within a given VDS rating substantial variance in VAS scores is observed. Subjects prefer the ease of use of the polar-anchored NRS.

PRM127

COMPARING HEALTH-RELATED QUALITY OF LIFE OF SCHIZOPHRENIC PATIENTS WITH PREDOMINANT NEGATIVE SYMPTOMS TREATED WITH CARIPRAZINE AND RISPERIDONE

Nemeth B[1], Molnar A[1], Horvath M[2], Koczian K[2], Nemeth G[2], Gotze A[2], Voko Z[3]
[1]Syreon Research Institute, Budapest, Hungary, [2]Gedeon Richter Plc., Budapest, Hungary, [3]Eötvös Loránd University, Budapest, Hungary

OBJECTIVES: Our study aimed at assessing the health-related quality of life gain with the drug cariprazine in the treatment of schizophrenia for patients with predominant negative symptoms (PNS) compared to risperidone. **METHODS:** We conducted a data analysis on individual patient level data derived from the RGH-188-005 clinical trial. The 30 items of the Positive and Negative Syndrome Scale (PANSS) were used to categorize patients into 8 different health states defined according to the approach of Mohr and Lenert published in 2004 and 2005. Utilities were assigned to Mohr-Lenert health states in accordance with the 2004 publication by Lenert et al. A Bayesian polytomous state transition model with an uninformative prior was constructed with the software WinBUGS with the involvement of three psychiatrists. This was linked to a Markov model with 8 health states based on the 8 Mohr-Lenert health states to estimate the potential gains in quality-adjusted life years (QALYs) of patients. Therapy switch as an option was built into the model, linked to lack of efficacy and adverse events to reflect real-life treatment patterns. **RESULTS:** Based on the transition relative frequency matrices, patients had a higher probability of reaching better health states on the cariprazine arm of the RGH-188-005 clinical trial compared to the risperidone arm. In the Markov model, this resulted in an estimated QALY gain of 0.02922 per patient when therapy switch was not considered, comparing cariprazine to risperidone after one year of treatment. The model showed an estimated QALY gain of 0.02530 per patient when therapy switch was considered, comparing cariprazine to risperidone after one year of treatment. **CONCLUSIONS:** Cariprazine can provide additional health-related quality of life gain in the treatment of schizophrenia for patients with predominant negative symptoms compared to risperidone.

PRM128

IS THE SF-6D DAILY SENSITIVE TO CAPTURE QALY-VARIATION ON REACTOGENICITY OF INJECTABLE VACCINES?

Meier G[1], Kosinski M[2], Dort T[3], Madan A[4], Standaert B[5], Schuind A[4]
[1]Eisai, Woodcliff Lake, NJ, USA, [2]Optum, Lincoln, RI, USA, [3]Keyrus Management S.A. on behalf of GSK Vaccines, Strombeek-Bever, Belgium, [4]GSK Vaccines, Collegeville, PA, USA, [5]GSK Vaccines, Wavre, Belgium

OBJECTIVES: Injectable adjuvanted vaccines cause local reactogenicity which may temporarily impact the Quality of Life (QoL) of vaccinated individuals. Variation in QoL-change expressed as quality-adjusted life year (QALY)-scores can be assessed with validated questionnaires used at regular time points capturing the health states of vaccinees. **METHODS:** Adult subjects (N=50) received a 2-dose vaccination schedule of an AS03-adjuvanted H5N1 pandemic influenza vaccine. At Day0 (just before the injection) and during the next 6 days (post-injection) subjects completed the SF-36 questionnaire with a 24 hours recall period (ClinicalTrials.gov Identifier: NCT01788228). Data were analyzed to obtain a daily QALY-score using the same algorithm as for the transformation of the SF-36 weekly questionnaire into a SF-6D being considered an appropriate QALY-score measure. During the same period, local and general symptoms were evaluated for each participant on a daily basis. It was hypothesized that the daily QALY-scores and the symptom scores were to correlate, if the former instrument was able to capture appropriately QALY-variation. **RESULTS:** Questionnaires were filled in with an average rate of compliance of 98%. The daily sum of local (pain, redness, swelling) and general (fatigue, gastrointestinal symptoms, headache, arthralgia, myalgia, chill, sweating, fever) symptoms scores were 90 (Day0), 127 (Day1), 99 (Day2), 41 (Day3), 28 (Day4), 12 (Day5), and 4 (Day6). The average daily QALY-scores were 0.885 (Day0), 0.860 (Day1), 0.874 (Day2), 0.887 (Day3), 0.893 (Day4), 0.901 (Day5), and 0.902 (Day6). The correlation coefficient between the two scores was -0.952 ($p<0.001$). **CONCLUSIONS:** We observed that symptom scores slightly increased for the first 2 days post-vaccination, and daily QALY-scores reflect and are able to capture that change. Noteworthy is that the QALY-loss on reactogenicity of the adjuvanted vaccine was marginal in time and score (-0.020/day during 2 days) which supports the tolerability of the H5N1 AS03-adjuvanted vaccine

PRM129

LET THERE BE LITE

Kind P[1], Chuang L[2]
[1]Institute of Health Sciences, University of Leeds, Leeds, UK, [2]Pharmerit International, Rotterdam, The Netherlands

OBJECTIVES: Health status measures vary widely in size and complexity, defining from 2 to 12 million unique states. The simplest system comprises two states – alive and dead; the standard 3-level version of EQ-5D defines 243 health states. This paper examines a theoretical precursor version of EQ-5D based on 2 response levels per dimension. **METHODS:** National population surveys for England and Wales were pooled to create a single dataset of EQ-5D-3L self-reported health status for more than 38,000 individuals. Responses were recoded so that no problem = 0 and ANY problem =1. Values for the resulting classification of 32 health states were estimated using the 0-100 VAS ratings as the dependent variable in an OLS model. The "lite" index was then applied in two further datasets (in lung cancer and back-pain patients) which also included standard clinical measures of severity. **RESULTS:** When used as a state measure or in valuing changes in health status, the "lite" index demonstrated statistically significant results consistent with the clinical parameters designate as primary markers in the two clinical studies – the Lung Cancer Symptom Scale and Roland/Morris Disability Questionnaire. For the purposes of identifying change in health status over time, the "lite" index performs satisfactorily, distinguishing groups of patients who improve/deteriorate following treatment. The "lite" index values show only small differences when compared with corresponding scores based on the conventional EQ-5D-3L. **CONCLUSIONS:** For mild to moderate disease/conditions a 2-level descriptive classification and an associated weighting system (in this case based on the 3-level version of EQ-5D) functions as well as more complex health status measurement systems. A small, compact descriptive system has the merit of requiring much simpler valuation methods than more complex systems. It is worth noting that the first index system in common usage by UK health economists was based on a 28 health state classification.

PRM130

EQUIVALENCE OF TELEPHONE AND FACE-TO-FACE PATIENT-REPORTED OUTCOME INTERVIEWS: LITERATURE REVIEW AND IMPLICATIONS FOR THE NEI VFQ-25

Kapre A[1], Tschosik E[1], Silverman D[2], Dolan C[3], Varma R[4], Bressler N[5]
[1]Genentech, Inc., South San Francisco, CA, USA, [2]Roche Products Limited, Welwyn Garden City, UK, [3]CMD Consulting, Inc., Sandy, UT, USA, [4]USC Eye Institute, Keck School of Medicine, University of Southern California, Los Angeles, CA, USA, [5]Johns Hopkins University School of Medicine, Baltimore, MD, USA

OBJECTIVES: The NEI VFQ-25, a patient-reported outcome (PRO) measure of vision-related quality of life, is often administered by telephone or face-to-face interview, given the difficulties of self-administration in patients with low vision. To evaluate whether available evidence informs the equivalence of these two modes of administering the NEI VFQ-25, we conducted a literature review to identify: 1) studies on equivalence of telephone and face-to-face administration of any PRO instrument, and 2) studies with mixed-mode NEI VFQ-25 administration. **METHODS:** A systematic literature review was conducted for each objective. Medline was searched using keywords for English articles published after 1980 for objective 1 (equivalence review) and after 1997 for objective 2 (research review). Bibliographies of published articles were also reviewed. Studies on food frequency, mental illness, drug/alcohol use, or sexual behavior were excluded. **RESULTS:** The equivalence review identified 11 publications comparing face-to-face and telephone PRO interviews, all of which supported equivalence of the two modes. However, no equivalence study comparing the two modes of administration specifically for the NEI VFQ-25 was identified. In 8 out of the 9 studies in adults using other PROs, equivalence was assessed by comparing mean scores of the two interview modes administered successively to the same population. In 7 of these 9 studies, interviews were conducted within 2 weeks. The research review identified 6 instances in which NEI VFQ-25 data were obtained by a mix of face-to-face and telephone interviews. These 6 studies (3 interventional, 3 observational) were conducted across conditions including age-related macular degeneration, diabetic macular edema, and retinal vein occlusion. **CONCLUSIONS:** The literature review shows that it is common to use mixed-mode telephone and face-to-face interviews for administering the NEI VFQ-25. Equivalence studies of face-to-face and telephone interviews of PROs across a wide range of instruments, diseases, and ages support this method of combined analysis.

PRM131

TRANSLATION OF THE ZARIT BURDEN INTERVIEW 22 ITEMS (ZBI-22) INTO 95 LANGUAGES: CHALLENGES AND IMPORTANCE OF THE CONCEPTUAL DEFINTION OF THE ORIGINAL VERSION

Zarit S[1], Dulac M[2], Anfray C[2], Vasarri S[3], Giroudet C[4]
[1]Pennsylvania State University, University Park, PA, USA, [2]Mapi Research Trust, Lyon, France, [3]Mapi, Yardley, PA, USA, [4]Mapi, Lyon, France

OBJECTIVES: The Zarit Burden Interview (ZBI) is a caregiver self-report measure, developed in US English, specially designed to reflect the stresses experienced by caregivers of dementia patients. Caregivers are asked to respond to a series of 22 questions about the impact of the patient's disabilities on their life. For each item, caregivers are asked to indicate how often they felt that way (never, rarely, sometimes, quite frequently, or nearly always). The objectives of this study were to present the challenges of the translation of the ZBI-22 into 95 languages and the importance of developing a conceptual definition for each item. **METHODS:** In most

languages, the standard translation process consisted of: 1) Concept definition with the developer 2) Forward/backward translation step including a review of the backtranslation by Prof. Zarit; 3) Clinician review; and 4) Cognitive interviews with five caregivers. **RESULTS:** No cultural issues were identified during the process. Most of the challenges were semantic. One of the greatest challenges was in finding the most appropriate words for the description of the feelings of the caregivers (i.e., do you feel stressed, embarrassed, angry, uncomfortable, afraid); each word representing a specific concept needing a clear differentiation. Items 7 and 13 raised queries given their idiomatic nature (7. Are you afraid of what the future holds for your relative?; 13. Do you feel uncomfortable about having friends over?). The interventions of Prof. Zarit helped the teams in finding appropriate translations. Examples of solutions found are presented. **CONCLUSIONS:** The input of the developer in providing conceptual definitions and clarifications during the process was key in developing translations of the ZBI-22 conceptually equivalent to the original.

PRM132

LINGUISTIC VALIDATION OF AN INSTRUMENT TO EVALUATE HEALTH-RELATED QUALITY OF LIFE IN PEDIATRIC PATIENTS WITH GROWTH HORMONE INSUFFICIENCY IN 7 LANGUAGES FOR 5 COUNTRIES

Brandt B[1], Yohe Moore E[2], Jacobs K[1], McKown S[1], Poepsel T[1]
[1]*Corporate Translations Inc, East Hartford, CT, USA,* [2]*Corporate Translations Inc, Chicago, IL, USA*

OBJECTIVES: To translate and linguistically validate a pediatric HRQOL instrument for paper administration in 7 languages for 5 countries, intended for use by children with growth hormone insufficiency or idiopathic short stature. Pediatric instruments are often intended for respondents with a wide range of developmental abilities, demanding varied approaches to cognitive testing. To enrich our understanding of pediatric populations, we seek a cognitive interview approach with the goal of consistently yielding more robust qualitative data. **METHODS:** Corporate Translations translated, harmonized, and back translated the instrument into 7 languages for 5 countries, with an emphasis on age-appropriate terminology. The harmonizations were subjected to in-person cognitive debriefing interviews with children. Informed by the Report of the ISPOR PRO Good Research Practices for the Assessment of Children and Adolescents Task Force (Matza, et al., 2013), age-based interview criteria were developed for subjects aged 3-12 years. Subjects aged 3-6 years completed the instrument via interviewer administration, with follow-up questions targeting difficulty in comprehension. Subjects 7-12 years self-completed the instrument, with probes targeting difficulty in comprehension and the impact of short stature on QOL. A caregiver was present at all interviews. Item and probe responses, suggestions for translation revisions, and additional substantive comments were recorded and analyzed. **RESULTS:** Cognitive debriefing was successfully completed with 35 subjects, 15 children aged 3-6 years and 19 children aged 7-12 years. Both groups provided substantive comments to confirm understanding. As a result, revisions were made to the questionnaire translations in favor of age-appropriate language and improved conceptual clarity. **CONCLUSIONS:** Cognitive interviews were conducted successfully with pediatric patients with shorter stature. This approach provided evidence that a single instrument can be accessible for a wide age range, given that interviewer- and self-administered options are available. This instrument is considered linguistically validated for use in 7 languages for 5 countries.

PRM133

ADAPTATION AND ASSESSMENTS OF THE CHINESE VERSION OF THE ICECAP-A MEASUREMENT

Xu J[1], Tang C[1], Xiong Y[1], Wu H[2]
[1]*Southwestern University of Finance and Economics, Chengdu, China,* [2]*Guizhou Medical University, Guizhou, China*

OBJECTIVES: To adapt and assess the ICECAP-A measurement for estimating the general quality of life (QoL) in China **METHODS:** Both qualitative and quantitative analysis were conducted to validate the translated ICECAP-A well-being measurements. After a focus group discussion regarding the appropriateness and wording of ICECAP attributes in Chinese, we conducted an online survey in China with 1000 randomly selected adults aged over 18 years. We conducted psychometric tests and compared factors influencing the ICECAP-A with those influencing EQ-5D-3L. **RESULTS:** In general, discussion group members agreed that the 5 attributes content is sufficient to evaluate wellbeing in China. To adapt to Chinese culture, the direct translation of "being settled" and "friendship" are reworded to direct translations of "stability" and "kindness". Our results show that the Chinese version of ICECAP-A has good internal consistency with an overall Cronbach's Alpha coefficient of 0.7999. The concurrent validity indicates that ICECAP-A is only weakly correlated with EQ-5D-3L ($r<0.4$). Although both ICECAP-A and EQ-5D-3L are highly correlated with happiness, they may reflect different perspectives of wellbeing measurements. **CONCLUSIONS:** ICECAP-A can be adapted for a wellbeing measurement in China but it requires cultural changes to the wording. It is a valid measurement and can complement the EQ-5D in measuring general QoL. However, further work is still needed to value and test the sensitivity of the ICECAP-A in relation to public health and social care interventions for patients.

PRM134

THE NECESSITY OF A VISUAL CONCEPT ELABORATION WHEN TRANSLATING STANDARD ANATOMICAL TERMS FOR CLINICAL OUTCOMES ASSESSMENTS (COAS) IN NON-LATIN LANGUAGES

Richards A, Mead H
ICON Plc, Abingdon, UK

OBJECTIVES: COAs often contain questions pertaining to distinct body parts of the subject. This is troublesome as some cultures refer to multiple body parts as one entity, for example, 'upper arm' and 'shoulder' referred to as 'arm'. The aim of this study is to investigate how much linguistic validation methods such as visual concept elaborations guarantee accuracy when translating human anatomy. The study focuses on 3 non-Latin languages, Russian, Urdu and Arabic, as these languages have previously produced difficulties when translating COAs. **METHODS:** Linguists were asked to provide literal translations of 17 commonly-used terms for human anatomy with no visual concept elaboration for context. A selection of anatomical terms was used to establish whether they have a direct translation or need to use multiple terms or descriptions. Linguists were then provided with a visual concept elaboration consisting of an image with arrows illustrating the intended anatomical location. This was followed by a review of the translation alongside the visual image whereby linguists gave their feedback regarding the changes needed for anatomical accuracy. Based on this data, an evaluation on the effectiveness of a visual concept elaboration was determined. **RESULTS:** An overall percentage for changes needed for accuracy was given across all languages. A percentage of words changed per language was also calculated and then a sample of 3 terms were cross-referenced to analyse the proportion of changes needed within the languages in the study. Out of the 17 body parts, edits to the translation were necessary for 55% overall across the 3 non-Latin languages. The general trend was that extremities produced the most issues in translation, for example, differentiations between 'forearm' and 'upper arm' were only discerned through using the visual concept elaboration. **CONCLUSIONS:** To obtain anatomical accuracy in translation for each language, a visual concept elaboration was proven to be an essential tool.

PRM135

CONTENT VALIDITY OF THE PRESCRIPTION OPIOID MISUSE AND ABUSE QUESTIONNAIRE (POMAQ) AMONG CHRONIC PAIN PATIENTS

Coyne KS[1], Barsdorf AI[2], Brooks A[1], Mazière J[3], Pierson RF[4], Butler SF[5], Schnoll S[6]
[1]*Evidera, Bethesda, MD, USA,* [2]*Pfizer, Inc, New York, NY, USA,* [3]*PPD, Wilmington, NC, USA,* [4]*Janssen Global Services, LLC, Raritan, NJ, USA,* [5]*Inflexxion, Inc., Waltham, MA, USA,* [6]*Pinney Associates, Bethesda, MD, USA*

OBJECTIVES: To assess the content validity and patient interpretation of the Prescription Opioid Misuse and Abuse Questionnaire (POMAQ), a questionnaire to evaluate potential prescription opioid misuse and abuse behaviors among patients with chronic pain prescribed long-term opioid therapy, as part of FDA PMR Study 3033-3. **METHODS:** A cross-sectional, qualitative study was conducted in patients with chronic pain, most currently on prescription opioids. Four patient groups were recruited from 6 clinical sites (Known Opioid Abusers; Known Abusers of Other Substances; Non-opioid Abusers; and Non-opioid Users) to participate in a one-on-one cognitive interview. Patients completed the POMAQ via web-administration and participated in an in-depth semi-structured interview to assess the patient's understanding of the questionnaire. Descriptive statistics and content analysis were performed. **RESULTS:** 54 patients were interviewed. Mean age was 48.7 ± 12.3 years; 57.1% female; 78.6% Caucasian; mean duration of chronic pain was 11.2 ± 8.2 years with lower back pain at 74.5%. Overall, the POMAQ was well-understood, received positive feedback, and all but one participant stated they were comfortable completing the questionnaire. A few (n=6, 11%) expressed concerns about completing the POMAQ using a secure internet site as they were not computer savvy (n=3, 5.4%) or were concerned about internet security (n=3, 5.4%). All participants stated they were honest when completing the POMAQ, but 51% (n=18/35) did not think others would be honest when completing the POMAQ. Minor wording modifications were made to the POMAQ to address concerns or issues noted by the participants and to enhance clarity and understanding of the POMAQ. **CONCLUSIONS:** The POMAQ has demonstrated acceptability and content validity among patients with chronic pain. The POMAQ is currently undergoing quantitative validation among a larger cohort of chronic pain patients on prescription opioids.

PRM136

COGNITIVE DEBRIEFING OF THE ADVANCED SYSTEMIC MASTOCYTOSIS SYMPTOM ASSESSMENT FORM (ADVSM-SAF)

Taylor F[1], Kreil S[2], Reiter A[2], Horny H[3], Evans E[4], Mazar I[1], McNamara P[4], Boral A[4], Lamoureux RE[1], Shields A[1], Gotlib J[5]
[1]*Adelphi Values, Boston, MA, USA,* [2]*University Hospital Mannheim, Mannheim, Germany,* [3]*Ludwig-Maximilians University, München, Germany,* [4]*Blueprint Medicines, Cambridge, MA, USA,* [5]*Stanford Cancer Center, Standord, CA, USA*

OBJECTIVES: Advanced forms of systematic mastocytosis (advSM) are rare diseases characterized by neoplastic mast cell infiltration of tissues, resulting in a variety of disease-related signs and symptoms. Informed by results from the literature, expert advice meetings, and patient concept elicitation interviews, the advSM Symptom Assessment Form (advSM-SAF) was developed to evaluate treatment efficacy in regulated clinical trials. Before implementation in clinical studies, the advSM-SAF was subject to cognitive debriefing interviews (CDIs) to understand and document the extent to which the tool was understandable to patients with advSM and the extent to which they could provide meaningful responses to the questionnaire. **METHODS:** The advSM-SAF is a 10-item electronic diary assessing eight advSM symptoms using a 24-hour recall period and a 0-10 numeric response scale. CDIs were conducted with patients with advSM to evaluate the advSM-SAF for readability, relevance, and comprehensiveness, and to test the usability of the electronic patient-reported outcome (ePRO) device. Subjects were asked to complete the advSM-SAF and provide feedback on the instructions, items, and response options. **RESULTS:** CDIs were conducted with 13 subjects with advSM. At least 78%, 89%, and 92% of subjects interpreted each of the response options, instructions, and items, respectively, as intended by the instrument developers. Based on subject feedback, one text deletion and one revision, a reordering of items on sign/symptom severity to follow those on sign/symptom frequency, were made to the advSM-SAF. Subjects reported no issues with ePRO device usability. **CONCLUSIONS:** The CDI results indicate that the

advSM-SAF is understandable to patients with advSM and that it can provide scores that accurately reflect their health status. These results, along with those from previously collected information from the literature, therapeutic area experts, and patients provide support for the ADVSM-SAF as a content valid questionnaire ready for implementation into clinical trial settings.

PRM137

CHALLENGES IN TRANSLATING THE NEUROPSYCHIATRIC INVENTORY (NPI) INTO 74 LANGUAGES

Cummings J[1], Giroudet C[2], Dulac M[3], Anfray C[3], Vasarri S[4]
[1]Reed Neurological Research Center, Los Angeles, CA, USA, [2]Mapi, Lyon, France, [3]Mapi Research Trust, Lyon, France, [4]Mapi, Yardley, PA, USA

OBJECTIVES: The Neuropsychiatric Inventory (NPI) was developed in US English to assess, through interviews with caregivers, ten behavioral disturbances occurring in dementia patients: A. Delusions, B. Hallucinations, C. Agitation/Aggression, D. Depression/Dysphoria, E. Anxiety, F. Elation/Euphoria, G. Apathy/Indifference, H. Disinhibition, I. Irritability/Lability, and J. Aberrant Motor Behavior. Two neurovegetative areas were added afterwards: K. Sleep, and L. Appetite and Eating Disorders. Screening questions assess the presence or absence of changes in behaviors in the patient. If the behavioral change is present, then, subquestions (n=7 to 9) are asked to evaluate behaviors in terms of frequency, severity, and distress. The objective of this study was to present the challenges faced during the translation of the NPI-12 into 74 different languages representing ten language families. **METHODS:** The NPI was translated in most languages with a process including: 1) Concept definition with the developer 2) Forward/backward translation step; 3) Final reconciliation; 5) Clinician review; and 6) Proof-readings. **RESULTS:** The translation process did not reveal any cultural issues since most of the concepts assessed were cross-culturally relevant. The psychiatric terms (e.g., delusions, euphoria, etc.) were carefully translated with the clinician input in each country. When a literal translation was impossible, synonyms or periphrases were used. Most of the challenges identified were linked to the use of idiomatic/colloquial content, such as the use of "talk big" in subquestion 6 (Does the patient "talk big") in section F, or the use of "flying off the handle" in subquestion 1 (Does the patient have a bad temper, flying "off the handle"…) in section I. In some languages, idiomatic expressions were available to express the same notions. However, in many languages either a synonym or a circumlocution was needed. Examples are presented. **CONCLUSIONS:** A rigorous methodology was essential in producing NPI translations conceptually equivalent to the US English original.

PRM138

SATURATION OF SIGN AND SYMPTOM CONCEPTS IN CONCEPT ELICITATION STUDIES WITH RARE DISEASE AND VULNERABLE PATIENT POPULATIONS

Mazar I, Shields A, Stokes J
Adelphi Values, Boston, MA, USA

OBJECTIVES: In qualitative research, saturation reflects the point at which little or no new novel data can be elicited from an interview sample. Research suggests that saturation in symptom-focused concept elicitation (CE) studies can be demonstrated in samples with as few as 10 subjects. The objective of this study was to examine the applicability of these results to patient populations that are difficult to recruit and/or interview. **METHODS:** A retrospective analysis of results from n=10 CE studies completed between 2014 and 2016 was conducted. Saturation was assessed by dividing each sample into chronological groups and comparing the number of unique concepts spontaneously elicited in the earlier groups to those emerging in the final group. **RESULTS:** A total of 140 participants across 10 studies were included in this analysis with sample sizes ranging from N=8 to N=20 (M=14). Average age of participants was 40.8 years (SD=23.0) and sixty-seven (48%) were female. Therapeutic areas included rare genetic disorders (n=4), rare and advanced stage cancer (n=5), and a dermatological condition in adolescents (n=1). A total of 341 sign/symptom concepts were elicited across all studies with an average of 34 (SD=16.50, range=13 to 57 concepts) concepts per study. An average of 91.5% (range = 75.4% to 100%) of concepts across studies emerged within the first 75% of interviews. **CONCLUSIONS:** Results from the present analysis are consistent with previous studies, can inform sample size decisions in qualitative research, and provide researchers working in rare disease or with vulnerable populations confidence that, if rigorously designed and conducted, their concept elicitation studies can be successful with sample sizes of 10 to 15 participants.

PRM139

SLEEP TRACKING AND EXERCISE IN DIABETES PATIENTS (STEP-D): A PILOT STUDY TESTING THE CONCURRENT VALIDITY OF FITBIT HR DATA WITH SELF-REPORT DATA

Weatherall J[1], Paprocki Y[1], Kudel I[2], Meyer T[3], Witt EA[3]
[1]Novo Nordisk Inc., Plainsboro, NJ, USA, [2]Kantar Health, New York, NY, USA, [3]Kantar Health, Princeton, NJ, USA

OBJECTIVES: Determine the direction and magnitude of the associations between Fitbit data and self-report data for sleep and exercise data collected from active users with type 2 diabetes (T2D). **METHODS:** STEP-D is a longitudinal, pilot study composed of individuals (n=86) diagnosed with T2D. Participants wore a Fitbit for 14 consecutive days and completed four Internet surveys taken at three time points: Day 1 (baseline), Day 7 (interim) and Day 14 (closing). The Fitbit tracked minutes asleep and number of steps taken. The questionnaire included items gauging the number of days exercised in a typical week, gym membership, number of nights in a typical week having trouble sleeping and the number of nights having sleep problems. Means and standard deviation were used to report all data and Pearson correlations were used to test the association between the Fitbit and self-report data. **RESULTS:** Participants, on average took 4,955.0 steps/day and slept 6.7 hours/day. They also self-reported an average of 2.0 days of exercise and 2.3 nights having trouble falling asleep in a typical week. The association between self-reported days exercised in a typical week and the correlation for mean steps was strong for Fitbit ($r=0.60$; $p<0.01$). Self-reports of sleep issues were moderately correlated with sleep variability. Self-reported nights having trouble falling asleep in a typical week was associated with more time spent in bed based on the Fitbit ($r=0.28$, $p=<0.05$). **CONCLUSIONS:** Findings indicate that Fitbit and self-report data are positively associated for sleep and exercise, but physical activity is more closely aligned than sleep-related information. This may indicate that FitBit is more valid for measuring certain behaviours. If these findings are replicated in T2D, then large-scale collection of certain objective HRQoL measures is possible, but data limitations will need to be acknowledged.

PRM140

IMPACT OF THE AGE OF THE TARGET AUDIENCE ON TRANSLATION DECISIONS

Volkmann CG, Windridge A
ICON Plc, abingdon, UK

OBJECTIVES: The aim of this study is to assess how the age of the target audience in patient questionnaires impacts on translation decisions using, as an example, the linguistic validation of the Child Behavior Checklist (CBCL) aimed at preschool children aged from 1½ to 5. **METHODS:** We assessed the list of children's commonly used terms from the CBCL for any potential linguistic difficulties. We thereby ascertained that some terms would need to be adapted from Modern Standard Arabic (MSA) into Lebanese Dialect, as the children would not understand MSA. We compared this approach to the translation process for Korean and Japanese. **RESULTS:** The word list was reviewed by the lead linguist, and we ascertained that a number of the MSA terms would be unfamiliar to a child. We decided to substitute terms where necessary, in order to provide terms in a dialect familiar to the child, as well as culturally appropriate for the age group concerned. Out of the 310 terms, 19 were also localized. We compared this to the approach taken in both Korean and Japanese where there was little need to adapt the translation to a local dialect. There was also little need to alter the source terms for localization purposes. **CONCLUSIONS:** To enable understanding, it was sometimes essential to either change the dialect or localize the source terms to ones that would be familiar to the target audience. In the case of Arabic for Lebanon, the decision to replace some of the original MSA terms demonstrates that in order to achieve comprehension, particularly for a young age group, country- and age-specific adaptation is sometimes a vital component of the translation process.

PRM141

A HEARING BOLT-ON ITEM CAN INCREASE THE SENSITIVITY OF THE EQ-5D-5L INDEX SCORE TO HEARING IMPAIRMENT

Luo N[1], Wang P[2], Chong SL[3]
[1]National University of Singapore, Singapore, Singapore, [2]Fudan University, Shanghai, China, [3]National University Hospital, Singapore, Singapore

OBJECTIVES: To investigate the effect of adding a hearing bolt-on item to the EQ-5D-5L on the sensitivity of the utility-based index score. **METHODS:** Cross-sectional data on the EQ-5D-5L questionnaire with the addition of a hearing bolt-on item, namely, 'I have no/slight/moderate/severe/extreme problems hearing', was collected through face-to-face interviews with 428 participants of a community-based hearing impairment screening program in Singapore. We calculated the standard EQ-5D-5L index score using the Singaporean value set. By assuming that the multiplicative model used to predict the Singaporean EQ-5D-5L values applies to the hearing bolt-on system, we calculated the bolt-on index score using a series of hypothetical disutility values for hearing loss. In order to achieve comparability, the range of the bolt-on index score was adjusted to equate that of the EQ-5D-5L index score. We compared the mean EQ-5D-5L and bolt-on index scores of individuals with differing levels of hearing impairment and their ability to discriminate between different levels of hearing impairment using the F-statistic from the ANOVA test and the area under the curve (AUC) from the receiver operating characteristic (ROC) analysis. **RESULTS:** In all the comparisons of individuals with different levels of hearing impairment, the absolute mean difference in the bolt-on index score was larger than that in the standard EQ-5D-5L index score, and the bolt-on index score showed larger F-statistic and AUC values than did the standard EQ-5D-5L index score. The absolute mean difference, F-statistic, and AUC values increased with increasing disutility assumed for hearing loss. **CONCLUSIONS:** The hearing bolt-on EQ-5D-5L can be more sensitive than the standard EQ-5D-5L in discriminating between different levels of hearing impairment. The increased sensitivity increases with the disutility of hearing loss.

PRM142

LINGUISTIC VALIDATION OF THE RESPIRATORY SYNCYTIAL VIRUS NETWORK (RESVINET) PARENT AND CLINICIAN-FACING QUESTIONNAIRES IN ENGLISH AND SPANISH FOR THE UNITED STATES

King KM, Towns L
ICON Plc, Abingdon, UK

OBJECTIVES: The ReSVinet parent and clinician-facing Clinical Outcomes Assessments (COAs) are questionnaires intended to assess the condition of children with Respiratory Syncytial Virus. The original questionnaires were developed in Spain Spanish and required translation and linguistic validation into English and Spanish for the United States. The impact of using non-English source files on the application of the ISPOR Principles of Good Practice (PGP) was reviewed. **METHODS:** The PGP outline the steps for Linguistic Validation projects but were designed for an English source COA and, consequently, adjustments were required for the following steps: Preparation (reduced scope for COA analysis; no concept elaboration development); Back Translation and Cognitive Debriefing Reviews (reduced scope for project manager involvement in discussions). Once the US English files were finalised, the Spanish for the US could begin following

the PGP. This paper compares the changes made in the editing and back translation review steps of the translation process. **RESULTS:** When editing the English translation, 15% of items required updates to the parent COA, and 17% of the clinician COA items. Of these; 14% were stylistic, 77% were translation errors; and 9% were formatting updates. The Spanish translation required 28% and 12% of items to be updated respectively. Of these; 37% were translation errors; 50% were formatting issues; 9% were to improve consistency; and 4% were to correct an error in the source. During back translation review of the English, 5% and 11% of items were edited respectively (50% were misunderstandings of the source, and 50% were a wrong translation). In the Spanish, these figures were 0% and 1% respectively (25% were to improve consistency, 25% were to correct translation errors while 50% were misunderstandings of original). **CONCLUSIONS:** This analysis demonstrates the necessity for full preparation and concept elaboration, ensuring accurate linguistic validation and a reduced need for edits.

PRM143

"AM I BOTHERED?" INVESTIGATING THE POTENTIAL PROBLEMS WITH THE WORD "BOTHER" IN THE LINGUISTIC VALIDATION OF QUALITY OF LIFE QUESTIONNAIRES

Oke L
ICON Plc, Abingdon, UK

OBJECTIVES: QoL questionnaires often contain items that enquire how bothered a patient is by their condition. Corpus-based studies concluded that three meanings could be defined for "bother"; relating to "pain", "annoyance" or "hassle" [Glynn, 2010]. This evidently poses a challenge for translators in faithfully conveying the meaning for accurate data collection. This study investigates the extent to which this is an issue in linguistic validation projects. **METHODS:** A selection of experienced translators was contacted covering 20 languages. The linguists were asked whether "bother" posed problems in their translations of PRO instruments. They were then asked whether it was possible to find a "direct equivalent" in their language which could be used to convey the intended meaning without affecting patient understanding. Their answers were collated into two categories; one where a direct equivalent could be easily identified, and a second where a direct equivalent could not be found, and translation would require further clarification in order to truly reflect the source. **RESULTS:** 35% of linguists confirmed there was not a direct equivalent in their language which could cover all intended meanings. The French translator advised that, depending on context, several potential words could be implemented with additional adverbs to further explain the meaning. In Dutch several terms exist which convey a part of the meaning, but there is no single term, and it may be necessary to select one "most appropriate" term. **CONCLUSIONS:** A significant proportion of languages studied have difficulty finding an exact equivalent for the range of meanings that "bother" conveys. To produce a translation that accurately conveys the intended aim of the question and therefore gather accurate data, context should be taken into consideration, and the possibility of using a more restricted or descriptive text should be considered. Developers may also consider whether a more specific term is advisable.

PRM144

PLACEMENT OF RECALL PERIOD IN PATIENT-REPORTED OUTCOME QUESTIONNAIRE ITEMS: DOES IT MATTER?

Mazar I[1], Taylor F[1], Higgins S[1], Shields AL[1], Carson RT[2], Eremenco S[3], Reasner DS[4], Levy-Hacham O[5], Mizrahi R[5], Milbauer M[5], Nov O[5], Toledano O[5], Coons SJ[3]
[1]*Adelphi Values, Boston, MA, USA,* [2]*Allergan plc, Jersey City, NJ, USA,* [3]*Critical Path Institute, Tucson, AZ, USA,* [4]*Ironwood Pharmaceuticals, Inc., Cambridge, MA, USA,* [5]*Sol Gel Technologies, Ness Ziona, Israel*

OBJECTIVES: Questionnaire developers lack evidence to inform basic item construction activities, including the appropriate placement of a recall period. This study evaluated whether participants interpreted items in three English language patient-reported outcome (PRO) questionnaires consistently, regardless of whether the recall period was placed at the beginning or end of the item. **METHODS:** In three separate studies, cognitive interview participants were assigned to one of two groups. Group A completed an item with the recall period at the end followed by the completion of an alternative version of the item identical in content but with the recall period at the beginning. Group B completed the items in the reverse order. In both groups, participants were asked to provide their interpretations of both versions. An example of a tested item pair is as follows: "Over the past 24 hours, rate your worst stomach pain" and "Rate your worst stomach pain over the past 24 hours." All interviews were audio-recorded, transcribed, and the qualitative data were entered into ATLAS.TI for analysis. **RESULTS:** Of the 97 total participants, 69.1% were female and the mean age was 43.9 years. Eighty-eight participants contributed to the analysis with all participants in Group A (n=8) having a gastrointestinal condition and, in Group B (n=80), 44 participants had a gastrointestinal condition and 36 participants had a dermatological condition. In Group A, 100.0% of participants interpreted the items consistently (i.e., stated that the items were the same). In Group B, 79 of the 80 participants (98.8%) interpreted the items consistently. **CONCLUSIONS:** This study provided evidence that placement of the recall period at either the beginning or end of PRO questionnaire items does not impact the interpretation of the item content. Additional research will be needed to confirm these findings in other cultures/languages and content areas.

PRM145

PREVELANCE OF CVD AMONG TYPE 2 DM PATIENTS

Modaresahmadi S
al-ameen college of pharmacy, bangalore, India

OBJECTIVES: The study was designed to assess the proportion of CVD among type 2 DM patients, to assess the risk factors for developing CVD among type 2 DM patients and to assess the CVD risk factor for the next 10 years by using JBS3 scale. **METHODS:** A hospital-based study was carried out at St. Philomena's hospital. Subjects were recruited based on inclusion and exclusion criteria and the data collected were pooled and analyzed. **RESULTS:** Among 106 patients' recruited 72 patients were diabetics and 34 patients were Non-diabetics. Majority was in the age group of 51-60 years in both the groups. The BMI value was found to be abnormal in diabetic patients. Majority of the DM patients had HTN than the Non-DM group. It was also observed that the prevalence of CVD was higher among the DM patients than Non-DM patients. Hypothyroidism was found to be a common co-morbidity among both the groups. It was found that there were elevated biochemistry values and abnormal ECG and ECHO readings in DM patients than Non-DM patients. By using JBS3 scale, it was found that DM patients had more risk for developing CVD than Non-DM patients. **CONCLUSIONS:** The study was concluded that type 2 DM patients were more prone to develop CVD than the Non-Diabetics.

PRM146

AN ALTERNATIVE WEIGHT ELICITATION METHOD FOR USE IN MULTI-CRITERIA DECISION ANALYSIS FOR HEALTHCARE

Diaby V[1], Sanogo V[2], Moussa RK[3]
[1]*Florida A & M University, Tallahassee, FL, USA,* [2]*Florida State University, Tallahassee, FL, USA,* [3]*Cergy-Pontoise University, Cergy-Pontoise, France*

OBJECTIVES: The aim of this study was to develop and illustrate the use of an alternative weight elicitation method for use in multi-criteria decision analysis for healthcare, in the context of imprecision and uncertainty. **METHODS:** The proposed method consists of two steps: 1) the rank ordering of evaluation criteria based on decision-makers' (DMs) preferences using the principle component analysis and 2) the estimation of the criteria weights using the variable interdependent analysis and the Monte Carlo simulation. The method was applied to a hypothetical case study involving the elicitation of DMs' preferences for five criteria, cost, sensor size, zoom, weight and optical image stabilizer, used to select the best device for eye surgery. **RESULTS:** The criteria were ranked from 1–5, based on a strict preference relationship established by the DMs. For each criterion, the deterministic weight was estimated as well as the standard deviation and 95% credibility interval. **CONCLUSIONS:** The proposed method is appropriate in situations where only ordinal DMs' preferences are available to elicit decision criteria weights.

PRM147

AN INNOVATIVE APPROACH TO MIXED-MODE LONGITUDINAL DATA COLLECTION: METHODS AND RESPONSE RATES FROM THE CHRONIC CONSTIPATION & IBS -C TREATMENT AND OUTCOMES REAL WORLD RESEARCH PLATFORM (CONTOR)

Essoi B[1], Taylor DC[2], Abel JL[3], Carson RT[3], Goolsby Hunter A[1], Buzinec P[1], Martin C[1]
[1]*Optum, Eden Prairie, MN, USA,* [2]*Ironwood Pharmaceuticals, Inc., Cambridge, MA, USA,* [3]*Allergan plc, Jersey City, NJ, USA*

OBJECTIVES: CONTOR is a novel, mixed-mode longitudinal research platform combining administrative medical and pharmacy claims and patient-reported data to examine associations between symptoms, treatment use and experience, and patient-reported outcomes among patients with chronic idiopathic constipation and irritable bowel syndrome with constipation. The objective of this abstract is to describe methods and response rates for CONTOR participants. **METHODS:** Fully-insured patients ≥18 years old were identified in two waves from a large, geographically-diverse US health plan using medical and pharmacy claims. Patients were invited by mail to participate and complete a self-administered paper survey at baseline, a 7-day daily diary at baseline and month 12, and monthly and quarterly online surveys over 12 months. Outcomes assessed include medication use, quality of life, symptoms, treatment satisfaction, and demographics. Eligible participants at baseline were invited to continue participation throughout the study period regardless of response to each monthly/quarterly survey. Patients were compensated for participation via pre- and post-paid incentives. Survey responses were linked to administrative claims data. **RESULTS:** Of 18,590 patients invited to participate, 2,693 responded to the baseline survey (16.8% of eligible mailed invitees). In addition, 1,725 daily diaries were returned at baseline (11.3% of eligible mailed invitees) and 1,177 at 12 months (64.4% of enrolled participants). Response rates for enrolled participants averaged 70.5% (range 66.9-74.6) for monthly surveys and 70.8% (range 65.2-74.2) for quarterly surveys. **CONCLUSIONS:** CONTOR study response rates highlight the success of innovative approaches to real-world data collection by combining mixed-mode surveys and pre- and post-paid incentives to effectively engage participants in a longitudinal observational study. The initial response rate of <20% reflects the length and complexity of the baseline survey and the year-long study commitment. Once participants were enrolled, response rates over the 12-month period were higher than anticipated and remained steady throughout data collection for both samples.

PRM148

VALIDATING SELF-REPORTED PATIENT SURVEY DATA ON DIABETES SELF-MANAGEMENT USING PATIENT ELECTRONIC MEDICAL RECORDS

Khairnar R[1], Kamal KM[2], McConaha J[2], Giannetti V[2], Dwibedi N[3]
[1]*University of Maryland, Baltimore, MD, USA,* [2]*Duquesne University Mylan School of Pharmacy, Pittsburgh, PA, USA,* [3]*West Virginia University, School of Pharmacy, Morgantown, WV, USA*

OBJECTIVES: To validate self-reported patient survey data on diabetes self-management using patient's electronic medical records (EMR). **METHODS:** The cross-sectional study included patients (age≥18 years) diagnosed with type 2 diabetes mellitus (T2DM) (ICD-9 code: 250.xx) and had ≥2 physician visits. The

sample was identified from a physician group's EMR database. A mail-based survey assessing diabetes self-management practices was administered to a random sample of 2,100 patients, stratified into three groups based on HbA1c level: <7, 7-9, and >9. Patient survey responses were then linked to their EMR data using unique patient codes. A 'concurrent triangulation design' was then employed to validate and substantiate patient survey responses with the EMR database for variables that were common in the two databases such as demographics, comorbidities, HbA1c, year since diagnosis, and diabetes medications. Descriptive, comparative and correlational analyses were conducted using IBM SPSS Statistics 24.0. **RESULTS:** A total of 210 responses were received (10% response rate). Self-reported age (mean: 63.7±11.7 years) and age from EMR (mean: 64.5±12.2 years) were strongly correlated ($r=0.94$, $p<0.001$). Marital status ($\rho=0.72$, $p<0.001$), race ($\rho=0.69$, $p<0.001$), and gender ($\rho=0.99$, $p<0.001$) showed strong significant correlation as well. Moderate correlation ($r=0.63$, $p<0.001$) was observed between self-reported HbA1c (mean: 7.8±1.7) and HbA1c from EMR (mean: 7.9±1.7). Additionally, important clinical variable such as HbA1c in the EMR data had fewer missing values (n=7) compared to self-report data (n= 59). **CONCLUSIONS:** Since the patient groups were based on HbA1c, it was an extremely important variable and yet, HbA1c data was missing for 28.1% of survey respondents. Supplementing EMR data not only validated the survey responses, but also enabled substitution of survey reported HbA1c with HbA1c from EMR. The use of mixed-method research offers an in-depth understanding of the data and overcomes the limitations of a single method.

PRM149

RECRUITMENT STRATEGIES AND GEOGRAPHIC REPRESENTATIVENESS FOR PATIENT SURVEYS IN RARE DISEASES

Yu J, Paranagama D, Parasuraman S
Incyte, Wilmington, DE, USA

OBJECTIVES: Describe patient recruitment strategies and assess geographic representativeness of the sample in a survey of US patients with myeloproliferative neoplasms (MPNs), a group of rare blood cancers. **METHODS:** The Living with MPNs survey was a 20-minute online questionnaire administered to patients between the ages of 18-70 who had MPNs. The survey assessed the impact of MPNs on employment, work productivity, and activities of daily living. Survey data were collected between April and November 2016. An optional $25 incentive was offered to respondents who completed the survey. Survey recruitment strategies included posts on MPN-focused social media (e.g., patient group Facebook pages), emails and/or post cards sent by MPN groups, posts on patient advocacy websites, banner ads at selected medical websites, text or banner ads through Google or Facebook, and postcards sent to hematologist/oncologist offices for distribution. Geographic representativeness was assessed by number of respondents per 10 million residents of each US state. **RESULTS:** 904 eligible MPN patients completed the survey. Largest recruitment was through survey ads posted on MPN-focused social media groups (47.6%), followed by emails (35.1%) and postcards (13.9%) sent by MPN groups, and other communication channels (3.4%). 779 patients (86.2%) opted to receive the incentive. CA, TX, and NY had the highest number of respondents (89, 65, and 51, respectively). Four states (DE, HI, MT, and VT) had no respondents. After adjusting for state population, 17 states had ≥25 patients per 10 million residents. **CONCLUSIONS:** Recruitment through patient groups and advocacy organizations using social media was an effective approach in obtaining a geographically representative sample of patients with rare diseases.

PRM150

USING AGGREGATE DATA TO PROXY INDIVIDUAL-LEVEL CHARACTERISTICS IN HEALTH SERVICES RESEARCH: THE IMPACT OF GRANULARITY

Kilgore K, McClellan M, Tao VQ, Teigland C
Avalere Health - An Inovalon Company, Bowie, MD, USA

OBJECTIVES: To examine the impact of systematically varying the size of the neighborhood from which aggregate proxies for individual-level characteristics are calculated. Health services researchers commonly employ aggregate proxies for individual-level data when the latter is not available. Socioeconomic characteristics of residential areas (e.g. counties) from census data frequently augment outcomes studies. Extant studies on biases introduced by aggregate proxies yield inconsistent results, and may suffer from confounds due to differences between aggregate vs. individual data collection methods. This study explored the impact of systematically varying the granularity of the aggregate proxies, i.e., the size of the geographic neighborhood used to calculate the individual proxy characteristics, while holding the underlying data collection methodology constant. **METHODS:** Data were taken from a commercial market research database of the entire US population aggregated at the 9-digit zipcode level (>30MM groups). The sociodemographic variables age, ethnicity, education, marital status, home ownership, and mean net worth were extracted to be used as predictor variables. Four different granularities were calculated: the original zip+4 level, followed by successive aggregations to the block group, census tract and county levels. The response variable selected was mean household income. This variable, which simulates an individual-level response variable was maintained at the zip+4 level, but successively matched to predictors on the basis of zip+4, block group, census tract and county. Means, standard deviations (SD) and zero-order correlation coefficients between the predictor variables and the response variable were calculated at the four granularity levels. **RESULTS:** As neighborhood size increased, predictor variable means remained relatively stable, SDs consistently decreased, and correlations with the response increased, except for county, which showed the lowest correlations of all four granularities. **CONCLUSIONS:** When other sources of bias, such as methodological differences, are controlled for, the use of aggregate proxy data may overestimate the true relationship with a response variable, up to county level, which may be too large to be a valid proxy.

PRM151

MATCHING-ADJUSTED INDIRECT COMPARISONS IN ANKYLOSING SPONDYLITIS, PSORIATIC-ARTHRITIS AND PSORIASIS: HOW DO THEY ALIGN WITH NICE DSU RECOMMENDATIONS?

Thom H[1], Jugl SM[2], Gilloteau I[2], Hawkins N[3]
[1]*University of Bristol, Bristol, UK,* [2]*Novartis Pharma AG, Basel, Switzerland,* [3]*University of Glasgow, Glasgow, UK*

OBJECTIVES: Matching-Adjusted Indirect Comparison (MAIC) in comparative effectiveness research is increasingly used and complements traditional approaches. The NICE Decision Support Unit (DSU) recently published a Technical Support Document (TSD) on population-adjusted indirect comparisons, including recommendations for the application and reporting of MAICs.1 The objective was to review MAICs in Ankylosing Spondylitis (AS) Psoriatic-Arthritis (PsA) and psoriasis in the context of these recommendations. **METHODS:** A systematic literature review (2010-2016) and a targeted search in congress proceedings in AS, PsA and psoriasis was conducted to identify published MAICs. We developed a checklist based on the NICE DSU recommendations to assess alignment. This included amongst other criteria if the target population had been clearly stated, evidence of imbalance or heterogeneity between source trials was provided, if all matching variables and effective sample size (ESS) post matching were reported or whether evidence was considered that matched variables included effect modifiers or prognostic variables. **RESULTS:** 19 MAIC publications were identified: AS (4), PsA (7), psoriasis (8). All were published prior to NICE DSU and included only biologic treatments. Results of the assessment with developed checklist revealed that many publications failed to fully report all items recommended by NICE DSU. Almost all MAICs (n=18) reported baseline variables used for matching. Only 11 reported the ESS and same number of MAICs did not report any measure of uncertainty. A large variability was observed among other criteria such as the rationale for selecting the matching variables, or evidence of imbalance pre matching. **CONCLUSIONS:** This review of MAICs in AS, PsA and psoriasis showed low compliance to recent NICE DSU TSD recommendations. This research raises important issues to be addressed in each MAIC and can inform future MAIC guidelines. 1Phillippo, D.M.,Ades, A.E., Dias, S.,Palmer,S., Abrams,K.R.,Welton, N.J. NICE DSU Technical Support Document 18:Methods for population-adjusted indirect comparisons in submission to NICE.2016. Available from http://www.nicedsu.org.uk

PRM152

IRT IN ACTION: A DEMONSTRATION OF THE EQUIVALENCE OF IRT-BASED SCORING WHEN USING ITEM SUBSETS

Houts CR, Wirth R
Vector Psychometric Group, LLC, Chapel Hill, NC, USA

OBJECTIVES: In our role as psychometricians, concerns have been raised to us by researchers less familiar with the technical mechanics of item response theory (IRT)-based scoring that the items or item subsets used to score individuals could negatively influence the accuracy and resulting conclusions made from estimated IRT scores. Our objective is to provide an accessible demonstration that, when using items from a common, previously calibrated item bank, regardless of the items seen by individual patients or groups, the obtained IRT-based scores from a patient reported outcome are unbiased, precise, and equivalent. **METHODS:** Data were simulated using item parameters from an existing item bank, which includes several subsets of items of relevance to the domain (such as Social quality of life (QoL) within a general QoL scale; somatic symptoms within depression; End of Day Comfort within overall contact lens comfort). Scores were obtained for these simulated observations using a variety of subsets of items, including the use of computerized adaptive testing as well as items from only specific substantive subsets. Estimated scores were then compared to the known generating values to examine accuracy, as assessed by bias, root mean squared error, correlation of estimated scores to true scores, and group descriptive (mean, SD) comparisons to the generating distribution. **RESULTS:** Known associations (such as more answered items lead to more accurate scores) were reflected in the findings. Further, regardless of the specific items used, the estimated scores were generally unbiased, adequately precise, and the distributional summaries of the estimated scores mirrored those of the generating distribution well. **CONCLUSIONS:** Regardless of the content of items seen by individuals, up to presenting only items with content from a specific substantive subset of items, the statistical mechanics underlying IRT-based scoring provide for equivalent scores that accurately reflect true values.

PRM153

STATISTICAL EFFICIENCY AND BIAS OF DIFFERENCE IN DIFFERENCE DESIGN VERSUS NON-EQUIVALENT CONTROL GROUP ANALYSIS METHODS

Wasser T
HealthCore Inc., Wilmington, DE, USA

OBJECTIVES: Multiple analysis methods exist for various research designs. Testing the efficiency of these methods is important to prevent Type I and Type II errors from entering the data interpretation. These efficiency studies are more important when non-randomized studies are used, such as the Non-equivalent Control Group (NECQ) design, because the researcher cannot rely on adverse effects from being equally distributed between groups. **METHODS:** Two simulated data sets (N=100,000) were constructed for Control 'patients' with no treatment effect for pre-posttest values. (Normal Distribution with mean=0,Standard Deviation=1 N (0,1)). Three groups were simulated for Treatment groups each (N=100,000) reflecting increasing treatment effects with N(0,1) at baseline, and N(-0.5,1), N (-1.0,1), and N(-1.50,1) for increasing treatment effect posttest values. Two analysis

methods for NECQ were tested. 1. Standard Difference in Difference (DnD) statistics - group t-tests on (Post-Pre) data. 2. Paired t-tests within groups and group t-test for posttest values (G/PTT). Samples were extracted for analysis if there was a difference between baseline mean values. For each of the three conditions 1,000 replications were performed. **RESULTS:** Statistical differences at Baseline were present in 6.9% (approximately what would be expected under the null), of all aggregated comparisons. When these samples from the simulation were extracted, successful treatment effects by DnD were present in 12%, 30% and 46% of trials whereas using G/PTT found significant treatment effects in 9%, 24% and 38% of the N(-0.5,1), N(-1.0,1), and N(-1.50,1) combinations respectively. **CONCLUSIONS:** Different results were found between identical samples depending on which statistical method was used. It is unclear if the difference is due to selection bias, regression artifact or some other bias. DnD analysis may over-estimate the effectiveness of treatments when baseline bias is present (Type I error), or G/PTT methods may underestimate treatment effects (Type II error). Clearly in non-randomized studies baseline tests of equivalence need to be performed.

PRM154

USING LATENT CLASS ANALYSIS TO MODEL PREFERENCE HETEROGENEITY IN HEALTH: A SYSTEMATIC REVIEW

Zhou M, Thayer WM, Bridges JF
Johns Hopkins Bloomberg School of Public Health, Baltimore, MD, USA

OBJECTIVES: We sought to document the applications of LCA in the stated-preference literature focusing on health and to inform future studies by identifying current norms in published applications. **METHODS:** We conducted a systematic review of the MEDLINE, Embase, EconLit, Web of Science, and PsycINFO databases. We included English-language stated-preference studies that used LCA to explore preference heterogeneity in healthcare or public health. Two reviewers independently reviewed titles, abstracts, and texts. Key outcomes extracted included segmentation methods, preference elicitation methods, number of attributes and levels, sample size, model selection criteria, number of classes reported, and hypotheses tests. Study data quality was assessed using the PREFS quality checklist. **RESULTS:** 78 met the inclusion criteria. 84% were published between 2011 and 2016. Preferences were assessed on a wide variety of topics. Most focused on the preference of patients (32.9%) and the general population (29.1%). Nearly 80% were discrete choice experiments. The number of attributes ranged from three to twenty, with over half of the studies (57.7%) having four to six attributes. Sample size in LCAs ranged from 47 to 2,005, with a mean of 480 and a median of 300. BIC (55.9%) and AIC (52.5%) were commonly used for model selection. 80% of studies reported two to three classes. The number of classes was associated with sample size, country of origin, stated-preference methods, segmentation methods, and criteria used for model selection. While 45% of studies discussed clinical implications, LCA has been increasingly used to inform policy since 2010. **CONCLUSIONS:** LCA has been increasingly used to study preference heterogeneity in health and support decision-making. As its application in health is relatively new, there is little consensus on some modeling issues. More guidance is needed to improve the quality of LCA studies in health to meet increasing demand to study patient preference heterogeneity.

PRM155

SELECTING THE BEST PERFORMING METHODS TO CONTROL FOR BIAS IN COMPARATIVE EFFECTIVENESS RESEARCH USING REAL WORLD DATA

Parks DC[1], Alfonso R[2], Gutierrez B[3]
[1]*GSK, Phoenixville, PA, USA,* [2]*GSK, Collgeville, PA, USA,* [3]*GSK, 1250 S. collgeville Road, PA, USA*

OBJECTIVES: To assess the performance of five commonly used methods to reduce confounding bias in Comparative Effectiveness Research using Real World Data. **METHODS:** Using two hypothetical interventions in simulated cohorts, with different sample sizes, (n= 200, 500, 1000, 2000,5000), we examined the effect in the estimation of the treatment effect, using: 1) Multivariate regression (MR), 2) propensity score matching (PSM), 3) propensity score stratification (PSST), 4) doubly robust estimation (DR), and 5) inverse probability treatment weighting with regression model (IPTW) . **RESULTS:** For each model, we assessed the true positive rate for correctness of statistical significance and the root mean square error. Our results showed that if model is specified correctly and the sample size is large (>1000), the results of the models do not show differences regardless of random noise levels. More specifically, if covariates are correlated with each other or with the interventions, MR does not perform well unless the sample size is large. For small sample sizes, IPTW is often the best performing model, even for misspecified postulated propensity score and regression models. PSM should be considered under low noise levels and larger sample sizes. DR does not perform well when model is corrected. DR does not show good performance even when both postulated propensity score and regression models were misspecified. **CONCLUSIONS:** The selection of the method to control for bias in CER using RWD, should consider the specification of the models, sample size, and the correlation of the variables included. IPTW, for most scenarios, is the best choice and PSM should be used with care especially under high noise levels and small sample sizes.

PRM157

TWO-STAGE PIECEWISE LINEAR MODEL FOR INVESTING DOSE-RESPONSE RELATIONSHIP IN META-ANALYSIS: METHODOLOGY, EXAMPLES, AND COMPARISON

Chang X
Chinese Evidence-based medicine Center, Chengdu, China

OBJECTIVES: Dose-response meta-analysis (DRMA) is widely employed to establishing potential dose-response relationship between exposure and disease outcome. However, no method is readily available for exploring relation between discrete exposure and a binary or continuous outcome. **METHODS:** We proposed a piecewise linear (PL) DRMA model which provide a solution to this issue. We used parity and sleep data to illustrate how to apply PL model in DRMA for assessing relation between discrete or continuous exposure with outcome. We also empirically compared PL model with nonlinear spline model. **RESULTS:** PL model fitted well in our two examples. For parity and risk of rheumatoid arthritis (discrete exposure): among women with 3 or less birth, the RR was 0.88 (95%CI: 0.77, 1.00) for every 1-birth increment; otherwise (3 or more births), the RR was 1.10 (95%CI: 0.99, 1.23) for every 1-birth increment. For sleep duration data: RR of all-cause mortality was 1.31 (95%CI: 1.25, 1.39) for every 1-hour reduction of sleep duration among people who slept less than 7 hours; and was 1.15 (95%CI: 1.07, 1.24) for every 1-hour increase among people who slept more than 7 hours. For continuous exposure, the results of PL model were less precise and flexible compared to higher order function. **CONCLUSIONS:** Piecewise linear function is a simple and valid method for DRMA and can be used for discrete exposure. It also represents an alternative to non-linear model DRMA.

PRM158

POPULATION-ADJUSTED TREATMENT COMPARISONS: ESTIMATES BASED ON MAIC (MATCHING-ADJUSTED INDIRECT COMPARISONS) AND STC (SIMULATED TREATMENT COMPARISONS)

Phillippo DM[1], Ades A[1], Dias S[1], Palmer S[2], Abrams KR[3], Welton NJ[1]
[1]*University of Bristol, Bristol, UK,* [2]*University of York, Heslington, York, UK,* [3]*University of Leicester, Leicester, UK*

OBJECTIVES: To review the properties and assumptions of methods for population-adjusted treatment comparison, including Matching-Adjusted Indirect Comparison (MAIC) and Simulated Treatment Comparison (STC), and to provide guidance on their use in health technology appraisal. **METHODS:** Standard methods for indirect comparisons and network meta-analysis are based on aggregate data, with the key assumption that there is no difference between trials in the distribution of effect-modifying variables. Two methods which relax this assumption, MAIC and STC, are becoming increasingly common in industry-sponsored treatment comparisons, where a company has access to individual patient data (IPD) from its own trials but only aggregate information from competitor trials. Both methods use IPD to adjust for between-trial differences in covariate distributions. We review the properties of these methods in light of the wider literature on standardisation and calibration based on propensity score reweighting and covariate adjustment, which are the foundation for MAIC and STC respectively, and identify the key assumptions in the context of indirect comparisons. **RESULTS:** There is a lack of clarity about how and when the methods should be applied in practice, and both MAIC and STC as currently applied can only produce population-adjusted estimates that are valid for the populations in the competitor trials, rather than the target population for the decision. In addition, the fundamental distinction between "anchored" and "unanchored" forms of indirect comparison – where a common comparator arm is or is not utilised to control for between-trial differences in prognostic variables – is under-emphasised, with the unanchored comparison making assumptions that are infeasibly strong. **CONCLUSIONS:** We provide recommendations on how and when population adjustment methods of this type should be used in order to provide statistically valid, clinically meaningful, transparent and consistent results for any given target population, and set out the additional analyses that should be presented to support their use.

PRM159

MATCHING-ADJUSTED INDIRECT COMPARISONS TO ASSESS COMPARATIVE EFFECTIVENESS: A SYSTEMATIC REVIEW OF APPLICATION IN SCIENTIFIC LITERATURE AND HEALTH TECHNOLOGY APPRAISALS

Thom H[1], Jugl SM[2], Nikoglou E[3], Jawla S[4]
[1]*University of Bristol, Bristol, UK,* [2]*Novartis Pharma AG, Basel, Switzerland,* [3]*Product Lifecycle Services - NBS, Novartis Global Service Center Dublin, Dublin, Ireland,* [4]*Novartis Healthcare Pvt. Ltd., Hyderabad, India*

OBJECTIVES: In the absence of head-to-head studies, indirect comparisons are being recommended and widely used to estimate comparative effectiveness. Matching-Adjusted Indirect Comparison (MAIC) re-weights Individual Patient Data from one study to match the distribution of baseline characteristics of another, reducing heterogeneity due to observed trial differences compared with conventional meta-analytic methods. The objective of this study was to review the application of MAIC in the scientific literature and in Health Technology Assessments (HTA). **METHODS:** A systematic literature review was conducted using Ovid (Medline, Cochrane Library) and Embase (Embase, Medline) platforms from years 2010 through October 2016. In addition, assessment documents from key HTA bodies (England, Scotland, Canada and Australia) were reviewed. Publications from conferences where the authors of this study have been involved were also targeted for evidence. **RESULTS:** A total of 61 publications (manuscripts, posters or abstracts) reported the use of MAIC across different therapeutic areas: auto-immune and rheumatology(23), oncology(22), infectious diseases(7), neuroscience(4), hematology(2), metabolic diseases(1), respiratory(1) and unspecified disease(1). An increasing trend in MAIC publications was observed as 29 publications were released alone in 2016, compared to 6 in 2010. Differences were observed in the methodologies employed regarding placebo effects and variable matching between publications. The MAIC methodology was part of 21 HTA submissions with the first submission in 2012. Comments on MAICs were inconsistent across HTA bodies, with some requesting MAIC analyses, others questioning them. This diversity in quality and acceptability is likely explained by unclear standards of application, reporting and interpretation of the MAIC analyses. **CONCLUSIONS:** The current study found that the use of MAIC has been increasing across different therapeutic areas, and so has its acceptability by HTA

bodies even though many MAICs have not been reported adequately. If applied, reported and interpreted correctly, MAIC can be a valid technique for comparative effectiveness research.

PRM160

AN OUTCOMES REGRESSION APPROACH FOR INDIRECT COMPARISONS OF SURVIVAL OUTCOMES WHEN STANDARD NETWORK META-ANALYSIS IS NOT FEASIBLE

Jansen JP[1], Jeffers A[1], Chan K[2], Incerti D[1]
[1]Precision Health Economics, Oakland, CA, USA, [2]Precision Health Economics, Vancouver, BC, Canada

OBJECTIVES: In many cases the relevant evidence base of competing interventions cannot be reflected with one connected evidence network of randomized controlled trials (RCTs) to perform standard network meta-analysis. We present an outcomes regression method to perform indirect comparisons regarding time-to-event outcomes when the evidence bases consist of disconnected RCTs and/or single-arm trials. **METHODS:** This method requires access to individual patient data for at least one index interventions from which a set of bootstrap samples are obtained with replacement. For each bootstrap sample multiple competing multivariable survival models are estimated that describe the log-hazard over time as a function of prognostic factors and effect-modifiers. Their predictive performance is assessed based on the "out-of-bag" samples. Next, for each trial for which only summary data is available and not connected to other trials, a large number of hypothetical individuals are simulated based on the reported marginal distributions of the covariates of interest and their assumed correlation. For each of these populations the average log-hazards over time with the index intervention is predicted based on the model with best predictive performance for each of the bootstraps. Their summary distribution by trial effectively represents the outcome with an index intervention-based control group for each of these trials, which in turn allows all trials of relevance to be connected and to proceed with between-trial comparisons using standard network meta-analysis models. **RESULTS:** The method is illustrated with an indirect comparison of interventions for advanced melanoma. **CONCLUSIONS:** The proposed outcomes regression method uses cross-validated models, ensures that the prediction of outcomes and indirect comparisons are performed on the same (transformed) scale, and uncertainty associated with estimation of the outcome model parameters is propagated through the indirect comparison. It can be considered a useful addition to previously proposed methods for indirect comparisons in the presence of disconnected networks.

PRM161

OPTIMIZING SYSTEMATIC LITERATURE REVIEWS FOR THE CONDUCT OF NETWORK META-ANALYSES: SUGGESTIONS FOR GOOD PRACTICES

Pacou M[1], Mesana L[2], Belhadi D[1], Gauthier A[2]
[1]Amaris, Paris, France, [2]Amaris, London, UK

OBJECTIVES: Network meta-analysis(NMA) is recommended by most HTA guidelines to assess the relative effect of interventions. Guidelines recommend collecting data using systematic literature reviews(SLR). However, adherence to SLR guidelines is generally insufficient to optimize NMA feasibility and reduce the risk of producing incorrect results. Our aim was to review common issues faced when collecting data for NMAs and propose approaches to avoid them. **METHODS:** Specific challenges to collect data for NMAs were identified based on our experience of NMAs for HTA submissions: (1)Definition of study question to optimize NMA feasibility, (2)Transparency on study selection, (3)High level of missing data due to publications reporting incomplete data (4)Risk of double-counting patients. Examples are given for each challenge and recommendations for good practices are suggested. **RESULTS:** Common challenges related to the definition of the study question include the specificity of the study population and the inclusion of comparators not relevant to the study question to connect the network of studies. The study selection process generally lacks transparency due to NMA-specific exclusion criteria (e.g.non-availability of data in a format suitable for NMAs, studies that are disconnected from the network due to the absence of common comparator). Missing data or data reported in graphs only are frequent and may lead to the exclusion of trials from NMAs. Finally, SLRs generally capture several publications from the same trial, which may result in double-counting patients in NMAs. To overcome these common issues, we propose a template of flow chart to document the NMA study selection process, and a list of secondary sources to be searched to avoid missing data. **CONCLUSIONS:** The SLR process is of utmost importance to optimize NMA feasibility. While we suggest recommendations to ensure the quality of this process, further research is needed to reach a consensus on good practices for NMA data collection.

MEANINGFUL MENTORSHIP ASSOCIATED WITH REWARDING SHORT-TERM RESEARCH: RESULTS FROM AN EVALUATION OF ISPOR STUDENT EXPERIENCES

Adamson BJ[1], Lyons N[2], Chou Y[3], Gangan N[4], Cannon-Dang E[2], Chen C[5], Law EH[6]
[1]University of Washington, Seattle, WA, USA, [2]Thomas Jefferson University, Philadelphia, PA, USA, [3]University of North Carolina, Chapel Hill, NC, USA, [4]Center for Pharmaceutical Marketing and Management, University of Mississippi, University, MS, USA, [5]University of New Mexico College of Pharmacy, Albuquerque, NM, USA, [6]University of Illinois at Chicago, Chicago, IL, USA

OBJECTIVES: Results from the 2013 International Society for Pharmacoeconomics and Outcomes Research (ISPOR) Student Member Internship Survey suggested that many students felt unprepared to manage multiple projects and present to leadership. This study, conducted by the 2016-2017 ISPOR Student Network Survey Committee, aimed to describe recent internship experiences and identify key facilitators for success. **METHODS:** An online, mixed-methods survey was developed and distributed to student members with the goal of evaluating internship/short-term research experiences. The survey collected data between October 2016 and December 2016. Logistic regression models evaluated associations between student and internship attributes and satisfaction outcomes. Two committee members independently identified themes in qualitative responses. **RESULTS:** Thirty-two ISPOR student members completed the survey (48% female, ages range: 22-40 years): PhD (71%), masters (13%), and PharmD students (10%). Most experiences were in the US (81%) and lasted 13 weeks on average (range: 4-52 weeks). The most common employer settings were pharmaceutical industry (45.5%), consulting (23%), and non-profit companies (18%). Scope of responsibilities included market access (14%), pre-market research (14%), post-market research (18%), and policy research (23%). Two major facilitating themes emerged from the qualitative responses: mentorship and networking. Meaningfully mentored students were 3.5 times more likely to have a personally rewarding experience (OR =33; $p<0.01$) and twice as likely to "strongly agree" their skills were challenged and strengthened (OR=8; $p<0.05$). Too short of duration was described as a barrier; however longer internships were not associated with contribution to a publication (p=0.2). Employer type, scope of responsibility, gender, or degree program were not associated with a personally rewarding internship. **CONCLUSIONS:** Meaningful mentoring was the most important factor contributing to a personally rewarding internship that challenged and strengthened skills. The results of this study can assist employers understand the range of opportunities available to ISPOR students and the factors that cultivate a positive experience.

PRM163

QUALITY OF REPORTING IN SURGICAL RANDOMIZED CLINICAL TRIALS

Yu J[1], Sun X[2], LI Y[1], Li X[3]
[1]West China Hospital of Sichuan University, Chengdu, China, [2]West China Hospital, Sichuan University, Chengdu, China, [3]Chengdu Military General Hospital, Chengdu, China

OBJECTIVES: Randomized controlled trials testing surgical interventions have drawn increasing attention. The adequate reporting of surgical trials represents one of important issues. We conducted a cross-sectional survey to assess the reporting quality of surgical trials and explored associated factors. **METHODS:** We searched PubMed for 2-arm parallel randomized trials assessing surgical interventions published in 2003 or 2013. Quality of reporting was evaluated against the CONSORT checklist containing 29 items (standard CONSORT plus CONSORT Extension for Nonpharmacological Treatments). Univariate and multivariate linear regression was undertaken to explore factors associated with quality of reporting measured with CONSORT scores. **RESULTS:** Some 120 trials were identified and included. The mean (s.d.) CONSORT score was 12.7 (4.0). Trials published in 2013 achieved a higher CONSORT score than those in 2003 (mean 14.5 (3.8) versus 10.8 (3.4) respectively, $P<0.001$). The extent to which those trials met the requirement for CONSORT reporting differed substantially across items: four of 29 items were adequately reported across trials, and seven were reported adequately in less than 20% of trials. Less than 40% of the trials described the details on surgical interventions and care providers (such as nursing care and anesthetics management). In multivariate regression analysis, trials published in 2013 (coefficient 3.0, 95%CI, 1.9 to 4.2) and multicenter studies (coefficient 2.1, 95%CI, 0.8 to 3.4) were associated with statistically higher quality of reporting. **CONCLUSIONS:** The quality of reporting in surgical trials improved in the past decade. Overall quality, however, remains suboptimal, particularly in those important details regarding surgical interventions and management. Journal editors and trials investigators should consider more rigorous standards in the reporting of surgical trials.

PRM164

A METHOD FOR IDENTIFYING PERIPHERAL INTRAVENOUS (PIV) CATHETER-RELATED COMPLICATIONS IN A U.S. HOSPITAL DISCHARGE DATABASE

Lim S[1], Adams E[2], Hyde R[2], Danker III W[2], Broder MS[3], Chang E[3], Reddy SR[3], Tarbox M[3], Bentley TG[3], Ovington L[2]
[1]Ethicon Inc, Somerville, NJ, USA, [2]Ethicon, Inc., Somerville, NJ, USA, [3]Partnership for Health Analytic Research, LLC, Beverly Hills, CA, USA

OBJECTIVES: To evaluate the feasibility of identifying patients with peripheral intravenous lines (PIV) in real world data and, if possible, estimate rate of PIV-related complications. **METHODS:** We studied hospital admissions (7/1/2013-6/30/2015) in the Premier Perspective Database® of US hospital discharge records. We first identified PIV with dedicated procedure codes, but found significant under-reporting. Therefore, based on interviews with expert clinicians, we identified conditions that were unlikely to cause a complication themselves that would be mistaken as PIV-related (i.e., blood stream infections [BSI], cellulitis, phlebitis, infections not elsewhere classified [NEC], and extravasation), but in which PIV use could be assumed. The selected conditions were pneumonia, chronic obstructive pulmonary disease (COPD), myocardial infarction, congestive heart failure, chronic kidney disease, diabetes with complications, and major trauma (hip, spinal, and cranial fractures). Admissions with potential non-PIV causes of complications such as dialysis, surgery, and central line use excluded. We reported number of patients with each condition and proportion with each complication (number of patients with complication/number of patients in condition cohort). **RESULTS:** We identified 588,375 qualifying admissions (N=15,637–187,904 depending on condition): mean (SD) age 66.1 years (20.6), 52.4% female, 71.2% white, and mainly non-elective admission (95.2%) in urban hospital setting (83.5%). Medicare was primary payment source (66.2%). There were 10,354 patients (1.8%) with at least one complication. Complication rates varied by cohort: from 0.98% of COPD cohort to 2.67% of pneumonia cohort. Overall, BSI accounted for 82.2% of complications, cellulitis for 13.9%, phlebitis for 4.6%, infections for 0.8%, and extravasation for 0.1%. **CONCLUSIONS:** Using a methodology based on clinical expert input, PIV-related complications were uncovered in hospital data at rates consistent with clinical research on PIV

complications. Future analyses will explore the clinical and economic impact of these complications in each of the conditions studied.

PRM165

RELATIVE EFFICACY AND SAFETY OF LACOSAMIDE AS MONOTHERAPY FOR ADULTS WITH NEWLY DIAGNOSED FOCAL SEIZURES: A NETWORK META-ANALYSIS OF RANDOMIZED CLINICAL TRIALS

Kroep S[1], Bouwmeester W[1], Dimova S[2], Zhang Y[3], Borghs S[2], Charokopou M[2]
[1]Pharmerit BV, Rotterdam, The Netherlands, [2]UCB Pharma, Brussels, Belgium, [3]UCB Pharma, Raleigh, NC, USA

OBJECTIVES: Lacosamide was recently approved as monotherapy for adults with focal seizures in the European Union (already approved in USA). Comparative data are needed to inform clinical decision-making. This network meta-analysis (NMA) compared lacosamide with other antiepileptic drugs (AEDs). **METHODS:** Randomized, controlled trials of AED monotherapy in newly-diagnosed patients (aged ≥16 years) were identified via systematic literature review. NMA was performed to obtain relative estimates for efficacy (6 and 12-month seizure-freedom) and safety (discontinuations due to adverse events [AEs], serious treatment-emergent-AEs [TEAEs], serious drug-related-AEs [DRAEs]) for the overall population and elderly subpopulation. Efficacy analyses used pooled data for immediate-release and controlled-release (CR) carbamazepine. **RESULTS:** Data from twelve trials evaluating ten AEDs were analyzed. For 6-month seizure-freedom, lacosamide showed similar efficacy to carbamazepine (odds ratio [OR]: 1.23 [95% Credible Interval: 0.91-1.63]) and levetiracetam (1.25 [0.77-1.91]), with numerically better efficacy versus other AEDs (lamotrigine: 1.39 [0.62-2.70]; zonisamide: 1.63 [0.99-2.52], phenytoin: 1.92 [0.66-4.46]). Comparison with valproate showed large uncertainty (0.70 [0.08-2.59]). Lacosamide showed similar efficacy to carbamazepine for 12-month seizure-freedom (1.02 [0.77-1.32]), with OR versus other AEDs ranging from 1.18 (levetiracetam) to 1.66 (lamotrigine). Lacosamide tended towards numerical advantages versus levetiracetam, carbamazepine-CR, and zonisamide for discontinuations due to AEs (OR range: 0.48-0.74) and for risk of serious TEAEs versus carbamazepine-CR and zonisamide (range: 0.78-0.90). Risk of serious DRAEs for lacosamide (0.38 [0.10-0.90]) and levetiracetam (0.33 [0.06-0.95]) was similar versus carbamazepine-CR. Similarly, elderly subpopulation analyses showed similarities between lacosamide, lamotrigine, and levetiracetam when compared to each other and versus carbamazepine-CR (with some numerical advantages) on seizure-freedom, and serious DRAEs. **CONCLUSIONS:** Numerical benefits versus other AEDs indicate lacosamide is a valuable addition to the armamentarium of focal seizure monotherapies. However, the available evidence was insufficient to demonstrate meaningful differences between AEDs for efficacy outcomes, as reflected by the wide Credible Intervals. **STUDY SUPPORT**: UCB Pharma-sponsored.

PRM166

ASSESSING TRENDS OF DEVELOPING STUDENT INTERESTS WITHIN THE ISPOR STUDENT NETWORK, 2011 TO 2016

Gangan N[1], Chou Y[2], Adamson BJ[3], Cannon-Dang E[4], Chen C[5], Law EH[6], Lyons N[4]
[1]Center for Pharmaceutical Marketing and Management, University of Mississippi, University, MS, USA, [2]University of North Carolina, Chapel Hill, NC, USA, [3]University of Washington, Seattle, WA, USA, [4]Thomas Jefferson University, Philadelphia, PA, USA, [5]University of New Mexico College of Pharmacy, Albuquerque, NM, USA, [6]University of Illinois at Chicago, Chicago, IL, USA

OBJECTIVES: Each year, the International Society of Pharmacoeconomic and Outcomes Research (ISPOR) Student Network administers a "Student Interest Survey" to identify student member interests in the field. This study aims to evaluate changes in student interests. **METHODS:** Survey data was available for years from 2011 to 2016. Each year, the online survey was posted on ISPOR website and Student Network's Facebook Page. Additionally, email reminders were sent to registered ISPOR members via the ISPOR Student Network and Student Chapter Presidents. To improve the response rate, incentives were offered. Responses were evaluated according to its availability in each year. **RESULTS:** The survey was distributed to approximately 900 student members each year. The response rate ranged from 18%-24% (total number 141-218 each year) during the study period. Most respondents lived in North America (mean±SD:57±12.24%) and were enrolled in a PhD program (mean±SD:52±2.9%). The interest in attending the next Annual International meeting averaged 51% over the years. The level of interest in the Student Research Showcase and Mock Interviews significantly increased over the past five years (51% in 2013-14 to 81% in 2015-16) while interest for Student T-shirt Competition dipped (52% in 2012-13 to 30% in 2015-16). Most students were interested in guest speakers from government/policy makers (mean±SD:77±4.4%), academia (mean±SD:77±6.4%), pharmaceutical industry (mean±SD:73±6.5%), and consulting (mean±SD:71±4.7%) at student forums and educational webinars. Shifting interest in research topics for student forums and educational webinars changed from general health outcomes overview (91% in 2012) to specific HEOR areas such as economic evaluation, comparative effectiveness, and patient-reported outcomes (80%, 82%, 70% respectively in 2016). Students preferred specific topics presented as case studies at educational webinars. **CONCLUSIONS:** As the field of HEOR keeps evolving, students interest are becoming more specific. The trends of student interest over the past 5 years highlight avenues to enhance student engagement and knowledge.

PRM167

MEASURING THE VALIDITY AND RELIABILITY OF VALUE ASSESSMENT FRAMEWORKS FOR CANCER DRUGS: AN EVALUATION METHOD

Bentley TG[1], Cohen JT[2], Elkin EB[3], Huynh J[4], Mukherjea A[5], Neville TH[6], Mei MG[7], Copher R[8], Knoth RL[8], Popescu I[6], Lee J[1], Zambrano JM[1], Broder MS[1]
[1]Partnership for Health Analytic Research, LLC, Beverly Hills, CA, USA, [2]Tufts Medical Center, Boston, MA, USA, [3]Memorial Sloan-Kettering Cancer Center, New York, CA, USA, [4]Hematology Oncology Medical Group of San Fernando Valley, Encino, CA, USA, [5]California State University, East Bay, Hayward, CA, USA, [6]David Geffen School of Medicine at UCLA, Department of Medicine, Los Angeles, CA, USA, [7]City of Hope National Medical Center, Duarte, CA, USA, [8]Eisai Inc., Woodcliff Lake, NJ, USA

OBJECTIVES: We aimed to develop a methodology for evaluating convergent validity and inter-rater reliability of value assessment frameworks. **METHODS:** Framework convergent validity, defined as the correlation among drug rankings across frameworks, can be assessed using Kendall's W coefficient. Framework reliability is evaluated using intraclass correlation coefficients (ICC), which measure the stability of outcomes across users. Drugs can be assessed by independent physician and non-physician evaluators, who can use published drug trial data and instructions provided by framework developers to assign each drug a numeric or letter score. Mean scores for drugs within pre-defined categories (e.g., condition; indication) are rank-ordered to estimate Kendall's W. Multiple scores for the same drug are compared using ICC. To evaluate stability of results, W and ICC are assessed with varying numbers of evaluators and frameworks. The method was applied here by 8 evaluators, who assessed 15 oncology drugs and completed a survey on their experiences. **RESULTS:** Excluding review of drug trial data, each assessment took on average 25 minutes for ASCO, 21 for ICER, 14 for ESMO, and 8 for NCCN. Mean time to review each drug's data was 20 minutes. Kendall's W was 0.560 (p=0.010), 0.562 (p=0.010), and 0.920 ($p<0.001$) for drugs assessed in breast, lung, and prostate cancers, respectively. ICC (95% CI) for ASCO, ESMO, ICER, and NCCN were: 0.800 (0.660-0.913), 0.818 (0.686-0.921), 0.652 (0.466-0.834), and 0.153 (0.0045-0.371), respectively. Evaluators considered framework usability reasonable with this method. **CONCLUSIONS:** This novel method allows quantitative analyses of value assessment frameworks' convergent validity and inter-rater reliability. Although the approach can be used to determine the reproducibility of value assessments produced by these frameworks, the true test of their contribution to value-based decision-making will be how they influence decisions made by clinicians and patients when used in clinical practice settings.

PRM168

RELEVANCE OF INDIRECT COMPARISON IN HAS ASSESSMENT

Hanna E[1], Rémuzat C[2], Auquier P[3], Jadot G[4], Toumi M[1]
[1]Aix-Marseille University, Marseille, France, [2]Creativ-Ceutical, Paris, France, [3]Faculté de Médecine, Laboratoire de Santé Publique, Aix-Marseille Université, Marseille, France, [4]Lyon 1 University, Villeurbanne, France

OBJECTIVES: "Head-to-head" trial or direct comparison is the classical approach considered as gold standard to compare the efficacy, safety and additional overall benefit of 2 treatments. Indirect comparison may in some cases be the only option to compare interventions. Although, in theory, French health authority (HAS) accepts the indirect comparisons and a guideline for indirect comparison is published, it is not clear if they are accepted in practice. The aim of this study is to identify the number of indirect comparisons in oncology as well as their acceptability by HAS. **METHODS:** HAS reports published between 01/01/2012 and 31/12/2016 for oncology products were extracted from HAS website. Only initial submission reports were included in this study. Generics and biosimilar products assessments were excluded. Then, indirect comparisons were identified in each report as well as the opinion of HAS on these comparisons when available. **RESULTS:** 292 reports for oncology products were extracted among which 67 were included in this study. Indirect comparisons were submitted only for 8 of the 67 products in addition to the head-to-head randomized clinical trials. HAS considered that indirect comparisons have a minor impact and they were not considered actually in the final assessment. Consistently, HAS questioned the value of these indirect comparisons because they were thought to have limitations due to period differences, potential heterogeneity of studies (population and patients' management etc) as well as potential population selection that may be very different even though those heterogeneity criticisms were not robustly documented. **CONCLUSIONS:** The use of indirect comparison is becoming unavoidable as it is almost impossible to generate comparative head-to-head data for all relevant interventions. Despite some products indirect comparisons availability for other HTA agencies, they are not filed to HAS. When filed they happen to have very little impact on the HAS assessment.

PRM169

PREFERRED INFORMATION SOURCES AND NEEDS OF CANCER PATIENTS ON DISEASE SYMPTOMS AND MANAGEMENT: A CROSS-SECTIONAL STUDY

Belachew SA, Mekuria Ab, Erku dA
University of Gondar, Gondar, Ethiopia

OBJECTIVES: This study aimed at identifying the information needs of cancer patients, their preferences for the means of receiving health information, and the perceived level of satisfaction of existing possibilities for acquiring cancer-related information in Ethiopia **METHODS:** An institutional-based cross-sectional survey was employed on 556 cancer patients undergoing chemotherapy in the oncology wards of Gondar University Referral Hospital and Tikur Anbesa Specialized Hospital. Data were collected through interviewer-administered questionnaire. **RESULTS:** The principal information regarded as the most important by the majority of them (67.26%) concerned information on the specific type of cancer (name and stage of cancer), followed by the side effects of chemotherapy and their management (63.29%) and "prognosis (survival)" (51.8%). Doctors were the overwhelming information source about cancer (88.8%), followed by nurses (34%). The majority of respondents (70.3%) was not satisfied at all or satisfied a little, while 15.6% of respondents reported that they were "quite" or "very" satisfied with the existing possibilities for acquiring information regarding cancer. **CONCLUSIONS:** Medical practitioners other than doctors and nurses such as clinical pharmacists should support and identify measures that can enhance patients' satisfaction level regarding the existing possibilities for acquiring information regarding cancer. Periodic assessment of cancer patient's information

requirements is also crucial, considering the ever-changing dynamics of priorities of such information desires.

BARRIERS AND SOLUTIONS FOR REAL-WORLD CHART REVIEW EVIDENCE GENERATION
Stein D[1], Ross L[2]
[1]Evidera, St-Laurent, QC, Canada, [2]PPD, Waltham, MA, USA
OBJECTIVES: The growing importance of real-world evidence (RWE) has resulted in the need to generate and evaluate more data under tighter timelines. We aim to describe challenges and propose solutions in conducting retrospective chart review studies that evaluate treatment patterns, clinical outcomes and healthcare resource use. **METHODS:** Qualitative assessment of the implementation of 3 chart review studies (1 in Europe [EU]; 2 in North America [NA]) in the last 2 years, and the identification of barriers during study conduct for future data collection improvement. Studies were evaluated based on patient selection procedures, robustness of data collection and timelines to collect data. **RESULTS:** The studies were in gastroenterology, oncology and respiratory disease therapeutic areas. Study scope ranged from 220-340 patients and 8-27 sites. Barriers identified included: patient consent requirement in the EU, electronic medical record (EMR) data accessibility and data collection duration. Consent rate for the EU study was 71%. Over 75% of sites used an EMR to abstract data, and data collection ranged from 8-12 months taking 1.7 times longer than anticipated. Potential solutions identified include: 1) working with EU ethics committees to better understand patient privacy and data protection requirements for chart review studies, 2) working with site technology departments to set-up EMR data extracts (i.e., reducing manual chart abstractions thereby reducing data collection duration) and 3) providing supportive tools for data collection and automated analytics without breaching patient confidentiality. **CONCLUSIONS:** Understanding the key challenges associated with study design and execution as well as leveraging technological innovations resulting in cost and timeline efficiencies is paramount. Since most sites are using EMR systems and patient-level data abstraction is time consuming, exploring alternative approaches to extracting data directly from site EMR systems is warranted to generate RWE more efficiently.

PRM171
IMPORTANCE OF CLINICAL OUTCOME ASSESSMENT (COA) DATA IN THE EVALUATION OF MEDICINES FOR THE TREATMENT OF RESTLESS LEGS SYNDROME (RLS): A REVIEW OF THE LABELS OF MEDICINES APPROVED BY THE FDA AND THE EMA
Perrier L[1], Emery M[1], Anfray C[1], Acquadro C[2]
[1]Mapi Research Trust, Lyon, France, [2]Mapi, Lyon, France
OBJECTIVES: Restless legs syndrome (RLS) is a neurologic sensorimotor disorder characterized by an irresistible urge to move the legs when they are at rest. The urge to move is usually due to unpleasant feelings in the legs. Treatment includes lifestyle changes and use of medicines. The objectives of this study were 1) to identify the medicines approved for the treatment of RLS by the Food and Drug Administration (FDA) and the European Medicines Agency (EMA); 2) to find out about the use of clinical outcome assessments (COAs) in the approval process; and 3) to identify the COAs endpoint positioning. **METHODS:** The EMA and FDA websites were explored to identify all medicines approved for RLS. The PROLabels database, through the ePROVIDE platform, was used for labeling claim identification. All corresponding labels and reviews were reviewed for endpoint positioning. **RESULTS:** The agencies approved nine products with RLS indication (representing four INN, i.e., gabapentin, pramipexole, rotigotine, ropinirole); four products were approved by the FDA, and five by the EMA, including one generic of pramipexole. For the products approved by both agencies (n=2), the sponsors submitted the same data for approval. All products were evaluated using the same PRO measure, i.e., the International Restless Legs Syndrome Study Group Rating Scale (IRLS), which assesses disease severity. All had a similar claim, i.e., improvement in baseline IRLS score. The mean change from baseline in IRLS was a co-primary efficacy endpoint. The other COA used to develop a co-primary efficacy endpoint was a ClinRO, either a Clinical Global Impression scale of Improvement (CGI-I) or a Clinical Global Impression scale of Illness Severity. **CONCLUSIONS:** The patient's perspective is of paramount importance in the evaluation of medicines approved for RLS. The clinician input is also considered as a valuable endpoint since all evaluations were based on the use of co-primary PRO/ClinRO.

PRM172
SYSTEMATIC LITERATURE REVIEWS IN RARE DISEASES: CONSIDERATIONS, ISSUES AND RECOMMENDATIONS WHEN FACED WITH AN IMPERFECT EVIDENCE BASE
Gara A[1], Mueller K[1], Waser N[1], Goring SM[1], Thompson JC[2]
[1]ICON plc., Vancouver, BC, Canada, [2]ICON plc., Abingdon, UK
OBJECTIVES: Systematic literature reviews (SLRs) of real world evidence (RWE) are often conducted to summarize evidence on treatment patterns, natural history, and the epidemiological, humanistic and economic burden of illness. When the disease of interest is rare, the evidence can be difficult to find, and conventional approaches to SLR conduct may need to be adapted. Our objectives were: 1) to highlight key differences in SLR conduct between those focusing on RWE in rare diseases versus common diseases; and 2) to present a conceptual framework outlining pertinent considerations and recommendations for researchers designing and carrying out SLRs of RWE in rare diseases. **METHODS:** We conducted a targeted review of SLRs in rare diseases that used RWE, as well as of methodological guidance on SLRs. We used this literature base to develop and synthesize key considerations and recommendations regarding the conduct of SLRs in rare diseases as it compares with SLRs conducted for more common diseases, focusing on RWE. **RESULTS:** Our framework highlights key considerations relating to: inclusion criteria, search strategies, data sources, data extraction, risk of bias assessment, and analysis. Compared with SLRs in more common diseases, rare disease SLRs tend to require a broader approach: due to limited data availability, search strategies are often kept broad at the beginning to increase sensitivity, and may be narrowed iteratively. Furthermore, rare diseases SLRs can capture evidence from non-traditional research designs and data sources (e.g. patient or caregiver blogs) as well as employ additional analytics and modeling in order to make the best use of imperfect evidence. **CONCLUSIONS:** Limited methodological guidance is available on designing and conducting SLRs of RWE in rare diseases where evidence is scarce. Our comprehensive conceptual framework can serve as a methodological reference for researchers conducting SLRs in a rare disease.

PRM173
METHODOLOGICAL CHALLENGES OF INDIRECT COMPARISONS IN HEMOPHILIA A
Booth J[1], Lu M[1], Lee H[2], Valentino LA[3]
[1]Shire, Cambridge, MA, USA, [2]Shire, Zurich, Switzerland, [3]Shire, Chicago, IL, USA
OBJECTIVES: Indirect treatment comparisons must adjust for inter-study differences in design and patient characteristics, which may strongly influence outcomes. This study investigated impact of inter-trial patient differences on the comparative effectiveness of rFVIII (ADVATE) and extended half-life rFVIII (ADYNOVATE). **METHODS:** A targeted review identified Advate or Adynovate trials for which individual patient data were available (i.e., Baxalta-sponsored). Enrolled patients aged 12-65 years with severe hemophilia A (HA) who received and complied with prophylactic treatment with Advate or Adynovate were included in the analysis. A negative binomial model was used to compare number of bleeds during the first 6 months, and logistic regression was used to compare the odds of achieving ≤ 1 bleed. All regression models controlled for the effect of patient characteristics. **RESULTS:** Two Advate studies (Tarantino 2004, $n = 55$; Valentino 2012, $n = 49$) and one Adynovate study (Konkle 2015, $n = 68$) were included. Patients exhibited statistically significant differences in body mass index ($p = 0.03$), Caucasian race ($p = 0.01$), and prior medications (alimentary tract and metabolism, $p < 0.01$; nervous system disorder, $p < 0.001$). Presence of target joints was not consistently recorded so could not be included in the regression models. The incident rate ratio of annualised joint bleeding rates (AJBR) was not statistically significantly different (odds ratio 1.0 for Adynovate vs Advate; 95% CI 0.5 – 2.0). Additionally, no significant difference was observed for patients who had ≤ 1 bleed (odds ratio 0.5 for Advate vs Adynovate; 0.5–1.2). **CONCLUSIONS:** No difference was found for AJBRs among adolescents and adults with severe HA treated with Advate or Adynovate targeting a trough level of 1-3%; however, clinically meaningful heterogeneity remained. Despite techniques to control for differences, patient heterogeneity remains a significant challenge for conducting comparisons of hemophilia studies.

PRM174
MAKING THE MOST OF EXTERNAL COMPARATORS: A STUDY OF FRACTURE HEALING IN PATIENTS AT RISK OF NON-UNION
Mack C[1], Pavesio A[2], Kelly K[2], Wester T[2], Jones J[2], Maislin G[3], Irwin D[4], Brinkley E[1], Zura RD[5]
[1]QuintilesIMS, Durham, NC, USA, [2]Bioventus LLC, Durham, NC, USA, [3]Biomedical Statistical Consulting, Wynnewood, PA, USA, [4]Truven Health Analytics, an IBM Company, Chapel Hill, NC, USA, [5]Louisiana State University, New Orleans, LA, USA
OBJECTIVES: Fracture non-unions result in significant physical, emotional, and economic burden on patients. Low-intensity pulsed ultrasound (LIPUS) is an FDA-approved device to treat established fracture non-unions and facilitate the healing of acute radius and tibia fractures. However, commercial insurers routinely cover use in patients with fractures beyond approved indications in an attempt to avoid surgical non-union repair costs later. To align LIPUS's real-world use with its labeling, a novel real-world study to establish effectiveness of LIPUS for mitigating fracture nonunion is proposed. **METHODS:** The fracture non-union rate between a prospectively enrolled LIPUS-treated cohort will be compared to untreated historical controls selected from MarketScan™ Claims. Fracture status will be obtained from presence of non-union diagnosis codes 12 months post-fracture date. The potential for selection bias will be addressed using propensity score methodology. Given underlying differences in data collection, key methodological issues include creation of equivalent operational definitions for patient selection, study time points, patient characteristics, and outcomes to maximize the probability of equivalent ascertainment across different modes of data capture. **RESULTS:** Variables were defined for controls using diagnosis and procedure codes; patient questionnaires and chart abstraction will be used for the LIPUS cohort. For example, to minimize recall bias, the LIPUS cohort will use a 3-month pre-fracture recall period, while controls will use 6 months pre-fracture claims to account for 90-day supplies. Non-unions in the LIPUS cohort will be assessed by interview and chart review, while algorithms will be developed for claims analysis to capture non-unions reported within a clinically meaningful period. Methodological solutions will be presented. **CONCLUSIONS:** This novel approach demonstrates methodology for measuring device effectiveness in the real-world comparing cohorts enrolled both prospectively and within "Big Data".

PRM175
IMPORTANCE OF CLINICAL OUTCOME ASSESSMENT (COA) DATA IN THE EVALUATION OF MEDICINES FOR THE TREATMENT OF ALZHEIMER'S DISEASE (AD): A REVIEW OF THE LABELS OF MEDICINES APPROVED BY THE FDA AND THE EMA
Perrier L[1], Emery M[1], Anfray C[1], Acquadro C[2]
[1]Mapi Research Trust, Lyon, France, [2]Mapi, Lyon, France
OBJECTIVES: Alzheimer's Disease (AD) is a chronic neurodegenerative disease. It is the most common cause of dementia among older adults, leading to the loss of

cognitive functioning and behavioral abilities interfering with a person's daily life and activities. The objectives of this study were 1) to identify the medicines approved for the treatment of AD by the Food and Drug Administration (FDA) and the European Medicines Agency (EMA); 2) to find out about the use of clinical outcome assessments (COAs) in the approval process; and 3) to identify the COAs endpoint positioning. **METHODS:** The EMA and FDA websites were explored to identify all medicines approved for AD. The PROLabels database, through the ePROVIDE platform, was used for labeling claim identification. All corresponding labels and reviews were reviewed for endpoint positioning. **RESULTS:** Generics were neither included in the list of approved products nor reviewed, since the material used for their approval is identical to the original product. The agencies approved 14 products (representing five INN, i.e., donepezil hydrochloride, galantamine hydrobromide, memantine hydrochloride, memantine hydrochloride + donepezil hydrochloride, and rivastigmine); ten products were approved by the FDA, and four by the EMA. All products were evaluated using COAs as co-primary end-points, i.e., measures of cognitive performance [(ADAS-cog, Severe Impairment Battery (SIB)], and global impression of change [Clinician Interview-Based Impression of Change-Plus (CIBIC-Plus)], or daily functioning [Modified Alzheimer's Disease Cooperative Study Activities of Daily Living Inventory for Severe Alzheimer's Disease (ADCS-ADL-sev); Behavioral Rating Scale for Geriatric Patients (BGP) - dependency subscale]. **CONCLUSIONS:** COAs are of paramount importance in the evaluation of medicines approved for AD. Most of the COAs used are either performance outcome (PerfO) or clinician-reported outcome (ClinRO) measures, given that the self-evaluation by the patient is impossible.

PRM176

CLINICAL MANAGEMENT AS A RESOURCE FOR COST STUDIES METHODOLOGY: AN EXAMPLE APPLIED TO NON-SMALL CELLS LUNG CANCER (NSCLC)

Paredes Fernandez D[1], Lenz Alcayaga R[2], Quirland-Lazo C[1]
[1]*Universidad de Chile, Santiago, Chile,* [2]*Lenz Consultores, Santiago, Chile*

OBJECTIVES: In the context of a payment mechanism construction for submitting a proposal to the Chilean National Health Fund and on the basis that current payment mechanisms do not consider accurate reviews on the actual costs of diseases, it was necessary to develop an efficient and realistic strategy for costs estimation. The aim of this work was to estimate direct costs associated to NSCLC by using an efficient and appealing methodology for the public insurance. **METHODS:** A cost study based on a hybrid and novel methodology was conducted. An specialty facility and physicians familiar with the disease were identified. Clinical pathways were developed according to real clinical care and supplies consumed (variable: quantity). These results were matched with statistic data provided by local information system and complemented with national-official price lists (variable: price). **RESULTS:** Comprehensive clinical pathways reflecting clinical behaviour were developed (payment base), allowing micro-costing. Patients routes were also identified (frequencies). Afterwards, costs per disease-stage were obtained at patient level and population level (Total Cost for all stages and full treatments coverage: USD 4.077.000 (n=350 cases); Most expensive stages -IIIB and IV stage- UDS 2.141.762 (n=25 cases), which represents the 52% of expenditure. Equity costs were defined as barriers preventing patients from a specialized treatment, these were also calculated: USD 302.000 (n=25 cases). Tyrosine Inhibitors (2nd line high-cost treatment) represent the 28,05% of expenditure. By including novel strategies for funding, inmunotherapy represents only a 3,81% of the High-Cost Fund, making feasible including these drugs at the current expenditure level. **CONCLUSIONS:** A cost study of high internal validity was achieved. The role of specialty facilities and medical teams it is crucial towards a more efficient and clinically validated costs studies, based on clinical pathways reflecting the accurate consumption and evidence-based medical behaviour. Based on these data, a proposal was submitted for promoting immunotherapy coverage.

COHORT ANALYSIS METHODS TO ESTIMATE THE BUDGET IMPACT OF ONCOLOGY TREATMENTS BY LINE OF THERAPY

O'Day K, Brown D
Xcenda, LLC, Palm Harbor, FL, USA

OBJECTIVE: Estimating budget impact (BI) is relatively simple for chronic conditions and isolated acute conditions. However, estimating BI for oncology treatments is complicated by episodic treatment patterns and variable treatment times. We present cohort analysis methods to estimate the BI of oncology treatments by line of therapy. **METHOD:** BI analyses are based on the size of the treated patient population, cost of treatment per patient, and potential market share shifts over a given time horizon. In oncology, duration of treatment can vary based on differential progression-free survival by treatment regimen and line of therapy, with patients receiving initial treatment shortly after diagnosis until disease progression followed by additional lines of therapy. To model these treatment patterns, BI analyses may utilize treatment sequencing among individual patients to estimate treatment costs and BI, resulting in greater complexity and additional data requirements. We present simple cohort analysis methods to estimate the cost and BI of oncology treatments. Incidence of disease and the proportion of patients receiving each line of therapy are used to estimate the size of the annual target population. Utilizing a few plausible assumptions, the target population and average duration of treatment are used to estimate the annual steady-state treatment cost in the form of a diagonal treatment vector with an area equivalent to the incidence multiplied by the duration of treatment. We show how these cohort analysis methods relate to an individual patient level analysis and provide some worked examples to illustrate how they are used to calculate treatment cost and BI. **CONCLUSION:** Cohort analysis methods can be used to estimate the cost and BI of oncology treatments despite episodic treatment and variable duration of therapy. Use of cohort analysis methods can reduce the complexity of oncology BI models and make it easier to communicate the results to healthcare payers.

PRM178

IMPROVING DISEASE MANAGEMENT THROUGH INSIGHTS GAINED FROM REAL-WORLD OBSERVATIONAL DATA

Mehta S[1], Gani R[2], Lang K[3]
[1]*QuintilesIMS, Cambridge, MA, USA,* [2]*QuintilesIMS, Berkshire, UK,* [3]*QuintilesIMS, New York, NY, USA*

Background: Predicting disease progression or adverse health outcomes can be accomplished using insights gained from real-world observational data. Information collected routinely while providing patient care enables the development of risk models that identify patients with increased likelihood of disease or poor/costly health outcomes. Such models can improve patient management, especially in populations prone to such outcomes (e.g. type 2 or gestational diabetes, asthma, mental disorders). Here we describe the process of developing risk models, along with selected successful examples. **Methods:** Large nationally representative EMR, claims, and EMR-claims linked databases were processed to evaluate demographics, vital signs, diagnoses, diagnostic tests/results, procedures, insurance, and prescription details in disease-specific patient populations. Predictive models were developed and validated using multivariable regression techniques in these populations to identify key drivers of disease and health outcomes. **Results:** Risk models successfully predicted primary and secondary medication non-adherence and non-persistence in diabetic patients, with index medication type, history of non-adherence to other chronic condition medications, HbA1C level, and prior prescription fill patterns identified as key predictors. Similar models of medication non-adherence for schizophrenia and bipolar disorder patients identified age, substance abuse and concomitant psychiatric medications as key drivers, while models of hospitalization highlighted substance abuse or other psychosis diagnosis, concomitant use of psychiatric medications and history of non-adherence to antipsychotics as key drivers. **Conclusion:** Key variables that identify patients at high risk of adverse outcomes such as those identified in our examples can be easily ascertained during physician visits, and thus used to initiate disease management interventions. Building risk models into EMR or healthcare claims systems, and arming physicians or other healthcare decision-makers with the ability to facilitate their use at the point of care, has the potential to intercept disease progression and improve outcomes. Such analytics can help both providers and payers achieve effective disease management goals.

PRM179

HOW TO EVALUATE THE IMPACT OF A REAL-WORLD QUALITY IMPROVEMENT PROGRAM ON A MEANINGFUL HEALTH SYSTEM OUTCOME THAT HAS A POLICY IMPLICATION?

Rojanasarot S[1], Carlson AM[2]
[1]*University of Minnesota, Minneapolis, MN, USA,* [2]*Data Intelligence Consultants, LLC, Eden Prairie, MN, USA*

During the last two decades, there has been an increasing number of quality improvement programs for patients with chronic diseases that aim to enhance the efficiency and outcomes of chronic care. While such programs have been well generated, the evaluation tools for these real-world implementations are somewhat underdeveloped, particularly for programs that originated at the upper level of the health care system (i.e., programs that attempt to change the organizational and environmental structure of a system rather than solely individual patients). Therefore, the purpose of this study is to employ an innovative approach called a multiple baseline design to investigate naturalistic, multi-setting quality improvement programs. A multiple baseline design is a novel analytical tool in healthcare research and a class of interrupted time series analysis that involves both repeated measurements of outcomes over a period and the serial introduction of an intervention to each study unit on a staggered schedule. This study uses a multi-geographical state, community-based change program for children with asthma that has been developed in the four South Central States as an example of real-life, upper-level improvement efforts. This study also proposes the use of both longitudinal patient-level administrative claims data and clinic-level performance indicators to determine if the community-based change program subsequently decreased unnecessary utilization of health services among children with asthma. The unnecessary utilization that is imperative for healthcare policies includes emergency department visits and hospitalizations. The insights gained from this study could facilitate policy decision making if a huge investment at the upper level enhances chronic illness care.

PRM180

THE USE OF QUALITATIVE (EXIT) INTERVIEWS IN CLINICAL TRIALS: VALUE, IMPLEMENTATION AND KEY CONSIDERATIONS

Gater A, Marshall C, Grant L, Wells J
Adelphi Values Ltd, Bollington, UK

Background: As the healthcare industry becomes more patient-centric, ensuring the patient voice is heard throughout the product life cycle is critical. Patient-reported outcome (PRO) measures provide a standardized means of evaluating and monitoring the efficacy and safety of products and services from a patient perspective. However, conducting qualitative interviews as part of clinical research studies provides unique opportunities for in-depth exploration of patient experiences. **Objectives:** To discuss the application, value and key considerations for implementing qualitative (exit) interviews in clinical research with reference to illustrative examples from a range of disease areas. **Results:** When implemented in clinical studies alongside PRO assessments, rich data from interviews can be used to contextualize PRO data and provide supplementary insights as part of a mixed-

methods approach to evaluating the benefit of medical interventions. Such interviews can also capture concepts that are not adequately measured by available PRO measures (e.g., satisfaction of a novel treatment) or concepts that are too complex to capture reliably using a PRO (e.g., benefit-risk evaluations). When employed in early clinical studies, interviews may also help to generate evidence to evaluate content validity of PRO measures prior to their implementation in pivotal studies. Qualitative exploration of the significance of changes experienced by patients can be used to complement quantitative data and help to establish valid responder definitions and interpretation of meaningful change. Finally, feedback during these interviews could inform operational aspects of trial design. Key considerations for sponsors include how best to incorporate interviews into clinical trial programs (either within or outside the clinical trial protocol), timing of interviews in the study schedule, standardization of data collection and analysis and how to minimize patient burden. **Conclusions:** Qualitative (exit) interviews provide a novel and valuable means of maximizing insight from study participants but pose unique considerations for implementation into clinical research.

PRM181

DEFINING MULTI-AGENT CHEMOTHERAPY REGIMENS USING CLAIMS DATA ANALYSIS: IS THERE A ROLE FOR DATA VISUALIZATION?

Albarmawi H[1], Onukwugha E[1], Nagarajan M[1], Gardner JF[1], Yared JA[2]
[1]University of Maryland School of Pharmacy, Baltimore, MD, USA, [2]University of Maryland, Greenebaum Cancer Center, Baltimore, MD, USA

In the oncology setting, health services researchers often utilize claims-based algorithms to identify complex chemotherapy regimens and lines of therapy. The algorithms build on prior investigation of claims data and/or electronic medical records (EMR) or on prior published work. However, prior studies do not typically provide the methodological detail that permits reproduction or supports evaluation of the algorithm, which can limit opportunities to improve on a key measure for cancer studies. We show how the use of data visualization software provides longitudinal views, supports the identification of multi-agent chemotherapy regimens using claims data, and provides transparency. **Recommendation**: we propose incorporating data visualization during the process of algorithm development as follows: (a) based on clinical guidelines, clinician input, and relevant literature, identify the regimens and their constituent medications. (b) Using claims data, flag the occurrence of any of these medications following diagnosis. (c) On a random subset of the event-level data, characterize the longitudinal sequence of chemotherapeutic agents using data visualization software and compare actual patterns against expected patterns. (d) Define and describe regimens in terms of constituent medications, duration, and time between regimens. (e) Using [c] and [d], develop and apply a preliminary algorithm that specifies the medications, the acceptable period of time for treatment administration within the regimen, the acceptable period of time between regimens. (f) Confirm the face validity of the graphical and summarized quantitative output from [c], [d], and [e] with a practicing oncologist/specialist. (g) Modify and expand the algorithm as needed given the desired objective (e.g., to define first-line therapy or multiple lines of therapy). **Conclusion:** Compared to an approach that utilizes primarily claims and/or EMR data to develop algorithms for identifying treatment with multi-agent chemotherapy regimens, the incorporation of data visualization provides an efficient way to elucidate the embedded structure and assumptions of claims-based algorithms.

PRM182

MODELLING DISEASE PROGRESSION IN PATIENTS WITH GEOGRAPHIC ATROPHY

Tournier C[1], Pope L[1], Silverman D[2]
[1]F.Hoffmann-La Roche AG, Basel, Switzerland, [2]Roche Products Limited, Welwyn Garden City, UK

OBJECTIVES: Geographic Atrophy (GA) is an advanced form of age-related macular degeneration (AMD). Unlike neovascular AMD (nvAMD), GA has a minimal impact on best-corrected visual acuity (BCVA) in the early stages of the disease. Therefore, modelling disease progression based on BCVA levels may not be appropriate in the context of GA. The objective of this research is to define the most appropriate attributes to model GA progression. **METHODS:** A qualitative search was undertaken to understand which disease characteristics are used to describe GA progression. The literature was screened (non-systematically) and relevant publications were identified. The disease characteristics used to describe the progression of GA and those that impacted patient outcomes were extracted and their importance assessed. **RESULTS:** In the context of GA, several disease characteristics have been identified that have a significant impact on patient outcomes. The number of eyes affected (unilateral vs. bilateral disease) and the location of the GA lesion (fovea-involved versus non fovea-involved) appear to be the most important variables. Other variables that have an impact on patient outcomes are the total size of the GA lesions and the number of lesions in the retina (unifocal vs. multifocal GA). BCVA appears to be impacted only when the GA lesion spreads into the fovea (in the later stages of the disease). **CONCLUSIONS:** To date, disease progression for most visual disorders has been based on the level of BCVA, which is then linked to patient outcomes. In the context of GA, where BCVA is not an appropriate measure, the multi-factorial concept of visual function (which includes BCVA) should be used to model GA progression and to link GA progression to patient outcomes. This research could be applied in the context of cost-effectiveness modeling.

PRM183

RWE DECODER: A DECISION MAKER'S FRAMEWORK FOR ASSESSING REAL WORLD EVIDENCE

Moloney RM[1], Messner DA[1], Stoto M[2], Tunis S[1]
[1]Center for Medical Technology Policy, Baltimore, MD, USA, [2]Georgetown University, Washington, DC, USA

Objectives: With the growth of electronic health records and large data repositories, and increasing efforts to systematically collect information from routine clinical encounters, the potential for development and use of Real World Evidence (RWE) is exploding. However, there is not yet consensus among "post-regulatory" decision makers (see methods) on a framework for assessing RWE that accurately discriminates between studies deserving greater consideration in decision making and those inappropriate or irrelevant for use. For many decision makers, the value of RWE is still unclear, creating uncertainty for researchers using rapidly growing RWE resources. The Center for Medical Technology Policy (CMTP) and Green Park Collaborative (GPC, a CMTP program) developed a framework for decision makers more confidently and consistently to assess RWE for their unique decision making needs. **Methods:** The project approach entailed: 1) Stakeholder and Expert Engagement, 2) Background Research, 3) Vetting of Draft Framework and In-Person Meeting, and 4) Incorporation of Key Findings and Final Framework. Key stakeholders engaged were post-regulatory decision makers: payers, clinical guideline developers, health system leaders, health technology assessment groups, and accountable care organizations. Patient advocates, industry stakeholders (who were sponsors), and academic researchers were also engaged. **Results:** The Framework establishes Rigor and Relevance as the two primary domains with which to assess RWE for decision-making. It is an interactive Excel tool, composed of a series of modules: Module 1. Articulating the Research Question, Module 2A. Assessing the Relevance of each RWE study, Module 2B. Assessing the Rigor of each RWE study, Module 2C. Magnitude and Direction of Effect, Module 3. RWE Framework Visual Summary. **Conclusions:** The GPC RWE Framework offers a manageable approach for decision-makers who currently lack a systematic approach to assessing RWE for decision-making, or who otherwise have limited training, staff, or time dedicated to the regular assessment of research evidence for decision-making.

PRM184

A WORKED EXAMPLE OF USING COMPUTER-ASSISTED QUALITATIVE DATA ANALYSIS SOFTWARE (CAQDAS) TO SUPPORT CONTENT VALIDITY IN PATIENT-CENTERED OUTCOMES RESEARCH

Marshall C, Grant L, Wells J, Williamson N, Gater A
Adelphi Values Ltd, Bollington, UK

Background: Standards for the development of patient-reported outcome (PRO) instruments emphasize the importance of establishing content validity in the target population to ensure comprehensive and relevant assessment of the concept(s) of interest. Content validity is supported by evidence from qualitative research studies with the target population. Compiling this evidence often involves analysis of extensive and diverse sets of qualitative data (written transcripts, audio, video etc.). **Objective**: To demonstrate, through a worked example, best practice techniques when using Computer-Assisted Qualitative Data Analysis Software (CAQDAS) to support PRO development and validation. **Methods**: CAQDAS facilitates iterative coding of qualitative data and assignment of codes reflective of the underlying concepts (e.g., specific symptoms and impacts) in accordance with thematic analysis and grounded theory approaches. Multiple codes can be assigned to excerpts of data where more than one concept is discussed. Concepts can then be grouped into 'families' based on commonality to facilitate the interpretation of content (e.g. all pain-related symptoms). Similarly, data can be simultaneously grouped by patient profile to identify differences based on demographic or clinical characteristics such as age, sex, or severity of condition. CAQDAS functions are used to attach researcher notes of interest to the data, perform keyword searches of transcripts and codes, and conduct complex exploration of the data (e.g. co-occurrence of codes suggestive of relationships between concepts). CAQDAS allows researchers to easily export the coded data for further analysis and reporting. Advanced output functions can be used to assess conceptual saturation (i.e., full exploration of the concepts of interest) and to determine if further data collection is necessary. **Conclusion**: CAQDAS is a valuable tool that can be used by researchers to facilitate the organization and analysis of large volumes of qualitative data, while providing the necessary audit trail and evidence to support PRO development to regulatory standards.

A POTENTIAL SOLUTION MAKING EXPENSIVE TECHNOLOGIES AFFORDABLE UNDER BUDGET CONSRAINTS IN UNIVERSAL HEALTH COVERAGE: CASE STUDY FOR JAPAN USING DIFFERENTIAL PRICING

Kamae I[1], Sugimoto T[2], Yamabe K[3]
[1]The Univeristy of Tokyo, Graduate School of Public Policy, Tokyo, Japan, [2]The University of Tokyo, Graduate School of Public Policy, Tokyo, Japan, [3]Takeda Pharmaceutical Limited, Tokyo, Japan

OBJECTIVES: Despite the introduction of a two-year pilot policy in government for value-based re-pricing in Japan, still no chart exist on affordability of expensive technologies and sustainability of the universal health coverage (UHC). To address this fundamental question, we aimed to seek a potential solution using differential pricing (DP) for the National Formulary list. **METHODS:** A theory is developed based on cyclic bipolar-state modeling with investment and disinvestment, in which cost increase by investments for new technologies is cancelled out by cost decrease by disinvestments using DP. Since the Japanese national list prices are applied to the whole country without any differentiation, cost-saving could be achieved if the government sets the list prices discounted by region instead of applying the same price to the whole country. Our approach formulated this hypothetical DP application. **RESULTS:** Suppose two statistical distributions by region, regarding:1) socio-economic statuses θi and 2) health outcomes δi . Then, four-step procedures were taken as follows: 1) Determine the weight wi by region in consideration of ranking the product, $\theta i \times \delta i$, 2) Determine the prices by region, multiplying the weight wi to the mean list price Pm , 3) Estimate the overall mean price at the national level based on the regional mean price estimated at Step 2, and finally, 4) Estimate the net cost-saving by subtracting the overall mean price obtained at Step 3 from the original mean list price Pm. Eventually the net cost-saving was simply formulated in the form of Pm x (1 - the mean of the weights wi). **CONCLUSIONS:** Our DP solution for affordability of

expensive technologies can work in theory to ensure an affordable budget space to maintain sustainability of the UHC system in Japan.

PRM186

EMBEDDING A VALUE FOCUS EARLY IN THE MEDICAL TECHNOLOGY INNOVATION PROCESS: INSIGHTS FROM 5 YEARS OF EXPERIENCE AT THE STANFORD BIODESIGN PROGRAM

Pietzsch JB, Yock CA, Peiffer V, Yock PG
Stanford University, Stanford, CA, USA

OBJECTIVES: The adoption of new medical technology is increasingly based on thorough assessment and demonstration of a health-economic value proposition. Innovators need to appreciate economic and clinical effectiveness data requirements early in the translational process to develop solutions that are not only clinically relevant, but also compelling from a health-economic value perspective. We report on our approach and experience in embedding value teaching in a postgraduate innovation fellowship program. **METHODS:** The Stanford Biodesign fellowship is an immersive, one-year full time fellowship that brings together postgraduate candidates from medicine, engineering, and business. Over the last 15 years, the teaching process, which includes three main phases (identify - invent - implement) has been refined and comprehensively documented, and is now replicated in numerous innovation programs worldwide. Over the last five years, we have inserted a value focus into the teaching process, building on existing concepts of technology assessment and cost-effectiveness analysis and applying them systematically to the Biodesign innovation process. **RESULTS:** We developed a value curriculum structured in 3 phases: Value exploration, Value estimation, and Value proposition. These value phases align with the three main phases of the Biodesign teaching process. Value exploration provides introduction and high-level guidance on identifying key value drivers in clinical need areas. Value estimation supports decision making as various solution concepts are being assessed. The third phase, Value proposition, provides fellows with the tools for evidence collection and definition of a rigorous value proposal. **CONCLUSIONS:** We describe a curriculum designed to teach innovators a systematic and structured approach to health economic needs identification and value demonstration. Application of a value focus early in the innovation process improves the likelihood of developing technologies that will be successfully translated to patient care in the current health economic environment.

PRM187

BEST PRACTICES FOR IMPROVED DESIGN AND EXECUTION OF "PIGGYBACK" HEALTH ECONOMIC STUDIES

Page MJ, Morris CA, Krahenbuhl J, Zhou R, Walke HL
Medpace, Cincinnati, OH, USA

Health economic (HE) studies comprise a variety of analytic approaches and utilize disparate data sources. Study objectives can range from determining the economic burden of a particular disease to evaluating the budgetary impact of a novel therapy. Data can be derived from payer databases, government sources, peer-reviewed literature, and myriad other sources. Health economic studies are conducted by different types of researchers working at various types of institutions. One of the more compelling types of HE study designs is a cost-effectiveness or cost-utility analysis “piggybacked” on a randomized controlled trial of an investigational pharmaceutical, biologic, or medical device or on an observational study of the real world use of a marketed product. While piggyback studies can be conducted across multiple institutions, they are perhaps most efficiently conducted in totoby a singular research organization. Building on lessons learned from actual studies, this presentation will elucidate best practices for design and execution of HE analyses piggybacked on Phase 2/3 trials or observational studies. Best practices presented will range from study initiation through analysis and dissemination of findings. Beyond electronic data capture (EDC) systems historically used in earlier phase clinical trials, piggyback studies may utilize electronic health record (EHR) data, claims data, patient reported outcomes (PROs), and other data. These data are companied by new sets of analytic, logistic, and regulatory challenges that must be addressed through all stages of study design and execution. Negotiation of study site contracts and payments and the development of informed consent procedures must reflect regulatory expectations and requirements for both clinical trials and HE studies. Database merging and validation, including the juxtaposition of coding for registrational studies with coding for medical billing, require particular consideration. Finally, simultaneous planning for, and execution of, analysis and reporting of results are essential.

PRM188

USING REAL-WORLD DATA TO INFORM SMARTER CLINICAL TRIALS AND PROSPECTIVE OBSERVATIONAL STUDIES

Mehta S[1], Mountford WK[2], McDonald MR[2], Stolper R[1], Zakar J[1], Lobeck F[3], Christian JB[3], Lang K[2]
[1]*QuintilesIMS, Cambridge, MA, USA,* [2]*QuintilesIMS, New York, NY, USA,* [3]*QuintilesIMS, Durham, NC, USA*

Background: The biopharmaceutical industry is evolving such that clinical development is moving from large, well-defined patient populations and highly prevalent disease areas to niche populations and new and rare diseases, making efficient design and recruitment critical. Furthermore, underperforming study sites and unanticipated enrollment and retention challenges compromise the success of clinical trials and other prospective studies. Electronic medical records (EMR), healthcare claims, hospital, and prescription drug data have the potential to guide and refine study protocol design and to inform targeted site selection to drive more efficient study execution. The utility of these data can be further enhanced through the use of both simple and advanced analytics. **Methods:** Through selected case studies, the use of real-world data to assess protocol feasibility and improve study site selection is illustrated. **Results:** In a study of respiratory syncytial virus (RSV), real-world data were used to narrow down the RSV patient population and understand RSV care in order to shape future clinical studies. A new patient sub-population was identified, and market sizes of previously identified patient sub-populations were estimated; physician profiles were defined in order to identify potential investigators for future studies. In a global study of irritable bowel disease, real-world claims and EMR data were used to quantify current treatment flow and identify key leverage points for use in recruiting optimal clinical trial patients and sites. Finally, nationally representative EMR data were utilized to highlight clusters of eligible patients within or near currently recruiting study sites, and to provide insights on eligible patients at potential new sites to assess efficacy of a new treatment for moderate to severe rheumatoid arthritis. **Conclusion:** Insights from real-world data can inform targeted and more efficient clinical trials and prospective observational studies. Such efforts have the potential to reduce the time and cost associated with these studies.

PRM190

ADDRESSING ECONOMIC EVALUATION NEEDS OF HOSPITAL DECISION-MAKERS IN THE UNITED STATES: A LITERATURE REVIEW AND RECOMMENDED FRAMEWORK FOR MEDICAL DEVICE BUDGET IMPACT MODELS

Delatore P[1], Hollmann S[2], Ferko N[2]
[1]*CR Bard Inc., Murray Hill, NJ, USA,* [2]*Cornerstone Research Group Inc., Burlington, ON, Canada*

Healthcare reform is increasing demand economic value of hospital products. The economic evaluation of drugs is established practice with support of comprehensive methodological guidance; however the equivalent for medical devices is less developed. Traditional cost-effectiveness analyses are sometimes not applicable for devices due to limitations on endpoints such as health utility or mortality. A budget impact analysis (BIA) can be an appropriate and practical tool to support the value analysis of many medical devices, but the frequency and methodology of such use has not been explicitly characterized. Our aim was to review how economic evaluations are currently being conducted from the hospital perspective, and to provide a dynamic framework, with illustrative examples, for device BIAs. The literature review demonstrated substantially less reports on hospital BIAs for devices compared with drugs. Of device BIAs, the common focus was determining how device costs were offset by averted downstream resources such as operating time, complications, repeat procedures, materials (and waste), and length of stay. Here, we illustrate examples of budget impact models using a similar framework but with design elements adapted to different device categories and situations. Examples are presented by: 1) capital, implantable, and commodity device categories; 2) various time horizons to reflect both initial hospitalization and bundled care; 3) incremental device reimbursement status; and 4) different resource and costing methodologies (e.g., direct versus direct plus indirect costs). Examples illustrate various comparative data sources to inform resource use including randomized trials, real-world time-in-motion studies, retrospective databases, expert panels, and network meta-analyses. Using these examples and BIA guidelines for drugs, recommendations are provided on developing and adapting device BIAs for hospitals and the utilization of such tools by hospital value analysis committees. In summary, budget impact models can be very informative for hospital decision-making and need to become more standardized for effective uptake.

PRM191

AN APPROACH TO PHYSICIAN RECRUITMENT FOR EVIDENCE BASED STUDIES IN THE HOSPITAL SETTING

Glembot T[1], Lessar S[1], Ochoa Gautier JB[2]
[1]*Valley Health Metabolic & Bariatric Program, Winchester, VA, USA,* [2]*Nestle Health Science, Florham Park, NJ, USA*

Developing and implementing evidence-based studies in the preoperative setting, while vital to quality care, can be a real challenge. Not only do you need the institution’s approval but you also need to recruit the surgeons, train the staff and develop programs the staff can use to communicate with and educate the surgical patients. And especially for multi-year studies, it is critical to have an internal education program in place to ensure that the reasons for initiating the study are transferred to future staff. Conducting studies related to the impact of pre-surgical immunonutrition supplements are even more challenging. Despite immunonutrition emerging as the gold standard, benefitting patients independent of their preoperative nutritional status and being one of the four components of enhanced recovery after surgery (ERAS) protocols, nutrition is often overlooked. And if nutritional intervention is considered at all, it is often times done in an uncoordinated and haphazard manner. This presentation will explore design and operational considerations for developing and implementing studies similar to the multi-year immunonutrition study conducted at Valley Health. It includes surgeon recruitment, training needs for the staff and patients as well as considerations for data collection, data base development and encouraging patient compliance. Based on the design and conduct of Valley Health’s actual immunonutrition study, this presentation will conceptualize a study design, an education model for staff and patients, as well as data selection, management and analysis. Optimizing a preoperative nutritional intervention requires a multidisciplinary strategy specifically aimed to improve patient compliance. Therefore, building upon this example, the presentation will enumerate important data elements and design considerations for those who want to implement an evidence based approach to preoperative immunonutrition therapy.

PRM193

NUANCES OF ASSESSING CLINICIAN AGREEMENT IN CLINICIAN REPORTED OUTCOMES (CLINROS)

Bender RH[1], Lenderking WR[2]
[1]*Evidera, Bethesda, MD, USA,* [2]*Evidera, Waltham, MA, USA*

Increased interest of pharmaceutical companies in using ClinROs for clinical trial endpoints and FDA submissions has resulted in renewed interest in the standards for their validation. ClinROs require some different approaches to validation when

compared to Patient-Reported Outcomes (PROs). For example, ClinROs can be based on readings, ratings, or even performance, which adds variability to them and nuances to their validation. One of the key components of validating a ClinRO is establishing its reliability. For most ClinROs, this means inter- and intra-rater reliability. Although often considered straightforward, reliability assessment can be the most technically challenging part of the validation analysis. An overview will be given of the primary competing statistics for assessing reliability (Pearson r, kappa, etc.) including a brief rationale and some pros and cons for each. We will focus on the intraclass correlation (ICC) statistic as the most useful for rating scale data, discussing its many forms and how to correctly choose among them. In particular, we will consider the distinction between aiming to demonstrate consistency or agreement in choosing an ICC. We will also discuss key design considerations that can seriously impact ICCs and undermine the meaningfulness of the validation, for example sample size and how flexible to be around departures from the intended test-retest interval. Also included will be a discussion of framing or identifying ICC standards or criteria for ClinRO validation. Throughout, we will share noteworthy insights from our experience with actual assessments, illustrating how key elements of this whole discussion may be realized in actual ClinRO validation work in the FDA context.

PRM194

THE GET-REAL NAVIGATOR: SUPPORTING HTA AND PAYER EVALUATION OF NEW MEDICINES

Stegenga H[1], Chambers M[2], Jonsson P[3], Thwaites R[4], Garner S[1]
[1]National Institute for Health and Care Excellence, London, UK, [2]MCHCE, London, UK, [3]National Institute for Health and Care Excellence (NICE), Manchester, UK, [4]Takeda, London, UK

Objectives: Payers and health technology assessment (HTA) agencies are tasked with assessing the effectiveness of new medicines relative to usual practice. There is a role for real-world evidence (RWE) to support traditional trial data in this respect but stakeholders have different views of the acceptability of using RWE. The European IMI GetReal project (www.imi-getreal.eu) was tasked with seeking clarity on the topic and communicating this to stakeholders. **Results:** We describe a web-based tool, the "RWE Navigator" (rwe-navigator.eu). The tool is an educational resource, a source of guidance, and a directory of resources related to RWE in medicines development. The tool includes a two-step process to explore potential effectiveness issues and potential options using RWE to address these issues. Other components include overviews of authoritative links to data sources, and on the governance, synthesis, quality assessment, and bias adjustment such data. The RWE navigator also contains summaries of case studies examined in GetReal and overviews of current policies and perspectives, and related initiatives. **Conclusions:**The RWE Navigator is a valuable shared platform for stakeholders to address the inclusion of alternative study designs and analyses in medicines development using RWE but further work is needed. This work has supported engagement and dialogue between industry and decision-makers, and has driven forward the scientific and policy agenda.

PRM195

ECONOMIC EVALUATIONS OF MEDICAL DEVICES - ISSUES AND CHALLENGES

Thokala P
ScHARR, University of Sheffield, Sheffield, UK

Introduction Economic evaluation of medical devices faces a number of challenges due to the issues involved in estimating the effectiveness and cost parameters. **Estimation of effectiveness** There are a number of challenges in estimating the effectiveness parameters. Randomized controlled trials are relatively rare in devices and data from observational studies may need to be used. Also, given short time cycle of medical devices, there may be multiple versions of the same device. Finally, effectiveness of a device is completely dependent on how it is used within the setting/pathway. **Estimation of costs** Costs of medical devices are dependent on organisational setting as the staff and other resource costs make up a significant proportion of the total costs. Furthermore, the costs also depend on diffusion of technology, lifetime of the medical device, redeployment and usage on multiple indications. Unit costs are also dependent on size of the patient population as the overall costs need to be divided by the number of patients. **Economic evaluation** Given the uncertainty in effectiveness estimates, modelling can help with the estimation of the cost-effectiveness of the medical devices. Modelling is useful in synthesising data from different sources which is useful as there may variations in the parameters between different settings. It is also useful to perform sensitivity and scenario analyses to identify which parameters are the key drivers of the cost-effectiveness. Value of information techniques can also be used to estimate the benefit of performing additional studies (e.g. randomised controlled trials) to reduce the uncertainty of the key parameters. **Choosing the evaluation approaach** There is no clear consensus on the methods to evaluate medical devices which may result in different devices being cost effective in different jurisdictions. For example, UK's NICE Medical Technologies Evaluation Programme uses cost-minimization analysis to evaluate medical devices while CVZ in the Netherlands uses an MCDA approach.

CROSS-SECTIONAL ANALYSIS OF CYSTIC FIBROSIS RELATED DIABETES INPATIENT ADMISSIONS IN THE UNITED STATES

Ruban C[1], Saunders W[2], Marino J[1]
[1]University of North Carolina Charlotte, Charlotte, NC, USA, [2]UNC Charlotte College of Health and Human Services – Health Informatics, Charlotte, NC, USA

OBJECTIVES: Cystic fibrosis-related diabetes (CFRD) is a distinct form of diabetes mellitus that is an important complication of cystic fibrosis (CF). The principal cause is a relative insulin deficiency related to destruction of pancreatic islets. Insulin resistance also may play a role, especially in association with acute exacerbations or chronic progression of pulmonary disease. Our objective is to characterize CFRD patients, their healthcare utilization, as well as associated hospitalization costs. **METHODS:** We conducted a cross-sectional study of CFRD patients (ICD-9 277.09) from the 2012 Nationwide Inpatient Sample (NIS). A prevalence estimate for CFRD was established using the discharge weight that was included in the NIS for each observation; however all other analysis did not include the discharge weight. We compared patients with CF (ICD-9 277.00, 277.01, 277.02, 277.03) to those with CFRD on length of stay (LOS) and total cost using chi-square test of association. **RESULTS:** We estimated US prevalence of inpatients with a diagnosis of CFRD at 4,060 cases. CFRD patients were similar in age, with an average age of 23.26 versus 23.08 years ($p<0.0231$) in their non-diabetic CF peers. Hospitalizations associated with CFRD patients had significantly greater LOS, 10.59 days compared to non-diabetic patients 8.86 ($p<0.001$) and number of comorbidities 5.21 versus 4.29 ($p<0.001$). As well, CFRD patients had greater mean cost of hospitalizations, $99,772.82 versus $76,607.43 ($p=0.4719$). **CONCLUSIONS:** CFRD patients have increased medical cost, increased length of stay, and increased disease severity compared to those without diabetes.

PHS2

AN EXPLORATION OF DIABETES-RELATED HOSPITALIZATION DISCHARGE STATUS AND ITS ASSOCIATION WITH PERIPHERAL LOWER-EXTREMITY DISEASES

Zhao R[1], Carlson AM[2]
[1]University of Minnesota, Minneapolis, MN, USA, [2]Data Intelligence Consultants, LLC, Eden Prairie, MN, USA

OBJECTIVES: Peripheral lower-extremity (PLE) diseases (peripheral arterial diseases and neuropathy) are severe complications of diabetes that can impact the length and cost of a diabetes-related hospitalization. Few studies have explored diabetes-related hospitalization discharge status and its association with PLE. This study examines the association between PLE and diabetes-related hospitalization from a national database. **METHODS:** A retrospective analysis of the 2010 – 2012 National Inpatient Sample (NIS). Diabetes-related hospitalization was defined by discharge records with principal or secondary diagnosis of Diabetes (250.XX). Hospitalization discharge status was dichotomized as routine discharge and non-routine discharge in consistency with previous studies. PLE was identified using diagnosis codes and was classified ("severe" v.s. "less severe") by combination of established severity algorithm, procedure codes and DRG. Descriptive analysis and Chi-square test were used to examine the unadjusted association between PLE and diabetes-related hospitalization discharge status. Multivariate logistic regression was employed to examine the adjusted association between PLE and diabetes-related hospitalization controlling other covariates. **RESULTS:** 804,192 diabetes-related hospitalization records were identified. Chi-square test showed that 47.7% of the hospitalized diabetes patients with severe PLE had non-routine discharges; while 28.5% of the hospitalized diabetes patients without PLE had non-routine discharges ($p<0.0001$). Controlling for age, sex, race, household income, primary payer, and comorbidities, diabetes patients with severe PLE had a 49.4% increase in the odds of having a non-routine discharge compared to those without PLE (OR=1.494, 95% CI: 1.465 – 1.522). The odds ratio was 1.221 for diabetes patients with less severe PLE to have non-routine discharge compared to those without PLE (95% CI: 1.204 – 1.239). **CONCLUSIONS:** Severe PLE was associated with increased likelihood of having non-routine discharges for diabetes-related hospitalization, indicating elevated subsequent health care utilization after discharge. Optimal diabetes disease management programs should be designed and implemented to reduce the incidence and prevalence of diabetes complications including PLE.

PHS3

REAL-WORLD RATE OF DIAGNOSTIC REVISION AMONG PERIPHERAL T-CELL LYMPHOMA (PTCL) CASES

Jiao X[1], Feliciano J[2], Manley T[2], Richhariya A[2]
[1]University of Southern California, Los Angeles, WA, USA, [2]Seattle Genetics, Bothell, WA, USA

OBJECTIVES: An accurate diagnosis is critical for determining prognosis and treatment options for patients with PTCL. However, the accurate diagnosis of PTCL remains challenging. Previous analyses have reported variable revision rates as high as 24%. However, the rate of revision among PTCL cases has not been characterized utilizing a large US claims database. **METHODS:** A retrospective analysis identifying newly diagnosed PTCL cases via ICD-9 and ICD-10 codes between 01/01/2010 - 12/31/2015 was conducted using the Truven MarketScan databases. Two PTCL claims during the study period were used to identify cases. Cases were indexed by the Date of first PTCL claim. Cases were required to have 6 months of pre-index baseline continuous enrollment and at least 6 months of post-index continuous enrollment. Cases with at least one prior claim for Hodgkin Lymphoma, DLBCL, EMZL or unspecified, uncertain and benign neoplasms at any time in the pre-index period were considered a case with diagnostic revision. The number of claims to confirm PTCL was changed from 2 to 1 to test the impact on the observed revision rate. **RESULTS:** A total of 289 cases with PTCL diagnosis were identified of whom 166 cases were without a diagnostic revision. There were 123 cases that had a diagnostic revision resulting in a diagnostic revision rate of 42.56%. The sensitivity analysis with a single PTCL claim required for inclusion resulted in a reduction of the revision rate to 33.56%. The median time to PTCL diagnosis in the commercial and Medicare populations was 154 and 219 days from misdiagnosis claim, respectively. **CONCLUSIONS:** This study found that diagnostic revision rates of PTCL ranges from 34% to 43%, highlighting the need for more accurate diagnostic testing to reduce unnecessary clinical burden associated with PTCL. Additional clinical data are required to understand how diagnostic revision impacts PTCL patient outcomes.

PHS4

PATIENT CHARACTERISTICS AND HEALTH OUTCOMES IN CHILDREN DIAGNOSED WITH MARFAN SYNDROME IN THE UNITED STATES

Gordon BD[1], Noone JM[2], Zacherle E[2], Whitmire SM[3], Clark LA[1], Howden R[1], Blanchette CM[2]
[1]University of North Carolina at Charlotte, Charlotte, NC, USA, [2]Precision Health Economics, Davidson, NC, USA, [3]University of North Carolina; Precision Health Economics, Charlotte, NC, USA

OBJECTIVES: Marfan syndrome is a rare systemic connective tissue disorder caused by mutations in the gene encoding fibrillin-1, which can contribute to serious cardiovascular (CV) and pulmonary related complications. While signs and symptoms may not appear until adulthood, some patients experience disease complications much earlier in life. Therefore, the purpose of this study was to evaluate the burden of CV and pulmonary related manifestations in children diagnosed with Marfan syndrome. **METHODS:** We used data from the 2012 Kids National Inpatient Sample. Marfan syndrome patients >10 years were identified using ICD-9 code 759.82. Patients were stratified by primary diagnosis; CV (CCS: 096, 097, 100, 101, 103-113, 115-118 or DRG: 025-027, 031-033, 219-221, 229, 230, 307) or pulmonary-related (CCS: 128-131, 133, 134) conditions. The reference group for all analyses included hospital discharges without a primary CV or pulmonary-related diagnosis. Descriptive and inferential statistics were used to compare demographics, healthcare outcomes, and hospital charges. **RESULTS:** 565 Marfan syndrome patients were identified, of which 100 (17.6%) were CV, 87 (15.3%) pulmonary, and 378 (66.9%) for the reference group. Mean CCI scores and total charges among CV patients (0.54 ± 0.7; $120,105.89 ± $118,841.14) were significantly higher (p=0.0073; p<0.001) compared to the reference group (0.32 ± 0.74; $53,644.47 ± $80,509.52). Among pulmonary patients, mean length of stay was higher (5.98 ± 4.44 days) but total charges ($41,616.33 ± $3,9467.57) were lower compared to the reference group (4.72 ± 5.75 days; $53,644.47 ± $80,509.92; both p=0.03). **CONCLUSIONS:** Marfan syndrome patients with CV specific manifestations had a higher presence of comorbidities and greater hospital charges compared with patients with pulmonary specific or other manifestations. Children presenting with signs and symptoms early in life may represent a greater lifelong burden of illness. Early diagnosis and onset of treatment could help to reduce healthcare cost and utilization in this population.

PHS5

THE USE OF E-HEALTH TO IMPROVE MEDICATION ADHERENCE AMONG PATIENTS WITH ASTHMA: A SYSTEMATIC REVIEW AND META-ANALYSIS

Jeminiwa RN[1], Qian J[2], Hansen RA[1], Garza KB[2], Fox BI[1]
[1]Harrison School of Pharmacy, Department of Health Outcomes Research and Policy, Auburn University, Auburn, AL, USA, [2]Auburn University Harrison School of Pharmacy, Auburn, AL, USA

OBJECTIVES: To systematically review the effectiveness of e-health (use of information and communications technology for health) in improving adherence to inhaled corticosteroids (ICS) among patients with persistent asthma, as well as the satisfaction of patients undergoing e-health interventions. **METHODS:** Literature searches were conducted in PubMed, CINAHL, Academic Search Premier, PsycINFO, and the International Pharmaceutical Abstracts databases in October 2016. Additional articles were identified by hand-searching, and from clinicaltrials.gov. Included studies were randomized controlled trials comparing e-health interventions versus usual care in improving adherence among patients taking ICS for persistent asthma. Quantitative synthesis was performed using a random effects model. **RESULTS:** Eighty records were identified after duplicates were removed. Of these, 15 trials including 13,907 participants were eligible for qualitative synthesis. Subsets of e-health trials included - social media (1), electronic health record (1), telehealth (6), and mHealth (7). Only 6 out of 15 trials were eligible for quantitative synthesis, including 3 telehealth and 3 mHealth trials. Results show an insignificant overall effect of e-health interventions on the improvement of adherence to ICS. However, a significant improvement in adherence was observed for mHealth interventions compared to usual care in a pooled analysis of 3 trials (SMD 1.29; 95% CI 0.43 to 2.14). We considered the risk of bias in included studies to be low, however, there was considerable heterogeneity among studies (I2 = 89%). Patient satisfaction was evaluated in 6 trials comparing telehealth (2) and mHealth (4) with usual care. Moderate satisfaction was reported in 1 study and high satisfaction in 5 studies. **CONCLUSIONS:** Among e-health interventions, mHealth interventions were found to be effective and acceptable in improving adherence to ICS. However, there is a need for more studies to evaluate the effectiveness of more e-health interventions in increasing adherence to ICS. Future studies should examine patients' satisfaction with these interventions.

PHS6

ESTIMATING THE EFFECT SIZE FOR CHANGES IN DEPRESSION AMONG COMMERCIALLY-INSURED ADULTS USING THE MYSTRENGTH SELF-CARE PLATFORM

Schladweiler K, Rivera S, Hirsch A
myStrength, Inc, Denver, CO, USA

OBJECTIVES: To evaluate the effectiveness of managing depression on a population-level using myStrength, a digital self-care behavioral health and well-being platform. An effect size model was developed to compare the impact of myStrength on depression symptom burden reduction relative to the effectiveness of psychotherapy, the standard of care. **METHODS:** This study quantified the normalized effect size achieved for 1,143 commercially-insured adults using myStrength's self-help tools, who initially demonstrated some depression, the intervention group. The DASS-21 measured self-reported baseline symptom severity among the intervention group. Consumers with mild or greater symptom severity were included in the analysis and were prompted to complete assessments at 14, 60, 180 and 365 days post-baseline. The difference between baseline and YTD last assessment quantified the change in depression symptom severity score. The effect size was estimated as the mean change in depression score divided by the average difference in standard deviation from baseline to last assessment. The comparator group, psychotherapy, was assumed to have an effect size of between 0.5 - 0.8 based on the literature. **RESULTS:** Of the 1,143 myStrength consumers with some baseline level of depression, 78% were female and the mean age was 45.70 years. On average, myStrength consumers accessed the platform 4.75 times in their first 30 days. The mean depression score was 21.50 among myStrength consumers at baseline (median = 20; standard deviation = 9.41). At last assessment, the mean depression score decreased to 16.10, demonstrating symptom burden reduction among the intervention group (median = 14; standard deviation = 11.87). The myStrength estimated effect size was 0.49 [95% CI: 0.41, 0.57]. **CONCLUSIONS:** Among a commercially-insured, adult population with some degree of depression, myStrength was shown to be at least 61% as effective as traditional psychotherapy. Depression management may benefit from expanding behavioral healthcare offerings to include digital platforms.

PHS7

ACHIEVEMENT OF CLINICAL GOALS OF A CARDIOVASCULAR RISK MANAGEMENT PROGRAM FROM A COLOMBIAN POOR POPULATION. A CROSS-SECTIONAL STUDY

Paz Wilches J[1], Miranda Machado P[2], Salcedo Mejia F[2], De la Hoz Restrepo F[3], Alvis Guzman N[4]
[1]Mutual Ser EPS, cartagena, Colombia, [2]Alzak Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia, [3]Universidad Nacional de Colombia, Bogotá, Colombia, [4]ALZAK Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia

OBJECTIVES: "De Todo Corazón" (DTC) is a risk management program with the aim of reducing complications and improving the quality of life of patients with cardiovascular risks. The aim of this study was to compare to evaluate the clinical goals of blood pressure control, metabolic control, weight control and lipid control in patients under program care. **METHODS:** We started follow-up of a cohort of 64.668 patients with hypertension and/or diabetes mellitus between June 2014 and December 2015. Clinical goals of blood pressure control (<140/90 mmHg), metabolic (HBA1C <7.5%), weight control (BMI < 30 kg/mts2) and lipid (LDL <100 mg/dl) were established. **RESULTS:** The average age was 64.5 + 13.9 years and 66.5% female. In 18 months of follow-up and independent of the number of medical controls and activities of risk management program, between 73% and 80% of patients achieved good blood pressure control; Between 6.8% and 36.7% achieved good metabolic control; 54% had good weight control; and 68% achieved good lipid control. **CONCLUSIONS:** The results in the clinical goals suggest a positive impact on the cardiovascular risk of patients under program care. Less effective was shown for weight control and metabolic control suggesting that new approaches should be undertaken to improve the results of the program.

PHS8

EFFECTIVENESS AND CLINICAL INERTIA IN ANTIDIABETIC THERAPY IN COLOMBIAN PATIENTS

Machado-Alba J[1], Machado-Duque M[2], Ramirez-Riveros C[3]
[1]Universidad Tecnológica de Pereira-Audifarma S.A., Pereira, Colombia, [2]Universidad Tecnológica de Pereira, Pereira, Colombia, [3]Hospital de Caldas, Pereira, Colombia

OBJECTIVES: To establish the effectiveness of antidiabetic therapy and the frequency of clinical inertia in the management of type-2 diabetes mellitus in Colombia - 2015. **METHODS:** A cross-sectional retrospective study with follow-up was conducted in 23 cities in diabetic patients who had been treated for at least one year and were receiving medical consultation for antidiabetic treatment. Effectiveness was established when haemoglobin A1c levels were <7% in general population and <8% in special situations. When clinical inertia was reached, which was defined as no therapeutic modifications despite not achieving management controls. Sociodemographic, clinical, and pharmacological variables were evaluated, and multivariate analyses were performed. The study received bioethical approval. **RESULTS:** In total, 363 patients with type-2 diabetes mellitus were evaluated, with a mean age of 62.0±12.2 years. A total of 1,016 consultations were evaluated, and the therapy was effective at the end of the follow-up in 57.9% of cases. Clinical inertia was found in 56.8% of patients who did not have metabolic control. The most frequently prescribed medications were metformin (84.0%), glibenclamide (23.4%), and insulin glargine (20.7%). Moreover, 57.6% of the patients were treated with two or more antidiabetic medications. In the logistic regression analysis having metabolic control in the first consult of the follow-up was a protective factor against clinical inertia in the subsequent consultations (OR:0.09; 95%CI:0.04–0.17; p<0.001). **CONCLUSIONS:** The effectiveness of treatment for patients with type-2 diabetes mellitus has increased in Colombia, and for the first time, clinical inertia was identifiable and quantifiable and found in similar proportions to other countries with previous reports. Clinical inertia is a relevant condition given that it interferes with the possibility of controlling this pathology.

PHS9

RISK OF THE FIRST MYOCARDIAL INFARCTION EVENT IN A CARDIOVASCULAR HEALTH PROMOTION PROGRAM OF A DEVELOPING COUNTRY "DE TODO CORAZON". A COHORT STUDY

Miranda Machado P[1], Salcedo Mejia F[1], Paz Wilches J[2], De la Hoz Restrepo F[3], Alvis Guzman N[4]
[1]Alzak Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia, [2]Mutual Ser EPS, cartagena, Colombia, [3]Universidad Nacional de Colombia, Bogotá, D.C., Colombia, [4]ALZAK Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia

OBJECTIVES: "De Todo Corazón" (DTC) is a risk management program with the aim of reducing complications and improving the quality of life of patients with cardiovascular risks. The aim of this study was to compare the risk of first myocardial infarction event in patients under program care. **METHODS:** We started follow-up of a cohort of 12.045 patients with hypertension and/or diabetes mellitus without previous

history of confirmed cardiovascular events between June 2014 and December 2015. First event were considered to be first admissions due to myocardial infarction. Incidence is reported by 100 person years follow-up. Kaplan-Meier curves were used to evaluate time a first myocardial infarction events. Differences between survival curves were compared using Long-Rank test. Multivariate Cox proportional-hazards models were used to evaluate the risk for first myocardial infarction event, on the basis of any potentially significant predictor. **RESULTS:** The average age was 62.7 + 12.6 years and 70.1% female. Mean follow-up time was 11.6 + 6.1 months. The proportion of hypertension, diabetes mellitus and hyperlipidemia was 92.7%, 100% and 89.7%, respectively. The prevalence of blood pressure control (<140/90 mmHg), metabolic (HBA1C <7%) and lipid (LDL <100 mg/dl) was 91.7%, 27.5% and 38.7%, respectively. Incidence of first myocardial infarction event was 0.12 events per 100 person-years. Age (HR 1.02; 95% IC 1.01-1.03), male (HR 2,0; 95% IC 1,5-2,6), metabolic non-control(HR 1,44; 95% IC 1,02-2,02) , blood pressure non-control > 140/90 mmHg (HR 1,48; 95% IC 1,02-2,02) and dyslipidemia (HR 4,7 95% IC 1,7-12,8) were significantly associated with the incidence of first myocardial infarction event. **CONCLUSIONS:** The incidence of the first myocardial infarction event was significantly higher in patients with blood pressure non-control and metabolic non-control.

RISK OF THE FIRST STROKE EVENT IN A CARDIOVASCULAR HEALTH PROMOTION PROGRAM OF A DEVELOPING COUNTRY "DE TODO CORAZON". A COHORT STUDY

Alvis Guzman N[1], Miranda Machado P[1], Salcedo Mejia F[1], Paz Wilches J[2], De la Hoz Restrepo F[3]

[1]*ALZAK Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia,* [2]*Mutual Ser EPS, cartagena, Colombia,* [3]*Universidad Nacional de Colombia, Bogotá, Colombia*

OBJECTIVES: "De Todo Corazón" (DTC) is a risk management program with the aim of reducing complications and improving the quality of life of patients with cardiovascular risks. The aim of this study was to compare the risk of first stroke event in patients under program care. **METHODS:** We started follow-up of a cohort of 47.877 patients with hypertension and/or diabetes mellitus without previous history of confirmed cardiovascular events between June 2014 and December 2015. First event were considered to be first admissions due to stroke. Incidence is reported by 100 person years follow-up. Kaplan-Meier curves were used to evaluate time a first stroke events. Differences between survival curves were compared using Long-Rank test. Multivariate Cox proportional-hazards models were used to evaluate the risk for first stroke event, on the basis of any potentially significant predictor. **RESULTS:** The average age was 62.8 + 12.2 years and 67.6% female. Mean follow-up time was 1.1 + 0.4 years. The proportion of hypertension, diabetes mellitus and hyperlipidemia was 97.1%, 41.3% and 89.1%, respectively. Incidence of first stroke event was 1.35 events per 100 person-years. At 18 months follow-up, the incidence of first stroke event was higher in women patients compared with male patients (301 vs. 250 events; p <0.001; Long-Rank test). Age (HR 1.04; 95% IC 1.03-1.05), male (HR 1.6; 95% IC 1.3-1.9), blood pressure non-control >140/90 mmHg (HR 1.5; 95% IC 1.2-1.9), dyslipidemia (HR 1.90 95% IC 1.2-2.8) and high cardiovascular risk >20% 20% Coronary heart disease (CHD) risk at 10 years (HR 1.3, 95% IC 1.1-1.5) were significantly associated with the incidence of first stroke event. **CONCLUSIONS:** The incidence of the first stroke event was significantly higher in patients with blood pressure control >140/90 mmHg under program care.

TRANSITION PROBABILITIES OF CHRONIC KIDNEY DISEASE IN A CARDIOVASCULAR RISK MANAGEMENT PROGRAM

Alvis Guzman N[1], Miranda Machado P[1], Salcedo Mejia F[1], Paz Wilches J[2], De la Hoz Restrepo F[3]

[1]*ALZAK Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia,* [2]*Mutual Ser EPS, Cartagena, Colombia,* [3]*Universidad Nacional de Colombia, Bogotá, Colombia*

OBJECTIVES: "De Todo Corazón" (DTC) is a cardiovascular risk management program. The aim of this study was to estimate the transition probabilities of Chronic Kidney Disease (CKD) in patients under program care. **METHODS:** We followed up a cohort of 55,915 patients with hypertension and / or diabetes mellitus between June 2014 and December 2015. The glomerular filtration rate (GFR) was calculated using the Cockcroft Gault formula. A diagnosis of CKD in GFR <60 ml/ min/ 1.73m2 at the end of follow-up was considered. To estimate the progression of CKD, the percentages of patients at each stage of kidney disease were estimated according to the Kidney Disease Improving Global Outcomes Guidelines (KDIGO), at the beginning and at the end of follow-up. To establish association between arterial hypertension and diabetes mellitus with progression of CKD, the Odds Ratio (OR) was estimated. **RESULTS:** 50.1% of the patients were> 65 years and 66.5% were female. The prevalence of hypertension and diabetes mellitus was 96.5% and 36.1%, respectively. At 18 months follow-up, 3.0% of patients with hypertension without diabetes mellitus progressed to CKD (Stage 3B, 4 and 5). 3.8% of patients with hypertension and diabetes mellitus progressed to CKD. The risk of progression of CKD was significantly higher in patients with hypertension with diabetes mellitus (OR: 1.30 CI 95% 1.17-1.45). **CONCLUSIONS:** The presence of hypertension with diabetes mellitus was significantly associated with progression to CKD over a period of 18 months, independent of baseline GFR.

PHS14

INCREMENTAL HEALTHCARE EXPENDITURE OF ANXIETY DISORDERS AMONG US ADULTS WITH ARTHRITIS

Zhao X, Rai P, Ilobuchi C, Zhang Y, Tan X

West Virginia University, School of Pharmacy, Morgantown, WV, USA

OBJECTIVES: To estimate the incremental total healthcare expenditures associated with anxiety disorders (AD) and examine the risk factors that contribute to excessive healthcare expenditures among a national representative sample of adults with arthritis in the United States. **METHODS:** A retrospective cross-sectional study was conducted using the 2014 Medical Expenditure Panel Survey data. Adults with self-reported arthritis who were alive and had positive healthcare expenditures were included in the study (n=7549). Total expenditures for all healthcare utilization were estimated in adults with arthritis by the presence/absence of AD. Multivariate ordinary least square (OLS) regression on log-transformed expenditures was used to evaluate the magnitude of the association between AD and healthcare expenditures. The contribution of each construct of the Andersen's Health Behavioral Model of Health Services Use to the difference in expenditures among adults with and without AD was evaluated using post-regression linear decomposition. **RESULTS:** About 19.6 % of the US adults with arthritis also reported AD. Patients with both arthritis and AD were significantly more likely to visit the emergency department (AOR=1.30, 95% CI:1.07-1.58) compared to those without AD. The mean total expenditure was $8,516for adults with arthritis and $12,293 (SD: for those with arthritis and AD. Multivariable OLS regression analysis indicated that adults with AD had 35% (β=0.302, p<0.001) higher healthcare expenditures compared to those without AD.

Post-linear decomposition analyses revealed that 41.7% to 65.5% of the differences in expenditures can be explained by the differences in the need factors of the two groups, including comorbid depression, poor health status, pain, and other chronic conditions. **CONCLUSIONS:** Among adults with arthritis, the excess healthcare expenditures associated with coexisting AD were mainly contributed by the needs factors. A collaborative care model which provides timely interventions for both physical and mental conditions may potentially reduce the excessive expenditures.

PHS15

EPIDEMIOLOGY OF POSTPARTUM DEPRESSION IN A MEDICAID POPULATION– A RETROSPECTIVE STUDY

Bonthapally V[1], Broder MS[2], Tieu RS[2], Gannu L[3], Meltzer-Brody S[4], Chang E[2]
[1]Sage Therapeutics, Inc., Cambridge, MA, USA, [2]Partnership for Health Analytic Research, LLC, Beverly Hills, CA, USA, [3]Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA, [4]University of North Carolina, Chapel HIll, Chapel Hill, NC, USA

OBJECTIVES: Postpartum depression (PPD) risk has been reported to be correlated with socioeconomic factors. More than 50% of US deliveries are covered by Medicaid, for which all pregnant women with an income <133% of the federal poverty line are eligible. Although Medicaid covers a large portion of deliveries, few estimates of PPD prevalence have examined this population. The objective of this study was to estimate PPD prevalence in the Medicaid population using a large population database. **METHODS:** This retrospective analysis used the Truven Medicaid database (>30 million patients; 11 states) to identify claims for women who were 15-50 years old at the time of delivery from 2012-2014 based on ICD-9 coding. PPD cases were identified based on a combination of inpatient and outpatient claims for PPD or major depression (MDD), adjustment disorder or depression not otherwise specified, or claims for treatment. Women with continuing MDD were excluded. Prevalence and disease severity were estimated. **RESULTS:** In this Medicaid database population, the algorithm determined a PPD prevalence of 1.7%, 1.9%, and 2.1%, for the years 2012-2014, respectively. In 2014, no difference was observed in PPD prevalence in women ≤17 years old (2.2%) and in either women 18-34 or 35 or older (both 2.1%). Prevalence was also estimated by race/ethnicity, with rates of 2.8% among Whites, 1.2% among Blacks, 1.3% among Hispanics, and 1.9% among others. Overall, mild cases accounted for 6.7% of the population, moderate 88.5%, and severe 4.8%. **CONCLUSIONS:** PPD prevalence estimates were determined by the algorithm in a low-income population insured by Medicaid. Previous literature indicated that lower income and socioeconomic status may increase risk for PPD. However, our findings reveal a lower prevalence within this large US Medicaid population database than cited in the literature, which suggests an estimated prevalence of 10-20%, suggesting that PPD may be markedly underdiagnosed.

PHS16

IMPACT OF TIME OF DIAGNOSIS ON PREVALENCE OF POSTPARTUM DEPRESSION IN WOMEN WITH COMMERCIAL AND MEDICAID HEALTH INSURANCE – A RETROSPECTIVE STUDY

Bonthapally V[1], Broder MS[2], Tieu RS[2], Gannu L[3], Meltzer-Brody S[4], Chang E[2]
[1]Sage Therapeutics, Inc., Cambridge, MA, USA, [2]Partnership for Health Analytic Research, LLC, Beverly Hills, CA, USA, [3]Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA, [4]University of North Carolina, Chapel HIll, Chapel Hill, NC, USA

OBJECTIVES: Postpartum depression (PPD) has multiple definitions. The Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition defines PPD as a subtype of major depressive disorder with onset during pregnancy and up to 4 weeks postpartum—i.e. “peripartum onset.” Due to differing time-based definitions of PPD, we sought to determine the impact of time of PPD onset on prevalence estimates of PPD. **METHODS:** We used the Truven Commercial Claims database (>70 million patients), the Medicaid Multi-State database, (>30 million patients; 11 states), and ICD-9 coding to retrospectively study women between the ages of 15 and 50 years at childbirth from 2011-2014. For the commercial database, women had to be continuously enrolled in health insurance for one year before and after delivery. Since Medicaid has limited coverage, continuous enrollment for 6 months before and 60 days after delivery was required. PPD was defined based on inpatient and outpatient claims for PPD, MDD, adjustment disorder, or depression not otherwise specified, or claims for treatment. Subjects with MDD prior to the last trimester of pregnancy were excluded. **RESULTS:** There were 230,927 deliveries in the commercial database and 351,533 deliveries in the Medicaid database. In months 0-2 postpartum, the prevalence estimates for PPD were 1.7% in the commercial database and 1.9% in Medicaid. The prevalence in the commercial database was 2.7% for 0-4 months postpartum. (Medicaid prevalence could not be determined due to enrollment restrictions.) The prevalence estimates for PPD at 8, 10, and 12 months were 3.4%, 4.0%, and 4.9%, respectively. **CONCLUSIONS:** Of the total PPD cases identified by the algorithm over 12 months postpartum, only one third were identified in only the first two months postpartum, suggesting that restrictive, time-based PPD definitions and the limited duration of postpartum screening may contribute to underestimates of PPD prevalence.

PHS17

PREVALENCE AND HEALTHCARE UTILIZATION BURDEN ASSOCIATED WITH RHINOSINUSITIS IN A UNITED STATES COMMERCIALLY INSURED POPULATION

Khanna R[1], Holy CE[1], Romano A[2]
[1]Johnson & Johnson, New Brunswick, NJ, USA, [2]Johnson & Johnson, Irvine, CA, USA

OBJECTIVES: This study aimed to determine the prevalence and healthcare utilization burden associated with acute rhinosinusitis (ARS), chronic rhinosinusitis (CRS), and recurrent acute rhinosinusitis (RARS). **METHODS:** The study involved a cross-sectional, retrospective analysis of the 2014 Truven MarketScan database. Prevalence (projected national estimates) of ARS, CRS, and RARS, and associated healthcare utilization were determined. Patients with ARS were identified using ICD-9-CM 461.x. CRS was identified where 1 medical visit had ICD-9-CM 461.x or 473.x and a second medical visit had a ICD-9-CM of 473.x, with the two visits separated by at least 12 weeks or more. RARS was classified when a medical visit had an ICD-9-CM 461.x followed by subsequent sinusitis diagnoses with ≥4 visits during the year and ≥6-weeks between visits. **RESULTS:** In 2014, more than 22 million individuals had ARS, 1.1 million had CRS, and 100,000 had RARS in the US. More than 60% of all ARS, CRS, and RARS patients were females, and close to half resided in the South. The average number of office visits were 1.18, 1.55, and 3.03, while the average number of prescription claims were 3.02, 4.03, and 5.61 among patients with ARS, CRS, and RARS, respectively. The average cost per office visit varied from $138 among patients with ARS to $412 among patients with RARS. The average cost per hospital outpatient visit varied from $289 among patients with ARS to $1,148 among RARS patients. The average annual total costs (medical visits and prescription drugs) were $285, $553, and $885 among patients with ARS, CRS, and RARS, respectively. **CONCLUSIONS:** Most of the patients with rhinosinusitis were female. Though ARS is the most common form of rhinosinusitis followed by CRS and RARS, the healthcare burden in terms of medical care utilization, particularly office visits and prescription drug utilization, was observed to be higher among patients with RARS.

PHS18

A REVIEW OF THE BURDEN OF HEPATITIS C VIRUS INFECTION IN KAZAKHSTAN

Almadiyeva A, Ibrayev S, Turgambayeva A
Astana Medical University, Astana, Kazakhstan

OBJECTIVES: Hepatitis C virus (HCV) infection is associated with substantial clinical and economic burden and is an important public health issue in Central Asia. The objective of this review was to characterize HCV epidemiology and related complications in Kazakhstan. With more efficacious therapies becoming available, decision-makers require accurate estimatesof disease prevalence to assess the cost-benefit ratio of new treatments for HCV infection. The objective of the study was to synthesize estimates of the epidemiologic burden of HCV from Kazakhstan. **METHODS:** A review was conducted in electronic databases and conference abstracts, by two reviewers to identify populationbased estimates of HCV prevalence and incidence. Additionally, patients diagnosed with HCV (ICD-10 codes 070.41, 070.44, 070.51, 070.54, 070.70, 070.71, V02.61) between 2011 and 2015 were identified in National HCV registry. **RESULTS:** A search of electronic databases and conference abstracts identified 43 potentially relevant articles. Of those, 32 were included in the epidemiology review and 6 in the review of HCV-related complications. HCV prevalence in the general population was 0.6-0.7%. Prevalence was higher for injecting drug users (56-90%) and those with human immunodeficiency virus coinfection (12-20%) and was lower for blood donors (1-2%). Annual incidence of HCV in Kazakhstan was 5.43 per 100,000. HCV genotype 1b was associated with the highest incidence of hepatocellular carcinoma (HCC). Five-year survival for patients with liver cirrhosis was 75.1%, decreasing to 36.9% following liver transplantation; the majority of deaths were attributable to HCC. Limitations were that the majority of studies included in the epidemiology review were small, regional studies conducted in specific populations, and there was an absence of large population-based studies. **CONCLUSIONS:** These population-based prevalence estimates, and the prevalence estimates from blood donors, may be useful for inclusion in disease models. Discrepancies between estimates from the different sources underscore the need for methodologically-rigorous epidemiologic studies to maximally inform decision-makers in Kazakhstan.

PHS19

BURDEN ATTRIBUTABLE TO CARDIOVASCULAR DISEASE AND CHRONIC KIDNEY DISEASE IN A COLOMBIAN POOR POPULATION

Miranda Machado P[1], Salcedo Mejia F[1], Paz Wilches J[2], De la Hoz Restrepo F[3], Alvis Guzman N[1]
[1]ALZAK Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia, [2]Mutual Ser EPS, Cartagena, Colombia, [3]Universidad Nacional de Colombia, Bogotá, Colombia

OBJECTIVES: "De Todo Corazón" (DTC) is a risk management program with the aim of reducing complications and improving the quality of life of patients with cardiovascular risks. The aim of this study was to estimate the disease burden of cardiovascular disease and chronic kidney disease and describe its impact on the health of the population under program care. **METHODS:** Disability adjusted life years (DALYs) for cardiovascular disease and chronic kidney disease, resulting from the sum of loss of health due to premature death and disability was calculated. For the calculation of life years lost the death registration on the Program DTC for the period between January and December 2015, as well as the abridged life tables for the years lived with disability, the individual records of outpatient and inpatient service June 2014 and December 2015, bibliography and a map of weighted disability in the global study of the burden of disease were consulted. For data processing a template developed in Microsoft Excel 2007 was used, based on the methodology described by the World Health Organization. **RESULTS:** In 2015, DALYs lost due to stroke, myocardial infarction, acute heart failure and chronic kidney disease were estimated at 1111, 869, 1220 and 296, respectively. The major relative weight of the lost years was given by the premature death component (96%, 85%, 82% and 93%, respectively); females contributed on average to 51.4% and 50.7% of the DALYs lost due to stroke and myocardial infarction; males contributed on average to 52.8% and 52.7% of the DALYs lost due to acute heart failure and chronic kidney disease and the most affected age was over 60 years. **CONCLUSIONS:** The major relative weight of the

DALYs lost due to stroke, myocardial infarction, acute heart failure and chronic kidney disease of the population under program care was given by the premature death component

PHS20

ESTIMATES OF POSTPARTUM DEPRESSION PREVALENCE IN A COMMERCIALLY INSURED POPULATION – A RETROSPECTIVE ANALYSIS

Bonthapally V[1], Broder MS[2], Tieu RS[2], Gannu L[3], Meltzer-Brody S[4], Chang E[2]
[1]Sage Therapeutics, Inc., Cambridge, MA, USA, [2]Partnership for Health Analytic Research, LLC, Beverly Hills, CA, USA, [3]Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA, [4]University of North Carolina, Chapel Hill, Chapel Hill, NC, USA

OBJECTIVES: Postpartum Depression (PPD) is a common complication of childbirth and is associated with impaired maternal function and poor mother-infant interactions. Prevalence estimates vary depending on setting, evaluation method, and observation period. The objective of this study was to estimate PPD prevalence in a large, nationally-representative commercial insurance claims database. **METHODS:** This retrospective study used the Truven MarketScan Commercial Claims database. to identify women who gave birth between 2011-2014, were 15-50 years old, and were continuously enrolled in insurance one year before and one year after delivery. The main analysis used a 6-month postpartum observation period to identify PPD cases based on ICD-9 coding for diagnoses and treatment claims. Women with major depressive disorder prior to the third trimester were excluded. Restrictions were removed for sensitivity analyses (SA). **RESULTS:** During the 6-month postpartum observation period, algorithm-based PPD prevalence estimates were 2.6%, 3.2%, and 3.7% for 2012, 2013, and 2014, respectively. Stratified by severity, most cases were moderate (95.4%). In SA1 (allowing pre-existing MDD), the prevalence was 4.5%, 5.4%, and 5.8%, respectively, in the 3 years studied. In SA 2 (extending to 12 months postpartum) it was 4.3%, 4.9%, and 5.5%, respectively. Combining both SAs yielded prevalence estimates of 7.3%, 8.1%, and 8.4%, respectively. **CONCLUSIONS:** Based on the algorithm, PPD prevalence in this commercially insured population increased from 26 per 1000 persons to 37 per 1000 persons from 2012-2014. In 2014, prevalence estimates ranged between 3.7% and 8.4%. These prevalence estimates are lower than in other studies in which all postpartum women in the studied population were screened for PPD at routine postpartum obstetrical visits, suggesting that PPD maybe be underdiagnosed.

PHS21

INCIDENCE OF CARDIOVASCULAR EVENTS IN A CARDIOVASCULAR HEALTH PROMOTION PROGRAM OF A DEVELOPING COUNTRY "DE TODO CORAZON". A COHORT STUDY

Alvis Guzman N[1], Miranda Machado P[1], Salcedo Mejia F[1], Paz Wilches J[2], De la Hoz Restrepo F[3]
[1]ALZAK Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia, [2]Mutual Ser EPS, Cartagena, Colombia, [3]Universidad Nacional de Colombia, Bogotá, Colombia

OBJECTIVES: "De Todo Corazón" (DTC) is a risk management program with the aim of reducing complications and improving the quality of life of patients with cardiovascular risks. The aim of this study was to describe the evolution of incidence of cardiovascular events in patients under program care. **METHODS:** We started follow-up of a cohort of 64.668 patients with hypertension and/or diabetes mellitus between June 2014 and December 2015. The cumulative incidence of cardiovascular events was considered to be admissions due to myocardial infarction, acute cardiac insufficiency or stroke per semester. The hospital readmission for cardiovascular events was considered to be first readmissions due to myocardial infarction, acute cardiac insufficiency or stroke after 30 days of the first admission for same event. The cumulative incidence and hospital readmission for cardiovascular events were reported in percentages and incidence density was reported by 100 person years follow-up. **RESULTS:** Between the second half of 2014, the first semester and the second half of 2015, the cumulative incidence for stroke was 8.0%, 6.7% and 5.1%, respectively. The cumulative incidence for myocardial infarction was 7.3%, 7.2% and 6.1%, respectively; and for acute heart failure was 5.3%, 5.2% and 3.7%, respectively. The risk of hospital readmission for stroke was 77.4%, 69.8% and 59.6%, respectively. The risk of hospital readmission for myocardial infarction was 85.3%, 80.3% and 79.2%, respectively; and for acute heart failure was 88.6%, 80.8% and 74.2%, respectively. The incidence density (events 100 person years for stroke was 15.9, 13.4 and 10.3 events per 100 person years, respectively. The incidence density for myocardial infarction was 14.5, 14.3 and 12.1 events per 100 person years, respectively. **CONCLUSIONS:** The incidence and hospitalization for cardiovascular events in patients under program care showed a downward trend between June 2014 and December 2015. The hospital readmission for cardiovascular events is high.

PHS22

ESTIMATED PREVALENCE OF POSTPARTUM DEPRESSION AMONG DELIVERIES BY WOMEN COVERED BY U.S. PRIVATE PAYERS

Carls GS[1], Chawla A[1], Epperson CN[2], Chace M[1], Bonthapally V[3]
[1]Analysis Group, Menlo Park, CA, USA, [2]University of Pennsylvania, Philadelphia, PA, USA, [3]Sage Therapeutics, Inc., Cambridge, MA, USA

OBJECTIVES: Postpartum depression (PPD) occurs in an estimated 10-20% of postpartum women and is one of the most common complications of childbirth. The research objective was to estimate the prevalence of PPD among deliveries by women covered by U.S. private payers, and to estimate severity based on resource utilization. **METHODS:** The OptumHealth Care Solutions, Inc. claims database (January 2010-September 2015) was used to identify PPD cases using both a broad (12 months postpartum) and a more narrow (third trimester through 6 months postpartum) definition requiring diagnoses of PPD/depression for at least one inpatient (IP) or emergency department (ED) visit, or two outpatient (OP) visits, or one OP visit and an antidepressant or antianxiety prescription drug fill. The narrower definition excluded preexisting bipolar, schizophrenia, or other psychosis. Severity classification was based on medical resource utilization and pharmacotherapy within 6 months postpartum. Patients were characterized as severe (IP or ED visit for PPD/depression, suicidal ideation or attempt, electroconvulsive therapy, IP psychotherapy, transcranial magnetic stimulation, or partial hospital program treatment); moderate ($\geq$12 psychotherapy visits or $\geq$ 3 drug fills); mild-moderate (3-11 psychotherapy visits or 1-2 drug fills); mild (1-2 psychotherapy visits and no drug fills); or not classified. **RESULTS:** Using broad and narrower definitions, 7.0% (N=11,514) and 3.9% (N=4,756) of 163,565 and 120,865 deliveries, respectively, met claims-based criteria for PPD. The majority of women were classified as mild-moderate (27-36%) or moderate (25-34%) using the two definitions; they received psychotherapy or prescription drug treatment only. Fewer cases were mild (4-5%) or severe (6-7%). A significant percentage of cases (39% broad, 18% narrow) could not be classified because treatment was not observed 6 months postpartum. **CONCLUSIONS:** The prevalence of PPD in this privately-insured cohort of women was 3.9-7.0%, much lower than previously published estimates of 10-20%, suggesting a potentially sizable undiagnosed population.

PHS23

PREVALENCE OF COMPLICATIONS IN PATIENTS WITH DIABETES MELLITUS IN COLOMBIA

Acuña L[1], Bryón A[2], Aschner P[3], Chica LG[4], Espin J[5], Jaimes D[2], Londoño D[4], Lopez R[2], Ruiz A[3], Soler L[6]
[1]Cuenta de Alto Costo, Bogotá, Colombia, [2]HEORT, Bogota, Colombia, [3]Pontificia Universidad Javeriana Medical School, Bogota, Colombia, [4]Fundacion Santa Fe de Bogota, Bogota, Colombia, [5]Andalusian School of Public Health, Granada, Spain, [6]Risk Management Cordinator, Fondo Colombiano de Enfermedades de Alto Costo, Bogota, Colombia

OBJECTIVES: The prevalence of complications in patients with Diabetes Mellitus was determined in the 8 insurance sectors that are part of the health system through the Colombian High Cost Illness Fund created by the Ministry of Health and the Ministry of Finance has managed the registry administrative work in the health of Diabetes Mellitus during 8 years, which has allowed to identify 920.000 patients at the cut of 2016. The literature has identified as the most frequent clinical complications in the countries to Diabetic Neuropathy, Diabetic Retinopathy and Diabetic Nephropathy. **METHODS:** A cross-sectional descriptive epidemiological study was performed; As well as a sample size of 3.136 patients (cluster sampling), selected in 16 health insurers (48) operating their services in 28 departments (32). The studies that were considered relevant for the research are: UKPDS, DCCT, STENO, EDC and EURODIAB. **RESULTS:** A total of 12.181 patients were identified, with complications: 4.170 patients (34.23%). Based on the 12,181 patients, the complications to be highlighted were: Diabetic Nephropathy: 23.92%, Coronary Disease: 8.83%, Diabetic Retinopathy: 4.71%, Heart Failure: 3.82%, Cerebrovascular Disease: 3.20%, Lower Limb Amputation: 0.61%. **CONCLUSIONS:** The study generates a baseline diabetic population with complications in a Latin American country, scientifically contributes a new ladder of complications for the objective pathology where the most frequent are highlighted: Diabetic Nephropathy, Coronary Disease and Diabetic Retinopathy. In turn, it is an important input for decision making in the distribution of economic resources for the planning of the delivery of health services based on the perspective of payers in health systems.

PHS24

DETERMINATION OF CHRONIC VENOUS DISEASE PREVALENCE AMONG AT-RISK INDIVIDUAL EMPLOYING CLINICAL VALIDATED SCORING PATIENT-CENTERED OUTCOMES

Yoma T[1], Netwila A[2], Udombhornprabha A[2], Klongpityapong P[2]
[1]Eastern Asia University School of Pharmacy & Vibhavadi General Hospital, Pathumthani, Thailand, [2]Eastern Asia University School of Pharmacy, Pathumthani, Thailand

OBJECTIVES: The population-based Edinburg Vein Study(EVS) was adapted for CVD prevalence assessment prior to clinical counseling and referring. We determined CVD prevalence among hairdressers within community pharmacy clinical counseling program using clinical validated,14-item Short Form Chronic Venous Insufficiency Quality-of-Life Questionnaire(CIVIQ-14) and 12-Item Short Form Health Survey(SF-12) Thai version. **METHODS:** A prospective consecutive sampling of hairdressers at Thunyaburi district geographically covering all 6 regions was performed at random. Participants eligible were current hairdresser above 18 years old, continuosly over 1 year working as hairdresser. CIVIQ-14 and SF-12 assessments were conducted by two researchers separately. Baseline demographics, scale reliability, correlation between CIVIQ-14 and SF-12 score were determined with descriptive statistics using Cronbach's alpha correlation coefficient, Interclass Correlation Coefficient(ICC) with 95%CI, and Pearson Correlation. Pearson Chi-square test between two scales for subjects with $\leq$6 hours of long-standing was tested. Probable clinical diagnosis of CVD employed global CIVIQ-14 index score of $\leq$75 to indicate CVD whereas prevalence was based on risk-adjustment estimation from EVS. **RESULTS:** Overall 70 participants, mean ($\pm$SD)of 31.39($\pm$9.48) years old, 43(61.4%) female, 2.8($\pm$4) years working as hairdresser, 44(62.9%) had >6 hours long-standing, 15(21.4%) smokers, 16(22.9%) regular contraceptive users, 29(41.4%) alcoholic drinkers. The overall Global mean $\pm$SD score, min-max, and Cronbach's alpha with mean ICC(95% Confidence Interval) for CIVIQ-14 were 86.56 $\pm$14.49, 38-100, and 0.931 with 0.931(0.905 – 0.953), $p<0.001$ whereas for SF-12 Global were 78.49 $\pm$12.23, 53-98, and 0.812 with 0.812(0.740 – 0.871), $p<0.001$. The CIVIQ-14 and SF-12 was correlated with Pearson correlation coefficient of 0.707($p<0.001$). Specifically, the Pearson Chi-square test of two scores from subjects with $\leq$6 hours long-standing(N=26) was well correlated at p-value=0.003. Overall 13(18.6%) of participants were clinically

referring. **CONCLUSIONS:** The CVD prevalence among hairdresser at Thunyaburi was 18.6%. The CIVIQ-14 was reliable, sensitive for CVD assessment and correlated with SF-12, useful for raising awareness and early detection of CVD among at-risk individual.

PHS25

HOSPITAL VOLUME AND 30-DAY READMISSION RATES AMONG PATIENTS WITH PNEUMONIA

Carlson KB[1], Dabbous F[2], Kabir C[1], Nitti K[1], Blair C[1], Summerfelt T[1]
[1]Advocate Health Care, Oak Lawn, IL, USA, [2]Russell Institute for Research & Innovation, Park Ridge, IL, USA

OBJECTIVES: Pneumonia is one of the main causes of readmissions in the United States, with estimates of 30-day readmissions as high as 20%. Given the high costs associated with readmissions, it is important to understand what factors contribute to readmissions in this patient population. Hospital volume, an indicator of availability of resources and staff, may be associated with readmission rates. In this analysis of a large, single-network hospital system, we examined the association between hospital volume and 30-day readmission in patients with pneumonia. **METHODS:** Adult (18 or older) patients admitted to one of the 11 Advocate Health Care hospitals with a pneumonia diagnosis between 2008 and 2015 were included for analysis. Hospitals were categorized as low, medium, or high volume based on inpatient beds. 30-day readmission was compared by volume and by patient gender, race, age, length of stay, insurance, calendar year, and discharge disposition (home or home health). Logistic regression was used to examine the association between hospital volume and 30-day readmission, adjusting for covariates. **RESULTS:** 37,757 pneumonia admissions occurred between 2008 and 2015. 30-day readmission rates were 10.5%, 11.5%, and 12.6% for low-, medium-, and high-volume hospitals, respectively. In adjusted models, increased odds of 30-day readmission were seen for patients in both medium-volume (OR = 1.14; 95%CI 1.04-1.25) and high-volume hospitals (OR = 1.28; 95%CI 1.23-1.34) when compared with low-volume hospitals. **CONCLUSIONS:** In this analysis of a single hospital network, patients treated for pneumonia in higher-volume hospitals were found to have significantly greater odds of 30-day readmission than in lower-volume hospitals, even after adjustment for other risk factors. This finding is surprising and should be investigated further to better understand the reasons for these differences.

PHS26

DYSLIPIDEMIA IN THE "DE TODO CORAZON" PROGRAM. A CROSS-SECTIONAL STUDY

Paz Wilches J[1], Miranda Machado P[2], Salcedo Mejia F[2], De la Hoz Restrepo F[3], Alvis Guzman N[2]
[1]Mutual Ser EPS, Cartagena, Colombia, [2]ALZAK Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia, [3]Universidad Nacional de Colombia, Bogotá, Colombia

OBJECTIVES: "De Todo Corazón" (DTC) is a risk management program with the aim of reducing complications and improving the quality of life of patients with cardiovascular risks. The aim of this study was to assess the prevalence of dyslipidemia in patients under program care. **METHODS:** The study comprised individuals (64.668) of all ages, living in the Colombian Caribbean. Dyslipidemia was defined as the presence of one or more of the following conditions: Triglycerides > 200 mg/dL, or total cholesterol (TC) > 240 mg/dL, or HDL cholesterol < 40 mg/dL, or LDL cholesterol > 100 mg/dl, or currently taking antilipemic agents. **RESULTS:** The average age was 64.5 + 13.9 years and 66.5% female. The prevalence of dyslipidemia was 82.5% (IC 82.2-82.8). Prevalence rates of dyslipidemia in men and women were: 32.8% and 67.2%. Prevalence LDL cholesterol > 100 mg/dl and currently taking antilipemic agents was 31.5% (IC 31.1-31.8) and 49.6% (IC 49.2-50.0). **CONCLUSIONS:** Dyslipidemia was highly prevalent in patients under program care.

PHS27

ASSESSMENT OF CARDIOVASCULAR RISK IN THE "DE TODO CORAZÓN" PROGRAM IN A COLOMBIAN POOR POPULATION. A CROSS-SECTIONAL STUDY

Miranda Machado P[1], Salcedo Mejia F[1], Paz Wilches J[2], De la Hoz Restrepo F[3], Alvis Guzman N[4]
[1]Universidad de Cartagena. Alzak Foundation, Cartagena de Indias, Colombia, [2]Mutual Ser EPS, Cartagena, Colombia, [3]Universidad Nacional de Colombia, Bogotá, Colombia, [4]ALZAK Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia

OBJECTIVES: "De Todo Corazón" (DTC) is a risk management program with the aim of reducing complications and improving the quality of life of patients with cardiovascular risks. The aim of this study was to assess the prevalence of cardiovascular risk factors in patients under program care. **METHODS:** The study comprised individuals (64,668) of all ages, living in the Colombian Caribbean. Data on anthropometric parameters, blood pressure, glycosylated hemoglobin, total, low-density (LDL) and high-density (HDL) lipoprotein cholesterol, triglycerides, physical activity and smoking status were collected of the program database. We used the risk classification of Framingham Heart Study. **RESULTS:** The average age was 64.5 + 13.9 years and 66.5% female. The overall prevalence rates were as follows: hypertension (ICD-10 hypertension code or >140/90 mm Hg or pharmacologic treatment), 96.5% (96.3%-96.6%); hyperlipidemia (total cholesterol >240 mg/dl or triglycerides >200 mg/dl or LDL cholesterol >100 md/dl or HDL cholesterol), 85.2% (84.8%-85.4%); diabetes (ICD-10 diabetes code or pharmacologic treatment or glycosylated hemoglobin >6.5%), 36.1% (35.7%-36.5%); metabolic syndrome, 6.3% (6.1%-6.5%); obesity (body mass index >30 kg/m2), 43% (42.6%-43.4%); smoking, 2.2% (1.9%-2.2%); and physical inactivity, 77.8% (77.5%-78.2%). 80% of the patients had data necessary for the classification of cardiovascular risk. 34.9% of the patients had a high cardiovascular risk according to the classification of Framingham Heart Study. **CONCLUSIONS:** The hypertension, hyperlipidemia and physical inactivity was highly prevalent in patient under program care. One-third of patients had a high cardiovascular risk according to the classification Framingham Heart Study.

PHS28

THE IMPACT OF PHARMACIST BASED DIABETES TREATMENT ON THE ODDS OF HBA1C REDUCTION AMONG MEDICAID PATIENTS

Simmons D[1], McCarthy C[1], Bateman MT[1], McGuigan KA[2], Wagner ML[1]
[1]Rutgers, The State University of NJ, Piscataway, NJ, USA, [2]Teva Pharmaceutical Industries Ltd., Frazer, PA, USA

OBJECTIVES: A randomized control trial is ongoing in Trenton, NJ to evaluate the outcomes of using clinical pharmacists to manage chronic diabetics, on Medicaid, with severely uncontrolled HbA1c (>8%). The purpose of this study was to evaluate the impact of pharmacists on the odds of achieving a clinically significant reduction in HbA1c of ≥1% at 6 months, while controlling for potential confounders. **METHODS:** A logistic regression model evaluated the impact of the treatment provider and each factor on the odds of HbA1c reduction. Potential confounders for the model were selected from the results of a literature search. A second logistic regression model evaluated the impact of the factors on study dropout. A mathematical correction was applied to the odds ratios to estimate the risk ratio. **RESULTS:** A total of 189 patients were randomized and scheduled for follow up appointments. Of the randomized patients, 113 returned for their 6 month follow up appointment. The group treated by the pharmacist demonstrated a 72% increase in the chance of a clinically significant HbA1c reduction (Adjusted OR: 1.72, 95% CI: 1.18-1.92). Treating with a pharmacist also did not produce a statistically significant impact on the odds of study dropout (Adjusted OR: 1.37 95% CI: 0.72-1.54). None of the previously identified confounders had a significant impact on the results. **CONCLUSIONS:** In the first 6 months of treatment, utilizing a clinical pharmacist increased the odds of a clinically significant reduction in HbA1c for severely unmanaged diabetics compared to treatment by a physician without increasing the odds of discontinuing treatment. Future research is needed to determine if the results continue past 6 months.

PHS29

ASSESSMENT OF CARDIOVASCULAR DISEASES RISK IN PATIENTS WITH TYPE 2 DIABETES MELLITUS

Jose C
Indegene private limited, Bangalore, India

OBJECTIVES: To assess the risk for developing cardiovascular diseases (CVD) in type 2 Diabetes Mellitus (DM) patients during a period of 10 years and establish the association between various risk factors and the risk score. **METHODS:** A prospective observational study conducted in a South Indian teaching hospital for a period of 6 months. Patients with type 2 DM hospitalized from October 2014 – March 2015 were included in the study and necessary data was collected from patient's case records and interview with patients or patient's representatives. The risk for developing CVD was calculated using Framingham Risk Score (FRS) and United Kingdom Prospective Diabetes Study (UKPDS) risk engine and then the significance of association of risk factors to the scores determined. **RESULTS:** Out of 100 patients evaluated for their risk scores 50%, 35% and 15% were found to have low, intermediate and high risk respectively using FRS, whereas 28%,41% and 31% were found to have low, intermediate and high risk respectively using UKPDS risk engine. Analysis of data revealed that gender, age-group, smoking and total cholesterol level had a significant association to the risk score with p values 0.000, 0.001, 0.017 and 0.048 respectively but High Density Lipoprotein (HDL) level and Systolic Blood Pressure (SBP) had a non-significant association. Similarly, gender, age-group, total cholesterol, duration of diabetes and glycosylated hemoglobin (HbA1c) level had a significant association to the risk score with p values 0.001, 0.016, 0.044, 0.047 and 0.015 respectively despite smoking, HDL level and SBP had a non-significant association, congruent to the FRS results. **CONCLUSIONS:** Cardiovascular risk scores are useful tools in the management of diabetes. Moreover, it is indicated that the risk factors had a significant association to the scores which provides evidence that computation of CVD risk is an important part of prioritizing therapy for individuals.

PHS30

METABOLIC PROFILES IN SPOUSAL ALZHEIMER CAREGIVERS WITH POOR SUBJECTIVE SLEEP QUALITY

Yeung P[1], Jen R[2], Vaida F[3], Mausbach B[1]
[1]University of California San Diego, La Jolla, CA, USA, [2]University of British Columbia, Vancouver, BC, Canada, [3]University of California San Diego, San Diego, CA, USA

OBJECTIVES: We examined the longitudinal effects of caregiving with other relevant predictors on metabolic parameters in a cohort of Alzheimer caregivers with controls. **METHODS:** A sample of 109 spousal Alzheimer caregivers and 53 non-caregiving age-and gender-matched controls were recruited for this community-based longitudinal study with annual assessments for up to four years. Among the participants, a total of 91 subjects (72 caregivers and 19 non-caregiving controls) with a baseline PSQI > 5, were included for the analysis. **RESULTS:** Metabolic profiles including body mass index (BMI), blood pressure, lipids profiles, and glucose were measured repeatedly during annual assessment. Mixed linear models with time effects for covariates known to affect metabolic parameters were used to evaluate their changes. Multivariate-adjusted metabolic parameters did not significantly differ between caregivers and non-caregivers over time except for systolic blood pressure. For male, HDL levels increased with

non-caregiving status (p = 0.02), higher role overload (p = 0.02), and baseline high HDL status (p < 0.001). For female, HDL levels increased with time (p = 0.02) and decreased with increased role overload (p = 0.02). **CONCLUSIONS:** Among poor sleepers (PSQI > 5), Alzheimer caregivers and non-caregiving controls had similar metabolic profiles. Role overload, caregiving status, and time had different effects on HDL levels on male and female.

BURDEN IMPACT ANALYSIS OF PERITONEAL DIALYSIS VERSUS HEMODIALYSIS IN KOREA

Kim J[1], Lee NR[2], Son SK[2], Sul AR[2], Kim YJ[2]
[1]National Evidence based Health-care Collaborating Agency, Seoul, South Korea, [2]National Evidence-based Collaborating Agency, Seoul, South Korea

OBJECTIVES: To investigate the 5-year health care budget impact of variable distribution of end-stage renal disease (ESRD) patients treated with peritoneal dialysis (PD) and hemodialysis (HD) in South Korea. **METHODS:** Budget impact model was developed to estimate the dialysis-related costs from the payers perspective. Analyzed of the national administrative healthcare database data to defined the target population, prevalence, incidence, medical cost. We assumed that specific ESRD patient would choose the PD instead of HD. In the baseline model, among dialysis patients 18% of them were assumed to receive PD and 82% HD in alignment with 2003-2015 national administrative healthcare database data. Eight hypothetical scenarios were compared with this reference scenario. The scenarios were increase in the PD use of prevalence by 6%, 13%, 20%, 50% per year. The other scenarios were increase in the PD use of incidence by 30%, 50%, 70%, 100% per year. **RESULTS:** There were no differences between HD and PD`s mortality, cardiovascular event in neither diabetic nor over 65 years old. The results showed all scenarios decrease the budget compared to the reference scenario. To examine the validity of this model, various sensitivity analyses were performed. Throughout the sensitivity analysis, the trend of budget impact did not change. **CONCLUSIONS:** Under the Korean Healthcare system for dialysis, increasing the proportion of patients on PD versus HD could generate substantial savings in dialysis-related costs to the payer. A PD-preferred policy for clinically appropriate patients is also a good strategy to address inequity in dialysis access.

PHS32
THE EXPERT IN HAEMOSTASIS AND THROMBOSIS: IS AN ECONOMIC ANALYSIS FEASIBLE?

Rognoni C[1], Liberato L[2], Marchetti M[3], Testa S[4], Quaglini S[5]
[1]Centre for Research on Health and Social Care Management (CERGAS), Bocconi University, Milan, Italy, [2]Department of Internal Medicine, Azienda Ospedaliera della Provincia di Pavia, Casorate Primo, Italy, [3]Haematology Unit, Cardinal Massaia Hospital, Asti, Italy, [4]Haemostasis and Thrombosis Centre, Azienda Ospedaliera Istituti Ospitalieri, Cremona, Italy, [5]Department of Electrical, Computer and Biomedical Engineering, University of Pavia, Pavia, Italy

OBJECTIVES: Bleeding and thrombosis are surgery complications leading to significant clinical and economic consequences. Prevention, diagnosis and management of these complications are generally entrusted to the surgical team, more rarely with specific expertise in Haemostasis and Thrombosis (ET). The aim of the present study is to evaluate the economic impact of experts in ET from the hospital perspective by comparing mid-sized structures, with or without such professionals. **METHODS:** Hospital discharge records (HDRs) related to surgical wards were analyzed for year 2012 for two Italian Hospitals comparable in size: 1) AOPV Hospitals, in Vigevano and Voghera cities, without formal experts in ET; 2) AOCR, Cremona Hospital, with formal experts in ET. HDRs reporting thrombotic/bleeding complications occurred during hospitalizations were selected. For each HDR we compared the DRG reimbursement with and without complications, when available. **RESULTS:** 7505 and 6719 HDRs were analyzed for AOPV and AOCR, respectively. The thrombotic/hemorrhagic complications resulted 60 and 27, respectively. Since bleedings were significantly more in the "no expert" structure (21 AOCR vs. 52 AOPV, p <0.05), the analysis focused on these complications. For bleedings detected in AOPV, the average difference in terms of reimbursement, in comparison to the corresponding DRG without complications, amounted to € 3,201 (range 0-33,385€), while for AOCR this value resulted € 1,936 (range 0-13,049€). The total reimbursement increase for the management of bleeding complications with and without experts in ET resulted respectively 40,656€ (28.7%) and 166,481€ (38.6%). The incremental difference of reimbursements between the two hospitals, resulted 125,826€, can be considered a proxy of the economic value associated to the annual experts' activity for the management of thrombotic/hemorrhagic complications. **CONCLUSIONS:** The study, albeit limited to the analysis of two sample structures, suggests that experts in ET in hospitals actually can represent an appropriate use of resources, from both clinical and economic perspectives.

PHS33
A NATIONAL BUDGET IMPACT ANALYSIS OF A SPECIALISED SURVIELLANCE PROGRAM FOR INDIVIDUALS AT VERY HIGH RISK OF MELANOMA IN AUSTRALIA

Watts CG
The University of Sydney, Camperdown, Australia

OBJECTIVES: Patients at very high risk of cutaneous melanoma make up 18% of the patient population diagnosed with melanoma in Australia. We aimed to estimate the five year healthcare budget impact of providing specialised surveillance using total body photography and digital monitoring of suspicious lesions for this high-risk population, from the perspective of the Australian health care system. Currently the cost for monitoring of suspicious lesions is largely borne by the patient, however in this study we analysed these services as health system costs. **METHODS:** A budget impact model was constructed using Microsoft Excel to assess the costs of specialised surveillance and potential savings. Data was utilised from a cost-effectiveness analysis and a micro-costing study conducted in a public hospital clinic where specialised surveillance was conducted, and Cancer Registry data to estimate the patient population and costs of surveillance from 2017-2021. **RESULTS:** If all eligible patients were monitored using specialised surveillance rather than the current service provided, the total cost savings to the Australian health care system in the first year would be $AU 1.7 million ($US 1.2 million), and in the fifth year $AU 9 million ($US 6.2 million). The cumulative cost savings over this period would be $AU 22.6 million ($US 15.5 million). If the introduction of the program was staggered from 60% coverage in year one to 90% coverage by year four, the cumulative cost for specialised surveillance over five years would be $75 million ($US 51.3 million), amounting to savings of $AU 18.8 million ($US 12.8 million). **CONCLUSIONS:** Specialised surveillance has the potential to lead to cost savings for the Australian health care system. Reimbursement through provision of Medicare Benefits Schedule rebates would alleviate out of pocket costs for patients. Follow-up should be conducted to investigate whether the current low rate of excisions is maintained.

PHS34
MIGRAINE IN OBESE ADULTS AND ITS IMPACT ON HEALTH CARE EXPENSES

Wu J[1], Davis-ajami ML[2], Lu K[3]
[1]Presbyterian College, Clinton, SC, USA, [2]Virginia Commonwealth University, Richmond, VA, USA, [3]University of South Carolina, Columbia, SC, USA

OBJECTIVES: Migraine and obesity add significant personal and societal burden, diminished quality of life, and increase health care utilization. Several studies suggest multifactorial pathophysiological associations between migraine and obesity that contribute to the prevalence of migraine in adults with obesity. This study aims to identify sociodemographic and health-related factors associated with migraine, and examine the effect of migraine on health care utilization and expenses in a nationally representative sample of obese US adults. **METHODS:** This study used Medical Expenditure Panel Survey (MEPS) longitudinal data (2006-2013) representing the US civilian noninstitutionalized population. The study included individuals aged > 18 years and with a body mass index (BMI, kg/m2) ≥ 30. After identifying migraine from the MEPS medical condition files, obese adults were divided into two groups: (1) obese with migraine and (2) obese without migraine. Outcomes measured included annualized per subject total health care expenses, and delineated medical services and pharmacy expenses. Multivariate logistic regression identified significant risk factors associated with migraine and a generalized linear model with a log link and gamma distribution assessed the effect of migraine on total health care expenses. **RESULTS:** Among 23,596 eligible obese adults, 4.7% (n=1025) reported migraine. Younger age, female sex, white race, poor perceived health status, and greater comorbidity increased the migraine risk among this obese cohort. Migraine versus no migraine showed higher outpatient, emergency, and prescription drug utilization (p<0.001). The medical, prescription drug, and total health expenses in the migraine group were $1321 (p=0.007), $760 (p<0.001), and $1991(p=0.001) higher than the non-migraine group. Migraine increased total health care expenses 31.6% in the obese population after controlling for sociodemographic and health-related variables. **CONCLUSIONS:** Sociodemographic characteristics, health status, and comorbidity level increased the risk for migraine among obese adults. Migraine in obese adults significantly increased total health care utilization and expenses.

PHS35
STATE MEDICAID COST SAVINGS FROM THE NEW YORK UNIVERSITY CAREGIVER INTERVENTION FOR FAMILIES COPING WITH DEMENTIA

Long KH[1], Moriarty JP[2], Farseth PH[3], Mittelman MS[4], Foldes SS[5]
[1]K.Long Consulting, LLC, St. Paul, MN, USA, [2]Mayo Clinic Rochester, Rochester, MN, USA, [3]Minnesota Department of Human Services, St. Paul, MN, USA, [4]New York University School of Medicine, New York, NY, USA, [5]Foldes Consulting LLC, Saint Louis Park, MN, USA

OBJECTIVES: The economic burden of long term care for people with dementia is significant and substantially covered by state Medicaid programs. While no therapies exist to substantially alter disease progression, supportive services for caregivers have been shown to improve caregiver capabilities and well-being and delay patients' institutionalization. We estimated the potential cost savings from offering the New York University Caregiver Intervention (NYUCI) to eligible Medicaid enrollees from a state payer perspective. **METHODS:** Data from the Minnesota Department of Human Services and the literature informed a population-based Markov model to predict and compare costs, including intervention costs, over 15 years with and without implementation of the NYUCI for family caregivers of community-based Medicaid eligibles with dementia. We incorporated original NYUCI randomized controlled trial results as appropriate, adjusted to Minnesota implementation. **RESULTS:** Approximately 5-6% more eligibles with dementia would remain in the community from year 3 (2014) on and 17% fewer would die in nursing homes over 15 years if their caregivers received the NYUCI. The state could save $40.4 million (2011 dollars, discounted at 3%) if all eligibles/caregivers participated in the NYUCI. Savings are expected within 5 years of program implementation. Best-and worst-case scenario estimates were $178.9 million and -$7.3 million, respectively, driven largely by the variation in the assumed NYUCI effect. **CONCLUSIONS:** State payers can use enhanced caregiver support to moderate the growing tax burden of dementia, even without a breakthrough in pharmacologic treatment of the disease. But because it takes time to realize savings from a program like the NYUCI, the frequently short time horizon of legislative fiscal notes presents a challenge to adoption. In deciding on program value it may be important to distinguish cost-effectiveness from return on investment and take long-term impact into consideration.

PHS36

ESTIMATING THE INCREMENTAL EFFECT OF DIABETES COMPLICATIONS TO DIABETES-RELATED HOSPITALIZATION COST

Zhao R[1], Carlson AM[2]
[1]University of Minnesota, Minneapolis, MN, USA, [2]Data Intelligence Consultants, LLC, Eden Prairie, MN, USA

OBJECTIVES: Peripheral lower-extremity diseases (PLE), kidney diseases, and coronary atherosclerosis are three important diabetes complications. Their incremental costs to diabetes-related hospitalization haven't been thoroughly examined in previous studies. This study explores the presence and severity of these three complications on diabetes-related hospitalization costs. **METHODS:** A retrospective analysis of the 2010 – 2012 National Inpatient Sample (NIS). Diabetes-related hospitalization was defined by principal and secondary diagnosis of diabetes (250.XX). Hospitalization costs were obtained by adjusting the total hospitalization charge by the hospital-specific cost-to-charge ratio and were adjusted to the 2012 dollar by medical CPI. The presence and severity of these three complications were identified by diagnosis codes, procedure codes and DRG. Stratified random matching was adopted to make the cohorts with/without each of the three complications comparable. Generalized linear model (GLM) was used to analyze the association between diabetes complications and hospitalization costs. The statistical significance level was p-value 0.0001. **RESULTS:** 804,192 diabetes-related hospitalization records were identified. 26.6% of the hospitalized diabetes patients had comorbid PLE; 21.6% with kidney diseases; 24.3% with coronary atherosclerosis. The mean and median diabetes-related hospitalization costs were $10,342 and $6,847. Controlling for covariates, the adjusted mean hospitalization costs for diabetes patients with severe PLE were $17,212 (95% CI: $16,610 - $17,835); while that for diabetes patients with less severe PLE or without PLE were $10,432 and $10,363, respectively. Diabetes-related hospitalization costs were also significantly higher for patients with severe coronary atherosclerosis ($12,822) than patients with less severe coronary atherosclerosis ($11,264) or patients without coronary atherosclerosis ($11,434). However, severe or less severe kidney diseases were not associated with significant increases in diabetes-related hospitalization costs. **CONCLUSIONS:** The incremental costs for severe PLE and severe coronary atherosclerosis were $6,849 and $1,388 to diabetes-related hospitalization costs. Optimal diabetes management programs are essential to reduce the burden of diabetes and its complications.

PHS37

ECONOMIC IMPACT OF ROUTINE OPT-OUT ANTENATAL HIV SCREENING: A SYSTEMATIC REVIEWÂ€™

Ibekwe E, Ibekwe E, Prof Francis Fatoye F, Haigh C
Manchester Metropolitan University, Manchester, UK

OBJECTIVES: To evaluate the economic impact of routine testing of HIV in antenatal (ANC) settings **METHODS:** A systematic review of published articles. Extensive electronic searches for relevant journal articles published from 1998 to 2015 when countries began to implement routine ANC HIV testing on their own were conducted in the following databases: Science Direct, MEDLINE, SCOPUS, JSTOR, CINAHL and PubMed with search terms as listed in box 1. Manual searches were also performed to complement the electronic identification of high quality materials. There were no geographical restrictions but language was limited to English. Fifty-five articles were retrieved; however, ten were eligible and included in review. **RESULTS:** The findings showed that many programmes involving routine HIV testing for pregnant women were cost effective and cost saving. Overall, in sensitivity analysis, the cost of the interventions at different settings were impacted by prevalence rate of HIV, the cost of screening for HIV, the overhead cost and the life time cost of treatment of an HIV infected baby. **CONCLUSIONS:** Routine HIV testing is both cost-effective and cost saving. However, there is wide variations in the methodological approaches to the studies. Adopting standard reporting format would facilitate comparison between studies and generalizability of economic evaluations.

PHS38

ASSOCIATION OF COMORBID DEPRESSION WITH HEALTH CARE EXPENDITURES IN ADULTS WITH RHEUMATOID ARTHRITIS

Khairnar R
University of Maryland, Baltimore, MD, USA

OBJECTIVES: To estimate the incremental health care expenditures associated with depression in a nationally representative sample of US adults with rheumatoid arthritis (RA). **METHODS:** This is a pooled cross-sectional study of adults aged 21 years and older with a diagnosis of RA using Medical Expenditure Panel Survey (MEPS) data from 2010-2014. Ordinary Least Square (OLS) regression with log-transformed expenditures was conducted. The dependent variable consisted of total health care expenditures and health care expenditures by type of medical services, while the presence of comorbid depression was the primary independent variable. Covariates included socio-demographic, economic and clinical characteristics that are found to influence an individual's healthcare utilization and costs. A secondary analysis using a generalized linear model (GLM) with log-link function and gamma distribution was also performed. All expenditures were adjusted to 2016 dollars. The analyses accounted for the complex survey design of MEPS and was conducted using SAS 9.4. **RESULTS:** Depression was present in 19% of the adults with RA. The unadjusted mean annual expenditures were higher in the individuals with depression compared to those without: mean annual total expenditure ($17,018 vs. $10,367) and mean annual prescription drug expenditure ($6,278 vs. $3,047). OLS regression demonstrated that individuals with comorbid depression had 55.3% higher total annual expenditures and 110.0% higher annual prescription drug expenditure compared to those without comorbid depression. GLM with log-link and gamma distribution showed that the incremental total annual cost for patients with RA and depression was $621, and the incremental annual prescription drug cost was $768, compared to those without depression. **CONCLUSIONS:** Depression is associated with higher annual healthcare expenditures in adults with RA. This underscores the importance of screening and treatment of depression in patients with RA so as to potentially lower the overall health care expenditures in this population.

PHS39

HEALTHCARE RESOURCE UTILIZATION AND COSTS OF CARE FOR MESOTHELIOMA MEDICARE BENEFICIARIES

Fryzek J[1], Ruterbusch JJ[2], Garabrant DH[1], Dalvi T[3], Beebe-Dimmer J[4]
[1]EpidStat Institute, Ann Arbor, MI, USA, [2]Karmanos Cancer Institute, Wayne State University School of Medicine, Detroit, MI, USA, [3]AstraZeneca, Gaithersburg, MD, USA, [4]Karmanos Cancer Institute, Detroit, MI, USA

OBJECTIVES: To estimate the health care resource utilization (HRU) and cost associated with newly diagnosed mesothelioma, a rare and deadly disease with limited treatment options, compared to Medicare beneficiaries without cancer. **METHODS:** Using data from SEER-Medicare, we describe HRU and costs for Medicare patients diagnosed with mesothelioma between 2008 and 2009 and a matched comparison group of patients without cancer. Patients were matched on age, sex, comorbidity index, race and SEER region, and were followed through 2010. The proportion of mesothelioma patients using each type of health care service within the study observation was compared to the matched sample using chi-square tests. A t-test and a non-parametric test (Wilcoxon-Mann-Whitney) were used to compare continuous cost variables. **RESULTS:** We identified 175 mesothelioma patients and 350 comparison subjects who were enrolled in Medicare Parts A, B, and D, and were not HMO members. Nearly all aspects of HRU that we examined, including inpatient hospitalization (92% of mesothelioma patients had an inpatient hospitalization versus 20% of comparisons; $p<0.001$), outpatient hospitalization (89% versus 61%; $p<0.001$), emergency room visit (41% versus 22%; $p<0.001$), physician office visit (98% versus 93%; $p<0.001$), hospice (52% versus 0.3%; $p<0.001$), use of durable medical equipment (56% versus 28%; $p<0.001$), and home health care (41% versus 10%; $p<0.001$), as well as actual mean costs for the total observation period associated with HRU (except pharmacy) ($US 66,659 versus $US 12,911; $p<0.001$) are higher in mesothelioma patients compared to matched comparisons without mesothelioma. Pharmacy use was similar between the groups (97% versus 94%, p=0.2551), and costs were higher for the comparison group ($US 1,917 versus $US 2,725; $p<0.001$). **CONCLUSIONS:** Mesothelioma- associated medical resource utilization and associated expenditures are substantive, and similar to other cancers. In order to reduce the burden of illness associated with mesothelioma, continued efforts in the development of more efficacious treatments are needed.

PHS40

COMPARISON OF HOSPITAL COSTS VS OUTPATIENT OF APPLICATION OF INTRAVENOUS INJECTABLE THERAPY IN THE TREATMENT OF PERIPHERAL OCLUSIVE ARTERIAL DISEASE IN COLOMBIA

Tamayo C[1], Upegui A[2], Robles A[2], Puentes SY[3]
[1]U Nacional, Bogota, Colombia, [2]Universidad Externado, Bogota, Colombia, [3]ECCI, Bogota, Colombia

OBJECTIVES: To develop a costing exercise that allows comparing the hospital vs ambulatory costs of application of intravenous injectable vasodilator therapy in the treatment of Peripheral Occlusive Artery Disease (POAD) in Colombia. **METHODS:** The increase in ambulatory or domiciliary medical care is in effect a systemic response to the increased needs of the Colombian health system, specifically the cost of beds occupancy and hospital rooms, which in some cases are not necessary. Through the collection of clinical data on the management of the application of a vasodilator pharmacological therapy for patients with POAD in the Fontaine III and IV stages, an exercise of economic cost was developed that allows comparing the options of intrahospital vs ambulatory application, in cases where this procedure can be performed ambulatorily according to medical criteria. The costs of resources and inputs were taken from the SOAT 2001 + 30% tariff manual and were adjusted when quartiles 25, 50 and 75 were required to ensure that the extreme values found in the database were not to affect the average estimation. **RESULTS:** The results are presented as the sum of the expenditure in the application and use of inputs and resources, such as single room of average complexity, macro drip equipment, intrahospital care by general medicine, among others. The option of application for ambulatory or domiciliary management represents a saving of about 28.14% to the Colombian health system in this specific therapy for POAD. **CONCLUSIONS:** The results of the exercise suggest the existence of thrifty alternatives of management options for the application of medications in an outpatient or domiciliary way without having to carry costs to the health system directly with the occupation of spaces in hospitals that can be used in a more efficient way.

PHS41

ENROLLMENT PATTERNS FOR HOSPICE AND COST OF END-OF-LIFE CARE AMONG ELDERLY PATIENTS WITH DIFFUSE LARGE B-CELL LYMPHOMA: A SEER-MEDICARE ANALYSIS

Kumar AJ[1], Winn A[2], Shah GL[3], Lin P[1], Parsons SK[1]
[1]Tufts Medical Center, Boston, MA, USA, [2]The University of North Carolina at Chapel Hill, Chapel Hill, MA, USA, [3]Memorial Sloan Kettering Cancer Center, New York, NY, USA

OBJECTIVES: Hospice has historically been underutilized for end-of-life care in hematological malignancies. We aimed to identify hospice enrollment patterns among patients with diffuse large B-cell lymphoma (DLBC) and compare end-of-life cost of care with non-hospice patients. **METHODS:** Using the SEER-Medicare database from 2002-2012, we identified predictors of hospice enrollment within

the last 30 days of life for DLBCL patients >65 years. We evaluated adjusted and unadjusted costs among hospice and non-hospice users. **RESULTS:** We identified 12,644 DLBCL patients. Hospice users were older than non-users (mean 80 vs. 78 years, p<0.001), more often white (p=0.02), less often married (45.1 vs. 53.7, p<0.001), more often female (p<0.001), and more often had advanced stage disease (p=0.004). There were no significant differences in enrollment by urbanicity, poverty level, hospital type, and Charlson comorbidity index (CCI). Non-hospice patients received more transfusions (p<0.001) and chemotherapy (p<0.001) in the last 30 days of life. During the last month of life, costs continually increased for non-hospice users from $2,063 for days 26-30 prior to death to $3,068 for days 0-5 (p<0.001). Hospice users' costs decreased from $1,752 to $1,326 (p=0.002). Our results were consistent after adjusting for age, CCI, disease stage, race, marital status, urbanicity, and census poverty level (non-hospice: $2,041 days 26-30 vs. $3,109 days 0-5, p<0.001; hospice: $1,800 days vs. $1,348, p=0.001). For non-hospice patients, inpatient admissions drove costs ($2,289). Our propensity score weighted models provided similar results. **CONCLUSIONS:** We found age, race, marital status, and sex were associated with hospice use among older DLBCL patients. Those who received transfusions or chemotherapy in the last 30 days of life were less likely to enroll in hospice. Total health care costs were higher in non-hospice patients, primarily driven by inpatient admissions. Earlier hospice intervention may reduce costs of care in the last 30 days of life.

PHS42

BURDEN OF ILLNESS IN PATIENTS WITH TENOSYNOVIAL GIANT CELL TUMORS

Burton T[1], Ye X[2], Parker E[3], Bancroft T[3], Healey JH[4]
[1]Optum, Boston, MA, USA, [2]Daiichi Sankyo Pharma Development, Edison, NJ, USA, [3]Optum, Eden Prairie, MN, USA, [4]Memorial Sloan Kettering Cancer Center, New York, NY, USA

OBJECTIVES: Little is known about the burden of illness in patients with tenosynovial giant cell tumors (TGCT), which are rare, typically benign, lesions of the synovial tissue including giant cell tumor of the tendon sheath (GCT-TS) and pigmented villonodular synovitis (PVNS). The objective of this study was to describe healthcare resource utilization and costs for patients with GCT-TS and PVNS. **METHODS:** A retrospective cohort study design was used to analyze administrative claims for adult commercial and Medicare Advantage health plan enrollees with diagnosis codes for GCT-TS (ICD-9: 727.02) and PVNS (ICD-9: 719.2x) between 1/1/2006 and 9/30/2014. Patients were continuously enrolled for 12 months before (pre-index) and 12+ months after (post-index) the date of the first TGCT claim (index date). One-year pre-index and post-index measures were compared using chi-square and Wilcoxon tests to account for skewed cost data. Results were stratified by TGCT type. **RESULTS:** The study identified 4,664 TGCT patients, 284 with GCT-TS and 4,380 with PVNS. Mean age (GCT-TS: 50 years; PVNS: 51 years) and sex distributions (GCT-TS: 60.2% female; PVNS: 59.5% female) were similar for each group. Approximately half of PVNS patients had a lower leg location on the index claim, and 2,133 (48.7%) had at least one post-index surgery versus 239 (84.2%) of GCT-TS patients. Mean total healthcare costs increased from $8,943 pre-index to $14,880 post-index (p<0.001) for GCT-TS patients and from $13,221 pre-index to $17,728 post-index (p<0.001) for PVNS patients. Pre-index to post-index ambulatory costs increased nearly 120% for GCT-TS patients ($4,340 to $9,570, p<0.001) and 50% for PVNS patients ($6,782 to $10,278, p<0.001), including costs for a significant increase in post-index physical therapy use (GCT-TS: 18% to 40%, p<0.001; PVNS: 38% to 60%, p<0.001). **CONCLUSIONS:** Higher post-index healthcare costs, with large increases in ambulatory care including physical therapy use, suggest a high healthcare burden once TGCT is identified.

PHS43

A 10-YEAR REVIEW OF ACUTE MYOCARDIAL INFARCTION HEALTH CARE COSTS IN ALBERTA, CANADA

Tran DT[1], Welsh R[1], Ohinmaa A[1], Nguyen T[2], Kaul P[1]
[1]University of Alberta, Edmonton, AB, Canada, [2]Institute of Health Economics, Edmonton, AB, Canada

OBJECTIVES: Acute myocardial infarction (AMI) is a global health problem. Little is known as to the cost burden of the disease to the Alberta health care system. We sought to examine the health care costs associated with AMI in Alberta, Canada between 2004- 2013. **METHODS:** We linked six Albertan health databases, including ambulatory care, discharge abstract database, practitioner claims, pharmacy information network, population registry, and vital statistics to identify patients with a primary diagnosis of AMI (ICD-10 codes I21 or I22) during 2004-2013. We used Alberta Health Data Application to provide unit cost for ambulatory care and inpatient services and Alberta Drug Benefit List to provide unit drug price. AMI health care costs were grouped in to ambulatory care, inpatient, practitioner claims and drug costs. All costs were inflated to 2016 Canadian dollar values. **RESULTS:** 52,912 patients (55,384 hospitalizations; 75,309 ambulatory care visits; 497,716 practitioner claims; and 4,003,982 drug dispensing events) with AMI were included in the analysis. Females accounted for 32.7% of study population. Patient age (median (IQR)) decreased during the study period (2004: 68 (56-79); 2013: 65 (56-77); p<0.001). Total hospitalization, ambulatory care, practitioner claims, and drug costs were $760.5 million (2004: $80.4 million; 2013: $70.7 million), $91.5 million (2004: $9.6 million; 2013: $6.4 million), $71.4 million (2004: $5.6 million; 2013: $8.8 million), and $118 million (2008: $19.1 million; 2013: $17.7 million), respectively. Cost per hospitalization and ambulatory care visit decreased from $16,191 and $1,282 in 2004 to $11,544 and $1,191 in 2013 (p<0.001), respectively. **CONCLUSIONS:** Health care costs for AMI in Alberta are significant; however, they decreased during the study period, except for practitioner claims costs. Not surprisingly, hospital services accounted for the most of the AMI care costs. Strategy to shift AMI management to outpatient settings is needed to alleviate the AMI care cost burden.

PHS44

COST OF CONGESTIVE HEART FAILURE: THE CASE OF AN INSURED COLOMBIAN POPULATION

Carrasquilla Sotomayor M[1], Alvis-Zakzuk NJ[2], Alvis Zakzuk J[3], Gomez de la Rosa F[2], Martínez-Zarzuk J[2], Moreno Ruiz DV[4], Alvis Guzman N[5]
[1]Alzak Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia, [2]ALZAK Foundation, Cartagena, Colombia, [3]Alzak Foundation, Cartagena, Colombia, [4]ALZAK Foundation, Cartagena, Colombia, [5]Universidad de Cartagena, Centro de Investigación y Docencia, Hospital Infantil Napoleón Franco Pareja, Cartagena de Indias, Colombia, [5]ALZAK Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia

OBJECTIVES: To evaluate the direct inpatient costs of patients with Congestive Heart Failure (CHF) from an insured population enrolled to "De Todo Corazón" cardiovascular risk management program in Colombia, 2015. **METHODS:** Data were collected retrospectively from 283 patients with arterial hypertension (AH) or AH + type 2 diabetes mellitus (DM2) who suffered a CHF. These patients were enrolled into a cardiovascular risk management program of a state-subsidized insurance company (IC). The direct hospital costs were estimated through a top-down analysis from the third payer perspective. Costs were extracted based on billing and hospitalization records of the IC and converted to US dollars 2015. We used median and interquartile ranges (IQR) to describe costs by age group, risk level and risk factors. **RESULTS:** In total, 58.3% of the patients who suffered a CHF had both risk conditions (AH+DM2). According to the Framinghan risk score, 18.4% of patients were classified as low-risk (LR), 4.6% as medium-risk (MR), 32.9% as high-risk (HR) and 44.17% were unclassified. The median inpatient cost per patient with CHF by risk groups was: LR: US$2,256 (IQR $510-$4,998), MR: US$4,184 (IQR $895-$9,988) and HR: US$2,096 (IQR $935-$4,850). By risk group of factor, the median cost per patient with AH was: <65year-old: US$1,973 (IQR $855- $7,225) and ≥65 years-old: US$1,548 (IQR $662- $3,675) in. Patients with AR+DM2 registered higher costs [US$2,666 (IQR $1,026-$5,283) in under-65 years and US$2,822 (IQR $935-$5,953) in ≥65 years]. Differences in cost by risk factor were statistically significant (Wilcoxon rank-sum p<0.01). However, differences by age groups and risk factors were not statistically significant (p>0.05). **CONCLUSIONS:** Direct costs of CHF increased by having one or more risk factors. Our findings are relevant for policy making focused on saving costs on patients with cardiovascular disease.

PHS45

HEALTH CARE COSTS OF STROKE IN CARDIOVASCULAR RISK PATIENTS IN INSURED COLOMBIAN POOR POPULATION

Carrasquilla Sotomayor M[1], Alvis-Zakzuk NJ[2], Moreno Ruiz DV[3], Martinez Zakzuk J[2], Alvis-Zakzuk NR[2], Paz Wilches J[4], Alvis Guzman N[5]
[1]Alzak Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia, [2]ALZAK Foundation, Cartagena, Colombia, [3]Universidad de Cartagena, Centro de Investigació y Docencia, Hospital Infantil Napoleón Franco Pareja, Cartagena de Indias, Colombia, Colombia, [4]Mutual Ser EPS, Cartagena, Colombia, [5]ALZAK Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia

OBJECTIVES: "De Todo Corazón" is a risk management program to reduce complications and improve the quality of life of patients with cardiovascular risk. The aim of this study was to estimate the direct medical costs related to confirmed stroke in a insured population enrolled in a risk management program in Colombia-2015. **METHODS:** We retrospectively collected data from 380 patients with confirmed stroke enrolled in a cardiovascular risk management program of a subsidized insurer who presented arterial hypertension (AH) or AH+ type 2 diabetes mellitus (DM2). We designed a top-down analysis to estimate direct medical costs due to stroke from a third payer perspective. Costs were calculated based on hospitalization billing records and expressed in US Dollars 2015. Median costs and interquartile ranges (IQR) were described by age group, risk level and risk factors. **RESULTS:** In total, 50% of patients who suffered a stroke had as underlying cause DM2+AH. According to the Framinhan risk score, 22.9% of the patients were classified as low-risk, 2.4% as intermediate, 32.6% as high and 42.1% were unclassified. The median costs of hospital care due to a stroke per patient by risk groups were $864 (IQR $2,414), $730 (IQR $3,141) and $1,902 (IQR $4,256) for low, intermediate and high-risk patients, respectively. By risk factor groups, the median cost for patients under-65 with DM2+AH was $1,531 (IQR $3,536) and $1,876 (IQR $ 4,796) for ≥65 years. Patients under-65 years who presented only HTA had median costs of $805 (IQR $937) and ≥65 years of $1,561 (IQR $ 3,077). Differences in cost per age group regarding to risk factors were statistically significant (Wilcoxon rank-sum p<0.01). **CONCLUSIONS:** Direct costs of stroke care increased with risk level and age. Our results are important to design policies focused on the cost and risk management of patients with cardiovascular disease.

PHS46

INCREMENTAL HEALTHCARE COSTS AND PRODUCTIVITY COSTS ASSOCIATED WITH DEPRESSION AMONG WORKING AGE (18 TO 64 YEARS) ADULTS WITH RHEUMATOID ARTHRITIS

Deb A, Meraya AM, Sambamoorthi U
West Virginia University, School of Pharmacy, Morgantown, WV, USA

OBJECTIVES: This study estimated the excess direct medical costs and indirect costs due to missed work days associated with depression among working-age adults (18 to 64 years) with Rheumatoid Arthritis (RA). **METHODS:** A retrospective cross-sectional study of working-age adults was conducted using data from the nationally representative Medical Expenditure Panel Survey (MEPS) for the years 2007, 2009, 2011 and 2013. Depression was identified using ICD9 codes. Indirect cost for each individual was calculated by multiplying missed work days with average daily wage of each individual. Adjusted total annual medical expenditures was estimated using generalized linear model with gamma distribution and log link in 2013 U.S. dollars. Adjusted annual missed work days were estimated using negative binomial regressions. Adjusted indirect costs were estimated in 2013 U.S. dollars using two-part logit-generalized linear regression models. The incremental direct medical costs and

indirect costs associated with depression in RA patients were calculated using recycled prediction methods. **RESULTS:** Compared with RA patients without depression (n = 1,050), those with depression (n = 370) had significantly higher direct medical costs ($5,605) and higher indirect costs due to productivity loss ($743) after controlling for differences in predisposing factors (age, sex and race), enabling factors (marital status, education and poverty status), need factors (number of chronic conditions, health status), and personal health practices (e.g. physical activity, obesity and smoking). **CONCLUSIONS:** Direct medical costs and indirect costs due to missed work days were higher among working age adults with depression and RA. Future studies need to evaluate whether depression treatment can reduce the direct and indirect costs among adults with RA.

PHS47

DIRECT MEDICAL COSTS DUE TO HYPERTENSION IN A COLOMBIAN POOR POPULATION, A TOP-DOWN MACRO COSTING ANALYSIS

Alvis Zakzuk J[1], Carrasquilla-Sotomayor M[2], Moreno Ruiz DV[3], Paz Wilches J[4], Martínez-Zarzuk J[2], Alvis-Zakzuk NR[2], Alvis Guzman N[5]

[1]Alzak foundation, Cartagena, Colombia, [2]ALZAK Foundation, Cartagena, Colombia, [3]Universidad de Cartagena, Centro de Investigación y Docencia, Hospital Infantil Napoleón Franco Pareja, Cartagena de Indias, Colombia, [4]Mutual Ser EPS, cartagena, Colombia, [5]ALZAK Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia

OBJECTIVES: To estimate the direct annual medical costs of hypertensive patients from a Colombian cardiovascular risk management program of a state-subsidized health insurance company in 2015. **METHODS:** Retrospective cross sectional study of 61,611 patients affiliated to a cardiovascular risk management program of a state-subsidized health insurance company in Colombia 2015 was conducted. Direct medical annual costs in inpatients and outpatients hypertensive patients were analyzed from the healthcare payer's perspective using the top-down costing approach. Costs were quantified based on financial and hospitalization records of the insurance company and converted to US dollars 2015. Costs were described using the framinghan risk score of the program. Medians and interquartile ranges (IQRs) were calculated and two groups of patients were defined based on the reported total cost (TC). Low cost: TC <percentile75 + 1.5*IQR and high cost: TC >percentile75 + 1.5*IQR. **RESULTS:** Out of total patients at risk of a cardiovascular event, 62.9% (38,802) are hypertensive (non-diabetes). Of these, 8.5% are classified as high-risk (HR), 49.2% as low-risk (LR) and 3.58% as medium-risk (MR) according to the Framinhan risk score (FRS). The remaining 42.3% were not classified by the program FRS. The median outpatient cost of a hypertensive patient was US$102.3 (IQR: USD$45.9-US$237.4). The median inpatient costs per patient (MIC) for the low cost group of patients were: HR: USD$461.3 (IQR: USD$353.2-USD$543.9), MR: USD $437.6 (IQR USD$311.8-USD$528.8), LR: USD$367.7 (IQR USD$251.3-USD$501.1) and the MIC per patient for the high cost group of patients were: HR: USD$2,066.4 (IQR USD$1,231.7-USD$5,902.3), MR: USD$2,064.2 (IQR: USD$1,137.5-USD$6,451.2), LR: USD$1,593.1 (IQR: USD$1,028.1-USD$3,250.1). **CONCLUSIONS:** In both groups of patients, inpatient cost in (non-diabetic) hypertensive patients increases as the risk level does. These findings may justify investments by the insurance company to control high blood pressure in order to save downstream health care budgets.

PHS48

EVALUATING THE ECONOMIC BURDEN AND HEALTH CARE UTILIZATION DUE TO DEPRESSION COMORBIDITY IN DEMENTIA

Desai R, Nayak R

St. John's University, Jamaica, NY, USA

OBJECTIVES: To assess the type and extent of health care utilization and medical care expenditures in adults with dementia and depression comorbidity. **METHODS:** Using the 2014 Medical Expenditure Panel Survey (MEPS), dementia patients with and without depression were compared to determine differences in health care utilization and costs of health care with respect to inpatient care, ambulatory care, ER visits and prescription drugs. Differences in utilization and costs stemming from demographic and socioeconomic variations in the two groups were examined. A series of Student's t-test was carried out to discern differences in utilization and costs. **RESULTS:** In 2014, about 32 % of the 1.4 million adults (weighted) who had dementia were also diagnosed with depression. The extent of comorbidity was found to be greater in individuals aged 60 years and over (35.8%) than in the younger age group (18-59 years; about 4%). Compared to the main sample, the comorbid depression sample was found to have a greater proportion of females (68% vs 66%), Caucasians (85% vs 79%) and low income individuals (16% vs 8%, $p<0.0001$). Depression comorbidity was also related to higher outpatient visits (0.91 vs 0.82, $p<0.0001$), office-based provider visits (11 vs 9, $p<0.0001$), and prescription drug use (67 vs 33, $p<0.0001$). The group also had higher expenditures for outpatient visits ($1379 vs $253, $p<0.0001$), office based provider visits ($2226 vs $1987, $p<0.001$) and prescription drug use ($4504 vs $3110, $p<0.001$). **CONCLUSIONS:** Depression comorbidity in dementia is associated with greater utilization of medical care and higher medical costs in the United States. Substantial differences are found in the use of prescription drugs and cost of outpatient care. Depression being both a risk factor and a prodrome of dementia, there is a strong need to identify high-risk individuals and emphasize screening for depression, especially in younger adults.

PHS49

ASTHMA-RELATED DIRECT COSTS AND HEALTH CARE UTILIZATION BY SEVERITY IN COLOMBIA

Florez Tanus A[1], Parra DM[2], Zakzuk J[3], Alvis Guzman N[4], Caraballo L[5], Marrugo Arnedo C[6], Gomez de la Rosa F[7]

[1]Universidad de Cartagena. Centro de Investigación y Docencia. Hospital Infantil Napoleón Franco Pareja. Centro de Investigación e Innovación en salud, Cartagena de Indias, Colombia, [2]University of Cartagena. Health Economics Research Group., Cartagena de Indias. Bolìvar, Colombia, [3]University of Cartagena.Institute for Immunological Research., Cartagena, Colombia, [4]ALZAK Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia, [5]University of Cartagena.Institute for Immunological Research. Fundemeb., Cartagena, Colombia, [6]Universidad de Cartagena. Centro de investigación e innovación en salud-CIISA, Cartagena de Indias, Colombia, [7]ALZAK Foundation, Cartagena, Colombia

OBJECTIVES: To estimate health care utilization and direct costs of asthma in Colombia from the health care system perspective **METHODS:** A retrospective prevalence-based study was used to analyze claims data on health services utilization and costs in all-age patients with asthma (CIE-10: J45-J46) for the year 2015. Patients were identified and selected between Jan-1-2004 and Dic-31-2014 using a nationally large-scale medical claims database from a subsidized-regime insurance company that required at least 12 months of continuous insurance coverage for eligibility. Sample was divided into 4 different levels based on the Leidy criteria, an established algorithm for assessing asthma severity with claims data based in rescue medication fills. Exacerbations were included for a more accurate classification. Costs were converted to international dollars using mean exchange rate of 2015 adjusted for purchase parity power **RESULTS:** Among 20,890 patients completing study criteria, 53.3% were female, mean age (SD) was 21.4 (±21.6) years. In regard to severity of symptoms, 69.9% had mild intermittent, 17.8% mild persistent, 6.7% moderate persistent and 5.4% severe persistent asthma. The most common co-morbidities were chronic obstructive pulmonary disease (n=2,251; 10.8%) and rhinitis (n=1,222; 5.9%). Overall median (IQR) cost per patient was $60.8(137.1). According to severity, cost were $35.1(57.6), $181.7(273.5), $481.1(1,026), $1,205.2(2,149) in level 1-4 respectively ($p<0.001$). Relative frequencies of prescriptions and services were: oral corticosteroids, 19.5%; inhaled corticosteroids, 24.5%; inhaled corticosteroids-long-acting B2-agonists combination, 2.3%; hospitalizations, 5.5%; ambulatory services, 34.5%; specialist outpatient visits, 27.6%; general physician visits, 55.7% and emergency department visits (ED), 3.4%. Median cost of ED visits and hospitalizations were $165.2(36.8) and $904.6(1,478.5), respectively. **CONCLUSIONS:** Health service utilization and direct costs of asthma in Colombia are high and related to severity of symptoms. Nationwide health policies aimed at the effective control of asthma are necessary and will play an important role in reducing the associated economic impact.

PHS50

HEALTH CARE COSTS OF ACUTE MYOCARDIAL INFARCTION IN A COLOMBIAN POPULATION AFFILIATED TO A CARDIOVASCULAR RISK-MANAGEMENT PROGRAM: A MACRO COSTING ANALYSIS

Alvis Zakzuk J[1], Carrasquilla-Sotomayor M[2], Moreno Ruiz DV[3], Martínez-Zarzuk J[2], Alvis-Zakzuk NR[2], Gomez de la Rosa F[2], Alvis Guzman N[4]

[1]Alzak foundation, Cartagena, Colombia, [2]ALZAK Foundation, Cartagena, Colombia, [3]Universidad de Cartagena, Centro de Investigación y Docencia, Hospital Infantil Napoleón Franco Pareja, Cartagena de Indias, Colombia, [4]ALZAK Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia

OBJECTIVES: To estimate the direct annual medical costs of Acute Myocardial Infarction (AMI) from a Colombian cardiovascular risk management program of a state-subsidized health insurance company in 2015. **METHODS:** Retrospective cross sectional study of 61,611 patients affiliated to a cardiovascular risk management program of a state-subsidized health insurance company in Colombia 2015. Direct medical annual inpatients costs of hypertensive and type2 diabetic patients were analyzed from the healthcare payer's perspective using the top-down costing approach. Costs were quantified based on billing inpatient records of the insurance company and converted to US dollars 2015. Costs were described using the framinghan risk score of the program. Medians and interquartile ranges (IQRs) were calculated. **RESULTS:** 472 patients suffered an average of 1.08 AMI in 2015. Of these, all patients resulted to have hypertension (HP) as a cardiovascular risk factor and 58.3% resulted to have type2 diabetes mellitus (DM2) in addition to HP. Out of total of patients, 38% were classified as high-risk patients, 4% as medium-risk and 26% as low-risk according to the framinghan risk score. The remaining 32% were not classified by the program. The median costs per patient by risk score were: high-risk: USD$2,625 (IQR USD$1,183-USD$7,162) and low-risk: USD$2,336 (IQR USD$914-USD$7,314). The median cost per patient with HP was: >65 years-old patients: USD$2,486 (RIC USD$1,074-USD$6,998) and <65 years-old: USD$1,899 (IQR USD$681-USD$5,293), and the median cost per patient with HP+DM2 was: >65 years-old patients: USD$2,814 (IQR USD$1,278-USD$8,290) and <65 years-old: USD$2,033 (IQR USD$1,104-USD$8,168). **CONCLUSIONS:** Age, level of risk and having one or two risk factors increase health care costs associated to AMI. These findings serve as evidence to support investments to control these risk factors in order to save downstream AMI costs.

PHS51

PRIMARY OPEN ANGLE GLAUCOMA: A REAL WORLD EVIDENCE ANALYSIS OF ASSOCIATED PREVALENT AND INCIDENT COSTS AND HEALTHCARE RESOURCE UTILIZATION

Arnold RJ[1], Layton AJ[1], Francis BA[2]

[1]Quorum Consulting, Inc, San Francisco, CA, USA, [2]UCLA, Los Angeles, CA, USA

OBJECTIVES: Assess total healthcare costs and resource utilization for primary open angle glaucoma (POAG) patients; examine real-world treatment patterns for POAG patients, including types and combinations of treatments for incident and prevalent cases; and assess the level of medication adherence with POAG-related medication. **METHODS:** Retrospective database analysis using administrative claims and eligibility records from Truven MarketScan Commercial and Medicare Supplemental databases (2012–2014) for patients (n=54,281) with ≥2 claims with an ICD-9-CM 365.11 (POAG) diagnosis or one POAG-related surgery after January 1, 2013. Index date was that of the first claim identified. Incident cases were patients

without POAG claims and prevalent cases had ≥1 POAG claim during the one-year prior-index period. The analysis period was one year following the index date. Adherence was assessed as the patient being without medication 30+ days at least once during the year. **RESULTS:** Mean Charlson Comorbidity Index was 2.4 (2.6) for incident (prevalent) patients. Component analysis demonstrated ambulatory visits were primary cost drivers (mean $614/$1,252 for incident/prevalent patients), followed by prescription medications (mean $488/$778 for incident/prevalent), then inpatient visits (mean $6,009/$10,834 for incident/prevalent). Per patient treatments included POAG medication (64%), laser trabeculoplasty (25%), no treatment (22%), drainage device implantation (internal and external approaches and drainage) (5%), trabeculectomy (4%) and other procedures (4%). Prevalent patients (81%) were approximately two-fold likelier to receive POAG medication than were incident patients (44%). "No treatment" was substantially greater in incident (44%) than in prevalent (3%) patients. Patients were non-adherent 58% of the time. **CONCLUSIONS:** Similar to recent American Academy of Ophthalmology expert consensus guidelines, medications were treatment drivers, followed by laser trabeculoplasty. Prevalent patients received treatment more frequently/aggressively than did incident patients. Regardless, poor medication adherence might be indicative of the need for procedures to be more frequently pursued.

PHS52

IMPACT OF DISEASE SEVERITY AND COMORBIDITY ON INFORMAL COSTS IN DEMENTIA: A SYSTEMATIC REVIEW OF AVAILABLE EVIDENCE

Shrikhande M[1], Desai R[2], Castro TD[1], Ohanian S[1], Nayak R[2]
[1]St.Johns University, Jamaica, NY, USA, [2]St. John's University, Jamaica, NY, USA

OBJECTIVES: To characterize different types of informal care costs (ICC) in dementia and assess how they are affected by comorbidity and disease severity, as measured by physical and cognitive functioning. **METHODS:** A systematic and comprehensive review of empirical studies conducted in the USA, published between 2000-present, retrieved from PubMed, EMBASE, Medline, SciDirect, and databases in health care and economics. Articles were grouped according to the setting of care, indirect cost type (paid Vs unpaid), and type of caregiving services performed. Evidence of disease severity was documented by reviewing assessment of ADL/IADLs and cognitive functioning. Comorbidity information was recorded if any coexisting conditions were also reported. A narrative analysis was used to synthesize the results. Meta-analysis was not performed due to a lack of homogeneity in studies. **RESULTS:** The review identified 17 eligible full-text articles. Nearly all the studies were cross-sectional and focused on community-dwelling adults; most care was given by spouses and female caregivers or adult children; and assistance with IADLs was a frequent care given. Reported costs of ICC range from $2000-$60,000 per year, with hours spent ranging from 13-107 hrs per week. Replacement Cost Approach was the most common method of valuing caregiver lost earnings (n=13). Mini Mental State Examination (MMSE) was the most frequently used (n=11) screening tool for study enrollment and cognitive assessment. Most cross-sectional reports show that recipient use of informal care rises over time and costs increase substantially with worsening cognition and physical functioning. None of the studies examined, however, a direct correlation between the extent of comorbidity and ICC **CONCLUSIONS:** Available evidence demonstrating association among severity-comorbidity-cost triad is scarce. Modeling of direct costs in economic studies continues to be dominant, but indirect costs often can be as high as direct costs, often surpassing direct costs.

PHS53

HEALTHCARE BURDEN AMONG PATIENTS NEWLY DIAGNOSED WITH MULTIPLE MYELOMA WITH COMMERCIAL AND MEDICARE INSURANCE COVERAGE IN THE US

Yong C[1], Seal B[1], Lingohr-Smith M[2], Menges BL[2], Noga SJ[1], Lin J[2]
[1]Millennium Pharmaceuticals, Inc., a wholly owned subsidiary of Takeda Pharmaceutical Company Limited, Cambridge, MA, USA, [2]Novosys Health, Green Brook, NJ, USA

OBJECTIVES: To evaluate healthcare costs among newly diagnosed patients with multiple myeloma (MM) in the US. **METHODS:** Patients newly diagnosed with MM who did not receive stem cell transplant were identified from the MarketScan Commercial and Medicare claims databases (1/1/2009-9/30/2015). All patients had continuous medical/prescription coverage 12 months before (baseline) and ≥12 months after the index date of MM treatment initiation. Demographics and clinical characteristics were evaluated during the baseline period. Healthcare costs (payments paid by insurance, patient, and other payers) and out-of-pocket (OOP) payments (copayments, co-insurance, and deductibles paid by patients) were determined among patients with age <65 and ≥65 years old and were inflation adjusted to 2015 US dollars. **RESULTS:** Among younger MM patients (<65 years; n=1,315), mean age was 56.7 years and 55.6% were male. During the follow-up, total mean healthcare costs (inpatient, outpatient, outpatient prescription) were $15,183 per-patient-per-month (PPPM). Inpatient costs were $4,204 PPPM, total outpatient medical costs were $8,100 PPPM. The total outpatient pharmacy costs were $2,880 PPPM including MM drug prescription costs of $2,521 PPPM. Among older MM patients (≥65 years; n=1,923), mean age was 76.6 years and 55.2% were male. During the follow-up, total mean healthcare costs were $8,277 PPPM. Inpatient costs were $1,583 PPPM, total outpatient medical costs were $4,448 PPPM, total outpatient pharmacy costs were $2,245 PPPM including MM drug prescription costs of $2,004 PPPM. Approximately 2% of total healthcare costs were OOP for both younger ($297 PPPM) and older MM patients ($181 PPPM), with approximately 16% of total OOP payments attributed to MM drug related outpatient services. **CONCLUSIONS:** Monthly total healthcare costs among both younger and older patients with MM are substantial with outpatient medical costs representing over half of the total healthcare costs.

PHS54

DIRECT COSTS FOR PATIENTS WITH CHRONIC KIDNEY DISEASE FROM A CARDIOVASCULAR RISK MANAGEMENT PROGRAM IN A COLOMBIAN POOR POPULATION

Moreno Ruiz DV[1], Alvis Zakzuk J[2], Martinez Zakzuk J[2], Carrasquilla Sotomayor M[3], Alvis Zakzuk R[2], Paz Wilches JJ[4], Alvis Guzman N[3]
[1]Universidad de Cartagena, Centro de Investigación y Docencia, Hospital Infantil Napoleón Franco Pareja, Cartagena de Indias, Colombia, [2]Alzak foundation, Cartagena, Colombia, [3]Alzak Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia, [4]Mutual ser, Cartagena-Bol, Colombia

OBJECTIVES: To estimate costs of care for patients with chronic kidney disease (CKD) from an insurance company (IC) of a state subsidized in Colombia. **METHODS:** Patients with CKD were identified from a cardiovascular risk management program of an IC. Outpatient and inpatient costs were estimated from the ambulatory and hospitalization financial records of 2015 and from the health systems perspective. Medians and interquartile ranges were calculated and two groups of patients were defined based on the reported total cost (TC). Low cost: TC <75 percentile + 1.5 IQR and high cost: TC> 75th percentile + 1.5 IQR. Results were classified by stages of disease and converted to US dollars 2015. **RESULTS:** Out of 61,611 patients affiliated to the program, 22.4% (13,816) were found to have CKD. In the defined low-cost group of patients, median hospitalization costs (MHC) and median outpatient costs (MOC) were as the following: stage 3a: US $720.1 (IQR US$1819.3), US$128.4 (IQR US$248.2); stage 3b: US$895.2 (IQR US $2060.6), US$135.7 (IQR US$264.0); stage 4: US$1074.2 (IQR US$2790), US$182.1 (IQR US$401.8); stage 5: US$2148.4 (IQR $2856.9), US$ 362.4 (IQR US$2226.7). In high cost group of patients, MHC and MOC were: stage 3a: US$12346.6 (IQR US$7704.2), US$5051.8 (IQR US$6158.4); stage 3b: US$12295.9 (IQR US$6486.1), US$3645.6 (IQR US$5282.8); stage 4: US$13014.7 (IQR US$12305.0), US$4850.9 (IQR US$8802.9); stage 5: US$11814.3 (IQR $10064.3), US$18869.2 (IQR US$6868). **CONCLUSIONS:** Among low cost patients, MHC stage 5 was 2.9 times higher than stage 3a and twice as high as stage 4. For high cost patients, stage 5 MOC was 3.7 times higher than stage 3a.

PHS55

HEPATITIS C COST STUDY C, BRAZIL, 2014

Itria A, Mendes GB
GOIAS UNIVERSITY, goiânia, Brazil

OBJECTIVES: Identify and measure direct medical, non-medical and indirect costs related to Hepatitis C and associated conditions in Brazil. **METHODS:** The costs of hepatitis C and associated conditions were estimated using the base year 2014. The perspective of the Unified Health System (SUS) and that of society was adopted. The data were obtained from universal access information systems provided by the Ministry of Health. Direct medical, non-medical and indirect direct costs were evaluated using the macro-costing methodology for each of the clinical conditions identified through the International Classification of Diseases (ICD 10). **RESULTS:** The estimated total medical direct cost of the different stages of HCV infection accounted for more than 399 million reais in 2014. Chronic hepatitis C, liver transplantation and liver fibrosis and cirrhosis were responsible for the largest portions of this amount, respectively 86.9, 12.1 and 0.6% of total direct medical costs. The non-medical direct cost, for all clinical conditions (CID), accounted for more than 1,400,000 reais. Where transport costs of patients and caregivers in chronic hepatitis C accounted for 69.4% of this value. The estimated total cost for the indirect cost of hepatitis C and associated conditions was over 6 million reais in 2014. The clinical condition responsible for 50% of this value was liver fibrosis and cirrhosis. **CONCLUSIONS:** This study allowed to show the economic impact of hepatitis C and associated conditions in Brazil, from the perspective of the Unified Health System and that of society. Health expenditures and losses evidenced the need for actions aimed at the prevention of HCV infection, as well as policies to reduce the price of antivirals; Which may be important strategies to reduce the consumption of resources in this reality. Both those used by the health service to defray the various actions and services, as well as the expenses or lost by society.

PHS56

HEALTH CARE COSTS DUE TO DIABETES MELLITUS 2 IN A COLOMBIAN POOR POPULATION AFFILIATED TO A CARDIOVASCULAR RISK MANAGEMENT PROGRAM

Martínez-Zarzuk J[1], Moreno Ruiz DV[2], Alvis Zakzuk J[3], Paz Wilches J[4], Carrasquilla-Sotomayor M[1], Alvis-Zakzuk NR[1], Alvis Guzman N[5]
[1]ALZAK Foundation, Cartagena, Colombia, [2]Universidad de Cartagena, Centro de Investigación y Docencia, Hospital Infantil Napoleón Franco Pareja, Cartagena de Indias, Colombia, [3]Alzak foundation, Cartagena, Colombia, [4]Mutual Ser EPS, cartagena, Colombia, [5]ALZAK Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia

OBJECTIVES: To estimate the direct medical costs due to type 2 diabetes mellitus (DM2) in a poor population affiliated to a cardiovascular risk management program. **METHODS:** A retrospective cohort of 61,611 patients affiliated to a cardiovascular risk management program of a Colombian state-subsidized health insurance company was followed during 2015. Direct medical annual costs in inpatients and outpatiens with DM2 were analyzed from the third party payer perspective using the top-down costing approach. Costing information were retrieved from the financial ambulatory and hospitalization records of the insurance company and converted to US 2015 dollars. Patients were analyzed by cardiovascular risk according to the Framinghan score. Medians and interquartile ranges (IQRs) were calculated and two group of patients were defined from total costs results: low cost: TC < percentile 75+1.5 IQR and high cost: TC>percentile 75+1.5IQR. **RESULTS:** 36.4% (22,412) of patients of the program resulted to be diabetic. Of these, 59.7% are classified as high risk, 19.4% as low risk and 1.3% as medium risk. The remaining 19.6% were not classified by the program. The median outpatient health care cost of a DM2 patient was USD$ 93.8 (RIC: USD$37.6-USD$206.2]. The median inpatient cost

of a high risk patient from the low cost group was USD$1,631.9 (RIC: USD$814.03-USD $3,539.9], of a médium risk patient was USD$1,179.1 (RIC: USD $559.2-USD$2,640.03) and of a low risk patient was USD$1,159.9 (RIC: USD$600.6-USD$2,177.7]. The median inpatients costs of the high cost group of patients were: high risk: USD$17,114.2 (RIC: USD$13,440.1-USD$24,111.2], médium risk: USD$16,767.8 (RIC: USD$12,134.7-USD $23,304.5) and low risk: USD$12,953 (RIC: USD$9,269.8-USD$19,893.6). **CONCLUSIONS:** Cardiovascular risk level is related to health care costs of DM2 Patients. These findings justify the investment to control DM2 high risk patients.

PHS57

EVALUATION OF MEDICAL RESOURCE USE AND COSTS AMONG PATIENTS WITH NON-CARDIOEMBOLIC ISCHEMIC STROKE IN BEIJING

Wei C[1], Fan D[2], WANG Y[3], PAN Y[3], HAN Q[4], HU Y[1]
[1]Peking University Health Science Center, Beijing, China, [2]Peking University Third Hospital, Beijing, China, [3]Capital Medical University, Beijing Tiantan Hospital, Beijing, China, [4]Hospital Health Insurance Management Committee of Chinese Hospital Association, Beijing, China

OBJECTIVES: To estimate medical resource use and direct medical cost of patients with non-cardioembolic ischemic stroke (IS) in Beijing, China. **METHODS:** This was a retrospective cohort study using Beijing Urban Employee Basic Medical Insurance database. Patients (≥18 years old) hospitalized with a primary diagnosis of non-cardioembolic ischemic stroke (index event) between Oct.01 2012 and Dec.31 2014 were included. High-risk patients were further identified by Essen Score ≥ 3, with absence of smoking information in the database. 2-year before and 1-year after index date was observed to analyse the baseline characteristics and direct medical cost. SAS 9.2 was used to conduct the statistical analysis. **RESULTS:** A total of 33,730 patients were included in the study, with mean age of 67.1 years and 68.7% male. 59.1% (N=19,942) were identified as high-risk patients. On average, patients experienced 1.2 ± 0.7 IS-related hospitalizations including index event every year. For all patients, the mean length of stay (LOS) was 15.3 days and the mean medical cost was 19651.5 RMB per admission. High-risk patients had a LOS of 16.0 days and medical cost of 20752.4 RMB. Among the annual IS-related hospitalization cost (RMB 24417.9) for total patients, medication cost accounted for 47.6%, followed by diagnosis/examination cost (37.7%), material cost (9.4%) and others. However, the 4 types of evidence-based secondary preventive drugs all together only accounted for 6.7% of medication cost above: 2.2% for antiplatelet therapy, 1.1% for antidiabetic medication, 1.9% for Lipid-lowering medication and 1.5% for antihypertensive medication, with 86.2%, 46.6%, 81.0% and 72.7% of patients were prescribed, respectively. Similar cost distribution was found for high risk patients. **CONCLUSIONS:** Patients with ischemic stroke suffered considerable economic burden. The major component of the medical cost was medication cost while the secondary prevention medications for ischemic stroke only accounted for a small proportion of it.

PHS58

MEDICAL COSTS ASSOCIATED WITH 30-DAY READMISSIONS AMONG PATIENTS WITH HEART FAILURE AND PERSISTENT HYPONATREMIA

Amin A[1], Sundar S[2], Chase S[2], Harmon AL[3], Kamat SA[2], Ortendahl JD[3]
[1]University of California, Irvine, CA, USA, [2]Otsuka Pharmaceutical Development & Commercialization, Princeton, NJ, USA, [3]Partnership for Health Analytic Research, LLC, Beverly Hills, CA, USA

OBJECTIVES: To estimate the medical costs among hospitalized heart failure patients discharged with or without corrected sodium. Hyponatremia (HN), defined as a serum sodium level <135 mmol/L, commonly occurs among patients hospitalized with heart failure (HF). Donzé et al. (Am J Med.2016;129(8)) established an association between persistent HN (sodium level <135 at both admission and discharge) and increased risk of all-cause 30-day readmissions. Since readmission rate is an important quality measure, healthcare professionals may benefit from understanding the costs associated with discharging patients with uncorrected sodium. **METHODS:** An interactive Microsoft® Excel-based economic model was developed to monetize (2016 $US) the risk of 30-day readmissions. Per the multivariable logistic regression analyses in Donzé et al., patients who were admitted and subsequently discharged with sodium <135 mmol/L are 1.28 times (95% CI 1.11-1.48) more likely to be readmitted compared to patients discharged with corrected sodium. To translate the risk of readmission into a practical metric such as costs, the current economic model calculated the average cost for patients discharged with corrected sodium as: [(Number of patients discharged with corrected sodium X Hospitalization cost) + (Number of patients readmitted X Hospitalization cost)]/ Number of patients discharged with corrected sodium. Similarly, average cost for patients discharged with uncorrected sodium was calculated. The numerical difference was the economic burden associated with discharging patients with uncorrected sodium. The model used readmission rate inputs from Donzé et al. and hospitalization costs from the Healthcare Costs and Utilization Cost Project and Premier Inpatient data, with an interactive functionality allowing users to specify costs for their own hospitals. **RESULTS:** Discharging HF patients with uncorrected sodium increased costs from $488-$507 per discharge compared to patients with sodium >135 mmol/L. **CONCLUSIONS:** Due to outcomes improvement over the continuum of care, results support the financial value of upfront monitoring and correction of low sodium before discharge.

PHS59

ECONOMIC BURDEN OF VERY PRETERM BIRTH: A SYSTEMATIC LITERATURE REVIEW

Sarda SP[1], Abogunrin S[2], Zhang Y[2], Sarri G[2]
[1]Shire, Lexington, MA, USA, [2]Evidera, London, UK

OBJECTIVES: We conducted a systematic literature review to evaluate healthcare resource utilization (HCRU) and costs associated with very preterm birth (<32 weeks' gestational age [wGA]) in North America (NA) and Europe. **METHODS:** Searches were conducted systematically in indexed literature databases for English-language articles published from January 2011 to July 2016. Eligible studies reported results on the economic burden (HCRU/costs) of very preterm birth in NA or Europe. **RESULTS:** Twenty-eight studies from NA (20 US, 8 Canada) and 20 from Europe (16 countries) were included. The majority reported HCRU/costs during the neonatal/infancy period (age <1y); 5 studies in NA and 10 in Europe reported follow-up at ≥1y, of which 1 in NA and 4 in Europe reported follow-up at ≥5y. Most studies reported inpatient or drug utilization/costs, whereas limited data were found on outpatient HCRU/costs. Total direct costs (reported in 6 studies; 4 NA, 2 Europe) among very preterm infants were generally high, particularly for those with lower GA at birth (e.g. $67,467 for children born at <28 wGA [extremely preterm], $54,554 at 28–32 wGA, $10,010 at 33–36 wGA, from birth–10y, in a Canadian study) and surgery ($196,196 vs $104,577, for infants with patent ductus arteriosus with and without surgical ligation, respectively, from birth to discharge, in a US study). Presence of chronic lung disease and congenital heart disease were also shown to increase inpatient costs from birth to discharge (2 US studies). Only 1 study in each of NA and Europe reported indirect costs, limiting conclusions that can be drawn for such outcomes. **CONCLUSIONS:** HCRU and costs associated with very preterm birth are substantial, and likely increase with lower GA at birth, comorbidities or need for surgery. Evidence on indirect costs and long-term economic consequences of very preterm birth is limited, with few studies reporting HCRU/costs beyond early childhood.

PHS60

ECONOMIC IMPACT OF UNINTENTIONAL CARBON MONOXIDE POISONING IN THE UNITED STATES

Ran T[1], Nurmagambetov T[2], Sircar K[2]
[1]Centers for Disease Control and Prevention, Atlanta, GA, USA, [2]Centers for Disease Control, Atlanta, GA, USA

OBJECTIVES: The purpose of this study was to estimate the morbidity cost of Unintentional Non-fire (UNFR) Carbon Monoxide (CO) poisoning, including medical costs and non-health-sector costs. We also compared the costs and benefits of installing CO detectors in residences. **METHODS:** We used 2009–2013 charges and cost data from the National Inpatient Sample (NIS), Nationwide Emergency Department Sample (NEDS) of Healthcare Cost and Utilization Project (HCUP), and Truven© Health MarketScan Commercial Claims and Encounters and Medicare Supplemental data. We directly measured the morbidity cost as the summation of medical and non-health-sector costs from different health care services using micro-costing method. Benefit of installing CO detector was estimated by summing up the morbidity cost and mortality cost (value of life). All the costs were converted into 2013 dollar. **RESULTS:** Total annual medical cost ranged from $33.6 to $38.1 million. Hospitalizations, outpatient hospital visits, and emergency department (ED) visits accounted for approximately two thirds of the medical cost. Annual non-health-sector costs varied from $3.7 to almost $5 million, approximately 80% of which were related to time spent on hospitalization and ED visits. Total morbidity cost (resulting from medical cost and non-health-sector cost) was between $37.3 and $43.1 million annually. Total annual benefit of installing CO detectors, including 60% of the morbidity cost averted and 50% of the mortality cost averted, ranged from $1.6 billion to $2.2 billion. Therefore, the benefit-to-cost ratio of installing CO detectors in residences can be as high as 7.9 to 1 in the least expensive case. **CONCLUSIONS:** UNFR CO poisoning causes significant economic burden in the U.S. The benefit of using CO detectors in homes can considerably exceed the cost of installation. Public health programs should use these findings to promote broad installation of CO detectors in homes.

PHS61

COSTS OF THE ACUTE OTITIS MEDIA IN PEDIATRICS, IN A CITY OF THE COLOMBIAN CARIBBEAN COAST

Coronell-Rodríguez W[1], Arteta Acosta C[1], Alvis-Guzmán N[2], Alvis-Zakzuk NJ[3]
[1]University of Cartagena, Cartagena, Colombia, [2]Universidad de Cartagena, Centro de Investigación y Docencia, Hospital Infantil Napoleón Franco Pareja, Cartagena de Indias, Colombia, [3]Universidad de Cartagena. Centro de Investigación y Docencia. Hospital Infantil Napoleón Franco Pareja, Cartagena de Indias, Colombia

OBJECTIVES: To estimate the costs of acute otitis media (AOM) in pediatric patients in Cartagena Colombia. **METHODS:** Prospective study of microcosteo from 2014 to 2015. The direct and indirect costs of AOM were determined through forms applied to parents or caregivers. Loss of productivity was estimated based on the monthly legal minimum wage of 2014 (COP $ 616.000) (USD $ 308). **RESULTS:** A total of 62 episodes of AOM were present. Total economic costs attributed per OMA episode were COP $ 358.954 of ± $ 254.903 (USD $ 179). The total economic burden was COP $ 22.503.141 (USD $ 11,250), indirect costs per episode were COP $ 101.402 (USD $ 51) and the average time spent by parents on care was 3.7 days. **CONCLUSIONS:** The estimated costs of AOM in this study are lower than the costs estimated in a review of high income countries (1) and similar to low income countries such as Nigeria (2). Information on total costs (direct and indirect) of AOM are necessary for public health decision-making and for full cost-effectiveness assessments.

PHS62

ASSOCIATION BETWEEN ASTHMA MEDICATION USE AND TOTAL HEALTHCARE COSTS AMONG PATIENTS WITH ASTHMA

Dave I[1], Nagar SP[2], Arif AA[1], Laditka SB[1], Huber LR[1]
[1]University of North Carolina Charlotte, Charlotte, NC, USA, [2]RTI Health Solutions, Research Triangle Park, NC, USA

OBJECTIVES: To compare health care costs among persons with asthma who took daily asthma medications with those who did not. We also evaluated whether costs differed by age or race/ethnicity. **METHODS:** This cross-sectional study used data from the 2012-2013 Medical Expenditure Panel Survey (MEPS) to identify persons with asthma age ≥18 who reported taking one or more daily medication to prevent

asthma exacerbations (asthma medication). Medication use and health care costs were self-reported. A two-part linear regression model was used to calculate total health care costs for persons with asthma controlling for age, gender, race/ethnicity, insurance status, Charlson's comorbidity index (CCI), and asthma attack in past 12 months. Tests of homogeneity were used to determine if costs differed by age or race/ethnicity. **RESULTS:** Of 1,336 adults who reported having asthma, 60.2% reported taking daily asthma medication. About half were non-Hispanic white, women, and aged 41-64 years. Nearly 85% reported at least one comorbidity at baseline; 60% reported having an asthma attack in the last 12 months. In adjusted results, total direct healthcare costs were significantly higher for persons who reported taking daily asthma medications compared with those who did not ($15,149 vs $7,485; $p<0.001$). This association differed by race/ethnicity and age: non-Hispanic whites and persons aged 41-64 years reported greater total healthcare costs ($p<0.001$). **CONCLUSIONS:** Persons with asthma who took daily asthma medication had higher health care costs compared to those who did not. It would be useful for future research to identify factors that may be associated with higher costs and to explore racial/ethnic disparities. Results could help medical and public health practitioners to better understand issues related to high healthcare costs, and may be useful to develop strategies to reduce these costs among persons with asthma.

PHS63

BURDEN OF ILLNESS IN CYSTIC FIBROSIS: A RETROSPECTIVE ANALYSIS OF MEDICAL EXPENDITURE PANEL SURVEY (MEPS) DATA

Vadagam P[1], Kamal KM[2], Mukherjee K[3], Covvey JR[2], Giannetti V[2]
[1]Duquesne University Mylan School of Pharmacy, PITTSBURGH, PA, USA, [2]Duquesne University Mylan School of Pharmacy, Pittsburgh, PA, USA, [3]Philadelphia College of Osteopathic Medicine, Philadelphia, PA, USA

OBJECTIVES: Cystic fibrosis (CF) is a chronic lung disease occurring at a rate of 1 in 3,400 births and affecting 30,000 people in the U.S and 70,000 globally. Current understanding of the burden of CF within the health care system is lacking. The goal of the present study is to estimate the cost of illness of CF using publicly available data. **METHODS:** The study is a retrospective analysis of Medical Expenditure Panel Survey (MEPS) data from 2010-2014 using ICD-9-CM diagnosis code for principal diagnosis CF (277.xx). Descriptive analyses were conducted to assess patient demographics, clinical characteristics such as comorbidities and resource utilization related to events in different settings. Cost calculations included expenditures occurring in inpatient, outpatient, office, home health and emergency visits, as well as prescription drugs utilization. Unweighted and weighted annual and cumulative out-of-pocket (OOP) costs and total health care costs were calculated. All statistical analyses were conducted using Statistical Analysis System 9.4 (SAS Institute; Cary, NC). **RESULTS:** A total of 130 unique CF cases were available, of whom 109 (83.8%) reported using a CF-related medical service. The mean age of the sample was 38.2 ± 25.3 years with a mean household income of $59,903.78 ± 54,970.57. The cohort was predominantly female (n=70; 64.2%), Caucasian (n=71; 65.1%), privately insured (n=73; 67.0%) and most commonly had comorbid hypertension (n=45; 41.3%). Over 5 years, unweighted cumulative OOP costs were $31,828.58 and total health care costs were $455,539.70. Prescription medications accounted for 57.5% of OOP costs ($18,328.66) and 33% of total health care costs ($150,634.20). Using weighted data, the cumulative OOP costs was $615,098,138 and total healthcare costs was $6,691,134,764. **CONCLUSIONS:** The study provides health care expenditure estimates for individuals with CF. These estimates can serve as a guide for policy makers to better determine resource utilization and cost-effectiveness of treatments in CF.

PHS64

HEALTHCARE RESOURCE UTILIZATION AND COSTS OF RENAL IMPAIRMENT IN PATIENTS WITH MULTIPLE MYELOMA

Bhowmik D[1], Song X[2], Intorcia M[3], Kent ST[4], Shi N[4]
[1]Amgen Inc., Thousand Oaks, CA, USA, [2]Truven Health Analytics, Shrewsbury, MA, USA, [3]Amgen (Europe) GmbH, Zug, Switzerland, [4]Truven Health Analytics, Cambridge, MA, USA

OBJECTIVES: Renal impairment (RI) is a common complication of multiple myeloma (MM). Up to 61% of MM patients experience RI. This study estimated economic burden associated with RI in MM patients in the US. **METHODS:** In this retrospective cohort study patients ≥ 18 years old with ≥1 inpatient or ≥2 outpatient MM diagnoses between 1/1/2008 - 3/31/2015 were identified from MarketScan® Commercial and Medicare Supplemental Databases. RI patients had ≥1 diagnosis of chronic kidney disease (CKD) Stage I-V (first CKD diagnosis date = index date) on or after the first MM diagnosis, and were propensity score matched 1:1 to MM patients without RI (controls). All patients had ≥6-month continuous enrollment prior to index date and were followed for ≥1 month from index date until the earliest of inpatient death, end of continuous enrollment, or end of the study period (9/30/2015). The average per-patient per-year (PPPY) healthcare resource utilization and costs were measured during follow-up. Costs were total reimbursed amount in 2016 dollars. **RESULTS:** A total of 2,541 MM patients with CKD and 2,541 matched controls met the study criteria (mean age: 69.3-69.6 years; male: 55%; mean days in follow up: 533-572). They were well-balanced on baseline demographic, clinical characteristics and costs. Compared to controls, CKD patients had significantly higher proportions (57.1% vs. 32.1%) and number (1.2 vs. 0.5) of inpatient admissions, emergency room visits (5.1 vs. 3.3), and total costs ($106,634 vs. $71,880). Sensitivity analyses found that patients with CKD stage III-V had $38,412 higher costs and patients with CKD or end stage renal disease had $78,455 higher costs (PPPY) than matched controls. $P<0.001$ in all comparisons. **CONCLUSIONS:** The economic burden associated with RI in patients with MM was estimated to be between $34,754 and $78,455 PPPY. Given its substantial impact, preservation of renal function is important in MM patient care.

PHS65

TOTAL COST OF CARE AMONG PATIENTS WITH EXTENSIVE DISEASE SMALL CELL LUNG CANCER (ED-SCLC)

Danese M[1], Gleeson M[1], Lubeck D[1], Bobiak S[2]
[1]Outcomes Insights, Inc., Westlake Village, CA, USA, [2]Bristol-Myers Squibb, Plainsboro, NJ, USA

OBJECTIVES: Cost-of-care information in ED-SCLC is limited. Most studies include only treated patients and do not provide costs over time or by chemotherapy status. This study was designed to quantify total direct medical costs 90 days and 1 year post-diagnosis for a cohort of US Medicare patients with ED-SCLC (overall and according to receipt of outpatient chemotherapy within 90 days of diagnosis). **METHODS:** Using Surveillance, Epidemiology, and End Results (SEER) data linked to Medicare claims, we identified patients aged ≥66 years with Medicare Parts A and B coverage and a first primary, ED-SCLC SEER diagnosis (pathologically confirmed) between 1/1/2007 and 12/31/2011. Patients were followed from diagnosis until death, second primary cancer, coverage change, or 12/31/2013. Treatment was determined using Medicare claims. Medicare-paid amounts were adjusted to 2013 US dollars using the Consumer Price Index medical component. Cumulative incremental direct medical costs were estimated, accounting for censoring with bootstrapped confidence intervals (CI). **RESULTS:** In our cohort of 5498 patients with ED-SCLC, mean age was 75 years (range: 66-98), 49% were male, and 86% were white. Median survival time for all patients was 4.7 months. Mean cumulative incremental cost per patient was $29,213 (95% CI: $28,589-$29,838) at 90 days and $50,206 (95% CI: $49,151-$51,260) at 1 year. Hospitalizations accounted for 56% of first-year costs. Of 3014 patients initiating outpatient chemotherapy within 90 days of diagnosis, 87% received platinum/etoposide. Mean costs were higher for chemotherapy-treated patients than untreated patients (n=2484) 90 days post-diagnosis ($30,182 [95% CI: $29,464-$30,901] vs $27,949 [95% CI: $26,877-$29,022]) and 1 year post-diagnosis ($61,532 [95% CI: $60,187-$62,877] vs $36,068 [95% CI: $34,585-$37,550]). **CONCLUSIONS:** A substantial portion of first-year costs for patients with ED-SCLC were incurred within 90 days of diagnosis. First-year costs were higher for patients initiating outpatient chemotherapy within 90 days than for untreated patients. Novel therapies could affect costs by reducing hospitalizations.

PHS66

COST-EFFECTIVENESS ANALYSIS OF A KIDNEY TRANSPLANT PROGRAM IN A PRIVATE, PHILANTHROPIC AND TERTIARY HOSPITAL IN BRAZIL

Malheiro DT[1], Matos AC[1], Morgado S[2], Pacheco-Silva A[2], Neto MC[1]
[1]Hospital Israelita Albert Einstein, São Paulo, Brazil, [2]Hospital israelita albert einstein, Sao Paulo, Brazil

OBJECTIVES: In 2015, according to Brazilian Transplant Register, there were 19.440 patients on kidney waiting list. Kidney transplantation (KT) remains the most effective treatment for end stage renal disease. However, there are few studies about cost in transplant in Brazil and decided to conduct a cost-effectiveness analysis of our KT program **METHODS:** We conducted a retrospective analysis where we included all patients that underwent KT in 2015. We collected data about costs per patient including the pre transplant phase (eligibility evaluation for the transplant, listing and outpatient follow up), the transplant and post-transplant phases, until 1 year of follow up. The unit costs of materials and medicines correspond to the average direct costs of acquisition. For the survival analysis we used Cox model, including all KT performed from 2002 to 2016. The values of GDP per capta and dollar exchange rate were the ones from 12/2015, being U$ 6.963,94 and BRL 3,91, respectively. Cost-effective therapy was defined here when the cost for each year of life saved was lower than 3x GDP (U$20,891.82). **RESULTS:** In 2015, 95 renal transplants were carried out. The mean and median costs of KT were U$ 37,329.50 and U$ 29.375,29, respectively. For survival analysis 967 KT were included. The calculated survival was 14.3 years. The cost per year of life saved was U$2,606.81. Considering the limit of 3x of GDP, the KT was considered a cost-effective therapy and 5,3 years of lifespan would be necessary for the treatment to be paid off. There would still be 9 years for the recipient to produce wealth, generating U$62,675.46 during that time span. **CONCLUSIONS:** The KT was considered cost-effective once it has generated enough survival results to cover the transplant costs and still generate wealth for the country.

PHS67

COST EFFECTIVENESS OF STROKE UNIT EQUIVALENT CARE FOLLOWED BY EARLY SUPPORTED DISCHARGE IN RURAL AREA

Zheng Y[1], Ohinmaa A[2], Jacobs P[1], Chuck A[1], Jeerakathil T[2]
[1]Institute of Health Economics, Edmonton, AB, Canada, [2]University of Alberta, Edmonton, AB, Canada

OBJECTIVES: To improve the outcome of stroke care in rural areas, a model of Stroke Unit Equivalent Care (SUEC) with/without early supported discharge (ESD) services was developed in Alberta, Canada. The objective of this study was to evaluate the cost-effectiveness of SUEC and SUEC followed by ESD (SUEC&ESD) compared with the pre-setting (nonSUEC). **METHODS:** We developed a three-arm cost-effectiveness model to compare three stroke care models: nonSUEC, SUEC and SUEC&ESD using health administrative data. We estimated the 180-day mortality in a generalized linear model with binomial family and estimated costs with gamma family. We applied the predicted mortality to Alberta age-sex specific life expectancy to calculate life-year expectancy for each patient after stroke onset. We applied a multi propensity score method with multinomial logit model to correct potential bias from observation data. We calculated the risk-adjusted incremental cost (IC), incremental effectiveness (IE), and then incremental cost-effectiveness ratios (ICERs). We performed 2,000 bootstrapping on study populations and presented them in cost-effectiveness plane for sensitiveness analysis. **RESULTS:** Of 988 patients retrieved, 895 new stroke patients were selected for the analyses. SUEC was less costly and more effective than the nonSUEC (IC= -$3,378, IE=0.45 year, ICER= -$7,522 per life-year gain). The SUEC&ESD was more costly but also more effective than either the SUEC (IC=$5,179, IE=1.64 year,

ICER=$3,154 per life-year gain) or the nonSUEC (IC=$8,557, IE=1.19 year, ICER= $7,174 per life-year gain). **CONCLUSIONS:** With a willingness-to-pay value threshold of $50,000, the SUEC was dominant strategy with lower in-hospital mortality and lower direct health care costs than the nonSUEC. The SUEC&ESD was also cost-effective when compared with the nonSUEC or the SUEC. This new model of care reduces urban/rural care discrepancies providing lower mortality for stroke while providing good value to the healthcare system.

PHS68

TO EVALUATE THE COST-EFFECTIVENESS OF BRENTUXIMAB VEDOTIN IN PATIENTS WITH RELAPSED/REFRACTORY HODGKIN LYMPHOMA WHO HAVE RECEIVED CHEMOTHERAPY/ CHEMOTHERAPY WITH STEM CELL TRANSPLANTATION AS FIRST LINE THERAPY FROM A US HEALTHCARE PERSPECTIVE

Patidar M, Campbell JD
University of Colorado Denver, Aurora, CO, USA

OBJECTIVES: To evaluate the cost-effectiveness of brentuximab vedotin in patients with relapsed/refractory Hodgkin Lymphoma as compared to Chemotherapy/ Chemotherapy with stem cell transplantation as first line therapy from a US healthcare perspective. **METHODS:** An Excel based Markov model was developed with three health states to follow the clinical end points reported in the AETHERA clinical trial. Health states included were Progression free survival, Progressed disease and Death. Progressed disease was defined as disease that progressed with time in scope and/or severity. Brentuximab vedotin was compared with the first line treatments like chemotherapy or chemotherapy with stem cell transplantation. The model outcomes were quality-adjusted life years (QALYs) and incremental cost per QALY. Model inputs such as transition probabilities, cost of drug and procedures, resource utilization and utilities of each health states were used from previously published literature. Due to short follow-up of patients in the trial, an extrapolation was assumed by holding fixed the relative rates observed in the trial to observed overall survival and progression free survival for a life time horizon. Deterministic and probabilistic sensitivity analysis was performed in the end to assess the effect of uncertainties in the model. **RESULTS:** In the base case analysis, the QALYs gained with brentuximab vedotin as compared to standard of care was 0.31 and incremental cost was $26,000. The incremental cost-effectiveness ratio for the base-case was $80,345/QALY gained. The probabilistic sensitivity analysis yielded incremental cost-effectiveness ratios in the range of $55000 – 111000/ QALY. **CONCLUSIONS:** The brentuximab vedotin cost-effectiveness findings appear to be in-line with or more favorable than many other newly approved anti-cancer therapies. At a willingness-to-pay of $100,000/QALY, brentuximab vedotin was found to be cost-effective more than 50% of the time.

PHS69

COST EFFECTIVENESS OF A HOME VISITATION PROGRAM FOR MOTHERS WITH POSTPARTUM DEPRESSIVE SYMPTOMS

Nguyen LK[1], Lal L[1], Chung TH[2], Le Y[2], Begley C[1], Bourg A[2], Van Horne B[3], Taylor L[2], Harris R[2], Swint J[1]
[1]*University of Texas School of Public Health, Houston, TX, USA,* [2]*The University of Texas Health Science Center at Houston - Medical School, Houston, TX, USA,* [3]*The University of Texas Health Science Center at Houston- Medical School, Houston, TX, USA*

OBJECTIVES: To evaluate the mental health benefits and cost-effectiveness of HOPE, a home visitation program for mothers at risk for postpartum depression. **METHODS:** A pre-post study was performed among women who were seen for postpartum visit within 8 weeks after giving birth (n = 169) during October 2014 - September 2016. The Edinburgh Postnatal Depression Scale (EPDS) and Brief Symptom Inventory-18 (BSI-18) assessments were administered at first and last home visit and at 3-month or 6-month follow-up. Mean pretest scores were compared with mean posttest scores, either at last home visit or at follow-up. The percentage of individuals who screened positive for depression was compared between pre and post intervention periods. Cost effectiveness analysis was conducted from the health care provider's perspective to estimate the average cost per unit change in EPDS and BSI-18 score and per reduction in the number of depressed woman. Program cost data in 2014 dollars included costs of office supplies, assessments, transportation, and program personnel. **RESULTS:** Among 169 HOPE participants, 52 and 32 women completed both pretest and posttest EPDS and BSI-18 assessments, respectively. There was an average improvement of 7.48 points ($p<0.05$) in EPDS score between pre- (16.46 $\pm$ 4.37) and post-intervention (8.98 $\pm$ 5.66) scores. The proportion of participants with depression was reduced by half, from 98.1% (51 women) to 44.23% (23 women) post-intervention. An average improvement in BSI-18 score of 14.09 points ($p<0.05$) was achieved. With an average cost per visit of $131, cost per unit of scale score improvement on EPDS and BSI-18 score was $88.1/unit and $47.9/unit, respectively. The cost per additional person improving from depressed to not depressed was $23.50. **CONCLUSIONS:** HOPE, the home visitation program demonstrated significant benefits including reduced severity of depression and psychological distress. The health improvement was achieved at modest cost suggesting the program is cost effective.

PHS70

MINIMUN COST-ANALYSIS OF METASTATIC MELANOMA TREATMENT BASED ON PATIENTS'S WEIGHT

García Gil S[1], Viña Romero MM[2], Nazco Casariego GJ[1], González García J[1], González de la Fuente G[1], Calzado Gómez G[1], Ramos Rodriguez J[1], Gutiérrez Nicolás F[1]
[1]*Complejo Hospitalario Universitario de canarias, San Cristobal de La Laguna, Spain,* [2]*Hospital Universitario Nuestra Señora de La Candelaria, Santa Cruz de Tenerife, Spain*

OBJECTIVES: Incorporation of new therapies for the treatment of metastasic melanoma(mM) in our hospitals has resulted in the requirement of measures to optimize available resources.The aim of this study is to perform a cost-minimization analysis for the treatment of mM based on current therapies, immunotherapy and antiBRAF-antiMEK targeted drugs. **METHODS:** Treatments were: nivolumab, pembrolizumab and vemurafenib-cobimetinib and dabrafenib-trametinib. Only direct costs of acquisition of drugs were assessed. Linear-modeling was made, which allowed us to represent the anual-costs of each treatment against the patient's weight with a timeframe of one year. A deterministic model for the sensitivity analysis was performed incorporating the costs of staying in oncology-day-hospital and the outpatient-units and vial use optimization. **RESULTS:** Base-case: nivolumab is shown as the least expensive treatment regardless of the patient's weight, but with an equal cost to pembrolizumab in patients weighing between 74-76kg. Moreover in patients over 76kg weight is less expensive to use vemurafenib-cobimetinib than pembrolizumab. Sensitivity-analysis1(with cost of staying in ODH): nivolumab is the less expensive therapy again, except for patients weighing 50kg; in which pembrolizumab is the most cheap treatment. The base-case results for patients over 76kg weight are repeated in this scenario. Sensitivity-analysis2(with vial-use optimization): nivolumab reappears as less expensive treatment for all weights studied. Again for patients over 76kg, the base case results are repeated in this analysis. **CONCLUSIONS:** Our results shows that nivolumab is the less expensive treatment for most patients, so with this study we wanted to show a tool to optimize resources indicating lower-cost therapy for the treatment of mM base of patient's weight. Of course, will be the characteristics of the pathological process of each patients that will determine the ideal treatment. However, in those situations where it's considered that two therapies are equivalent for a patient, this model can help to choose the suitable therapy.

PHS71

LONGTERM CLINICAL AND ECONOMIC OUTCOMES OF INTENSIVE VS STANDARD BLOOD PRESSURE REDUCTION IN NON-DIABETICS AT HIGH CARDIOVASCULAR RISK - EXTRAPOLATIONS FROM THE SPRINT TRIAL

Geisler B[1], Acharya B[1], Shrestha A[2], Pietzsch JB[3]
[1]*Massachusetts General Hospital/Harvard Medical School, Boston, MA, USA,* [2]*Harvard School of Public Health, Boston, MA, USA,* [3]*Wing Tech Inc., Irvine, CA, USA*

OBJECTIVES: Results from the recent SPRINT trial demonstrate lower rates of fatal and non-fatal major cardiovascular events and all-cause mortality in non-diabetics at high cardiovascular risk with intensive versus standard treatment, i.e., less than 120 versus less than 140 mmHg systolic, respectively. However, the long-term outcomes remain unknown. **METHODS:** A validated state transition model with multivariate risk equations was populated with the baseline characteristics of the SPRINT trial, and cost and health-related quality of life data for the United States. Model projections, based on trial-observed blood pressures, were compared to actual median follow-up trial results for calibration. To assess long-term outcomes, we projected 20-year incidence in myocardial infarctions, strokes, heart failure, and endstage renal disease, and derived relative risks and numbers needed to treat (NNT). Direct medical costs and incremental cost-effectiveness ratio (ICER in $/quality adjusted life year [QALY]), discounted at 3% p.a., were computed for both strategies. **RESULTS:** The calibrated model outcomes matched the published SPRINT trial results at a median followup of 39 months. Over the 20-year horizon, intense blood pressure control was projected to lead to lower incidences of all studied events; NNTs varied largely between clinical events such as heart failure (696) and cardiovascular and all-cause death (28 and 11, respectively). Life expectancy increased by 2.5 years (85.8 vs. 83.3 years), at similar discounted lifetime costs of about $47K and an ICER of $15,901/ QALY. **CONCLUSIONS:** Our model-based projections suggest intensive blood pressure control in nondiabetics at high cardiovascular risk is associated with significant longterm benefits. Numbers needed to prevent mortality are particularly attractive. Cost savings seem to be consumed by additional life expectancy. Patient-level data analysis via bootstrapping is necessary to quantify the uncertainty.

PHS72

COST UTILITY ANALYSIS OF A HEART FAILURE CLINIC PROGRAM IN A SPECIALIZED CLINIC IN COLOMBIA

Saldarriaga C[1], Gonzalez N[2], Orozco JJ[3]
[1]*Universidad de Antioquia, Medellín, Colombia,* [2]*Clinica CardioVID, Medellin, Colombia,* [3]*Medtronic PLC, Medellín, Colombia*

OBJECTIVES: Although there have been clinical and technological advances in the management of heart failure, high hospital readmission rate remains as a problem. There is clinical evidence that multidisciplinary and comprehensive management strategy is associated with important reduction in hospital readmission. This analysis aims to estimate the impact, in terms of quality of life, hospitalization costs, and cost-utility of a Heart Failure Clinic Program (HFCP) compared to Conventional Medical Management (CMM) in a cardiovascular institution in Colombia. **METHODS:** an Excel based cost-utility Markov model was developed. Clinical and admission rates were taken from 511 patient's institution database for 18-months follow-up period. Four Health states, one for each NYHA functional Class patient classification was considered, as well as the amount of admissions and LOS per admission. Effectiveness was calculated from the probabilities of moving from one NYHA Class to better one. Colombian general mortality rate, 3,5% discount rate and 20-years horizon were applied. Specific mortality rates for HF, were taken from Inglis-2011. The average cost for decompensated Heart Failure hospitalization was taken from local work done by Tamayo-2011, inflation updated. Incremental analysis and univariate sensitivity analysis were done. **RESULTS:** Discounted hospital cost for CMT was estimated in USD$ 143.278 vs. USD$ 58.902 for HFCP, and USD$ 84.376 cost savings. HFCP yield 4,72 discounted QALYs compared to 3,15 for CMT. The greatest QALYs gain was obtained in NYHA IV Class patients, with 13,3% improvement, followed by Class III with 7,4%. Because the low percentage participation of class IV in the total

group, it had low weigh in the final result. HFCP was dominant over CM. **CONCLUSIONS:** Compared to CMT, the HFCP yielded a higher total Quality of life to a lower admission total cost. Therefore, HFCP is dominant over CMT and is a cost-saving strategy that should be considered by policy makers.

PHS73

ESTIMATING HEALTH BENEFITS AND COST-SAVINGS FOR REDUCING THE INCIDENCE OF INVASIVE COLORECTAL CANCER IN THE UNITED STATES

Hung M[1], Ekwueme D([1], King JB[1], Chang S[2]
[1]US CDC, Atlanta, GA, USA, [2]School of Medicine, Washington University, St. Louis, MO, USA

OBJECTIVES: Healthy People 2020 (HP 2020) Objective C9 is to reduce invasive colorectal cancer (CRC) incidence from 46.9/100,000 population in 2007 to 39.9/100,000 population in 2020. This study aims to quantify the aggregate potential life-years (LYs) saved and the aggregate healthcare cost-savings if this objective were met. **METHODS:** We identified patients (n=886,380) diagnosed with invasive CRC between 2001 and 2011 from the National Program of Cancer Registries and the Surveillance, Epidemiology, and End Results Program. We stratified these patients by sex, race/ethnicity, and age into 12 cohorts. Using these data and data from the 2001-2011 US life tables, we estimated a survival function for each CRC patient cohort and the corresponding cohort of a reference population from the general population. We then computed potential LYs saved per person from the difference in life expectancies between each CRC cohort and the corresponding reference cohort. Annual healthcare cost-savings per person were estimated using data from the 2008-2012 Medical Expenditure Panel Survey. We calculated aggregate LYs saved and cost-savings by multiplying the reduced number of CRC patients with the per-person LYs saved and lifetime healthcare cost-savings, respectively. **RESULTS:** We estimated an aggregate of 150,000 LYs for males and 9,548 LYs for females would have been saved, which accounted for aggregate healthcare cost-savings of $584 million and $43 million, respectively. Per person, we estimated potential 6.3 LYs saved for both males and females, and healthcare cost-savings of $24,440 and $28,433, respectively. Among all racial/ethnic cohorts, non-Hispanic whites had the highest aggregate LYs saved and cost-savings. Among all age cohorts, patients age 65-69 years had the highest aggregate LYs saved and cost-savings. **CONCLUSIONS:** Achieving the HP 2020 objective for reducing invasive CRC rate by 15% by 2020 would potentially have public health impact by saving lives and healthcare costs.

PHS74

HEALTHCARE RESOURCE UTILIZATION ASSOCIATED WITH MANAGING DISEASE- AND TREATMENT-RELATED HEALTH EVENTS IN US MULTIPLE MYELOMA (MM) PATIENTS: REAL-WORLD ADMINISTRATIVE CLAIMS BASED ANALYSIS

Maiese EM[1], Kish J[2], Raje N[3], Mujumdar U[2], Laney J[2], Nero D[2], Mehta S[2], Feinberg B[2]
[1]Janssen Scientific Affairs, LLC, Horsham, PA, USA, [2]Cardinal Health Solutions, Dallas, TX, USA, [3]Massachusetts General Hospital Cancer Center, Boston, MA, USA

OBJECTIVES: This research estimated the real-world frequency of and healthcare resource use (HCRU) associated with health events during MM treatment. **METHODS:** MM patients initiating therapy between 01/01/2013-01/31/2016 were selected from the Inovalon More2 administrative claims database. Health events were identified by reviewing safety information from MM treatment labels and registration trials. Patients with a diagnosis of an event during MM treatment were identified (cases). Events that occurred in ≥5% of patients were included in the analysis. HCRU was assessed during a 30-day interval following the event and compared (using chi-square statistic) to a 30-day interval following a shadow date for controls (patients who did not have the event and propensity-score matched to cases). Shadow dates were determined by adding the number of days from treatment start date to event date among cases to the treatment start date among controls. **RESULTS:** Among 775 MM patients, 25 events were included in the analysis. Over the course of MM treatment, 80.8% had a claim for bortezomib, 58.3% for lenalidomide, 25.6% for cyclophosphamide, 7.2% for melphalan, 5.3% for carfilzomib, 4.7% for pomalidomide. The proportion of patients with an event ranged 5.2%-19.0%. The 5 most common events were: asthenia/fatigue (19.0%), dehydration (17.7%), nausea (17.2%), constipation (13.2%), hypokalemia (12.8%). The proportion of inpatient admissions observed among patients with an event ranged 17.7%-82.6% vs 3.8%-18.3% among controls. Inpatient admissions were most commonly observed among patients with sepsis (82.6% vs 8.7%), confusion (78.4% vs 10.8%), hyponatremia (68.9% vs 6.7%), pneumonia (68.5% vs 5.6%), and hyperkalemia (63.3% vs 8.2%) for cases vs controls, respectively; $p<0.0001$ for all. **CONCLUSIONS:** This study suggests that health events during the course of MM treatment occur frequently and with significant HCRU potentially imposing a substantial burden to patients and the healthcare system. Use of newer MM treatments with improved clinical profiles may help to reduce this burden.

PHS75

A REAL-WORLD CLAIMS ANALYSIS OF GLIOBLASTOMA COST OF CARE IN THE UNITED STATES

Norden A[1], You M[2], Dastani H[3], Bobiak S[3], Korytowsky B[3], Singh P[3]
[1]Dana-Farber/Brigham and Women's Cancer Institute, Boston, MA, USA, [2]Bristol-Myers Squibb, Plainsboro, NJ, USA, [3]Bristol-Myers Squibb, Princeton, NJ, USA

OBJECTIVES: Glioblastoma (GBM) is the most common form of primary brain cancer. Prognosis is poor, with survival beyond 2 years being rare, and the economic burden being high. The objective of this study was to evaluate total cost of care (TCC) in patients treated for GBM. **METHODS:** A retrospective GBM cohort study was conducted using US commercial and Medicare administrative healthcare claims data from Truven Health MarketScan®. Eligible patients were ≥18 years, had a malignant brain cancer diagnosis between 1/2010 and 9/2015, had brain-related surgery 90 days within diagnosis, received temozolomide (TMZ), radiation, or both within 90 days of diagnosis. TCC was calculated over 6- and 12- month periods following initiation of first-line (1L) or second-line (2L) treatment. **RESULTS:** 3,696 eligible patients with GBM were identified as receiving 1L with an average follow-up of 466 days. The majority 2,695/3,696 (73%) were treated with TMZ + radiation in 1L. During the 6 months prior to GBM diagnosis, cumulative mean direct medical costs was $12,040, with 82% incurred in the 3 months leading up to diagnosis, primarily as a result of hospitalizations. During the 6- and 12-month periods following 1L treatment start, mean total per-patient costs were $173,200 and $332,477, respectively. These were heavily driven by radiation costs. From 2L treatment to 6 and 12 months, the mean total per patient cost was $152,154 and $303,481, respectively, mainly resulting from systemic cancer therapy. Of the 3,696 patients identified in 1L, 31% patients received 2L. Most common treatments in 2L included bevacizumab (BEV) monotherapy (39%) and BEV in combination with other agents (30%). **CONCLUSIONS:** This large real-world evaluation of TCC in patients with GBM demonstrates an extensive cost burden across the treatment continuum. Novel interventions are needed to improve outcomes as well as reduce TCC by influencing outpatient and inpatient costs.

PHS76

HEALTHCARE UTILIZATION AND COSTS IN LUNG CANCER PATIENTS WITH PRE-EXISTING COPD AMONG SEER-MEDICARE BENEFICIARIES

Shah S[1], Blanchette CM[2], Arthur S[1], Coyle JP[1], Kowalkowski M[3], Howden R[1]
[1]University of North Carolina at Charlotte, Charlotte, NC, USA, [2]Precision Health Economics, Davidson, NC, USA, [3]Levine Cancer Institute, Charlotte, NC, USA

OBJECTIVES: In 2010, lung cancer accounted for $12.6 billion in total direct medical costs. We examined the healthcare utilization and costs in elderly lung cancer patients with and without pre-existing COPD. **METHODS:** Using SEER-Medicare data, we identified patients with lung cancer between 2006 to 2010, > 66 years, and continuously enrolled in Medicare Parts A and B in the 12 months prior to cancer diagnosis. Pre-existing COPD in lung cancer patients were identified using ICD-9 codes. Healthcare utilization and costs were categorized as inpatient hospitalizations, skilled nursing facility (SNF) use, physician office visits, ER visits, and outpatient encounters for every stage of lung cancer. The adjusted analysis was performed using a generalized linear model for healthcare costs and a negative binomial model for healthcare utilization. **RESULTS:** We identified 66,963 patients with lung cancer. Of these, 22,497 (33.60%) had documented COPD before lung cancer diagnosis. Healthcare utilization and costs were significantly higher in the COPD group compared to the Non-COPD group, increasing for every stage of lung cancer. Stage IV lung cancer patients with pre-existing COPD had the highest adjusted utilization per 100 person-months compared to the Non-COPD group (hospitalizations: 49.5 stays vs 31.24 stays, $p<0.0001$; SNF: 9.34 stays vs 4.78 stays, $p<0.0001$; physician visits: 2311.94 visits vs 681.84 visits, $p<0.0001$; ER: 56.58 visits vs 33.26 visits, $p<0.0001$; outpatient encounters: 2825.73 visits vs 2422.26 visits; $p<0.0001$). Similarly, the adjusted costs per person-month among stage IV lung cancer patients in the COPD group were highest compared to the Non-COPD group (hospitalizations: $3925.36 vs $2537.42, $p<0.0001$; SNF: $730.26 vs $380.49, $p<0.0001$; physician visits: $1169.49 vs $336.39, $p<0.0001$; ER: $199.71 vs $131.03, $p<0.0001$; outpatient encounters: $16021.90 vs $14025.50, $p<0.0001$). **CONCLUSIONS:** Healthcare utilization and costs among lung cancer patients with pre-existing COPD was approximately two to three times higher than the Non-COPD group.

PHS77

THE IMPACT OF COMORBID CONDITIONS ON HOSPITAL RESOURCE UTILIZATION AMONG PATIENTS WITH CYSTIC FIBROSIS

Craver C, Belk K
Vizient Inc., Mooresville, NC, USA

OBJECTIVES: Cystic fibrosis (CF) a common life-limiting autosomal recessive condition. Aside from respiratory complications the degenerative nature of CF is a causal factor for many other complicating conditions both acute and chronic. The objective of this study is to examine the impact of comorbid conditions on hospitalized CF patients. **METHODS:** A retrospective descriptive study was conducted on CF patients hospitalized in the MedAssets health system data from October 2015 through September 2016. Multivariable regression was used to identify complicating conditions that are significant drivers of inpatient admission, length of stay (LOS), and hospitalization cost. **RESULTS:** The sample included 7,936 unique patients from 298 hospitals. Half of the population was female (54.0%) with an average age of 22.4 years, and average Charlson comorbidity score of 1.4. The patient population averaged 3.7 outpatient visits during the study period. Over 29% of patients were admitted as an inpatient with an average LOS of 10.4 days and an average cost of $25,749. The population averaged nearly three comorbidities which primarily fell into respiratory (64.3%), gastrointestinal (41.6%), cardiovascular (30.4%) anxiety/depression (19.6%) disease groups. Primary predictors of inpatient admission included malnutrition (OR 5.5, 95% CL 4.8 - 6.3), chronic lower respiratory disease (OR 3.4, CL 3.3 - 3.8), epilepsy (OR 4.3, CL 3.0 - 6.1), and anemia (OR 4.2, CL 3.6 - 5.0). Once admitted respiratory failure (RR 1.6, CL 1.5 - 1.7), malnutrition (RR 1.4, CL 1.3 - 1.4), and arrhythmias (RR 1.2, CL 1.1 - 1.4) contributed to longer LOS. Additionally, coagulation defects (RR 1.2, CL 1.1 - 1.3), and coronary artery disease (RR 1.5, CL, 1.3 - 1.9) contributed to higher cost. **CONCLUSIONS:** Cystic fibrosis patients admitted to the hospital have a large number of comorbidities and complications. Improvements in disease management may lead to better patient outcomes and a reduction in hospital utilization and healthcare costs.

PHS78

HEALTH CARE RESOURCE UTILIZATION AND COSTS ASSOCIATED WITH COMORBIDITIES AMONG HIV-POSITIVE PATIENTS

Lachaine J[1], Baribeau V[2], Lorgeoux R[3], Tossonian H[3]
[1]Université de Montréal, Montreal, QC, Canada, [2]PeriPharm Inc., Montreal, QC, Canada, [3]Gilead Sciences Canada, Mississauga, ON, Canada

OBJECTIVES: The study objective was to evaluate the impact of renal-, cardiometabolic- and bone-related comorbidities on health care resource utilization and

costs in HIV-positive patients, using the Quebec (RAMQ) public drug plan database. **METHODS:** Patients who had received antiretroviral treatment for at least six months from January 2006 to June 2012 were selected. HIV-positive patients with no comorbidities were matched 1:1 for age, sex and time of follow-up and compared to HIV-positive patients with at least one comorbidity. Index date was defined as the date of the first medication, diagnosis or medical procedure related to comorbidities for the patient with at least one comorbidity, and the corresponding date of the case was defined for the controls. Cases and controls were compared with independent t-test for continuous variables and chi-square test for categorical variables. **RESULTS:** For the analysis of 1,336 HIV-positive patients with at least one renal-, cardiometabolic- or bone-related comorbidity and a matched control group of 1,336 HIV-positive patients with no comorbidities, the mean age was 45.1 years (SD=9.5) with 78.5% being male. The mean total health care cost per patient per year in the 2 years following index date was higher in HIV-positive patients with at least one comorbidity than in HIV-positive patients with no comorbidities (22,037 CAN$ SD=16,974 vs. 15,093 CAN$ SD=8,945, $p<0.01$). The higher cost in HIV-positive patients with at least one comorbidity can be explained by the higher number of hospitalization days (3.4 SD=10.9 vs. 1.0 SD=4.0, $p<0.01$) and the higher number of prescriptions (151.3 SD=261.6 vs. 76.1 SD=193.8, $p<0.01$) than in HIV-positive patients with no comorbidities. **CONCLUSIONS:** The presence of comorbidities has an impact on the burden associated with HIV leading to a significant difference in total health care cost observed between HIV-positive patients with at least one comorbidity and HIV-positive patients with no comorbidities.

PHS79

UTILIZATION AND COST OF HEALTHCARE SERVICES DURING EPISODES OF ACUTE BACTERIAL SKIN AND SKIN STRUCTURE INFECTIONS (ABSSSI) INVOLVING ADMISSION TO UNITED STATES (US) HOSPITALS: A RETROSPECTIVE OBSERVATIONAL ANALYSIS USING A LARGE HEALTHCARE CLAIMS DATABASE

Keyloun K[1], Murphy B[2], Gillard P[1], Berger A[2]
[1]*Allergan plc, Irvine, CA, USA,* [2]*Evidera, Lexington, MA, USA*

OBJECTIVES: To assess patterns of utilization and cost of healthcare during episodes of ABSSSI known/suspected to be due to methicillin-resistant Staphylococcus aureus (MRSA) involving admission to US hospitals. **METHODS:** We identified all admissions in the database from July 2010 to November 2014 with a principal diagnosis consistent with ABSSSI (ICD-9-CM codes 035.XX, 681.XX, 682.XX, 686.XX, 958.3, 998.5X). Among all such admissions, we selected those with continuous enrollment for 6 months prior to–and 44 days following–admission, and either secondary diagnoses of MRSA or receipt of anti-MRSA antibiotics. Admissions were excluded with secondary diagnoses of other infections. Care episodes were constructed, beginning with the first claim associated with ABSSSI within 7 days before the admission and ending on the earliest of either: (1) a 14-day gap in relevant claims; or (2) a claim for a non-ABSSSI infection post discharge. We examined patterns of healthcare utilization and cost during the episode (inpatient and outpatient). Reimbursed amounts were used in lieu of costs. **RESULTS:** Mean (SD) cost of ABSSSI episodes (n=30,241) was $11,894 ($10,167), of which inpatient care represented 78% ($9,287 [SD $8,153]). ABSSSI episodes lasted an average of 15.9 (5.6) days. Length of stay was ≥4 days for 25% of admissions. Fifty-three percent and 73% received outpatient care during pre- and post-admission, respectively; 93% were discharged home. While 97% received antibiotics post discharge (primarily with anti-MRSA agents), only 7% had evidence of receipt of outpatient intravenous therapy. **CONCLUSIONS:** Results of our study suggest that annual total costs of care to US payers for ABSSSI episodes known/suspected to be due to MRSA are $81.4 million. Treatment included limited use of outpatient intravenous therapy. Opportunity may exist to reduce costs of care for episodes of ABSSSI by leveraging existing guideline-driven outpatient treatment pathways and/or novel, long-acting antibiotics.

PHS80

HEALTH CARE RESOURCE UTILIZATION AND COSTS IN HIV-POSITIVE VERSUS HIV-NEGATIVE PATIENTS

Lachaine J[1], Baribeau V[2], Lorgeoux R[3], Tossonian H[3]
[1]*Université de Montréal, Montreal, QC, Canada,* [2]*PeriPharm Inc., Montreal, QC, Canada,* [3]*Gilead Sciences Canada, Mississauga, ON, Canada*

OBJECTIVES: The study objective was to evaluate the impact of HIV on health care resource utilization and costs, using the Régie de l'Assurance Maladie du Québec (RAMQ) public drug plan database. **METHODS:** Patients who had received antiretroviral treatment (ART) for at least six months from January 2006 to June 2012 were selected. HIV-negative individuals from a random sample were matched 3:1 for age, sex and time of follow-up and compared to HIV-positive patients. Cohort entry was defined for the HIV-positive patients as the date of the first script of ART and for the matched control group of HIV-negative individuals as the date of the first any diagnosis or any prescription recorded in the database. Cases and controls were compared with independent t-test for continuous variables and with chi-square test for categorical variables. **RESULTS:** For the analysis of 3,905 HIV-positive patients and the matched control group of 11,715 HIV-negative individuals, the mean age was 45.3 years (SD=11.9) with 77.3% being male. The HIV-positive patients had a higher Charlson comorbidity score (3.3 SD=3.3 vs. 0.3 SD=0.8, $p<0.01$), a higher proportion of drug or alcohol abuses (14.3% vs. 7.8%, $p<0.01$) and a higher proportion of smoking cessation medication utilization (26.7% vs. 19.4%, $p<0.01$) than the HIV-negative individuals. The mean total health care cost per patient per year in the 2 years following cohort entry was higher in HIV-positive than in HIV-negative patients (18,153 CAN$ SD=13,714 vs. 2,326 CAN$ SD=7,538, $p<0.01$). The higher cost in HIV-positive patients can be explained by the higher number of hospitalization days (2.2 days SD=8.2 vs. 0.9 days SD=6.5, $p<0.01$) and the higher number of prescriptions (105.3 SD=202.8 vs. 26.6 SD=71.0, $p<0.01$) compared to HIV-negative individuals. **CONCLUSIONS:** The impact of HIV significantly increased health care resource utilization and costs when we compared HIV-positive to HIV-negative individuals.

PHS81

HEALTHCARE UTILIZATION AND SURVIVAL ASSOCIATED WITH CLINICAL CARE PATHWAY FOR RECTAL CANCER TREATMENT

Campolina AG[1], Kobayashi ST[2], Soarez PC[3], Diz MD[4]
[1]*Cancer Institute of the State of Sao Paulo, Sao Paulo, Brazil,* [2]*Instituto do Cancer do Estado de Sao Paulo - Faculdade de Medicina da Universidade de Sao Paulo, Sao Paulo, Brazil,* [3]*Sao Paulo University, São Paulo, Brazil,* [4]*Instituto do Cancer do Estado de Sao Paulo, Sao Paulo, Brazil*

OBJECTIVES: To quantify resource utilization and to analyze survival associated with the use of an integrated care pathway (ICP) for rectal cancer treatment in a Brazilian tertiary academic oncology hospital. **METHODS:** Two cohorts of rectal cancer patients were compared: a control cohort from May06th, 2008 through May11th, 2011 (before ICP implementation – Pre-ICP group), and a cohort from May12th, 2011 through December 31, 2013 (after ICP implementation – ICP group). We included consecutive patients treated with neoadjuvant radio-chemotherapy followed by surgery. Patients with prior treatment or who have not performed the neoadjuvant treatment or with metastatic disease at diagnosis were excluded. Time intervals between treatment steps and resources used, including consultations, exams, hospitalizations, chemotherapy, radiotherapy and surgery were assessed. Survival analyses were performed. **RESULTS:** From a total of 624 patients, 330 were included: 112 Pre-ICP and 218 ICP. Interval between first medical consultation and neoadjuvant chemo-radiotherapy decreased 39.5% (Pre-ICP: 79.7 days, ICP: 48.2 days, $p<0.001$); interval between neoadjuvant step and surgery decreased 33% (Pre-ICP: 22.2 weeks, ICP: 14.8 weeks, $p<0.001$). Total time of treatment from initial consultation to surgery decreased 31% (Pre-ICP: 278.2 days, ICP: 191.8 days, $p<0.001$). We found higher utilization of consultations with clinical oncologists, CT, MRIs and radiotherapy in Pre-ICP compared to ICP ($p< 0.001$). There was no statistical difference in overall survival in the time periods examined. **CONCLUSIONS:** Implementation of a rectal cancer ICP reduced all treatment intervals and promoted rational utilization of oncology consultations and imaging, without detrimental effects in overall survival.

PHS82

HEALTH CARE RESOURCE UTILIZATION AND COSTS OF METASTATIC NON-SMALL CELL LUNG CANCER IN SELECT EUROPEAN COUNTRIES

Kurosky S[1], Lorenzo M[2], Cuyun Carter G[3], Parikh RC[1], Winfree K[3], Kaye JA[4]
[1]*RTI Health Solutions, Research Triangle Park, NC, USA,* [2]*Eli Lilly and Company Limited, Windlesham, UK,* [3]*Eli Lilly and Company, Indianapolis, IN, USA,* [4]*RTI Health Solutions, Waltham, MA, USA*

OBJECTIVES: Assess health care resource utilization (HCRU) and costs of metastatic non–small cell lung cancer (mNSCLC) among patients receiving ≥2 treatment lines in the United Kingdom (UK), Spain (SP), Germany (GE), and France (FR). **METHODS:** mNSCLC-related HCRU and treatment data were abstracted from medical records of patients aged ≥18 years who initiated 2nd line treatment for mNSCLC between January 2008, and December 2014 (UK)/January 2015 (SP, GE)/October 2015 (FR). HCRU (inpatient, outpatient, and specialist visits) was assessed as the mean number of visits per patient per month of active treatment. Costs were estimated by multiplying unit costs (obtained from official health service estimates and formulary listings) by resource use. **RESULTS:** Among 821 patients, over 70% were male and the median age at metastatic diagnosis was 62.4 years. Most tumors were adenocarcinoma (48.7%) or squamous cell carcinoma (45.1%). At metastatic diagnosis, 85.5% of patients had a performance status of ≤1. While receiving systemic treatment, median number of health care visits per month was 1.9 UK, 2.1 SP, 2.1 GE, and 2.0 FR. The most frequent type of visit in each country were outpatient consultant/hospital visits (1.5 UK, 1.4 SP, 2.0 GE, and 1.1 FR). The proportion of patients with at least one hospitalization was 14.6% UK, 20.8% SP, 32.5% GE, and 46.8% FR. Among patients with at least one hospitalization, the monthly median number of hospitalizations during systemic treatment was lowest in SP (0.1) and highest in FR (0.9). The total median monthly health care costs during active treatment were £1941 UK, €2134 SP, €2712 GE, and €3151 FR. Chemotherapy incurred the highest cost in the UK, SP, and GE. Inpatient visits incurred the highest cost in FR. **CONCLUSIONS:** Total monthly HCRU is similar across countries; however, utilization by visit type varied. Costs differed by country, with the highest total cost incurred in FR.

PHS83

SICKLE CELL DISEASE INPATIENT DATA ANALYSIS OF MEDICARE PATIENTS

Saunders W[1], Ruban C[2]
[1]*UNC Charlotte College of Health and Human Services – Health Informatics, Charlotte, NC, USA,* [2]*University of North Carolina Charlotte, Charlotte, NC, USA*

OBJECTIVES: Among the genetic-based anemias, sickle cell disease (SCD) is a major cause of morbidity and mortality. In addition to anemia, patients present with, vaso-occlusive crisis (VOC), a prevalent painful complication of SCD in adolescents and adults. Limited information is available to understand causes and types of readmissions for patients with SCD VOC to determine the quality and efficiency of SCD care, the potential budget impact and the need for improvement. The objective is to understand the frequency and charges of readmission among SCD patients discharged following a VOC. **METHODS:** Using Medicare data, we calculated readmission rates among patients with a primary diagnosis of unspecified VOC (International Classification of Diseases, 9th Revision, Clinical Modification diagnosis code 282.62, 282.64, 282.69, 282.42). Readmission was defined an all-cause hospital admission or VOC admission within 3, 7, 15 and 30 days after the index admission. **RESULTS:** There were 1, 753 institutions (individual and organization

health care providers) with VOC related discharges from January to December 2013. The average all cause readmission rate for this institution was 42% and for VOC readmissions was 36%. Within these institutions there were 23,753 VOC related patient discharges from January to December. Of these discharges, 4,412, did not have a readmission, 8,179 discharges had an all cause readmission and 6,995 had a VOC specific readmission within 30 days. A total of 19,678 discharges from January to October in an inpatient setting resulted in 33% returning to an ER visit within 30 days. Of these discharges the average charges ranged from $1,589.54 to $2,036,824.40. **CONCLUSIONS:** Our findings suggest there is a high readmission rate of adult patients with SCD/VOC. It indicates the need for improvement in the management of pain during hospitalization and at home post discharge.

PHS84

THE LONG-TERM IMPACT OF PULMONARY EXACERBATIONS AMONG PATIENTS WITH CYSTIC FIBROSIS (CF) IN COMMERCIAL MANAGED CARE PLANS

Hassan M[1], Bonafede MM[2], Limone B[2], Stenson K[1]
[1]*Vertex Pharmaceuticals Incorporated, Boston, MA, USA,* [2]*Truven Health Analytics, Cambridge, MA, USA*

OBJECTIVES: To describe the impact of pulmonary exacerbations (PEx) on subsequent long-term healthcare resource utilization and recurrence of PEx among patients with CF enrolled in commercial health plans. **METHODS:** Healthcare utilization claims for patients with CF from MarketScan® Commercial Claims and Encounters database (N=16,943) between 2008-2015 were analyzed. Patients who were not treated with a CFTR modulator were continuously enrolled for ≥24 months from first claim in the database until date of disenrollment or end of data availability. PEx (total, requiring hospitalization [PExhosp], requiring IV antibiotics [PExIV], or requiring outpatient oral antibiotics only [PExOPoral]) and healthcare utilization (hospitalizations, total days in hospital) over the follow-up period were evaluated. Outcomes were compared between those with a PEx in the initial year vs those without. **RESULTS:** A total of 5295 patients (50.4% female; mean [SD] age, 21.6 [17.45] years) were included. Mean (SD) follow-up was 4.25 (1.72) years (range, 2.00-7.80). During year 1, 85.2% of patients had ≥1 PEx of any type, 32.8% had ≥1 PExhosp, 50.1% ≥1 PExIV, and 49.9% ≥1 PExOPoral. With each additional PEx in year 1, patients had ≈3 more PEx, ≈1 more hospitalization, and ≈5 more hospital days over the follow-up period. Patients with an initial year 1 PExhosp had ≈11 more PEx, ≈6 more hospitalizations, and ≈54 more hospital days during follow-up compared with patients without PEx during year 1; these patients also had ≈4 more hospitalizations and ≈42 more hospital days than patients with an initial year 1 PEx requiring oral antibiotics only. **CONCLUSIONS:** Commercially insured patients with CF who experienced greater numbers of, or more severe PEx during the initial year had higher numbers of subsequent PEx, hospitalizations, and more hospital days. These findings emphasize the long-term burden of PEx in CF and the importance of prevention of PEx. Sponsored by Vertex Pharmaceuticals Incorporated

PHS85

COST OF VISITS ASSOCIATED WITH MANAGEMENT OF INTERNATIONAL NORMALIZED RATIO (INR) RESULTS IN ATRIAL FIBRILLATION (AF) PATIENTS TREATED WITH VITAMIN K ANTAGONIST (VKA)

Ansolabehere X[1], Augier G[2]
[1]*QuintilesIMS, Paris La Défense, France,* [2]*Axess Research, Limonest, France*

In AF patients, VKA treatment requires a close follow-up and dose-adjustments to achieve targeted INR (2-3). Initiation phase is critical but modifications like diet or comedications could also impact INR level and efficacy of VKA treatment. A follow-up by physicians is needed and represents an economical burden which is difficult to estimate as reasons for consultations are uneasily available. **OBJECTIVES:** To assess cost of physician visits motivated by management of INR in AF patients treated with VKA from collective and National Health perspective (NHI) perspective. **METHODS:** A survey about the number of visits linked to INR management only was performed among 100 GPs and 50 cardiologists. Two phases of treatment (initiation and maintenance) have been distinguished. Unit costs were obtained from French official sources. Costs are reported in 2014 Euros. **RESULTS:** According to GPs, duration of the initiation phase is 4.4 weeks and 3.3 weeks according to cardiologists. During this phase, GPs indicated that 54% of patients are followed by phone, 34% require 2 visits in doctor's office, 12% require 1.8 visits at home. In cardiologists practices, these rates are respectively 66%, 26% require 1.6 visits and 8% require 1.5 visits. During the maintenance phase, 64% of patients are followed by phone, 26% require 3 visits in doctor's office and 10% require 2.8 visits at home per year according to GPs and 67% of patients are followed by phone, 25% require 2.8 visits in doctor's office and 8% require 1.8 visits at home per year according to cardiologists. Daily costs of visits motivated only by INR management in AF VKA-treated patients are estimated to €0.10 and €0.09 from collective and NHI perspective respectively. **CONCLUSIONS:** In addition to drug cost, INR analysis and time spent by phone, physician management of INR represents additional spending for NHI.

PHS86

DRIVERS OF HOSPITAL UTILIZATION AMONG PATIENTS WITH SPINAL MUSCULAR ATROPHY

Craver C, Belk K
Vizient Inc., Mooresville, NC, USA

OBJECTIVES: Spinal muscular atrophy SMA is a genetic disorder that affects the control of muscle movement. The objective of this study is to examine patterns of hospital utilization in patients diagnosed with SMA. **METHODS:** A retrospective descriptive study was conducted on a cross-section of SMA discharges in the MedAssets health system data for inpatient (N=1,928) and outpatient (N=10,373) visits from October 2015 through September 2016. Multivariable logistic regression was used to identify significant drivers of inpatient admission. **RESULTS:** The sample included 5,376 unique patients from 319 hospitals. The just over half of the population was male (54.0%), and was comprised of adults > 40 years of age (80%) with an average Charlson comorbidity score of 0.83. Cardiopulmonary disease (16.4%), hypertension (15.1%), dysphagia (14.5%), gastronomy (7.8%), and diabetes (9.2%). 33% of patients were admitted as an inpatient, with an average length of inpatient stay of 15.1 days, and an average cost of $19,337. In the inpatient population 6.2% of the population was readmitted within 30 days. UTI (OR 8.5, 95% CL 9.7 - 11.7), hypertension (OR 8.2, CL 7.1 - 9.6), bed confinement (OR 4.6, CL 2.9 - 7.3), and gastrostomy (OR 3.5, 95% CL 2.9 - 7.3) largest predictors of inpatient admission. **CONCLUSIONS:** SMA patients admitted to the hospital have a large number of comorbidities and complications which contribute to longer hospital stays. Improvements in disease management may lead to better patient outcomes and a reduction in hospital utilization and healthcare costs.

HEALTH SERVICES – Patient-Reported Outcomes & Patient Preference Studies

PHS87

PHARMACIST LED COUNSELING AND THE IMPACT ON PATIENT ADHERENCE FOR ANALGESIC TREATED PAIN

Burruss RA[1], Olson T[1], Feinberg BA[1], Nabhan C[1], Arikian V[2], Jaster R[1], Oleru K[1], Traurig T[3]
[1]*Cardinal Health, Dublin, OH, USA,* [2]*SUNY Downstate Medical Center, Brooklyn, NY, USA,* [3]*OncoSource Rx, Columbia, MD, USA*

OBJECTIVES: The purpose of the study was to assess the impact of a specialty pharmacy's (SP) medication therapy management (MTM) program on the incidence of self-reported missed/skipped doses (M/SD) of analgesic(s) in patients with chronic moderate to severe pain associated with various disease states. **METHODS:** A six month study was conducted to assess the association of pharmacist counseling (PhC) on the incidence of patient self-reported M/SD of a non-narcotic analgesic. A start-of-care (SOC) assessment prior to the initial/first prescription fill at the SP included an opt-in for PhC (n = 1,410). M/SD of analgesics during the most recent prescription fulfillment period were compared at SOC and at the six month refill, using a Chi-Square analysis, Yates Correction for data continuity at $p<0.05$. **RESULTS:** Of the 4,103 patients on an analgesic, (72% migraine/headache, 27% bone pain), 1,410 (34%) opted to receive PhC at SOC. Of the initial 4103, 1,696 continued to refill analgesic prescriptions six months after SOC with 360 (21%) being in the PhC cohort. 81 of 1,696 (4.8%) patients at SOC reported having recently M/SD and 2 of the 360 (0.56%) patients reported M/SD at six months refill, a statistically significant difference ($p<0.05$ level). **CONCLUSIONS:** This SP MTM program incorporating PhC was associated with an 88% reduced incidence of M/SD doses of non-narcotic analgesic use. Further research is recommended to determine the impact of patient counseling and to identify sub groups of patients where counseling may be of particular value. Extension of the study to additional therapeutic areas and specialty drug classes is recommended.

PHS88

SELF-REPORTED ADHERENCE OF VETERANS LIVING WITH HIV USING MAIL-ORDER PHARMACY

Desai K[1], Chewning B[2], Wilcox A[3], Safdar N[3]
[1]*Stanford University, Stanford, CA, USA,* [2]*University of Wisconsin, Madison, WI, USA,* [3]*William S. Middleton Memorial Veterans Hospital, Madison, WI, USA*

OBJECTIVES: The efficacy of HIV medication depends on near perfect adherence to medication regimens by individuals. The aim of this study was to examine the degree of adherence and associated factors for Veterans using the Consolidated Mail Order Pharmacy (CMOP) System at one Veteran Administration (VA) site. **METHODS:** A cross-sectional study design was used to assess self-reported Veteran's adherence rates at one Midwestern VA Hospital Infectious Disease Clinic. A combination of telephone and in-person methods were used for recruitment and data collection to reach maximum number of patients. Adherence was measured using the Brief Medication Questionnaire (BMQ) survey. All 57 Veterans who were contacted consented to participate. Thirteen others with HIV could not be reached. **RESULTS:** The sample consisted primarily of white (66.7%), male (96.5%) respondents with a mean age of 54.4 years (SD=8.0) and an average of 4.3 comorbidities (SD=2.2) along with a positive diagnosis for HIV. More than half used a combination of two medications to keep their viral loads in check (57.89%). Almost 48% of patients were non-adherent (30% sporadically and 17.5 % regularly non-adherent) with HIV medications. About 33% reported having refill issues for their HIV medications and 43% doubted how well the medication worked for them. Raltegravir was the most commonly used medication amongst Veterans, followed by a combination medication of tenofovir & emtricitabine. The combination drug with lopinavir and ritonavir was found to be the least well tolerated drug, followed by the combination drug with rilpivirine, tenofovir and emtricitabine. Adherence was significantly associated with finding the medication bothersome (p=0.031). **CONCLUSIONS:** The results suggest both practical issues and medication beliefs may affect adherence rates. Tailored interventions targeting these factors should be explored to address non-adherence by this vulnerable population, particularly given that the VA system is the largest single healthcare provider for patients with HIV.

PHS89

EXPECTATION AND SATISFACTION OF HIV/AIDS PATIENTS TOWARD THE PHARMACEUTICAL CARE PROVIDED AT GONDAR UNIVERSITY REFERRAL HOSPITAL, NORTHWEST ETHIOPIA- A CROSS-SECTIONAL STUDY

Abebe TB, Erku DA, Gebresillasie Bm, Haile KT, Mekuria Ab
University of Gondar, Gondar, Ethiopia

OBJECTIVES: To assess human HIV/AIDS patients' expectation from and satisfaction with the pharmaceutical service delivered at Gondar University Referral Hospital, Ethiopia. **METHODS:** An institution-based cross-sectional study was performed from May 11 to 25, 2015. A total of 291 patients living with HIV/AIDS were included using a

simple random sampling method. Data were collected using structured questionnaires measuring expectation and satisfaction of respondents using a Likert scale of 1–5 through face-to-face interviews. The data collected were entered into and analyzed using Statistical Packages for Social Sciences. Comparison was made between those respondents who lived in and outside the town **RESULTS:** The overall mean expectation and satisfaction of respondents toward pharmacy setting and services were 3.62 and 3.13, respectively. More than half (56.1%) of the participants were dissatisfied with the comfort and convenience of waiting area and private counseling room. Similarly, 69.3% of the respondents claimed that pharmacy professionals did not give information about side effects and drug–drug and drug–food interactions of antiretroviral medications. There was a statistically significant difference between respondents who live in and outside Gondar town in overall expectation (t=3.415, P=0.001) with the pharmacy setting and services. **CONCLUSIONS:** In this study, the overall satisfaction level of respondents with pharmaceutical service (pharmacy setting and services) provided at Gondar University Referral Hospital was found to be low, while the overall respondents' expectation from the pharmaceutical services were exceedingly high. The hospital should implement good dispensing practice systems in relation to the services and continuing professional development to professionals in order to improve the satisfaction of patients.

PHS90

TREATMENT OUTCOMES OF TUBERCULOSIS AND ASSOCIATED FACTORS IN AN ETHIOPIAN UNIVERSITY HOSPITAL

Amdie FZ, Biruk M
University of Gondar, Gondar, Ethiopia

OBJECTIVES: To assess the outcome of tuberculosis treatment and to identify factors associated with tuberculosis treatment outcome. **METHODS:** A five year retrospective cross-sectional study design was employed and data were collected through medical record review. This study uses the following operational definitions: **Successful treatment outcome:** If TB patients were cured or completed treatment with resolution of symptoms. **Unsuccessful treatment outcome:** If treatment of TB patients resulted in treatment failure, default, or death. Data were analyzed using Statistical Package for Social Sciences of windows version 16, binary and multiple logistic regression methods were used. A p value of less than 0.05 was considered as statistically significant in the final model. **RESULTS:** Out of the 1584 pulmonary TB patients (882 males and 702 females) included all age group, 60.1% had successful outcome and 39.9% had unsuccessful outcome. In the final multivariate logistic model, the odds of unsuccessful treatment outcome was higher among patients weight category (30-39.9Kg) (AOR = 1.51, 95% CI: 1.102-2.065), smear negative pulmonary TB (AOR=3.204, 95% CI: 2.277-4.509), extra pulmonary TB (AOR=3.175, 95% CI: 2.201-4.581), retreatment (AOR = 6.733, 95% CI: 3.235-14.013), HIV positive TB patients (AOR = 1.988, 95% CI: 1.393-2.838),unknown HIV status TB patients (AOR=1.506,95% CI: 1.166-1.945) as compared to their respective comparison groups. **CONCLUSIONS:** In this study high proportion of unsuccessful treatment outcome was documented. Therefore emphasis has to be given for patients with high risk of unsuccessful TB treatment outcome and targeted interventions should be carried out.

PHS91

IMPACT OF COLLABORATIVE COUSTOMIZED PATIENT EDUCATION IN PSYCHIATRIC DISEASES

Kurian J[1], Ramesh M[1], Rajesh R[2], Kishore M[2]
[1]*JSS College of Pharmacy, Mysore, India,* [2]*JSS Medical college, Mysore, India*

OBJECTIVES: o study the impact of Pharmacist-Psychiatrist Collaborative customized Patient Education in patients with depression, Bipolar Affective Disorder (BPAD), Schizophrenia and alcohol dependent Syndrome(ADS) in an Ambulatory Care Setting. **METHODS:** A prospective randomized control study was conducted in the psychiatry out-patient department of a tertiary care hospital for a period of 9 months. Eligible patients (225) were randomized into test group and control groups by simple randomization in each disease and followed for a period of six months. Customized patient education was provided to the test group with the help of patient education materials while the control group was on usual care. The medication adherence and quality of life (QOL) of both the groups were assessed and compared once in every two months by using Medication Adherence Rating Scale (MARS) and World Health Organization Quality of Life (WHOQOL) – BREF questionnaire respectively. **RESULTS:** Among the study population 210 completed all the follow-ups out of which 100 were in control group and 110 in test group. Mean age was found to be 38.07 ± 11.60. Majority [n=75 (35.71%)] of patients were diagnosed to have had depression followed by BPAD [n=73 (34.76%)]. A statistically significant increase in the mean medication adherence score of test group was observed in all the follow-ups. The mean medication adherence scores was high in BPAD (1.4) and depression (1.4) compared to schizophrenia and ADS. Upon the analysis QOL, the difference in the overall mean score between test group and control was 8.45 which was statistically significant. Comparison of mean medication adherence scores of all patients in each disease showed that BPAD patients had a mean increase of 2.04 than depression, 1.36 than ADS and 2.01 than schizophrenia patients. **CONCLUSIONS:** Provision of customized patient education by pharmacist and psychiatrist improved the patient medication adherence and QOL.

PHS92

STRUCTURED TELEPHONE FOLLOW-UP OF PATIENTS DISCHARGED AFTER STROKE: A LONG-TERM QUALITY IMPROVEMENT PROGRAM

Escobosa DM, Ruiz AD, Miranda RC, Vacari AM, Bizutti CC, Sogayar AM, Massaud RM, Silva GS
Hospital Israelita Albert Einstein, São Paulo, Brazil

OBJECTIVES: Stroke is the most important cause of death in Brazil a major cause of disability all over the world. The follow up of patients with Stroke is important in order to detect recurrence, as well as to measure the impact of acute treatments in the long-term follow up. Objective: Our objective was to describe the implementation of a program of long term follow up ("célula de desfecho") of patients admitted with acute stroke in a private tertiaty center in Brazil, as well as the difficulties in implementing this follow up. **METHODS:** A group of health professionals were trained in application of the modified Rankin Scale using telephone contact as well as in the delivery of a structured questionnaire containing questions regarding stroke recurrence and use of medications. We describe the results of the follow up of patients admitted to our hospital from January 2012 to December 2016. A telephone interview was planned 30, 90, 180 days and one year after hospital discharge. **RESULTS:** A total of 779 patients were discharged home after a stroke in this time period. Only 508 patients (67%) responded to the first telephone interview (30 days after discharge), 516 (73%) in 90 days, 464 (73%) in six months and 374 (72%) in one year. The main reasons for loss of follow up were: lack of answer to telephone contact and hospital readmissions at the time of the contact. **CONCLUSIONS:** A structured follow up of patients discharged after a stroke is feasible, however alternative methods of personal contact such as email and protected digital social networking should be further evaluated in order to improve adhesion to the program.

PHS93

ASSESSMENT OF BENEFITS SUITABLE FOR INCLUSION INTO AN ECONOMIC EVALUATION FOR CHILDREN WITH MOTOR SPEECH DISORDER IN CEREBRAL PALSY

Aluko PO, Vale L, Pennington L
Newcastle University, Newcastle upon Tyne, UK

OBJECTIVES: To review the Quality of Life (QOL) tools suitable for capturing the benefits of an internet delivered speech therapy in children with speech and language difficulties in cerebral **METHODS:** PubMed, Embase, Medline, PsycINFO, NHS Economic Evaluation Database and Evidence Based Medicine Reviews (Ovid) databases were searched to identify literatures on QOL tools for children with speech, language and communication disabilities aged 3-18 years. Full text articles were included with no year limitation but language restricted to English. **RESULTS:** 1052 studies were identified from the search with eight studies meeting the inclusion criteria for the review. Of the six tools identified from the review, Health Utility Index 3 (HUI3) was recommended as the most appropriate tool as it can be used to derive Quality Adjusted Life Years (QALYs) and preferred by decision-makers for utility estimation. Studies also reported the reliability and sensitivity of the tool in capturing different ranges of speech and language disorder as it includes a domain on speech. Strong correlation was found in the HUI3 scores and level of impairment in children with cerebral palsy reinforcing it sensitivity. Paediatric Speech and Language Quality of Life (PedSal QoL), a condition specific measure was also identified as being suitable for this group of children but cannot be applicable because further work would be needed to assign utility scores to responses to this tool. **CONCLUSIONS:** HUI3 was identified to be the most suitable tool for the assessment of benefit in children with motor speech disorder and cerebral palsy. Another alternative for consideration would be PedSalQoL, but further research would be required before this tool could be used as the basis of health state utilities.

PHS94

FACTORS AFFECTING PROXY REPORTING OF PATIENT OUTCOMES

Roydhouse JK[1], Gutman R[1], Keating NL[2], Mor V[1], Wilson IB[1]
[1]*Brown University School of Public Health, Providence, RI, USA,* [2]*Harvard University, Boston, MA, USA*

OBJECTIVES: Patient experience and health status measures are part of surveys which are included in pay for performance approaches and public reporting. If patients are unable to respond, family members such as proxies are asked to report on their behalf. It is not known if proxy-specific information affects how proxies report on patient care experience and health status. The aim of this study was to evaluate if proxy-specific covariates impact proxy reporting of patient cancer care experience, quality, and quality of life, and determine if these covariates are important for data collection. **METHODS:** Secondary analysis of data from the Cancer Care Outcomes Research and Surveillance (CanCORS) study, a cross-sectional survey. Respondents were proxies for living patients with colorectal or lung cancer. Outcomes included experiences with medical and nursing care, care coordination, care quality rating, physical and mental health. All outcomes were on 0-100 scales (0=worst, 100=best). Proxy characteristics included relationship to patient, sex, education, frequency of proxy-patient contact, frequency of attending consultations, and frequency of discussing medical decisions and discussing the patients' feelings with the patient. Analyses used linear regression models with patient sociodemographic and clinical characteristics and proxy-specific covariates. Multiple imputation was used for missing data. **RESULTS:** Of the 1,011 proxies, most were the patient' spouse/partner (49%) or child (36%). Although most proxies (66.3%) always attended medical visits, a minority reported never attending (2.6%). In adjusted analyses, child proxies reported worse average care experiences and lower quality ratings than spouses (-3.5 to -8.8 points lower on average). For medical care and care coordination, proxy responses became progressively more negative as proxy frequency of attendance decreased. Proxies who never attended reported significantly worse medical care (-10.5 points, 95% CI: -18 to -3) and care coordination (-13.4 points, 95% CI -20.4 to -6.4). **CONCLUSIONS:** Collection of proxy-specific covariates in surveys using proxy data is warranted.

PHS95

PATIENT EXPERIENCES WITH LOW-DOSE CT LUNG CANCER SCREENING IN THE VETERANS HEALTH ADMINISTRATION SYSTEM

Roth JA[1], Sayre G[2], Todd K[2], Zeliadt S[2]
[1]*Fred Hutchinson Cancer Research Center, Seattle, WA, USA,* [2]*VA Health Services, Seattle, WA, USA*

OBJECTIVES: The Veterans Health Administration (VHA) was an early adopter of low-dose CT (LDCT) lung cancer screening for heavy smokers (≥30 pack-year history, age 55-80) in 2013, and continues to be a critical research resource in this area. The objective of this study was to use qualitative inquiry to understand patient experiences with LDCT lung cancer screening in the VHA system. **METHODS:** We conducted a semi-structured telephone-based qualitative evaluation of patient experiences with LDCT screening at Portland, OR and Charleston, SC VHA sites. Participants met U.S. Preventive Services Task Force screening criteria and the sample was enriched for Lung-RADS positive results (50% of sample). Trained staff interviewed 20 participants in the summer of 2016. Interviews were recorded, transcribed, and independently evaluated by two study investigators using inductive content analysis methods to identify major themes. **RESULTS:** Among the 20 participants, mean age was 64 years, 95% were male, 60% were Caucasian, and 60% self-reported current smoking. Most participants were unaware of lung cancer screening before having it offered by their clinician. The majority of participants discussed a screening benefit ('early detection' was most common), and few discussed any screening harms. Nearly all described the experience of the screening scan as "easy", "quick", and/or "painless". Most participants with positive results expressed desire for more information about screening and results, whereas few with negative results did. Participant quotes supporting these themes will be presented. **CONCLUSIONS:** Among participants who recently received LDCT screening in the VHA system, screening was frequently introduced by clinicians, screening benefits were noted more often than harms, the screening exam was often described as 'easy', and patients with positive results wanted more information about screening. Our findings provide insights to help VHA and other stakeholders understand patient perspectives on LDCT screening, and can be used to inform efforts to improve screening processes.

PHS96

EFFECT OF PATIENT INVOLVEMENT ON INTENTION TO INITIATE BREAST CANCER CHEMOPREVENTION

Bhansali A[1], Fleming ML[2], Essien EJ[3], Mehta P[3], Rajan S[4], Sansgiry SS[2]
[1]University of Houston College of Pharmacy, Houston, TX, USA, [2]College of Pharmacy, University of Houston, Houston, TX, USA, [3]University of Houston, Houston, TX, USA, [4]University of Texas SPH, Houston, TX, USA

OBJECTIVES: The purpose of this study was to test the effect of patient involvement levels, developed using different breast cancer risk scenarios on their intention to initiate breast cancer chemoprevention. **METHODS:** In this experimental field study involvement was manipulated at 2 levels (high and low) and was developed using two scenarios. Breast cancer risk levels were considered using the Gail risk score. A breast cancer risk level of 16% with family history was used for low risk scenario and breast cancer risk level of 55% with family history and a breast biopsy was used for high risk scenario. Women across the Houston metropolitan area evaluated two chemoprevention drug decision aids after reading scenarios simulating high and low involvement. A pre-validated, self-administered survey instrument was used to measure their intention to start chemoprevention using a Likert scale ranging from 1 (strongly disagree) to 5 (strongly agree). ANCOVA and post-hoc analyses were done using SAS®9.3. **RESULTS:** Of the 320 women included in the study (81.4% response rate) majority were married 144 (46.45%), white 160 (51.61%) with a mean age of 40.25 (± 11.27) years. Majority 182 (58.52%) had at least one family member with a history of cancer. A univariate and post hoc analyses indicated women with high involvement level had significantly higher mean (4.14 ± 0.99) intention to start chemoprevention when compared to women in a low involvement scenario (2.52 ± 1.1). **CONCLUSIONS:** Patient involvement manipulated using breast cancer risk levels plays an important role in intention to initiate chemoprevention. Interventions can be targeted among women emphasizing on their breast cancer risk.

PHS97

PATIENTS' PREFERENCES AND TRADE-OFFS IN CHOOSING A SURGEON TO DECREASE WAITING TIMES

Marshall DA[1], Deal K[2], Conner-Spady B[1], Bohm E[3], Hawker G[4], Loucks L[5], Sanmartin C[6], MacDonald KV[1], Noseworthy T[1]
[1]University of Calgary, Calgary, AB, Canada, [2]McMaster University, Hamilton, ON, Canada, [3]University of Manitoba, Winnipeg, MB, Canada, [4]University of Toronto, Toronto, ON, Canada, [5]Concordia Hip and Knee Institute, Winnipeg, MB, Canada, [6]Statistics Canada, Ottawa, ON, Canada

OBJECTIVES: Patients face significant waiting times for hip and knee total joint replacement (TJR) in Canada. One waiting time management strategy is the single-entry model (characterized by pooled referrals, central intake and triage for referral to specialist). Central intake can improve access by offering the choice of next available surgeon. We aimed to assess patients' preferences and trade-offs for reducing waiting times for TJR including surgeon choice. **METHODS:** We administered a questionnaire, including a discrete choice experiment (DCE) with 12 choice tasks, to Canadian patients (>18 years) referred as candidates for TJR. Five attributes were included based on our previous research, pre-testing and pilot testing: surgeon reputation, surgeon selection process, waiting time to surgeon visit, waiting time to surgery and travel time to hospital. Preferences were assessed using hierarchical Bayes analysis and evaluated for goodness-of-fit. We conducted simulation analyses for alternative scenarios representing various combinations of attributes. **RESULTS:** Of 422 participants, 59% were female and 68% were referred for knee TJR. Overall, mean baseline EQ-5D was 0.4 (SD=0.2) and mean Oxford score was 19.8 (SD= 8.7). The most important attribute was surgeon reputation followed by waiting time to surgery, waiting time to surgeon visit, surgeon selection process and travel time. Patients appear willing to wait 10 months for consultation with an excellent reputation surgeon before switching to a good reputation surgeon. Simulations indicate that patients in the lowest pain category have stronger preferences for choosing their surgeon than those in the highest category. Patients in the highest pain category were willing to wait 7.3 months, after which they would accept the next available surgeon. Those experiencing the least pain were willing to wait 12 months. **CONCLUSIONS:** Next available surgeon increases choice and may result in shorter waiting times. However, surgeon reputation is a dominant consideration, albeit poorly assessed by patients.

PHS98

"WHAT MATTERS IN HEMOPHILIA" – A QUANTITATIVE SURVEY OF PEOPLE LIVING WITH OR CARING FOR SOMEONE WITH HEMOPHILIA

Yang K[1], Weston SB[1], Schneider BR[2], Peacock E[2], Buckley BC[1]
[1]Biogen, Weston, MA, USA, [2]MyHealthTeams, San Francisco, CA, USA

OBJECTIVES: A quantitative patient study was conducted to better understand symptoms experienced, quality of care, and overall impact of Hemophilia. **METHODS:** An email invitation was sent to all U.S. members of MyHemophiliaTeam, a social network of 890 people diagnosed with or caring for someone with Hemophilia. In total, 47 members responded to a 16 question survey between July 18 and August 10, 2016. **RESULTS:** Both adults and children with hemophilia are impacted well beyond bleeding episodes. In fact, 65% of adults rank depression as having as much of an impact on their daily lives as bleeding. General pain (57% of adults, 30% of children) and physical limitations (57%, 15%) are also quite prevalent. Respondents are generally satisfied with management of bleeds (60% for adults, 85% for children), but there is dissatisfaction with how their other symptoms are being treated. Respondents indicate their depression/anxiety is not being addressed (87%, 86%), and pain is not being well managed (62%, 83%). Many also described the care provided by their multiple providers (HTCs, doctors, nurses, etc.) as not well coordinated (55%, 39%). Parents worry about their child's future and ability to have a "normal" life and are burdened by its impact on their children and their own time/careers. Many have struggled to be financially secure and some adults with hemophilia still feel the stigma from the HIV/Hep C tainted blood issues. **CONCLUSIONS:** People with hemophilia responded that their bleeding episodes are under control, however, their depression, anxiety and pain are not being properly treated. There is an opportunity to provide a more holistic, coordinated approach to treating hemophilia and associated symptoms in this community. Understanding the range of symptoms and the impact in totality will better allow medical professionals to treat individual with hemophilia more effectively.

PHS99

ONE-YEAR PREVALENCE AND HEALTH CARE UTILIZATION OF DIABETES IN LUNG CANCER-RELATED INPATIENT ADMISSIONS IN THE UNITED STATES

Ruban C[1], Blanchette CM[2], Marino J[1], Saunders W[3]
[1]University of North Carolina Charlotte, Charlotte, NC, USA, [2]Precision Health Economics, Davidson, NC, USA, [3]UNC Charlotte College of Health and Human Services – Health Informatics, Charlotte, NC, USA

OBJECTIVES: The incidence of type 2 diabetes (T2D) in patients with lung cancer (LC) may vary from that of the general population, as there is a likely association with hyperinsulinemia, which is a result of insulin resistance characteristic of T2D. Insulin's role in cell proliferation, through the action of insulin-like growth factor-1, could play a significant role in the development of cancerous tissues. Our objective is to characterize healthcare utilization and associated hospitalization costs in LC patients with diabetes. **METHODS:** We conducted a cross-sectional study of LC patients (ICD-9 162.xx) from the 2012 Nationwide Inpatient Sample. A prevalence estimate for T2D patients with LC was established using the discharge weight that was included in the NIS for each observation; however, all other analysis did not include the discharge weight. We compared patients with diabetes (ICD-9 250.xx) to those without on length of stay (LOS) and total cost using chi-square test of association. Finally, we assessed factors predicting increased LOS and inpatient mortality using logistic regression. **RESULTS:** We estimated US prevalence of inpatients with a diagnosis of LC and diabetes at 91,240 cases. LC diabetic patients were older, with an average age of 70.27vs.68.47 years($p<0.001$) compared to their non-diabetic LC-peers. Hospitalizations associated with diabetic LC patients were associated with a significantly longer LOS 6.31vs.6.11 days($P<0.001$), compared to non-diabetic patients. Significant positive predictors of increased LOS among diabetic LC patients included visiting a hospital in a rural location (Odds Ratio(OR)=1.20, 95%Confidence Interval= 1.11-1.31) and Private Insurance (OR=1.25 95%CI=1.04-1.50). Significant positive predictors of inpatient mortality included Medicare (OR=2.52 95%CI=1.81-3.5), Medicaid (OR=2.01 95%CI=1.37-2.97), and hypertension as a comorbidity (OR=1.32 95%CI=1.18-1.48). **CONCLUSIONS:** These data suggest that LC patients with diabetes have extended hospitalizations compared to those without diabetes. Clinical strategies to better manage diabetes in LC patients could enhance metabolic health, reduce hospitalization time, and lower healthcare costs.

PHS100

DEVELOPMENT OF AN EYE DROP COMFORT MEASURE FOR TOPICAL OCULAR DROP APPLICATION

Park J[1], Covert D[2], Fairchild C[1], Brubaker M[2], Martin SA[3], Lewis S[4], DeMuro C[4]
[1]Alcon, Fort Worth, TX, USA, [2]Novartis Pharma US, Fort Worth, TX, USA, [3]RTI Health Solutions, Ann Arbor, MI, USA, [4]RTI Health Solutions, Research Triangle Park, NC, USA

OBJECTIVES: To develop a new patient-reported outcomes (PRO) measure assessing the comfort of topical ocular drop applications - the Eye Drop Comfort Scale (EDCS) in an adult population who have an ophthalmologic condition. **METHODS:** In alignment with FDA PRO Guidance, development occurred across three ocular categories (inflamed, non-inflamed, and post-surgical) and included literature review, and the conduct of two sets of interviews with topical ocular drop users: focus groups interviews to elicit concepts for a draft measure, and cognitive debriefing interviews to refine items and further establish content validity. **RESULTS:** Results from the nine

focus groups (n=61 eye drop users; 3 groups per category) provided concepts that were appropriate, comprehensive, and relevant to patient experiences with topical ocular drop application comfort in each of the categories. Qualitative analysis demonstrated that saturation was achieved for these concepts, resulting in a fifteen item measure assessing sensations or symptoms experienced after instillation of a topical eye drop. Patient input from the cognitive debriefing interviews documented patient understanding of the items, response scale and recall period as well as confirmation of concept relevance. The interview results supported content validity of the tool. The EDCS is designed to be self-administered and may be completed in hard copy or on an ePRO tablet. **CONCLUSIONS:** The EDCS is a brief, comprehensively developed measure designed to assess the comfort or discomfort experienced after the instillation of eye drops in patients with inflamed, non-inflamed or post-surgical conditions. Results of the qualitative research provided evidence to support the content validity of the EDCS. The next phase of development of the EDCS is psychometric evaluation. Future uses of the measure in clinical studies may facilitate identification of improved treatment modalities in development as well as allow comparison of topical ocular drop comfort and safety between products to inform patients, and prescribers.

PHS101

ASSESSMENT OF KNOWLEDGE ATTITUDE AND PRACTICE OF FAMILY PLANNING AMONG MARRIED WOMEN ATTENDING TERTIARY CARE HOSPITAL QUETTA

Haq N, Hameed S, Nasim A, Khan S
University of Balochistan, Quetta, Pakistan

OBJECTIVES: Study aimed to assess Knowledge Attitude and Practice of Family Planning among married women attending tertiary care Hospital Quetta. **METHODS:** A cross sectional study was conducted in obstetrics & gynaecology wards from public sector hospitals of Quetta. Data was collected from February-September 2016 from 503 Females who were sexually active, willing to participate and able to understand Urdu and local languages. Knowledge, attitude and practices on family planning were assessed with the help of predesigned questionnaire. Statistical analysis was done by using SPSS version 20. Descriptive and inferential statistics used where applicable. **RESULTS:** Result showed that out of 503 women, majority (41.2%) were uneducated, house wife (79.1%), Pashtun (40.6%), (89.7%) belong to urban area and (43.7%) had married life span of 6-10 years. 500 (99.4%) had knowledge about family planning and their methods and its source was TV/Radio (28.8%) followed by health care personal (22.7%). 497(98.8%) believed that use of family planning methods is beneficial, (62.0%) health care providers encourage the use of family planning services. 430 (85.5%) women were practicing family planning methods out of which most of them were using condom (39.4%) followed by Oral Contraceptive (20.3%). Reason for practicing these methods were Prevention of unwanted birth (35.9%), followed by Spacing of birth (27.6%). The relationship between Knowledge and Attitude was investigated using Pearson product-moment correlation coefficient. There was a small, positive correlation between Knowledge-Attitude [r=0.83, p=0.064], Knowledge-Practice [r=0.119, p=0.008] and Attitude-Practice [r=0.119, p=0.001] was observed. **CONCLUSIONS:** Study concluded that overall KAP was good among women towards contraception. Husband being dominant member plays the pivotal role in approving the family size and contraceptive practices. Women education and counseling of couples can play an important role to adopt family planning methods. There is a need to improve the educational status of the females to improve understanding and uptake of modern contraceptives.

PHS102

ASSESSMENT OF HEALTH RELATED QUALITY OF LIFE AMONG PATIENTS WITH TUBERCULOSIS IN GOVERNMENT INFECTIOUS DISEASE HOSPITAL, GUNTUR

Narne HM
Acharya Nagarjuna University, GUNTUR, India

OBJECTIVES: Tuberculosis is one of the oldest infections known to affect humans. The aim of the study was to assess the quality of life including physiological, general health perception and social role functioning among patients with tuberculosis in Govt.Infectious Disease Hospital, Guntur. **METHODS:** Total 180 Tuberculosis patients with tuberculosis who registered were included in the study by using multi stage sampling method. From DOTS Centre we had taken 10 Sputum positive newly diagnosed, 6 category II (2 for each defaulter, relapse, failure), 2 MDR and 2 HIV patients. We excluded pediatric patients. Thus, a total of 180 cases were interviewed using a pre-designed, pre-tested questionnaire. Socio-demographic data, perception about the Quality of Life (QoL) was collected using RAND-SF 36questionnaire. **RESULTS:** Mean age of cases was 33.3+11.7years and 124 (68.9%) were male and 56(31.1%). The mean score of all domains was 53.4 with SD of 11.2.The worst affected domains were vitality (44.6 +13.8), general health (45.7+ 18.7) and mental health (47.7 + 16.6). MDR patients had lower mean score for physical health (56.3 + 15.2), vitality (35.8 + 13.5) and pain (46.3 + 16.1) as compared to other TB category patients. Mean score of social function (43.6 + 13.8), emotional role (37.1 + 27.9) and emotional wellbeing (38.3 + 13.7) were lower in TB with HIV patients. In all domains female have better scores except two domains, which are emotional health and social function. **CONCLUSIONS:** We recommend that early diagnosis and treatment decrease severity and infectivity to other person and improve QoL. Health education during diagnosis and family support may reduce social stigma and improve the mental component of QoL.

PHS103

EVALUATION OF AWARENESS, BENEFITS AND WILLINGNESS TO PAY FOR PHARMACEUTICAL CARE (PC) SERVICES AMONG OLDER ADULTS

Eze UI, Onasanya O
Olabisi Onabanjo University, Sagamu Ogun State, Nigeria

OBJECTIVES: To evaluate the awareness, benefits and willingness to pay for Pharmaceutical Care (PC) services among older adults. **METHODS:** A consecutive cross sectional survey was conducted for 4 weeks among 300 older adults visiting four community Pharmacies in Ijebu Ode, South Western Nigeria using a self administered 4 sectioned, 30 item pretested structured questionnaire which inquired on sociodemographics;, awareness of PC;, benefits of PC (anchored on a Likert scale of 1 (Not Beneficial) to 5(Very Beneficial);, and willingness to receive and pay for core components of PC Services. Data were analyzed using SPSS Version 17, P value was set at < 0.05. **RESULTS:** Reliability of the instrument was 0.930, most respondents 133(44.3%);, 167(55.7%) ;, 223(74.3%); , 189(63.0%);,89 (29.7%);, 153(51%);, and 159(53%) were 50-59.years, females, married, Christian(s), Traders, had tertiary education, and had an average income of N20,000-N99,999 (63.42 -317.09 US Dollars) respectively. Ninety (30.0%) respondents knew about PC, "Promoting increase in compliance/adherence to medications" was rated most beneficial 266(88.7%). Two hundred and seventy four (91.3%), 215(71.7%), and 252 (84.0%) respondents had purchased prescription or OTC medicines in the past, were not currently receiving but are willing to receive PC respectively, 85(28.3%) were willing to pay for such services and 33(38.8%) of them were willing to pay between N500- N999 (1.59-3.17 US Dollar) for PC services. Average income (P=0.04), Level of education (P=.003) and having heard of pharmaceutical care before (P=.024) had significant associations with willingness to pay for PC. **CONCLUSIONS:** Most respondents were not aware of PC, however they believed it could be beneficial and were willing to receive PC services though few were willing to pay. This needs to be addressed by way of increase in awareness and other educational interventions for Pharmacists, older adults and the entire society.

EXPLORING CONSUMERS' DECISION MAKING FOR USING COMPREHENSIVE MEDICATION REVIEW (CMR) SERVICE

Zhang Y, Doucette WR
The University of Iowa, Iowa City, IA, USA

OBJECTIVES: To explore consumers' decision making on using government-promoted Comprehensive Medication Review (CMR) service and factors affecting the uptake of CMRs among elderly residents in Iowa. **METHODS:** Semi-structured personal interviews were conducted among a purposive sample of 13 elderly residents in Iowa. Participants were recruited through either a local pharmacy or a registry of seniors maintained by University of Iowa, if they were 65 years or older and used medication(s) with Medicare Part D coverage. An interview guide informed by a conceptual framework in consumer behavior was developed, including domains of internal need, external influence, perceived risk in service use, and alternative comparison. Interview data were audio-recorded, transcribed and thematically analyzed, using MaxQDA. **RESULTS:** Five of thirteen participants received CMRs previously, and three of the eight non-recipients would like to receive one in the near future. The thematic analysis yielded four themes: CMR-recipients' experiences, consumers' perceived reasons for CMRs use, consumers' perceived reasons for no CMRs use, and promotion strategies for increasing CMR-uptake. Overall, CMR-recipients were highly satisfied with their CMR process and results. Perceived reasons for using CMRs included: seeking knowledge of personal medications, recommendation from pharmacists or physicians, and being worried about medication safety. Main perceived reasons for not using CMRs were poor awareness or understanding of CMRs, complete trust on physicians, and privacy concerns. Recommendation from either physicians or pharmacists was considered the most effective promotion approach to increase CMR-uptake. **CONCLUSIONS:** Consumers who received CMRs expressed a positive attitude toward them. However, awareness of CMRs remains low after being available for 7 years. Safety worriers or knowledge seekers appear more likely to use CMRs while physician believers or privacy worriers are more likely to not use CMRs. Recommendations from health professionals and understanding of service benefits were identified as factors affecting consumers' decision making for using CMRs.

PHS105

HOW COMMON ARE DIGITAL WRAP-AROUND PRODUCT TIE-INS WITH FDA-APPROVED NEW MARKET ENTRANTS?

Navaratnam P[1], Friedman H[2], Navaratnam A[2]
[1]*DataMed Solutions LLC., New York, NY, USA,* [2]*Sygeny Ltd, Helsinki, Finland*

OBJECTIVES: The objective of this study was to evaluate the extent by which the life sciences industry develops and promotes digital wrap-arounds that tie-in with new FDA-approved product introductions in order to optimize patient adherence, monitoring and health outcomes. **METHODS:** A review of recent novel product approvals in 2016 and the presence of digital wrap-arounds associated with these product introductions was conducted. We defined digital wrap-arounds as any digitally-based mechanism such as a web-enabled device, platform or mobile applications intended to improve patient outcomes, adherence, and treatment costs through enhanced monitoring, education, support and/or a feedback loop to providers. Literature review of scientific and medical literature; product package inserts; and lay media sources (Internet, trade journals, tech websites, etc.) were scrutinized to determine if there were any mentions of a digital wrap-around that was promoted concurrently with new product approvals. Key words and phrases using terms such as 'digital', 'mobile', 'apps', 'connected devices', 'internet of things', e-health', 'mobile health', and 'm-health' along with generic names of the drugs was utilized in these searches. **RESULTS:** A total of 22 new and novel product approvals were identified from the FDA website (www.fda.gov). Based on the search strategy described above, we found that there were just two specifically designed digital wrap-arounds associated with these compounds; primarily educational mobile apps associated with product patient support programs. **CONCLUSIONS:** While there has been a lot of interest in 'wrapping' new therapeutic products with digitized tools to enhance outcomes, improve adherence and reduce costs; these efforts appear to be promising but largely unfulfilled.

PHS106

ANALYSIS OF FORMULARY COVERAGE AND COST OF HUMAN IMMUNODEFICIENCY VIRUS ANTIRETROVIRAL DRUGS IN MEDICARE PART D (2006-2015)

Alshahrani A[1], Seoane-Vazquez E[2], Rodriguez-Monguio R[3], Araujo L[4], Eguale T[4]
[1]MCPHs, Boston, MA, USA, [2]Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA, [3]University of Massachusetts Amherst, Amherst, MA, USA, [4]MCPHS University, Boston, MA, USA

OBJECTIVES: This study examined trends in Medicare Part D plans' coverage of single ingredient and combination HIV ARV drugs; analyzed trends in cost sharing, premiums, and deductibles; and evaluated restrictions set by drug plans on HIV ARV drugs. **METHODS:** Data were obtained from the Centers for Medicare and Medicaid Services Prescription Drug Plan Formulary and Pharmacy Network Files for the month of December for the year 2005-2015. Information for each plan included: dosage forms, active ingredients (single or fixed-dose combination) formulary information (coverage, prior authorization, specialty tier), and cost-sharing structure (coinsurance or copayment). Descriptive statistics were conducted. **RESULTS:** The study included 37 HIV ARV drugs marketed in the US in the period 2006- 2015. There were 10 fixed-dose combination HIV ARV drugs and 27 single active ingredient HIV ARV drugs. There were 3 drugs subject to prior authorization and 1 drug subject to step-therapy during part of the study period. The median quantity limit ranged from 26.8 to 31.9 days. Most formulary plans required patients to pay co-insurance instead of copayments for covered HIV ARV drugs. The use of specialty tiers (tiers 4-6) increased during the study period. The percentage of formularies using tier 5 for at least 1 HIV ARV drug was 1.6% in 2006 and 13.6% in 2015. **CONCLUSIONS:** Part D plans covered all HIV ARV drugs marketed in the US in the period of 2006- 2015. Prior authorization or step therapy requirements were not common restrictions to access to HIV ARV drugs. Conversely, quantity limit days were common restrictions in drug coverage. Most plans required patients to pay a coinsurance and a higer percentage of HIV ARV drugs were placed in specialty tiers.

PHS107

FINANCIAL INFLUENCE OF CURRENT AND ALTERNATIVE PRICING BENCHMARKS FOR PHARMACY DISPENSED MEDICATIONS IN CALIFORNIA WORKERS' COMPENSATION SYSTEM

Wilson L, Turkistani F, Huang W, Tran DM
University of California, San Francisco, San Francisco, CA, USA

OBJECTIVES: California's Workers' Compensation (CWCS) questioned adequacy of current Medi-Cal pricing benchmark and requested analysis of alternatives that maximize price availability and maintain access and budget neutrality. Objectives are to compare CWCS drug prices under alternative fee schedules, and identify efficient alternative benchmarks which improve price availability **METHODS:** Claims transaction-level data (2011-2013) from (CWCS) were used to estimate total annual pharmaceutical costs. Medi-Cal pricing data was from WCIS. Average Wholesale Prices (AWP), Wholesale Acquisition Costs (WAC), Direct Prices (DP), Federal Upper Limit (FUL) prices, and National Average Drug Acquisition Costs (NADAC) were from Medi-Span matching NDCs, pricing dates, and drug quantity. We report pharmacy dispensed (PD) claims frequency, reimbursement matching rate, and paid costs by WC as the reference price against all alternative price benchmarks. **RESULTS:** Of 20,373,477 claims submitted to CWCS, 12,529,977 were for pharmaceutical products and 11.6% (1,462,814) were pharmacy dispensed (PD). Prescription drug WC cost was over $152M; $63.9M, $47.9M, and $40.6M in 2011-2013. WC spent over half of total amount paid on analgesics, anti-inflammatory agents, and antidepressants; $37.7M (59%), $27.3M (57%), and $22.5M (55.3%) across 2011-2013. Ninety seven percent of WC PD claims had a Medi-Cal price. Alternative mechanisms provided a price for fewer claims; NADAC 94.23%, AWP 90.94%, FUL 73.11%, WAC 66.98%, and DP 14.33%. Analgesics claims had highest percent of claims with no Medi-Cal prices (30.94%). Among WC drugs with no Medi-Cal price in PD claims, AWP, WAC, NADAC, DP, and FUL provided prices for 96.7%, 63.14%, 24.82%, 20.83%, and 15.08% of claims. For WC drugs not benchmarked by Medi-Cal, WC paid NADAC+40% or AWP-44%. **CONCLUSIONS:** CAWCS current Medi-Cal coverage for PD drugs is better than all alternatives except AWP, so alternative reimbursement approaches would require combinations of pricing benchmarks. Physician dispensed/administered drugs may have fewer Medi-Cal prices and require different alternatives.

PHS108

INVESTIGATION OF RELATIONSHIP BETWEEN DEMOGRAPHICS AND TYPE 2 DIABETES MORTALITY IN TWO TERTIARY HOSPITALS IN SOUTHEAST NIGERIA; EXPLORING EPIDEMIOLOGICAL DETERMINANTS

Ogbonna BO
NNAMDI AZIKIWE UNIVERSITY, AWKA, Nigeria

OBJECTIVES: Type 2 diabetes mellitus (T2DM) is a major cause of complications and mortality. The study examined the relationship between marital statuses, age, and death associated with T2DM to evidence-based data for pharmacoepidemiological studies. **METHODS:** The study was a retrospective cross sectional descriptive survey of postmortem records and death register of T2DM patients who died between January 2009 and December 2014. All the records, which met the inclusion criteria of death, associated with T2DM for patients who have been diagnosed with the disease and have been on antidiabetes medications for more than 12 months were used t increase reliability and consistency of results. Study was conducted between July and December 2015. Study was summarized using descriptive and inferential statistics. A confidence interval of $P < 0.05$ was considered statistically significant. **RESULTS:** Out of 431.0 deaths associated with T2DM, 336.0 (78.0%) were married, 49.0 (11.4%) were widows, 25.0 (5.8%) were singles while 21.0 (4.8%) were widowers. The highest T2DM mortality was recorded within the age range of 66.0- 85.0 years (44.1%), followed by 46.0- 65.0 years (31.6%) and 22-45 years (16.3%). The least group affected was those above 86 years (8.0%). Result showed that females had prevalence of 58.0% while males had 42.0%. P= 0.068 for relationship on the causes of death associated with T2DM in the two hospitals. **CONCLUSIONS:** Study suggested that married peoples have the highest prevalence of T2DM while T2DM patients above 65.0 years are at greatest risk of mortality associated with T2DM.

PHS109

HOSPITAL REIMBURSEMENT UNDER THE MEDICARE PPS: WHAT IS THE RELATIONSHIP BETWEEN COST AND QUALITY?

Alcusky M[1], Crawford M[2], Lieberthal RD[2]
[1]University of Massachusetts Medical School, Worcester, MA, USA, [2]University of Tennessee, Knoxville, Knoxville, TN, USA

OBJECTIVES: The 2010 Patient Protection and Affordable Care Act (ACA) and other recently enacted health policies attempt to improve the efficiency of hospitals through the use of "value based" payments. The purpose of this exploratory study is to explore the relationship between the cost and quality of hospital care delivered by the Medicare program. **METHODS:** This study utilized hospital demographics, Medicare payments, and hospital charge measures for 9 diagnosis related groups (DRGs) for acute myocardial infarction (AMI), pneumonia, and heart failure under the Medicare Inpatient Prospective Payment System (IPPS). The data came from a set of 3,007 acute care hospitals in the U.S. that accepts Medicare payments. We analyzed the distribution of hospital costs by applying principal components analysis (PCA) to the relative cost of care for these 9 DRGs. The cost analysis was combined with a previously validated measure of hospital quality for these hospitals through a correlation analysis. **RESULTS:** The distribution of hospital cost scores resembled a bimodal distribution of high and low cost hospitals with relatively few close to the mean. A small segment of hospitals were high-cost outliers. After matching cost scores with previously generated quality scores, the correlation coefficient for the cost and quality scores was 0.73 (95% CI: 0.72-0.75, $P < 0.0001$). **CONCLUSIONS:** The results of this study suggest that higher cost hospitals also tend to deliver higher quality care. Additional analyses are required to validate and determine the validity of these results. This type of analysis can be used to set the optimal reimbursement level under the Medicare program and other value based health insurance reimbursement systems.

PHS110

METABOLIC CONTROL IN PATIENTS WITH DIABETES MELLITUS TYPE 2 IN A DISEASE MANAGEMENT PROGRAM FROM PRIVATE HEALTH INSURANCER IN COLOMBIA

Ortiz AM[1], García D[1], Toro JM[2], Posada KM[1]
[1]Suramericana de Seguros, Medellin, Colombia, [2]University of Antioquia, Medellin, Colombia

OBJECTIVES: Suramericana is a private health insurer in Colombia. A multidisciplinary chronic care model (Disease Management Model) was designed, based on evidence-based care guidelines and monitoring of the indicators offered to the insured on a voluntary basis. Patients with type 2 diabetes mellitus voluntarily enroll in our DMM. The objective is to evaluate the optimal metabolic control (HbA1c <6.5%) and associate it with the adherence to the program during one year. **METHODS:** The study is a retrospective analysis from September 1, 2015 to August 31, 2016. We included data from 353 patients in DMM and 274 in conventional care, with a mean age of 63 years. It was conducted a comprehensive statistical analysis from the descriptive stage to a logistic regression to evaluate the effect of the adherence to the program in the glycated hemoglobin (whether it was controlled or not) considering the impact of the other relevant variables such as amount of Medication, hospitalizations, number of months in the policy, age of patient, among others. **RESULTS:** HbA1c <6.5% was found in 57.2% of DMM patients and 52.5% in conventional care. Patients in DMM used fewer antidiabetic medications (p <0.00), had fewer outpatient visits (p 0.028) and fewer hospitalizations (p 0.003). In the multivariate analysis, the only variables associated with metabolic control were adherence to the program OR 1.6 (p 0.05) and any hospitalization during the period OR 4.86 (p 0.005). **CONCLUSIONS:** A DMM for chronic diseases allows value-based health care and is associated with clinically significant outcomes in type 2 diabetic patients, such as metabolic control and fewer hospitalizations. It is possible that a greater follow-up will reveal greater differences with lower costs of health care.

PHS111

DETERMINANTS OF PATIENT-CENTRED CARE FROM THE PUBLIC AND PROFESSIONALS' PERSPECTIVES

Gogovor A, Valois M, Ahmed S
McGill University, Montreal, QC, Canada

OBJECTIVES: To assess the determinants of patient-centred care (PCC) from Canadian public and professionals' perspectives. We expected that respondents who strongly support team care models for chronic disease (CD) management will have a high level of support for attributes of PCC. **METHODS:** This study used the data from a national population-based survey, the 11th edition of the Health Care in Canada (HCIC) Survey, conducted by Pollara Strategic Insights between November 2013 and January 2014. The survey assessed the perceptions of 1000 Canadian adults, 101 doctors, 100 nurses, 100 pharmacists, and 104 administrators who were randomly selected from online panels based on multiple source recruitment. PCC was assessed using a summary score across 7 items. Two separate hierarchical regression models were run to estimate the association between several covariables including age, gender, type of CD, and e-technology and PCC. **RESULTS:** Of 1000 Canadian public adults surveyed, 51% were female, 74% were living with another person, 17% were living in rural areas, and 62% have

at least one chronic condition. Only 18 % of health professionals were working in teams. Multivariable regression models showed that older age (0.59, 95%CI:0.32, 0.86), work in teams (0.24, 95%CI:0.20, 0.28), adherence to medications (-0.81, 95% CI: -1.16, -0.47), use of e-technology (0.29, 95%CI:0.17, 0.42), and patient involvement in decision making (0.42, 95%CI:0.30, 0.55) were significantly associated with PCC of PCC. Variables such as gender and years in practice were not significant. **CONCLUSIONS:** The findings confirmed that perceptions of requiring health professionals to work in teams and the use of technology in healthcare are associated with support for patient-centred care from both the public and health professionals. Programs to accelerate the implementation of health care teams supported by information and communication technologies are needed, particularly for individuals living with chronic conditions.

PHS112

CORRELATES OF GOOD DIABETES MANAGEMENT AMONG AMERICANS WITH TYPE 2 DIABETES

Adjei Boakye E[1], Garba A[2], Stamatakis KA[2], Chen J[1], Buchanan PM[1], Burroughs TE[1], Armbrecht E[1]

[1]Saint Louis University Center for Outcomes Research (SLUCOR), Saint Louis, MO, USA, [2]Saint Louis University College for Public Health and Social Justice, Saint Louis, MO, USA

OBJECTIVES: This study aims to examine factors that are associated with diabetes management among United States adults. **METHODS:** Data from the 2011-1014 Behavioral Risk Factor Surveillance System (BRFSS), a random-digit-dialed telephone survey of the civilian, noninstitutionalized adult population aged 18 years, were analyzed for 78,698 individuals who self-reported diabetes. The outcome variable was diabetes management; good diabetes management was defined as monitoring blood glucose and foot sores daily as per the American Diabetes Association's recommendation, and engaging in regular physical activity. Independent variables included sociodemographic and healthcare access factors. Weighted, multivariate logistic regression models were constructed to examine the association between independent variables and diabetes management. **RESULTS:** Approximately 28% of the respondents engaged in good diabetes management. Weighted multivariable logistic regression revealed that compared to non-Hispanic Whites, non-Hispanic Blacks were more likely to engage in good diabetes management (aOR = 1.35; 95% CI: 1.24 – 1.47) as were respondents who had prior diabetes management education (aOR = 1.57; 95% CI: 1.48 – 1.67). Respondents who had a high school diploma (aOR = 0.90; 95% CI: 0.83 – 0.97) and did not graduate from high school (aOR = 0.87; 95% CI: 0.79 – 0.98) were less likely to engage in good diabetes management compare to those that had a college degree or higher. Respondents who were never married (aOR = 0.88; 95% CI: 0.80 – 0.98); who did not have a regular provider (aOR = 0.70; 95% CI: 0.60 – 0.81); and who self-reported poor/fair health (aOR = 0.77; 95% CI: 0.71 – 0.84) were less likely to engage in good diabetes management. **CONCLUSIONS:** Race, marital status, education, healthcare provider, and health status are associated with diabetes management. Increasing public health interventions aimed at educating diabetics and removing barriers to good diabetes management might provide a means for improving health outcomes.

PHS113

MANAGEMENT OF MINOR AILMENTS IN A COMMUNITY PHARMACY SETTING: FINDINGS FROM A QUALITATIVE STUDY IN GONDAR TOWN, ETHIOPIA

Ayele AA

university of Gondar, gondar, Ethiopia

OBJECTIVES: The aim of this study was to assess community pharmacists' management practice, and to identify potential barriers in the management of minor ailments in a resource limiting settings. **METHODS:** , A qualitative based structured in-depth interview was conducted from May 16 to June 1, 2016. The study participants were recruited through personal contacts and connivance sampling technique. The identified participants were contacted in person or on phone to fix interview appointments. In-depth interview guide was adopted and the content validity of the interview guide was confirmed by a team of experts. The transcripts were then analyzed line by line, read repetitively by the investigators and thematically analyzed for its content. **RESULTS:** One of the main reason customers encounter in community pharmacies were to get medications for minor ailments and most of the community pharmacists deliver management of minor ailments service. Most of the participants reported that the diagnoses of minor ailments in community pharmacies were entirely depends on history taking. This study also revealed that headache, diarrhea and cough are the most common minor ailments presented in community pharmacies. Moreover, most participants of this study take in to consider sex, age pregnancy status and cost before dispensing drugs for minor ailments. However, lack of training, knowledge and poor community awareness were the barriers to implement the service in community pharmacy setting. **CONCLUSIONS:** In areas where there is shortage of physicians, the communities can accesses primary health care service in community pharmacies. Though community pharmacists have an important role in the management of minor ailments, lack of training, knowledge and poor community awareness hinders them from appropriately managing patients of various needs.

PHS114

GENDER DIFFERENCES IN HEART FAILURE IN A REAL WORLD CONTEST: IMPACT ON DRUG UTILIZATION AND COSTS FOR THE MANAGEMENT OF THIS CLINICAL CONDITION

Colombo D[1], Maggioni AP[2], Cinconze E[3], Rossi E[3], Nica M[1]

[1]Novartis Farma, Origgio, Italy, [2]ANMCO Research Center, Florence, Italy, [3]CINECA Interuniversity Consortium, Casalecchio di Reno, Italy

OBJECTIVES: Heart failure has a high burden of morbidity and mortality, which imply substantial healthcare costs. It is the main hospitalization cause in eailerly patients. Gender is important risk factor for CV diseases. Using data from a large Italian database, we analyzed drug utilization and healthcare costs of managing HF from a gender prospective, in a "real world" scenario. **METHODS:** Data from "Osservatorio ARNO Cineca". This report reffers to a sample of 54,059 patients with heart failure, for whom hospitalizations, specialistic visits, and drug prescriptions, were available. Re-hospitalizations were analysed and costs were evaluated using Italian tariffs during the 1-year follow-up period: drugs, diagnostic and therapeutic procedures, hospitalizations. Mean cost was calculated per patient per year for 1-year follow-up or until death. Gender analysis were performed for a number of variables including drugs use and healthcare costs. **RESULTS:** Women medium age was 80.4 years (±10.1) and men 75.5 (±11.4). Distribution by age was different in the two genders: only 25% of women developed CHF before age 75, while 43% of men had CHF before age 75. Hospital admissions were major determinant of costs for management of HF and were analyzed from a gender prospective. Women were more likely to be admitted to general medicine services, while men to cardiology units. 54.6% and 15.2% of women were hospitalized in "General medicine" or "Geriatrics", compared to 44.6% and 12.0% of men, respectively. Only 16.3% and 4.3% of women are admitted to "Cardiology" or "Coronary Heart Disease" units, compared to 23.5% and 9.4% of men, respectively. Men were more likely prescribed ACE-i or ARBs and BB. **CONCLUSIONS:** Our data confirm, in a real world setting that gender makes difference in CV diseases. Moreover, costs for NHS are mainly driven by hospital costs and patient gender seems to influence them, so it must be taken into account.

PHS115

MEDICINES SEEKING AND TAKING BEHAVIOUR AMONG GENERAL PUBLIC IN THE STATE OF PENANG, MALAYSIA

Dawood OT[1], Hassali MA[1], Saleem F[2]

[1]Universiti Sains Malaysia, Penang, Malaysia, [2]University of Baluchistan, Quetta, Pakistan

OBJECTIVES: This study was conducted to evaluate the health seeking behaviour among general public and its associated factors; and to evaluate the medicine taking behaviour in public and the practice of self-medication. **METHODS:** A cross-sectional study was undertaken among general public in Penang Island, Malaysia. A convenience sampling of 888 participants successfully completed the survey. Self-administered questionnaires were distributed among the residents in the north east of Penang Island. **RESULTS:** This study showed that most of the participants chose to consult the doctor when they experience any health problems (66.7%), followed by self-medication (20.9%). The first action for consulting the doctor was significantly predicted by Malay respondents and retired people (OR 3.05, 95% CI 1.04-8.89). The prevalence of self-medication was 54%. The practice of self-medication was significantly associated with Chinese participants, educated people, people with alone living status and people with more self-care orientation. **CONCLUSIONS:** Increasing the awareness of the public about the rational choice of getting medical assistance is a very important issue to control their health. A health education program is needed to increase the awareness about the use of medicines among the general public and to enable them to make the right decisions relating to health problems.

PHS116

TREND IN 30-DAY READMISSION RATES AMONG PATIENTS WITH CONGESTIVE HEART FAILURE: RESULTS FROM A LARGE, SINGLE HEALTHCARE ORGANIZATION

Dabbous F[1], Kozmic S[1], Zamfirova I[1], Carlson KB[2], Summerfelt WT[3], Chaptini N[4]

[1]Russell Institute for Research & Innovation, Park Ridge, IL, USA, [2]Advocate Health Care, Oak Lawn, IL, USA, [3]Advocatte Health Care, Downers Grove, IL, USA, [4]Advocate Lutheran General Hospital, Park ridge, IL, USA

OBJECTIVES: Congestive heart failure (CHF) is the most frequent reason for hospital admissions and readmissions. Healthcare providers are striving to identify ways to reduce readmission rates to improve patient's health outcomes and avoid penalties. We investigated the trend over time in all cause 30-day readmission rates among patients with CHF in a large, single healthcare organization with 11 hospitals. **METHODS:** Patients with primary diagnosis of CHF admitted between 2008 and 2016, ≥18 years and discharged to home, home health, or home infusion were included for analysis. Logistic regression model with Generalized Estimating Equations (GEE) was utilized to account for clustering of repeated admissions within patients adjusted for age, gender, race, insurance, length of hospital stay, and discharge disposition. **RESULTS:** The records of 29,107 CHF patients were reviewed with 14% of these patients having a 30-day readmission. Demographic characteristics define the population as primarily White (49%), more males (52%) and with an average age of 70.5 years (±14.5). The majority of patients had public insurance (77%) and were discharged to home (60%). Readmitted patients were younger (69 vs 71) and had longer length of hospital stay (5.4 vs 4.5 days). Males were more likely to be readmitted (14.5% vs 13.7%) and so were patients on public insurance (14.7% vs 12.5% for public vs private, respectively). Patients discharged to home health were more likely to be readmitted compared to those discharged to home (15.1% vs 13.5%). A significant downward trend over time was observed in 30-day readmission rates in the fully adjusted model (OR = .96; CI = .94-.97) for this patient population. **CONCLUSIONS:** In an attempt to explore 30-day readmission rates over time in the CHF patient population, we found a steady reduction in 30-day readmission rates over time between the years 2008 and 2016, an encouraging finding from both medical and economic perspectives.

PHS118

HOW EFFECTIVE ARE DIABETES DIGITAL HEALTH TOOLS? A REVIEW OF THE SCIENTIFIC AND MEDICAL LITERATURE 2011-2016

Navaratnam P[1], Friedman H[2], Navaratnam A[2]

[1]DataMed Solutions LLC., New York, NY, USA, [2]Sygeny Ltd, Helsinki, Finland

OBJECTIVES: The objective of this study was to evaluate the effectiveness of diabetes digital health tools in improving diabetic patient outcomes when

deployed in the 'real world'. **METHODS:** A literature review was conducted in PubMed using key terms such as 'diabetes', 'digital', 'health', 'e-health', 'm-health', 'mobile', and 'randomized'. Only English language publications published from 2011 through 2016 were targeted for abstraction. Abstracts were included if they were interventional studies, utilized a parallel group randomized design, enrolled diabetes only patients and evaluated diabetic study end-points. Studies were excluded if they were screening or prevention studies; product feasibility evaluations, meta-analyses; systematic reviews, and small pilot studies (<20 patients). Full articles from study eligible abstracts were retrieved for review. **RESULTS:** A total of 186 abstracts were initially identified and 28 articles (15%) were deemed to be eligible for study inclusion. More than half (57%) of these studies were US studies. 83% of these studies were published between 2014-2016. Three quarters of these studies focused on tools that promoted self-management or improved overall diabetes management. The remainder focused on tools that improved lifestyle education (7%), telemedicine/telehealth (14%), and treatment adherence (4%). A thorough review revealed that across these studies, the populations were small (range: 30-567 patients); were of short duration (range: 30 days-1 year); and had a modest or no impact on glycemic outcomes such as hemoglobin A1-C. (average hemoglobin A1-C difference, active vs. control arms: 0.3%). **CONCLUSIONS:** The effective clinical management of diabetes may be enhanced using digital health technologies. However, a review of the studies conducted recently to evaluate the clinical effectiveness of diabetes-focused digital health tools revealed modest or no impact on important diabetes outcomes.

PHS119

KNOWLEDGE AND PRACTICE OF NURSES TOWARDS PREVENTION OF PRESSURE ULCER AND ASSOCIATED FACTORS IN GONDAR UNIVERSITY HOSPITAL, NORTHWEST ETHIOPIA

Amdie FZ, Nuru N
University of Gondar, Gondar, Ethiopia

OBJECTIVES: This study was aimed to assess knowledge, practice and factors associated with pressure ulcer prevention among nurses in Gondar University Hospital, North-west Ethiopia. **METHODS:** An institution-based cross-sectional survey was conducted from March 15 - April 10, 2014 among 248 nurses in Gondar University hospital. A structured self-administered questionnaire was used for data collection. Descriptive statistics was used to describe the study population. Bivariate and multivariate logistic regression was also carried out to see the effect of each independent variable on the dependent variable. **RESULTS:** In this study nearly half (54.4 %) of the nurses had good knowledge; similarly 48.4 % of them had good practice on prevention of pressure ulcer. Educational status, work experience and having formal training were significantly associated with knowledge on prevention of pressure ulcer. While, satisfaction with nursing leadership, staff shortage and inadequate facilities and equipment were found to be significantly associated with the practice on prevention of pressure ulcer. **CONCLUSIONS:** Knowledge and practice of the nurses regarding prevention of pressure ulcer was found to be inadequate. Having higher educational status, attending formal training and being experienced were positively associated with knowledge; while shortage of facilities and equipments, dissatisfaction with nursing leadership and inadequate staff number showed negative association with practice of nurse's pressure ulcer prevention. In-service training and upgrading courses are some of the important steps to improve nurses' knowledge and practice on prevention of ulcer pressure.

PHS120

A COMPREHENSIVE REVIEW OF ORPHAN DRUGS POLICIES, PROCEDURE, LEGISLATION, REGULATION, ESTABLISHED IN THE UNITED STATES AND AUSTRALIA

Hussain S
MCPHS University, Allston, MA, USA

OBJECTIVES: The objective of the study was to review and evaluate the policies and procedures of orphan drug programs in the US (FDA) and Australian (TGA). The availability of orphan drugs is a major global concern. It is essential to understand the dynamics and the efficiency of these policies to ensure that those who require these resources can get them. Accordance to their current polices on orphan drugs in order to ensure easy access by patients who need them. **METHODS:** A comprehensive Orphan Drug database was reviewed and focusing on data from the FDA and biotech pharmaceutical companies and furthermore the actual information was gathered from the experts, research articles, policy documents, regulatory framework, regulations. Multiple databases such as PubMed, Google Scholar, Springer Links, Scopus, and the Cochrane Library were searched. **RESULTS:** The results of this study found that the Therapeutic Goods Administration (TGA) implemented orphan drug legislation, regulations and policy after the U.S Food and Drug Administration (US-FDA) had initiated to do so in 1983. Regulations and policy tools from both agencies were reviewed with a focus on six broad categories: orphan drug designation; national orphan policies; incentives; marketing authorization; pricing and repayment plan; and marketing exclusivity. **CONCLUSIONS:** Patients with rare diseases have the same right to pharmaceutical products as patients that have more common diseases. The difficulty is enticing drug companies to put the expense and time into the development of orphan drugs that represent only a small portion of the market share. As a solution to the problem, several countries have developed some orphan drug policies, regulation, legislation, that provides incentives to help convince drug companies to develop drugs for the specific populations. Both countries have very nicely managed program in place. Both agencies have similar challenges in terms of availability, affordability and accessibility of the product by patient.

PHS121

USE OF ORAL CHEMOTHERAPY DRUGS AND FALLING INTO THE COVERAGE GAP IN MEDICARE CANCER SURVIVORS

Yuan J[1], Lu KZ[1], Wu J[2]
[1]*University of South Carolina, Columbia, SC, USA,* [2]*Presbyterian College, Clinton, SC, USA*

OBJECTIVES: Given the high costs of oral chemotherapy agents, Medicare cancer survivors are particularly vulnerable to Part D coverage gaps. However, few studies have focused on the economic burden associated with the initiation of oral chemotherapy. We examined the use of oral chemotherapy drugs and the entry rate into the coverage gap for elderly Medicare beneficiaries with cancer. **METHODS:** A retrospective cross-sectional study was conducted using national representative sample obtained from Medicare Current Beneficiary Survey. Cancer patients aged over 65 who continuously enrolled in Medicare Part A during 2006 through 2010 were included in the analysis. Selected oral chemotherapy drugs were identified using pharmacy claims and self-reports. Drug costs and entry into the gap were compared between with vs. without oral chemotherapy. Logistic regression models were used to predict the probability of falling into coverage gap. Generalized linear models were used for healthcare costs. **RESULTS:** The study sample included 7,665 Medicare beneficiaries with cancer. Beneficiaries filling oral chemotherapy agents had significantly higher drug costs ($7,305 vs. $2,676; $p<0.001$) and out-of-pocket costs ($4.263 vs. $ 1,396; $p<0.001$), compared to those without oral chemotherapy. In 2006-2010, 38.8% cancer beneficiaries without oral chemotherapy reached the coverage gap, while 84.3% beneficiaries having oral chemotherapy reached the gap. After adjusting for socio-demographic and clinical characteristics, the use of oral chemotherapy drugs was associated with a 10.7 times increased risk in reaching coverage gap (Odds Ratio [OR]=11.7, 95% confidence interval [CI]= 8.9-15.5), and $2,167 more in out-of-pocket costs for prescription drugs. The predictors of falling into coverage gap include race, income, having low income subsidy or other drug benefits, and number of chronic conditions. **CONCLUSIONS:** The majority of beneficiaries receiving oral chemotherapy had high out-of-pocket drug costs and reached coverage gap. Beneficiaries who had low socioeconomic status or more clinical conditions were at particularly high risk for reaching coverage gap.

PHS122

NATIONAL DISEASE AND ECONOMIC BURDEN OF MULTIPLE SCLEROSIS IN TAIWAN

Hsu JC, Chou C
National Cheng Kung University, Tainan, Taiwan

OBJECTIVES: Multiple Sclerosis (MS) is a rare disease in Taiwan due to its low prevalence. Few studies have estimated the disease and economic burden of MS in Taiwan overtime. This study aims to examine the trends in prevalence of MS and its health related economic burden in Taiwan. **METHODS:** We examined 2003-2014 (12 years) MS-related claims data from National Health Insurance Research Database. We used time series analysis to assess trends in prevalence of MS, and overall healthcare use and expenditures, including drugs. We also compared these burdens between Taiwan and other countries. **RESULTS:** During the 12-year study period, the estimated prevalence of MS increased from 1.8 to 4.7 per 100,000 population, an average rate of 14.68% increase per year. Higher number of patients was found for female (7.35 per 100,000 population) than male (1.98 per 100,000 population), and 35-39 years old female and male patients accounted the highest number in 2014. Total health expenditures for MS treatment increased from US $2.20 million to US$9.22 million, however, proportion of health expenditure for patients with MS among all patients with rare diseases decreased from 14.37% to 6.62%. Proportion of drug expenditure divided by health expenditure for all patients with MS increased from 16.92% to 84.18%. Proportion of drug expenditure for patients with MS among all population increased from 0.01% to 0.14%. We found a 9.64-fold difference in average health expenditure and a 31.09-fold difference in average drug expenditure between patients with rare diseases and all patients in 2014. **CONCLUSIONS:** Prevalence of MS and related health/drug expenditures have substantially grown in Taiwan over the past 12 years, but proportion of both health and drug expenditures for MS patients among all patients with rare diseases gradually decreased. Drug expenditures accounted for the increasing proportion of health expenditures. Accessibility and value assessment of drugs for MS treatment are getting important.

PHS123

GEOGRAPHICAL DIFFERENCE IN PROCESSES OF CARE IN CHRONIC KIDNEY DISEASE AMONG MEDICARE PART D ENROLLEES

Han Y[1], Balkrishnan R[2]
[1]*University of Michigan, Ann Arbor, MI, USA,* [2]*University of Virginia School of Medicine, Charlottesville, VA, USA*

OBJECTIVES: Previous research has shown there is a geographical clustering in health behaviors, access to healthcare, and healthcare utilization. Few studies have assessed geographical variation in processes of care in chronic kidney disease (CKD) patients across the United States. This study aimed to explore local variations in receiving nephrologist services, use of angiotensin-converting enzyme inhibitors (ACEIs) and angiotensin-receptor blockers (ARBs), and hospitalization among CKD patients with Part D coverage. **METHODS:** This retrospective cohort study was conducted using the 2013-2014 Medicare 5% sample claim data. CKD patients covered by a stand-alone Part D plan were selected. A one-year baseline period (2013) was applied to assess patients' medical history, and utilization of health services was assessed for year 2014. Geographically weighted logistic regression was used to explore predictors of using ACEIs/ARBs. In addition, utilization rate of nephrologist services, ACEIs/ARBs, and hospitalization rate were calculated at county level. Moran's I was calculated to examine spatial autocorrelation at county level and results were presented in spatial maps. **RESULTS:** A total of 100,159 CKD

patients residing in 3022 counties of the United States were selected. About 27%, 56% and 36% of them had receiving nephrologist services, ACEIs/ARBs and experiencing hospitalization in 2014. CKD patients with non-white race, having mild and moderate damage, having onset of diabetes and hypertension were more likely using ACEIs/ARBs (all $p<0.05$ in multivariate geographically weighted regressions). Patients with Part D Low-income subsidy were less likely using ACEIs/ARBs. Significant spatial clustering was observed in all of investigated health services. **CONCLUSIONS:** Findings from this study indicated there were spatial effects associated with use of nephrologist services, guideline-recommended ACEIs/ARBs, as well as hospitalization. Local interventions are needed to promote access to healthcare, healthcare utilizations, and in turn reduced CKD disparities.

PHS124

STATIN UTILIZATION AMONG PATIENTS WITH DIABETES IN AN EMPLOYEE SPONSORED PHARMACIST PROGRAM

Calabrese MJ, Gaitonde P, Cooke CE, Shaya FT, Rodriguez de Bittner M
University of Maryland School of Pharmacy, Baltimore, MD, USA

OBJECTIVES: Upon enrollment in the Patient Pharmacist Partnerships (P3) program, pharmacists conduct Comprehensive Medication Therapy Management (CMTM) monthly for the first three months, and then quarterly thereafter, with medications lists documented at each encounter. Statin use is recommended among patients with diabetes and utilization of this medication is indicative of good quality diabetes care. Quality metric NQF# 2712 assesses the proportion of people with diabetes aged 40-75 years on a statin. The objective of this study is to characterize changes in the use of statin therapy among P3 enrollees with diabetes. **METHODS:** The dataset used includes medication lists of P3 enrollees from each encounter in the mid-Atlantic region from two participating employers. Patients were included in the study if they were between 40-75 years old and had diabetes defined by the presence of anti-hyperglycemic medication and followed-up in at least one additional time point. NQF# 2712 is the proportion of statin utilized among diabetes patients. Therefore, we used chi-square tests to assess changes in this quality indicator at each time point (0.5, 1, 1.5, and 2 years) compared to program entry. **RESULTS:** There were 401 enrollees with at least 1 encounter with mean age of 56.4 years (SD: 7.7), 215 (53.6%) female, and 203 (50.6%) white. The proportion of statin utilization (range 27.5%-28.1%) ($p>0.05$) remained unchanged at 0.5 and 1 years. At 1.5 and 2 years, there were increases in statin utilization from 24.24% to 28.79% ($p<0.05$), and from 23.38% to 30.09% ($p<0.05$), respectively. **CONCLUSIONS:** Overall, statin utilization among P3 enrollees with diabetes is low. However, at 1.5 and 2 years after entry, there was a higher percentage of enrollees utilizing statins. P3 pharmacists improved statin use at time points greater than one year from entry into the program highlighting their contribution in improving statin utilization and this quality measure.

PHS125

ESTABLISHING SCREENING STRATEGIES FOR PROSTATE CANCER PATIENTS (ESCAPE)

Qureshi Z, Wang L, Horner R, Glover S, Khan MM, Bennett CL
University of South Carolina, Columbia, SC, USA

OBJECTIVES: Prostate cancer (PCa) screening has generated considerable controversy after recent recommendations to discontinue the use of the prostate-specific antigen (PSA). Our objective was to propose effective screening strategies for promoting early detection of PCa. **METHODS:** We applied generalized odds rate hazards (GORH) model for interval-censored data to the PCa subset of the Prostate, Lung, Colorectal and Ovarian (PLCO) Cancer Screening trial data. The final regression analysis on the PLCO data provided accurate estimates of the effects of significant risk factors for PCa and an estimate of the cumulative incidence function (CIF) which was used to propose the screening strategy. Participants with <2 PSA tests and those with missing values in important risk factors were excluded. Risk models depicting probabilities of developing PCa in the next 't' years were generated using 5 year age increments. **RESULTS:** The final dataset consisted of 33735 subjects. Majority of participants were on average 62 years of age, non-hispanic White males. About 89% of participants had not developed PCa during the course of the trial. Most participants (55%) had undergone 6 PSA tests. About 8% had undergone at least 1 biopsy. Age, race, baseline PSA, biopsy, diabetes and family history of PCa were identified as significant risk factors for the model used to develop the screening strategy. For men studied in 5 year increments beginning at age 50 with a family history of PCa and concurrent diabetes, Asian men were at the lowest risk with significant increase in risk occurring between 6-7 years of follow up, followed by White men. African American men had the highest risk of developing PCa. **CONCLUSIONS:** Our findings have significant implications for risk assessment for PCa by race and time elapsed since 50. How the risk factors and PSA values affect likelihood of PCa can help identification of specific and sensitive screening strategy.

PHS126

RACIAL AND ETHNIC DISPARITIES IN MEETING MTM ELIGIBILITY CRITERIA BASED ON STAR RATINGS COMPARED TO MMA

Wang J[1], Qiao Y[2], Spivey C[2], Shih YT[3], Wan J[4], Kuhle J[5], Dagogo-Jack S[4], Cushman W[4], Chisholm-Burns M[2]
[1]*The University of Tennessee Health Science Center College of Pharmacy, Memphis, TN, USA,* [2]*The University of Tennessee Health Science Center College of Pharmacy, Memphis, TN, USA,* [3]*The University of Texas MD Anderson Cancer Center, Houston, TX, USA,* [4]*The University of Tennessee Health Science Center College of Medicine, Memphis, TN, USA,* [5]*Pharmacy Quality Alliance, Springfield, VA, USA*

OBJECTIVES: Racial and ethnic disparities were found in meeting Medication Therapy Management (MTM) eligibility criteria implemented under Medicare Modernization Act (MMA). Therefore, the objective is to examine whether an alternative MTM eligibility standard based on Medicare Part D Star Ratings system can reduce racial and ethnic disparities. **METHODS:** The study analyzed 2012-2013 Medicare claims data for 3 million beneficiaries. Patients were considered MTM-eligible if they had any issues with measures of medication utilizations in Star-Ratings. Logistic regression and Blinder-Oaxaca approach were used to test disparities in meeting eligibility criteria of Star-Ratings across racial/ethnic groups. Multinomial logistic regression was used to examine whether there was disparity reduction by comparing individuals who were MTM-eligible under MMA but not Star-Ratings and those who were MTM-eligible under Star-Ratings but not MMA. Disease-specific analysis was conducted for each of the top ten MTM-targeted chronic conditions. Main and sensitivity analyses were conducted for MMA-based thresholds (used in 2009 and 2013 by Part D plans, and proposed for 2015 by the Centers for Medicare & Medicaid Services) and Star-Ratings measure combinations. **RESULTS:** Adjusted odds ratios to non-Hispanic Whites (Whites) were 1.394 (95% Confidence Interval (CI)=1.375-1.414) for non-Hispanic Blacks (Blacks) and 1.197 (95% CI=1.176-1.218) for Hispanics, indicating likelihood of MTM eligibility under Star-Ratings 39.4% higher among Blacks and 19.7% higher among Hispanics than Whites. Disparities were not completely explained by difference in patient characteristics based on Blinder-Oaxaca approach. Multinomial logistic regression found significant racial and ethnic disparity reduction in main analysis, e.g., Black-White and Hispanic-White disparities in MTM eligibility were reduced by 55.1% (Relative Risk Ratios (RRR)=0.449, 95% CI=0.434-0.465), and 45.6% (RRR=0.544, 95% CI=0.521-0.569), respectively, when using Star-Ratings compared to 2013 MMA criteria. Similar patterns were found in sensitivity and disease-specific analyses. **CONCLUSIONS:** Star-Ratings criteria would reduce racial and ethnic disparities in the general Medicare population and those with specific chronic conditions.

PHS127

THE EFFECT OF INSURANCE COVERAGE AND COPAYMENT LEVELS ON DILATED EYE EXAMS FOR PATIENTS WITH DIABETES MELLITUS IN A US NATIONAL SAMPLE

An J
Western University of Health Sciences, Pomona, CA, USA

OBJECTIVES: Insurance coverage has been suggested as a potential barrier of routine dilated fundus eye examinations (DFEs). This study was to assess the associations between insurance coverage and/or copayment levels on performing DFEs among patients with diabetes. **METHODS:** Using the 2009-2014 Medical Expenditure Panel Survey two-year longitudinal files, diabetic patients aged 18-75 years old were identified. Insurance coverage was categorized into 1) none; 2) any private; 3) public insurance only; and the quartiles of copayments for ophthalmologist/optometrist visits ($0, $1-$15, $16-$40, >$40) were investigated using year 1 data. DFEs were determined at year 2 through a self-reported questionnaire and ≥1 ophthalmologist/optometrist office visits. Multivariate logistic regressions were used to investigate the associations between insurance coverage and/or copayments and DFEs controlling for covariates and applying sampling strata and weights. **RESULTS:** A sample of 4,186 adult patients with diabetes was identified of which 9.7% was uninsured, 60.1% had any private insurance, and 30.2% had only public insurance. About 61.7% of the total respondents reported the receipt of DFEs at year 2, however, only 45.2% of those had ≥1 ophthalmologist/optometrist office visits. Insurance coverage was highly associated with higher odds of DFEs [adjusted odds ratios (OR) (95% CI) = 4.09 (1.81-9.26) for any private insurance vs. uninsured; OR = 3.18 (1.31-7.73) for public insurance vs. uninsured]. The copayment levels were also associated with DFEs. Less than $40 of copayments was associated with higher odds of DFEs compared to >$40 [OR = 2.02 (1.12-3.65) for $1-$15 vs. >$40; OR = 1.69 (1.08-2.65) for $16-$40 vs. >$40]. Older age, longer duration of diabetes, and higher education levels were also associated with higher odds of DFEs. **CONCLUSIONS:** Insurance coverage as well as lower copayments were associated with a likelihood of receiving DFEs in patients with diabetes. Future value-based insurance design efforts may be necessary to increase adherence to DFE recommendations.

PHS128

DO MEDICAL HOMES INFLUENCE HEALTHCARE UTILIZATION RATES AND PROCESS OF CARE MEASURES?

Singer D[1], Alcusky M[2], Hegarty SE[1], Keith SW[1], Djatche L[1], Lombardi M[3], Maio V[1]
[1]*Thomas Jefferson University, Philadelphia, PA, USA,* [2]*UMass Medical School, Worcester, MA, USA,* [3]*Parma Local Health Authority, Parma, Italy*

OBJECTIVES: This study sought to compare healthcare utilization rates and process of care measures between patient populations served by physicians affiliated with newly established medical homes (MH) and those not affiliated with MHs. **METHODS:** This population-based cross-sectional study of 2015 administrative healthcare data from the Local Health Authority of Parma, Emilia-Romagna, Italy included all residents ≥14 years old. Utilization measures included hospital admissions, including ambulatory care sensitive conditions (ACSC) hospitalizations, readmissions, pharmacy, specialty services such as diagnostic imaging, and emergency department (ED) visits. Process of care measures comprised diabetes care metrics (e.g., HbA1c monitoring, microalbumin, eye exam). Negative binomial regression models using generalized estimating equations (GEE) compared healthcare utilization rates and logistic GEE regression models compared the prevalence of process of care measures between populations of MH patients and non-MH patients. **RESULTS:** The study population comprised 368,917 residents. Age and gender distributions were similar between patients cared for (32.1%) and not cared for (67.1%) in MHs. Multivariable adjusted hospitalization rates overall (IRR 0.98; 95%CI: 0.95-1.01) and for acute ACSCs (IRR: 1.02; 95%CI: 0.87-1.19) were similar. The hospitalization rate for chronic ACSCs (IRR: 0.86; 95%CI: 0.74-1.00) and the ED visit rate (IRR: 0.86; 95%CI: 0.81-0.91) were

lower among patients in MHs. MH patients had lower readmission rates for select chronic conditions. Rates of specialty service use and pharmacy utilization were comparable between groups. Within the sub-population of 25,223 with diabetes, a larger proportion of MH patients obtained recommended diabetes care processes than non-MHs patients. **CONCLUSIONS:** This early evaluation of recently implemented MHs suggests that while aggregate measures of inpatient utilization were similar between groups, differences may exist in the rates of ED utilization, readmission, and hospitalization for chronic ACSCs. Longitudinal research will help elucidate processes and outcomes of care for populations served by MHs.

PHS129

SERIOUS PSYCHOLOGICAL DISTRESS AND EMERGENCY DEPARTMENT USE AMONG ADULTS WITH MULTIMORBIDITY IN THE UNITED STATES

Alhussain K[1], Meraya AM[2], Sambamoorthi U[2]
[1]West Virginia University, Morgantown, WV, USA, [2]West Virginia University, School of Pharmacy, Morgantown, WV, USA

OBJECTIVES: We sought to 1) examine the association between serious psychological distress (SPD) and emergency department (ED) use among adults with multimorbidity in the US and 2) investigate the association between SPD and the reasons for ED use. **METHODS:** A cross-sectional, retrospective, observational study design was conducted using data from the 2014 National Health Interview Survey (NHIS). The study sample consisted of 13,708 US adults with multimorbidity. Chi-square tests were used to examine unadjusted subgroup differences. Multivariable logistic regression models were used to assess the association between SPD and ED use. Among ED users, adjusted logistic regression models were conducted to examine the association between SPD and the reasons for the ED use in the past 12 months. **RESULTS:** After controlling for other variables, adults with SPD were more likely to use ED than those without SPD (AOR = 1.73, 95% CI = 1.40, 2.15). Among ED users, we found that adults with SPD were more likely (AOR = 1.43, 95% CI = 1.03, 1.98) to report "the clinic was not open" as the reason for using ED than those without SPD. **CONCLUSIONS:** Combination of SPD and multimorbidity was associated with higher ED use. Inconvenient clinic hours were more likely to be reported by adults with SPD as the reason for their ED use. Management programs addressing SPD among adults with multimorbidity are needed to minimize the risk of ED use.

PHS130

DOES ROUTINE SCREENING FOR CARDIOVASCULAR RISK FACTORS WIDEN SOCIOECONOMIC INEQUALITIES IN HEALTH? : A SYSTEMATIC REVIEW

Tan MM[1], Lee JT[1], Lorenc T[2]
[1]Saw Swee Hock School of Public Health, National University of Singapore, Singapore, Singapore, [2]University of York, York, UK

OBJECTIVES: Primary care treatment approaches for Cardiovascular diseases (CVD) focus on intervening individual's lifestyle choices through identifying and reducing modifiable risk factors for CVD such as blood pressure and cholesterol. While screening for cardiovascular disease risk targets to reduce CVD risk factors in high-risk individuals, it tends to benefit the predominant population and those with more socioeconomic ability. The aim of this review is to understand the impact of CVD screening on health inequalities. This systematic review investigates the uptake rates of health checks for multifactorial cardiovascular disease (CVD) risk factors to understand their impact on socioeconomic inequalities in health. **METHODS:** We searched Medline, Cochrane Database of Systematic Reviews; Cochrane Central Register of Controlled Trials (CENTRAL); Cochrane Methodology Register; Database of Abstracts of Reviews of Effects (DARE); NHS Economic Evaluation Database (EED); Health Technology Assessments Database (HTA); and Econlit. We selected all studies conducted at primary/ community care level, which screens for CVD multifactorial risk factors with uptake and risk factors as outcomes for all population and geographical location, published between 1985 and 2016. **RESULTS:** The included studies evaluated CVD health checks in various screening sites, including those conducted in General Practitioners' clinics. There was a higher likelihood of women attending health checks when compared to men. Uptake of health checks was less likely in men from low socioeconomic status. Higher uptake rates in health checks were detected in the less deprived and older age groups. Some evidence also observed higher prescription and uptake rates of health checks in south Asian patients. **CONCLUSIONS:** Socioeconomically disadvantaged population benefits less from screening for cardiovascular disease risk factors due to a generally low uptake rate. While CVD screening reduces CVD risk factors, it could threaten the socioeconomic inequalities gap. Further research could be conducted to combat the specific health inequalities.

PHS131

INEQUITY IN HEALTHCARE ACCESS IN ASIAN COUNTRIES WITH REPORTEDLY HIGH UNIVERSAL HEALTH COVERAGE LEVELS

Evans JS[1], Ma C[2], Noon K[1], Steeves S[1]
[1]Costello Medical Consulting Ltd, Cambridge, UK, [2]Costello Medical Singapore Pte Ltd, Singapore, Singapore

OBJECTIVES: To investigate inequity in access to inpatient and outpatient healthcare under universal health coverage (UHC) schemes in countries across Asia with reportedly high levels of coverage. **METHODS:** A pragmatic literature review was conducted using PubMed and Google Scholar. The most frequently reported measure of inequity was the concentration index (CI). This index demonstrates the concentration of healthcare resource distribution; a score of 0 indicates equal distribution, while values >0 indicate resource is disproportionately concentrated on the rich and values <0 on the poor. Comparisons of CIs before and after implementation of UHC and between rural and urban areas were conducted along with analysis of the relationship between CIs, UHC levels and government expenditure on healthcare (GEH). **RESULTS:** Data were available for China, Korea, Thailand and Taiwan. Both before and after UHC implementation in Korea and Thailand, CIs for inpatient and outpatient care were marginally in favour of the poor. In China, healthcare was generally concentrated on the rich, although the CIs reduced after UHC. Data for urban versus rural areas were available for Thailand, where there was a pro-poor CI (CI=-0.14) for inpatient care in urban areas but almost equal healthcare distribution (CI=-0.04) in rural areas. Across all four countries, higher levels of UHC and GEH (2013 Purchasing Power Parity) corresponded to lower CIs for outpatient care, with strong negative correlations (r=-0.7414 and r=-0.50721, respectively). Negative correlations, albeit weaker, were also observed for inpatient care (r=-0.2814 and r=-0.34833, respectively). **CONCLUSIONS:** Despite reportedly high levels of UHC in China, Korea, Thailand and Taiwan, inequities in access to inpatient and outpatient care were identified, and increasing UHC coverage and GEH were correlated with increasing distribution of healthcare resource towards the poor. Furthermore, the situation in Thailand highlighted a discrepancy in access to healthcare between urban and rural populations.

PHS132

STATUS ANALYSIS OF HOSPITALIZATION UTILIZATION AMONG DIFFERENT TYPES OF MEDICAL INSTITUTIONS WITHIN BEIJING URBAN EMPLOYEE BASIC MEDICAL INSURANCE SCHEME: A CASE STUDY OF A CERTAIN ONCOLOGY INSTITUTION

Leng JH[1], Chen ZS[1], Gao GY[2], Liu Y[1], Zheng QW[1]
[1]Peking University Cancer Hospital, Beijing, China, [2]Capital Medical University, Beijing, China

OBJECTIVES: China has entered the era of universal health insurance,and Urban Employee Basic Medical Insurance Scheme (UEBMIS) is one of the most important parts. Cancer is the first cause of death, but there is a lack of data on its status in health care system.This study analyzed hospitalization utilization among tertiary General Hospital (GH),Traditional Chinese Medical Hospital (TCMH),Specialized Hospital (SH) within UEBMIS in Beijing,and identified an Oncology Specialized Hospital (OSH) for typical case. **METHODS:** We used official database released by Municipal Bureau to disclose the status from 2013 to 2016 (The year 2016 only contained the first three quarters).Indicators covered average hospitalization expense (AHE),drug proportion (DP) and actual compensation rate (ACR).Two-way ANOVA test was adopted on comparison among different types of medical institutions. **RESULTS:** There were 53 GH,21 TCMH and 18 SH tertiary hospitals in 2015,and respectively the number of hospitalized patients were 637,130,90 thousand,the hospitalization costs were 12.65,2.37,1.94 billion RMB.The average annual growth rate among SH,GH,TCMH and OSH were 2.44%,2.98%,4.07% and 4.16% in AHE,and cost ranged in 20909-22479,19008-20756,16958-19113,and 17163-19949 RMB respectively;by ANOVA test,R2=0.946,year F=12.66(P=0.001),institutional type F=39.46(P=0.000).SNK test showed that institutions can be divided into three levels of OSH&TCMH,GH and SH in AHE($P<0.001$).The average annual descending rate among OSH,TCMH,SH and GH were 0.13%,1.54%,1.75% and 3.00% in DP,and the ratio ranged in 49.3%-50.0%,42.0%-44.0%,31.2%-32.9% and 38.7%-42.5% respectively; R2=0.992,year F=5.02(P=0.026),institutional type F=20.36(P=0.000).The average annual descending rate of TCMH,GH,SH and OSH were 0.05%,1.06%,1.57% and 3.04% in ACR,and the ratio ranged in 80.4%-80.9%,71.5%-73.8%,66.1%-69.3% and 57.9%-63.57% respectively;R2 =0.986,year F=4.36(P=0.037),institutional type F=36.51 (P=0.000).SNK showed that there were significant differences among all four groups in DP and ACR($P<0.001$).As for OSH,75.6-78.4% accounted for out-of-pocket payment. **CONCLUSIONS:** The GH took the predominant role in UEBMIS medical service market.The TCMH had the lowest AHE but the highest ACR.The AHE and DR of SH were relatively high,but had the lowest ACR.The out-of-pocket expenditure of OSH concentrated on drugs.

PHS133

EFFECT OF PAY-FOR-PERFORMANCE IN PRIMARY HEALTH CARE ON INFANT MORTALITY: EVIDENCE OF SYNTHETIC CONTROL FOR ARGENTINA

Palacios A
University of Buenos Aires (UBA), Buenos Aires, Argentina

OBJECTIVES: To analyse whether the pay-for-performance mechanism proposed by the SUMAR program -a maternal and child health program implemented in Argentina in 2004 (then called Plan Nacer)- had a causal effect in reducing the infant mortality rate (<1 year), neonatal mortality rate (<28 days) and under-five mortality rate in the country. **METHODS:** Because the SUMAR Program was implemented in Argentina and not in other middle-income countries, the Synthetic Control Method (Abadie and Gardeazabal, 2003; Abadie, Diamond and Hainmueller, 2014) is used to construct a counterfactual for the country as a convex combination of a set of control countries. To do this, a panel of data was constructed from information published by the World Bank, where the observation units are each of the middle-income countries and the time period analysed is 1990-2015, with Argentina being the unit treated and the year 2004 the beginning of the intervention. **RESULTS:** After the implementation of the incentives proposed by the SUMAR Program there was a moderate reduction in the infant mortality rate in Argentina in relation to the synthetic control. In particular, there was a decrease of 1.41 percentage points (p.p.) in the infant mortality rate, a reduction of 0.86 p.p. in the neonatal mortality rate and 1 p.p. in the under-five mortality rate. These results appear to be robust for a series of placebo experiments. **CONCLUSIONS:** It is expected that the results obtained in this work will contribute to the informed debate on the role of payment mechanisms and the results of maternal and child health in low- and middle-income countries, with the intention of designing and implementing care policies more timely and efficient for the vulnerable population.

PHS134

KEYS TO YOUR CARE: A MATERNITY HEALTH PROGRAM DRIVES IMPROVEMENTS IN PRENATAL/POSTPARTUM CARE AND INFANT BIRTH WEIGHTS

Higgins YL, Shera DM, Calabria S, Higgins T, Dominica L, Keleti D, Michael KE, Gelzer AD
Keystone First, Philadelphia, PA, USA

OBJECTIVES: Early, periodic maternity care is important in managing risk for delivering low birth weight (BW) babies. Keys to Your Care® (K2YC) is a Pennsylvania-based maternity engagement program that helps pregnant members schedule maternity checkups, provides evidence-based resources for improved self-care, and connects high-risk members to maternity care management. **METHODS:** Outreach to pregnant Medicaid managed care members was followed by enrollee engagement in English or Spanish up to twice weekly through text messaging and login to a mobile-optimized website. Gift cards, baby supplies, and portable cribs were sent to participating members who met the appropriate engagement criteria throughout the length of the program. Primary outcome measures included percent of members with a claim in first trimester (PPC1) and postpartum care 21–56 days post-delivery (PPC2), frequency of ongoing pregnancy care making ≥81% of recommended visits (FPC), and frequency of low BW events. **RESULTS:** Between April 2 and December 31, 2016, 2,654 subjects [median age, 27 years; interquartile range (IQR), 23–31 years] had claims for 9,049 prenatal and postpartum visits (median, 11 visits/subject; IQR, 8–14 visits; 1,426 deliveries). Importantly, 6.5% of participants enrolled in K2YC before their first prenatal claim. The median gestation ages were 23.1 weeks and 39.3 weeks during opt-in and delivery periods, respectively. Median infant BW was 3,203 g (IQR, 2,892–3,515 g); 55.9% delivered at normal BW (range, 2,500–3,999 g) versus 52.7% in the nonparticipating control cohort (N=3,948). High-, low-, and very low-BW babies accounted for 3.4% (≥4,000 g), 5.8% (1,500–2,499 g), and 1.1% (<1,500 g), respectively (control: 4.1%, 6.5%, and 2.8%, respectively). Other performance measures were: PPC1, 82.68%; PPC2, 59.78%; and FPC, 56.46% (control: 73.98%, 62.24%, and 48.52%, respectively). **CONCLUSIONS:** K2YC alerted care managers of pregnancies (often before first member claim), increased the number of maternity checkups and BWs of delivered babies.

PHS135

TRENDS IN REALIZED ACCESS TO RECOMMENDED CARE AMONG US ADULTS WITH DIABETES

Chhabra S, Farris K
University of Michigan, Ann Arbor, MI, USA

OBJECTIVES: The Affordable Care Act may produce significant changes in preventive and recommended care by improving access and eliminating cost barriers. The aim of this study was to (1) estimate realized access to recommended tests among adult diabetes populations and (2) examine the equity of access to the recommended care. **METHODS:** Data from the Medical Expenditure Panel Survey from years 2012 and 2014 was used to determine annual realized access to recommended care among people with diabetes. Recommended care was defined per recommendations of American Diabetes Association and included— bi-annual HbA1c testing and annual foot, eye, cholesterol test and flu vaccination (5 recommended tests/services). Population characteristics of diabetes populations during years 2012 and 2014 were compared using descriptive statistics. Hierarchical logistic regression was used to determine the equity of access. The outcome variable was defined as receipt of four or five of the preventive tests/services. The predictors were categorized into three broad categories including Predisposing, Enabling and Need. Access to care was considered equitable when need factors were the main determinants of healthcare use. **RESULTS:** In 2014, realized access was highest (86% [CI 84.07%-87.94%]) to annual cholesterol test followed by the foot exam (70.5% [68.22-72.87]). Similar trends were observed in 2012. Access to the bi-annual A1c test was lowest compared to all other measures in 2014 (58.1% [55.28% - 60.89%]) as well as 2012 (55.8% [52.94-58.74]). Realized access to four out of five tests/services in 2014 remained very low as well (23.3% [20.87-25.69%]). Results obtained from hierarchical logistic models for both the years, 2014 as well as 2012, confirmed that access was driven still by predisposing and enabling factors rather than need. **CONCLUSIONS:** Despite policy changes that supported increased potential access, realized access to recommended care among adult diabetes populations remained low.

PHS136

CANCER CENTRE FOLLOW-UP CARE OF CANCER SURVIVORS: A POPULATION-BASED ANALYSIS

Urquhart R, Lethbridge L
Dalhousie University, Halifax, NS, Canada

OBJECTIVES: To investigate (1) patterns of cancer centre routine follow-up (CC-FUP) care for breast, colorectal, gynecological, and prostate cancer survivors; (2) factors associated with receipt of CC-FUP; and (3) changes in CC-FUP over time. **METHODS:** From the Nova Scotia Cancer Registry, we identified all persons diagnosed in Nova Scotia, Canada, with an invasive breast, colorectal, gynecological, or prostate cancer between 01/01/2006 and 31/12/2013. We linked this population-based dataset, at the patient level, to cancer centre/clinic and census data. Next, we identified a non-metastatic survivor cohort (n=12,267) and developed decision rules to differentiate routine follow-up visits from non-routine visits during the follow-up care period (commencing one year post-diagnosis). Descriptive statistics were computed to describe patterns of care by patient and provider characteristics. Negative binomial regression was used to examine factors associated with the number of CC-FUP visits received and changes over time, adjusting for other covariates. **RESULTS:** Nearly half of survivors (48.4%) had at least one CC-FUP visit, which varied by disease site (range: 30.2-62.4%). Variation existed across providers, with six oncologists providing 34.7% of the CC-FUP visits to the study population. Disease site and stage at diagnosis were associated with receipt of CC-FUP care. For instance, gynecological cancer survivors had more visits [incidence rate ratio (IRR)= 1.48, 95% confidence interval(CI)=1.34-1.64] whereas colorectal cancer survivors had less (IRR=0.45, 95%CI=0.40-0.51) compared to breast cancer survivors. Sex and geography did not impact the likelihood of receiving CC-FUP visits. Year of diagnosis was associated with receipt of CC-FUP care, with each successive calendar year associated with an 8% increase in visits (IRR=1.08, 95%CI=1.07-1.10). **CONCLUSIONS:** Despite evidence that follow-up care can be effectively and safely delivered in primary care, and intensifying demands on oncology services, many survivors continue to receive CC-FUP. Tailored interventions may improve survivors' discharge to primary care post-treatment.

PHS137

HEALTH INSURANCE AND FEMALE LABOUR FORCE PARTICIPATION IN RURAL CHINA

Zhang X
University of New South Wales, Sydney, Australia

OBJECTIVES: In 2003, a heavily subsidized voluntary health insurance scheme - the New Cooperative Medical Scheme (NCMS) - was launched for rural residents in China. This paper investigates the impact of the NCMS policy on adult daughters/in-law's informal care-giving and their labour force participation outcomes. **METHODS:** This study is based on data from the China Health and Nutrition Survey, which is a commonly used longitudinal Chinese dataset focusing on health and nutrition of Chinese. We use data from the 2004 and 2006 waves to cover the critical phase of the progressive introduction of the NCMS. We use propensity score matching combined with difference-in-difference estimation to estimate the "average treatment effect on the treated". Our method addresses the selection bias resulting from the voluntary enrolment in the health insurance plan. **RESULTS:** Our results show that the NCMS has significantly decreased the propensity of older Chinese needing care and has significantly increased adult daughters/in-law's working hours. We also find heterogeneous impacts across household income groups. Older Chinese in low-income household group benefit more from NCMS enrolment in terms of care demand. **CONCLUSIONS:** Our results suggest that the NCMS helps to reduce health inequality in rural China. The paper contributes new findings to the literature on the beneficial impact of government-sponsored health insurance on health, informal care and labour markets in developing countries.

PHS138

IDENTIFICATION OF PATIENTS AT-RISK FOR 30-DAY READMISSION WHO SHOULD BE INCLUDED IN PREVENTION INTERVENTIONS: ASSESSMENT OF HOSPITAL AND COMMUNITY HEALTHCARE PROVIDERS

Flaks-Manov N[1], Srulovici E[1], Yahalom R[2], Peri-Mazra H[2], Reem L[2], Key C[2], Hoshen M[1], Balicer RD[1], Shadmi E[3]
[1]*Clalit Research Institute, Tel Aviv, Israel,* [2]*Clalit Health Services, Tel-Aviv, Israel,* [3]*University of Haifa, Haifa, Israel*

OBJECTIVES: Increasingly, big-data electronic health record warehouses are used for developing and implementing high-risk identification algorithms for targeted readmission prevention programs (RPPs). However, the ability of these electronic tools to accurately detect the "appropriate" patients for RPP according to personal and clinical characteristics (termed "care sensitivity") has not yet been established. The aim of the study is to examine the ability of electronic readmission prediction risk tools to detect care-sensitive patients for inclusion in RPPs. **METHODS:** Hospital physicians and nurses and primary care physicians and nurses were asked to complete a questionnaire on the clinical characteristics of discharged patients. The questionnaire assessed the degree to which each patient's automated risk score for 30-day readmission was care-sensitive and the degree to which the patient should be included in RPPs. The correlations between hospitals' and clinics' healthcare provider's assessments and between physicians' and nurses' assessments were examined. **RESULTS:** A total of 605 questionnaires regarding 276 patients were completed by physicians and nurses. Among patients with low risk scores (i.e., 0-39), both hospital physicians and clinic nurses found that 17% of the patients should have been included in RPPs whereas hospital nurses thought 28% should have been included. Among patients with high risk score (i.e., 50+), 17%, 28%, and 42% should not have been included in RPPs according to hospital nurses, hospital physicians, and clinic nurses, respectively. A significant correlation was found between hospital physicians and nurses regarding the assessment of patients' risk scores (r=0.159, P=0.018) and the appropriateness for inclusion into RPPs (r=0.289, P<0.001). The most common reasons for patients to be included in RPPs were polypharmacy, the need for continuous monitoring, and low adherence. **CONCLUSIONS:** Combining electronic data with patients recorded characteristics allows for better adaptability and synchronization across different healthcare providers and for better selection of patients for inclusion in RPPs.

PHS139

PREVALENCE, INCREMENTAL COST AND RESOURCE UTILIZATION ASSOCIATED WITH OPIOID OVERDOSES IN THE UNITED STATES

Electricwala BS[1], Carroll NV[1], Nadpara P[1], Cannon E[2], Wander C[2]
[1]*Virginia Commonwealth University, Richmond, VA, USA,* [2]*SelectHealth, Murray, UT, USA*

OBJECTIVES: The objectives of this study were to estimate the prevalence of opioid overdoses in prescription opioid users, their family members and in overdose victims with no identifiable source of prescription opioid ("others"), and to estimate incremental costs and resource utilization associated with

opioid overdoses in these groups. **METHODS:** This study was a retrospective analysis using claims data from SelectHealth, a not-for-profit health insurance organization serving members in Utah and southern Idaho. The data were from June 2010 through July 2015. We estimated the prevalence of opioid overdoses by year for each group. For cost estimation, family members and others were collapsed into a "non-medical users" category. We used an incremental cost approach whereby cases (patients who suffered from an opioid overdose) were propensity-score matched to controls (did not suffer from an opioid overdose) and estimated the direct medical costs and resource utilization incurred in each group in the year following an overdose. Generalized Linear Models were used to estimate incremental costs and resource utilization. **RESULTS:** The prevalence of overdoses increased by 84.8% in prescription opioid users (102.8 per 100,000 in 2014), by 37.9% in their family members (8.2 per 100,000 in 2014) and by 179.9% in others group from 2011 to 2014 (23.1 per 100,000 in 2014). Incremental direct medical costs associated with opioid overdose were estimated to be $65,277 per patient per year in prescription opioid users and $41,102 (p-values <0.05) in non-medical users. Overdose-specific costs were estimated to be $12,111 for prescription opioid users and $11,070 for non-users. Resource utilization was significantly higher among those who experienced an overdose across all places of service. **CONCLUSIONS:** The prevalence of opioid overdoses increased steadily from 2011 to 2014. Differences between overdose-specific costs and total incremental costs may suggest that overdoses are associated with substantial downstream costs.

PHS140

HEALTH CARE UTILIZATION AND EXPENDITURES FOR CHILDREN WITH SPECIAL HEATLH CARE NEEDS: A CROSS-SECTIONAL ANALYSIS FOR MEDICAID AND PRIVATE INSURANCE ENROLLEES

Lin C[1], Carlin C[2], Romley JA[1]
[1]University of Southern California, Los Angeles, CA, USA, [2]Medica Research Institute, Minneapolis, MN, USA

OBJECTIVES: To describe the differences in health care utilization and expenditures between Medicaid and privately insured children with special health care needs (CSHCN). **METHODS:** We conducted a cross-sectional analysis using 2013 insurance claims from a payer offering commercial and managed Medicaid coverages in the Upper Midwest. CSHCN were identified using a validate algorithm that applied the CSHCN screener to claims. Inverse probability treatment weighting was applied to balance Medicaid and private insurance cohorts. A standardized fee schedule was used to account for variation in reimbursement rates. We modeled expenditures using a two-part model adjusted for CSHCN characteristics, neighborhood socioeconomics status, and conditions. **RESULTS:** A total of 17,702 CSHCN were included in our sample and 31% had Medicaid coverage. After weighting and adjusted for covariates, CSHCN with Medicaid were more likely than privately insured CSHCN to use care in a hospital outpatient setting (OR=1.192, 95% CI:1.085-1.309) and in places other than hospital and office-based settings, including emergency department (ED: OR=1.794, 95% CI:1.628-1.977), urgent care(UC: OR=1.221, 95% CI:1.089-1.370), and other settings (OR=1.638, 95% CI:1.495-1.796). Medicaid coverage was also associated with a decreased use of office-based services (OR=0.247, 95% CI:0.178-0.341) relative to private coverage, especially visits for evaluation and management. Conditional on accessing care, places other than hospital and office-based settings were associated with significantly higher average expenditures for Medicaid CSHCN (ED=27.3%, $p<0.001$; UR=9.3%, p=0.027; and other=92.4%, $p<0.001$), and lower expenditures for hospital inpatient (-36.6%, $p<0.001$) and outpatient care (18.9 %, $p<0.001$). **CONCLUSIONS:** Medicaid CSHCN relied on ED, UC, and other non-hospital and non-office-based settings as the sources of care. They also had significantly higher average expenditures when accessing care. This access pattern is consistent with the Medicaid literature and suggests that care for Medicaid CSHCN was not optimal. This vulnerable population requires extra attention to develop efficient patterns of care.

PHS141

HOSPITALIZATION COST ESTIMATION MODEL USING A MULTILEVEL ANALYSIS

Romero Prada ME[1], Celis S[1], Acero G[2], Gallo D[2], Cruz AM[3]
[1]Salutia Foundation - Research center in economy, management and health technologies., Bogota, Colombia, [2]Salutia Foundation- Research center in economy, management and health technologies., Bogota, Colombia, [3]Coomeva EPS, Cali, Colombia

OBJECTIVES: To construct a model in order to predict the hospitalization cost of patients based on demographic, clinical and care-associated characteristics. **METHODS:** Based on the records of health care services for more than 3 million affiliates to a Colombian insurer, a base with 68,939 inpatient care services for 1 year was built. The analysis was developed using a regression model, where the dependent variable is the natural logarithm of the hospitalization cost per day and the independent variables were dichotomies. The multilevel model was adjusted using the smearing coefficient. We performed the necessary tests to validate the biggest possible explanatory capacity of the multilevel model: tests of individual statistical significance (t-test) for each variable and the level of explanation of this model compared to others (Chi2 test). **RESULTS:** A multilevel model with three levels was obtained: the characteristics of patients in the first level (age, gender, type of service and diagnosis of admission or discharge), previous comorbidity conditions in a second level and characteristics of Hospital development in a third level. All variables were statistically significant at a 95% confidence level. The multilevel model presented a higher level of explanation compared to the linear model, as indicated by the Chi2 test. **CONCLUSIONS:** It was possible to construct an explanation model that allows to estimate the hospitalization cost in order to be able to improve the management and allocation of the resources.

PHS142

DIRECT COSTS OF MEDICAL CARE FROM INTENSIVE CARE UNITS IN COLOMBIA

Florez Tanus A[1], Marrugo Arnedo C[2], Gomez de la Rosa F[3], Lopez Pájaro K[4], Mora Jayutt G[2], Mazenett Granados E[4], Dueñas Castell C[2], Alvis Guzman N[5]
[1]Universidad de Cartagena. Centro de Investigación y Docencia. Hospital Infantil Napoleón Franco Pareja. Centro de Investigación e Innovación en salud, Cartagena de Indias, Colombia, [2]Universidad de Cartagena. Centro de investigación e innovación en salud-CIISA, Cartagena de Indias, Colombia, [3]ALZAK Foundation, Cartagena, Colombia, [4]Centro de investigación e Innovación en Salud - CiiSA, Cartagena de Indias, Colombia, [5]ALZAK Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia

OBJECTIVES: To estimate the direct medical costs of inpatient care, in Intensive Care Units (ICU) from a Colombian government subsidized health insurer. **METHODS:** A sample of 9,763 inpatients from intensive care units distributed in 726 hospitals in 2015. Direct costs of medical care were calculated from the third party payer's perspective, with the micro-costing technique and the bottom-up methodology. Annual average costs were estimated by diagnosis groups and cost centers. Results are shown in international dollars adjusted for purchasing power parity (PPP). **RESULTS:** ICU care represents 13.4% [CI 13.2 - 13.6] of total hospital events and 24.3% [CI 24.19% - 24.42%] of bed days. Cost in ICU amount to 130.5 million PPP$ which represents 16.4% of the insurer total cost. The most important diagnoses in the ICU cost were: Cardiovascular 23.1%, Perinatal conditions 16.9%, Respiratory 13.3%, Parasitic infections 10.4% and trauma 5.3%. The diagnoses from ICU with the highest cost per stay day were: Cancer - 1,160.7 PPP$ [IQR 779.1-1,656.8]; HIV- 1,127.6 PPP$ [IQR 713.5-1.834.4]; Trauma - 1,103.8 PPP$ [IQR 655-1,744.3]; Benign tumors - 1.065.2 PPP$ [IQR 615.7-1.537.1] and Respiratory-chronic - 1.017.5 PPP$ [IQR 635.8-1.531.2]. Hospital stay, medications, diagnostic aids and medical procedures represents 41.2%, 38.3%, 10.2% and 7.4% of the ICU costs respectively. The highest average age group corresponds to people between 15 and 44 years old (mean = 1,198 PPP$ and median = 968.9 PPP$) mainly explained by the high impact of gestational care in women and trauma in men **CONCLUSIONS:** Identifying spending patterns and health services consumption in ICUs, are fundamentals for a planning and efficient allocation of resources in insurance companies.

PHS143

DIRECT AND INDIRECT ECONOMIC BURDEN OF ADULTS WITH RENAL FAILURE: NATIONAL U.S. ESTIMATES USING MEDICAL EXPENDITURE PANEL SURVEY DATA, 2008-2013

Alahmari AK[1], Almalki ZS[1], Cavanaugh T[1], Guo JJ[1], Penm J[2]
[1]University of Cincinnati, Cincinnati, OH, USA, [2]The University of Sydney, Camperdown NSW, Australia

OBJECTIVES: Renal failure (RF) imposes a significant burden on patients, providers, payers, and society. Economic evaluation from a national representative data isn't well-documented. Therefore, the aim of our study was to comprehensively evaluate the direct and indirect cost of RF in the USA. **METHODS:** A cross-sectional study was performed using MEPS 2008-2013. Direct healthcare (HC) cost and indirect cost (employment, wages, missed days, and cost to loss of productivity LOP) were compared between adults with and without RF. Propensity score matching (PS) to control for baseline differences and linear regression with logarithmic transformation to identify predictors of total healthcare expenditure were incorporated. All expenses were adjusted to 2016 USD. **RESULTS:** There was a total of 466 (0.31%) adults with RF compare to 148,045 without RF. RF patients had significantly ($p<.0001$) higher prevalence of hypertension, diabetes and other important comorbid conditions. With PS, 394 RF were matched to 788 no-RF (1:2 ratio) and the average annual cost per person were $40,804 vs. $15,851 (additional cost = $24,953, $p<.0001$). Events coded RF-specific had average annual cost of $16,708 per person. Compared to no-RF, patients experienced significant extra expenses ($p<.02$) for medications, ambulatory care and medical supplies due to RF disease. RF was significantly associated with lower employment ($p<.0001$), wages ($p<.0001$) and more missed days ($p<.0034$) but insignificant associations were observed post PS matching. The per person annual indirect cost of LOP for RF Patients was $42,893 before propensity score matching and $12,466 after (2016 UD dollars). For RF patients, age, gender, ethnicity, region, poverty level, education, insurance type, smoking, key comorbidities and perceived health status were identified as significant independent predictors ($p<.0001$) for direct total healthcare utilization cost. **CONCLUSIONS:** Compared to the general population, RF is associated with significant economic burden. Further investigation of the causes of higher utilization and expenses in this group is recommended.

PHS144

BUDGET IMPACT ANALYSIS ON A PHARMACIST-PROVIDED TRANSITIONAL CARE PROGRAM

Ni W[1], Colayco D[2], Hashimoto J[2], Komoto K[2], Gowda C[3], Wearda B[3], McCombs J[1]
[1]University of Southern California, Los Angeles, CA, USA, [2]Synergy Pharmacy Solutions, Bakersfield, CA, USA, [3]Kern Health Systems, Bakersfield, CA, USA

OBJECTIVES: To estimate the budget impact of adding an outpatient pharmacy-based transition of care (TOC) program to the benefit of a US managed Medicaid health plan. **METHODS:** A dynamic budget impact analysis was conducted using a decision-tree model developed in Microsoft Excel. The effect on inpatient and total healthcare costs from the payer perspective was estimated in the 2-year period following initial hospital discharge. Inputs were based on a total plan population of 240,000 lives, with a high-risk population of 7.5%. The TOC program was assumed to initially cover 30% of the high-risk group, with expansion to 60% over the 2 years. We previously reported that this program reduced readmission risk by 32% and saved the health plan $2,139 per patient referred, inclusive of program cost. Sensitivity analyses were performed to test the impact of uncertainty of model inputs on the results, with the cost of TOC services ranging from $99 to $2,000 per patient referred. **RESULTS:** The model showed that the TOC program was cost-

saving at over $3 per member per month, translating into over $25 million in total healthcare cost savings over 2 years. These results were primarily driven by the estimated reduction in inpatient costs associated with the program, which were estimated at $20 million over the 2 years. Sensitivity analyses illustrated that within all the reasonable ranges of model input parameters, including the upper limit of TOC services set to $2,000 per patient referred, the TOC program resulted in cost savings to the health plan. **CONCLUSIONS:** The TOC program resulted in cost savings of over $25 million to the health plan over a period of 2 years.

PHS145

ESTIMATES OF INCREMENTAL HEALTHCARE EXPENDITURES ASSOCIATED WITH DEPRESSION TYPE AND SYMPTOMS AMONG US ADULT POPULATION WITH DIABETES

Chhabra S[1], Farris K[2]
[1]University of Michigan, Ann Arbor, MI, USA, [2]UNIVERSITY OF MICHIGAN, ANN ARBOR, MI, USA

OBJECTIVES: Produce national estimates and compare healthcare expenditures associated with depression among adult diabetes populations. **METHODS:** The 2014 Medical Expenditure Panel Survey was used. Presence of diabetes and depression among adult (>18 Years) populations was confirmed using ICD-9-CM and Clinical Classification codes. Participants were classified by (1) presence of depression and (2) presence of depressive symptoms. For the latter, participants were identified as having no depression, unrecognized depression, asymptomatic depression or symptomatic depression based on an algorithm using PHQ-2 Scores and ICD-9-CM codes. Mean unadjusted healthcare expenditures associated with inpatient, outpatient, office-based, emergency room, prescription drugs as well as total healthcare expenditures were compared by depression categories. Adjusted relative healthcare expenditure ratios for each depression category by expenditure type were estimated using multivariate regression analyses with log-transformed data. Disease risk adjustment was made using Charlson Comorbidity Index. **RESULTS:** Based on the weighted sample of 25.6 million adults with diabetes, 18.96% had depression and had significantly greater mean annual total medical expenditures ($21,351 vs. $11,710) than those without depression. After adjustment, diabetes adults with depression spent 72% more on annual total healthcare expenditures compared to those without depression (RR = 1.72, 95% CI [1.41, 2.09]). When adults with diabetes were categorized based on the presence of depressive symptoms, 7.3% had unrecognized depression, 12.6% had asymptomatic depression and 6.3% had symptomatic depression. The mean annual total medical expenditures were significantly higher among adults with symptomatic depression ($23,794) and asymptomatic depression ($20,125) compared to the adults with unrecognized ($13,668) depression and no depression ($11,514), and similar expenditure patterns existed even after adjustment. **CONCLUSIONS:** Among people with diabetes, over 7 percent had unrecognized depressive symptoms. As expected, adults with diabetes and recognized depression had higher healthcare expenditures.

PHS146

MODELING BED NUMBER REQUIREMENTS FOR ISOLATED SURGICAL AORTIC VALVE REPLACEMENT CENTERS

Park LI[1], Zemanova B[1], Boleckova J[2], Moore M[1], Candolfi P[1]
[1]Edwards Lifescience, irvine, CA, USA, [2]Edwards Lifesciences, Nyon, Switzerland

OBJECTIVES: Modeling the number of hospital beds needed to cover a hospital patient population for isolated surgical aortic valve replacements (sAVR). **METHODS:** To simulate the skewed hospital length of stay (LoS) distribution a 3 layered gamma distribution of hospital LoS was fit to the 2014 Medicare Medpar (N=18,889) reported data. Mean LoS was 8.4 days with a 6.4 day standard deviation. One thousand, 52 week (364 day) simulations were created for each hypothetical hospitals with volumes of 1, 5, 10, and 15 sAVR/week. **RESULTS:** For a center with 1, 5, 10, and 15 sAVR/week volume, the number of beds required to cover 100% of patients for every one of the simulated 364 day period was modeled to be 6, 13, 22, and 30 beds respectively. When reducing patient day bed coverage rates to 95%, 90% and 80%, scale effects can be seen. Low volume centers see no or lower change in required number of beds when compared to higher volume centers. A 95% coverage leads to a substantial reduction in the number of required beds with 1, 5, 10, and 15 sAVR/week centers only requiring 4, 11, 18, and 25 respectively. 90% and 80% coverage rates for a 1 sAVR/week center remained at 4 beds, while a 5 sAVR/week center had a bed requirement of 10 and 9 respectively. 50% coverage for 1, 5, 10, and 15 sAVR/week centers were projected to be 2, 8, 14, and 19 beds respectively. **CONCLUSIONS:** Identifying the number of hospital beds needed to cover a patient population is critical in hospital resource planning. Simulating patient LoS variability can provide insight on the estimated number of beds required to service centers of varying isolated sAVR patient volumes and coverage requirements.

PHS147

IDENTIFICATION OF TYPE 2 DIABETES COST DRIVERS USING MEDICAL BILLING CODES IN ADMINISTRATIVE CLAIMS

Patel CA[1], Kozma CM[2], Slaton T[2]
[1]Janssen Scientific Affairs, LLC, Titusville, NJ, USA, [2]CK Consulting Associates, LLC, Saint Helena Island, SC, USA

OBJECTIVES: To identify medical billing codes that are cost drivers for Type 2 diabetes. **METHODS:** Medical billing codes were assessed using US administrative claims (Truven Health MarketScan® Database) between 1/1/2010-6/30/2015. Cost drivers were identified for Type 2 diabetes (DB) vs non-diabetes (NonDB) {Group 1} and complicated Type 2 diabetes (CompDB; ICD-9-CM=250.1X-250.9X where x= 0 or 2) vs Type 2 diabetes without complications (NoCompDB) {Group 2}. A random sample (n=500,000) from the DB and CompDB groups were matched 1:1 to the NonDB and NoCompDB groups on age, gender, region, payer type and months of eligibility. An empirical algorithm using code frequency (sensitivity, specificity, precision or accuracy between comparators and minimum claim counts) and cost parameters (cost ratios between comparators, minimum cost to include or exclude) qualitatively identified procedure, diagnosis and drug codes that differed between cohorts. **RESULTS:** For Group 1, 194 codes accounted for 12.2% of the DB cohort costs and 3.9% of the NonDB cohort. The 12.2% of costs in the DB cohort represented 36.4% of the overall cost difference between the DB and NonDB cohorts. The top qualitatively assigned categories in the DB cohort accounted for >90% of the identified costs and included diabetes-specific codes (51.5%), renal (18.7%), cardiovascular (14.5%), lipid (3.3%) and physician services (3.1%). For Group 2, 303 codes accounted for 17.0% of CompDB cohort costs and 5.9% of NoCompDB cohort costs. The identified costs in the CompDB cohort accounted for 46.4% of the cost difference between cohorts. The top categories in the CompDB cohort, renal (32.4%), diabetes-specific codes (24.7%), infection (7.6%), physician services (6.9%), cardiovascular (5.5%) and wound care (4.2%) accounted for 81.3% of the identified costs. **CONCLUSIONS:** Small code sets accounted for disproportionately large percentages of costs. Use of empirically derived disease-related codes may provide an efficient approach for assessing disease-related costs in administrative data.

PHS148

COSTS OF HOSPITAL ACQUIRED PRESSURE ULCERS

Malheiro DT, Ayres Fd, Ferreira JC, Ferreira ME, Shiramizo SC, Barros CG
Hospital Israelita Albert Einstein, São Paulo, Brazil

OBJECTIVES: The purpose of this study was to calculate and analyze the costs of treatment of the Hospital-acquired pressure ulcer (HAPU). **METHODS:** The study was developed as a pair-wise matched (1:2) case control study. The cases were defined by patients who HAPU during the march, 2015 until march, 2106 and the controls have been defined for patients who not developed pressure ulcer at the hospital during the same period. The pairing was carried out age, primary anda secondary diagnoses and presence of the comorbidities. Sample were excluded patients who developed PU prior to hospital admission. Costs were obtained in Reais and converted to US dollars considering the exchange rate of R$ 3.189 per US dólar. **RESULTS:** One hundred eighteen patients with HAPU were identified and fifty four were included in the final analysis. The incremental lenght of stay (LOS) of the cases was 83 days. Analyzing the results according to the last score collected the Braden Scale, the median costs were $134,105 for patients with very high risk, $ 93,840 for high risk, $ 110,339 for moderate risk and $ 94,645 for mild risk. Concerning costs, the average cost for cases was higher than for controls. The incremental cost associated with a HAPU episode was $ 75,311 and the incremental lenght of stay (LOS) of the cases was 83 days. **CONCLUSIONS:** This study demonstrated the excess LOS and high costs associated the treatment the hospital-acquired pressure ulcer. This result can be avoid with the revision of the protocol for prevention of pressure ulcer by the use of evidence-based practice, adoption of new technologies and the multidisciplinar team based care (nurses, physicians, nutritionist, physiotherapist). In addition, the protocol has the potential to eradicate enormous suffering and save thousands of lives.

PHS149

COST-EFFECTIVENESS ANALYSIS OF SOLID ORGAN TRANSPLANTS IN A PRIVATE, PHILANTHOPIC AND TERTIARY HOSPITAL IN BRAZIL

Malheiro DT[1], Matos AC[1], Morgado S[2], Bacal F[1], Junior JE[1], Almeida MD[1], Filho AP[1], Neto MC[1]
[1]Hospital Israelita Albert Einstein, São Paulo, Brazil, [2]Hospital israelita albert einstein, Sao Paulo, Brazil

OBJECTIVES: To perform a cost-effectiveness analysis of solid organ transplants carried out in a private philanthropic hospital in Brazil. **METHODS:** For cost analysis we included all patients that underwent kidney, liver, heart and lung transplants in 2015 in our Hospital. We collected data about costs per patient including the pre transplant phase (eligibility evaluation for the transplant, listing and outpatient follow up), the transplant and post-transplant phases until 1 year of follow up. Unit costs were associated to each health resource, obtained from the hospital costing system. For the survival analysis we used Cox model, using all the transplants performed from 2002 to 2016 in our institution. For the cost-effectiveness analysis we used the following calculations: 1. Calculation of average cost for each year of life = (average total cost/mean survival time); 2. Calculation of lifespan in years for the repayment of the transplant by the recipient = (average total cost /GDP per capta); 3. Calculation of wealth production after the transplant [(mean survival time)–(average total cost /GDP per capta)*GDP per capta]. The values of GDP per capta and dollar exchange rate were the ones from 12/2015, being U$ 6.963,94 and BRL 3,91, respectively. **RESULTS:** All types of transplant analyzed here were cost-effective; all of which had a cost of life saved per year less than 3x GDP and the dialysis treatment cost. Considering all of them together, there will still be a wealth production after paying off the treatment, in mean of U$ 32,672.67. **CONCLUSIONS:** In a private Hospital, where the Transplant Program is funded by the Public Health System, kidney, liver, heart and lung transplants were considered cost-effective therapies. This analysis can support our Hospital Managers and transplant teams to take the best decision in an era of growing chronic diseases.

PHS150

COSTS AND RESOURCE UTILISATION ASSOCIATED WITH COMORBID CONDITIONS OF TYPE 2 DIABETES PATIENTS IN A SOUTH AFRICAN PRIVATELY MANAGED HEALTHCARE ORGANISATION

Naidoo L[1], Butkow N[1], Barnard P[1], Libhaber E[1], Bezuidenhout J[2]
[1]University of Witwatersrand, Johannesburg, South Africa, [2]Sanlam Health, Johannesburg, South Africa

OBJECTIVES: Type 2 diabetes (T2DM) is rapidly becoming one of the most common non-communicable diseases of lifestyle. Managed healthcare organisations view

T2DM as a discrete condition, with little interaction with comorbid conditions. Coronary artery and cerebrovascular diseases are the predominate outcomes in T2DM. The impact of comorbid conditions such as cancer, rheumatoid arthritis and CNS diseases, referred to as discordant comorbidities are rarely considered in resources utilisation studies in T2DM. We compared the costs and resource utilisation of T2DM patients that were either enrolled on a Capitation Model (CM) or a standard Fee for Service Model (FSM). Comorbidities were defined as concordant such as cardiovascular diseases or discordant (e.g.: cancer, major depression). **METHODS:** Data was extracted retrospectively from claims database of adult T2DM patients (n=1060) for the year 2014. Costs per annum for concordant and discordant comorbidities were identified using ICD10 codes. **RESULTS:** The cohort of patients in the CM (n=714) were older than in the FSM (n=346). The resource use per diabetic patient was US$ 4,075 in the CM and US$ 4,305 in the FSM. When the capitation fee of US$ 1,368 per patient per annum was accrued, the average cost per patient was US$ 5,443 in the CM. The estimated expenditure per patient for the concordant comorbidities was US$ 2,059 (CM) and US$ 2,177 (FSM) and US$ 928 (CM) and US$ 666 (FSM) for the discordant comorbidities. Resource intensive comorbidities were kidney disease US$ 7,360 (CM) vs US$ 15,604 (FSM) and cancer that cost US$ 1,089 (FSM) and US$ 2,356 (CM) per affected patient. **CONCLUSIONS:** While capitation models are well-established, our data suggests that in this limited setting, CM accrued similar costs to a traditional FSM. Healthcare systems need to focus on combined integrated multiple disease management in T2DM patients to lower the financial burden.

PHS151

PERSONAL HEALTH DEVICES AND THEIR IMPACT ON HEALTH CARE COSTS AND UTILIZATION AND MEMBER ENGAGEMENT

Olson C, Nelson S, Newell J, Toensing P, Hertzberg J
Optum, Minnetonka, MN, USA

OBJECTIVES: Determine if self-monitoring of physical activity using PHDs (Garmin, Fitbit, etc.) affects patient health care costs and utilization. **METHODS:** Analyzed administrative claims records of 1,258 health plan members by their length of PHD usage (3+ months, 6+ months, 9+ months and 12+ months). Compared the cost and count of members' emergency room, office, inpatient and outpatient visits before and after they received PHDs, and the share of costs attributable to preventive services. **RESULTS:** Office visits increased 7% for members who used the devices 9+ months, and 10% for those who used them 12+ months. Total costs increased 21% in the 12+ group. Preventive service office visits increased 14% for the 9+ month group and 12% for the 12+ month PHD usage group. In addition, the total cost of preventive visits increased 11% for those who monitored their physical activity with PHDs for at least 9 months, and 12% for those who monitored their physical activity for at least 12 months. **CONCLUSIONS:** Providing PHDs to health plan members resulted in increased usage and spending on health care services, including preventive health services, in the 12-month period that followed. Follow-up research is needed to determine if the increase in preventive service visits, associated with PHD usage, drives down the need for costly ER and inpatient visits.

PHS152

ECONOMIC EVALUATION OF DIABETES MELLITUS TYPE 2 BURDEN AND IT'S MAIN CARDIOVASCULAR COMPLICATIONS IN THE RUSSIAN FEDERATION

Kontsevaya A[1], Karpov O[2], Shestakova M[3], Belousov Y[4]
[1]*State Research Center of Preventive Medicine, Moscow, Russia, Moscow, Russian Federation,* [2]*Sanofi, Moscow, Russian Federation,* [3]*Institute of Diabetes, Moscow, Russian Federation,* [4]*N.I. Pirogov Russian National Research Medical University, Moscow, Russia, Moscow, Russian Federation*

OBJECTIVES: Diabetes Mellitus Type 2 (DMT2) is a complex medical and social problem in the world and in the Russian Federation also due to prevalence (5,4% in population) and probability of cardio-vascular complications (CVC). Economic burden evaluation of DMT2 and it's main CVC complications in the Russian Federation is unknown. **METHODS:** Complex analysis of expenditures (direct and non-direct costs) based on epidemiological, pharmacoeconomics and clinical investigations, real world studies, population and medical statistics data. **RESULTS:** Calculated expenditures for DMT2 in the Russian Federation are 569 bln RUR ($8,247 bln) per year, that is correspond to 1% of the Russian GDP, and 34,7% of that are expenditures for main CVC (ischemic heart disease, cardiac infarction, stroke). Main part of expenses are non-medical (losses GDP) due to temporary and permanent disability, untimely mortality – 426,7 bln RUR ($6,185 bln) per year. Expenses of the Healthcare System (direct medical cost) in the general structure of expenditures were equal to 8.72%, direct non-medical cost (social security budget) – 16.26%, economic losses are – 75.02%. Expenditures in estimated group of patients with non-diagnosed DMT2 but with already having CVC were at least 107 bln RUR ($1,550 bln) per year (18,8% from total cost). Relationship between cost of DMT2 and degree of it's control was found in the Russian conditions. Estimated cost for compensated patient (HbA1c<6,5%) per year was 88 982 RUR ($ 1290), in the same time cost of non-control patient (HbA1c>9,5%) was in 2,8 times higher due to more often main CVCs in this group. **CONCLUSIONS:** DMT2 diagnosis improvement as well as effective treatment of early stages of illness can decrease probability of CVC and social economic expenditures. Economic efficacy should be calculated as result between additional expenditures for DMT2 effective control and potential savings due to CVC decreasing.

PHS154

IMMEDIACY TRENDS OF EMERGENCY DEPARTMENT (ED) VISITS, AND FACTORS PREDICTING NON-URGENT AND SEMI-URGENT ED VISITS IN THE UNITED STATES

Siddiqi KA, Haider MR, Demir I, Khan MM
University of South Carolina, Columbia, SC, USA

OBJECTIVES: Study assesses latest trends of emergency department (ED) visits and associated socio-demographic and facility level factors of non-urgent and semi-urgent ED visits to explore if non-urgent ED visits deserve special attention anymore and if semi-urgent visits should be discussed more closely. **METHODS:** Present study performed retrospective cross-sectional analyses of nationally representative ED visit data from National Hospital Ambulatory Medical Care Survey (NHAMCS) 2006 through 2011. Trend analysis, designed based F test, and weighted multinomial logistic regression were performed as statistical tools. **RESULTS:** Proportion of non-urgent ED visits were decreased each year until 2009 from 14% to 8% and almost got stuck for rest of the years. Most of the non-urgent visits received some sort of diagnostic or therapeutic services. Percentage of semi-urgent ED visits increased largely over the study period (25% to 36%), while proportion of urgent increased little, and immediate and emergent acuity level decreased. In cross tabulation, residence type, source of payment, episode of care, availability of non-urgent fast track, and use of EMR are found significantly associated with all ED visits. In multivariable analysis, patients with Medicaid, no insurance, younger, male, non-Hispanic Black, and who visit in nonurban hospitals are highly likely to visited ED for non-urgent health conditions, whereas, self-pay patients, younger, male, and who visited voluntary non-profit hospitals are highly likely, and Medicare recipients and patient living in nursing home are less likely to visit ED with semi-urgent health conditions. **CONCLUSIONS:** Non-urgent ED visits, along with semi-urgent visits deserve close attention and efforts to reduce these visits should focus on some particular groups who pose higher risks rather than blocking access to EDs.

PHS155

COST-EFFECTIVENESS ANALYSIS OF EARLY CANCER SURVEILLANCE FOR PATIENTS WITH LI-FRAUMENI SYNDROME

Tak C[1], Biltaji E[2], Kohlmann W[3], Maese L[1], Sherwin C[1], Brixner D[4], Schiffman J[5]
[1]*University of Utah, Salt Lake City, UT, USA,* [2]*University of Utah, Pharmacotherapy Outcomes Research Center, Program in Personalized Health, Salt Lake City, UT, USA,* [3]*Huntsman Cancer Institute, Salt Lake City, UT, USA,* [4]*Personalized Health Care, University of Utah Health Sciences Center, Salt Lake City, MA, USA,* [5]*University of Utah, SALT LAKE CITY, UT, USA*

OBJECTIVES: To compare the cost-effectiveness of an early cancer surveillance strategy versus no surveillance for patients with TP53 germline mutations. **METHODS:** A Markov decision analytic model was developed to estimate cost-effectiveness over a lifetime from a US third-party payer perspective. The model consisted of 4 possible health states: no cancer, cancer, post-cancer survivorship, and dead. Model probabilities and costs were populated using estimates from SEER database and published literature. Model outcomes included costs (2015 USD) and effectiveness (life years [LY] gained) of each surveillance strategy and incremental cost-effectiveness ratios (ICERs) comparing surveillance versus no surveillance strategies. Sensitivity analyses examined parameter uncertainty. **RESULTS:** The model showed a mean cost of $46,496 and $117,102 and yielded 23 and 27 LY for the non-surveillance and surveillance strategies, respectively. The ICER for early cancer surveillance versus no surveillance was $17,125 per additional LY gained. Sensitivity analyses showed that probability of tumor development and cost of surveillance had the largest impact on model result. At the commonly accepted willingness to pay above $50,000/life-year gained, surveillance had a 94% probability of being the most cost-effective strategy for early cancer detection in this high-risk population. **CONCLUSIONS:** Early cancer surveillance is cost-effective for patients with TP53 germline mutations. This is one of the first studies to explore cost-effectiveness of LFS cancer surveillance; the model will continue to improve in accuracy as it is validated with real world data.

PHS156

IMPACT OF AFFORDABLE CARE ACT COVERAGE EXPANSION ON WOMEN'S PREVENTIVE SERVICES

Arora P[1], Desai K[2]
[1]*University of Wisconsin-Madison, Madison, WI, USA,* [2]*Stanford University, Stanford, CA, USA*

OBJECTIVES: The Affordable Care Act (ACA) expansion mandated the private health plans to cover women's preventive services starting August 2012. With limited and contradictory evidence, this study intends to assess the impact of ACA on the utilization rates and the cost burden of women's reproductive preventive service. **METHODS:** A pre-post analysis was conducted using nationally representative sample of females (aged 15-44 years, n=4,397) participating in 2011-2013 National Survey of Family Growth. The utilization rates and cost burdens were compared for six services using bivariate and multivariate logistics regression models. **RESULTS:** After the ACA expansion, there wasn't a significant increase in the utilization rates of birth control/prescription (33.7% vs. 30.7%), birth control counselling (17.7% vs. 16.9%), sterilization counselling (3.3% vs. 3.5%), STI counsel/test/treat (15% vs. 14.6%) and HIV screening (24.1% vs. 23.1%). Respondents paying through insurance increased after ACA, but out-of-pocket spending (cost-sharing) didn't decrease for respondents. Type of insurance was an important predictor of utilization rates with publicly insured having significantly higher Odds Ratio (OR) or likelihood of receiving birth control counselling (OR:1.71), sterilization counselling (OR:2.67), STI counsel/test/treat (OR:1.54) and HIV screening (OR:1.69) compared to privately insured. **CONCLUSIONS:** The early-on impact of ACA expansion on utilization rates of women's reproductive preventive services didn't appear to be significant. Private health plans, however, might have expanded their coverage but burden of cost sharing still existed. Future research should evaluate the long term impact of ACA expansion on women's health and the economic gains.

PHS157

CHARACTERIZATION OF SPINAL MUSCULAR ATROPHY POPULATION IN A LARGE US FULLY-INSURED HEALTH PLAN POPULATION

Hall EC[1], Wells W[1], Juster I[2], Mehta R[2], Sanquini L[2]
[1]*Biogen, Weston, MA, USA,* [2]*Healthagen, New York, NY, USA*

OBJECTIVES: Characterize a spinal muscular atrophy (SMA) population to identify SMA utilization patterns based on demographics within a large US

health plan. **METHODS:** Descriptive statistics were generated from retrospective analysis on medical and pharmacy claims from Aetna fully-insured commercial and Medicare members between January, 2013 and August, 2016 with an ICD-9/10 code for SMA without age restrictions. Additional analyses were performed to improve specificity due to potential provider miscoding and rule-out claims by comparing members identified with 1 vs. 2 claims of SMA to increase the likelihood of accurate SMA coding. Further specificity analyses were performed to determine the percentage of members with > 1 SMA claim having another SMA claim or followed by a claim for amyotrophic lateral sclerosis, muscular dystrophy, or non-SMA anterior horn disease ('SMA-like conditions'). **RESULTS:** A total of 3,145 unique members with at least one month's eligibility following their Index Date were identified based on >1 ICD-9/10 and 438 unique members based on >2 ICD-9/10 claims for SMA, respectively. Of the total group, 96% (>1 claims) and 80% (>2 claims) were age 18 and older. Age at first SMA claim ('Index Date') may not reflect initial diagnosis. Only 2.5% of the > 1 claims population later showed claims for an SMA-like condition. **CONCLUSIONS:** The >2 claims population had more per-patient inpatient and ER visits, and less outpatient claims, health resource utilization (HRU) and generally higher costs, compared with the >1 claims population. These health services differences may be due to increased likelihood of having SMA, greater concentration of younger members, and/or increased SMA HRU. This analysis provides insight into real-world SMA patient journey through costs and health services utilization considerations for managing SMA and the usefulness of claims data for identifying and characterizing patients with this rare and often devastating condition.

PHS158

HEALTH CARE PROVIDER AND HEALTH CARE FACILITY FOR ADULT FILIPINO PATIENTS HOSPITALIZED FOR CONGESTIVE HEART FAILURE

Pestano NS[1], Tumanan-Mendoza BA[2], Mendoza VL[1], Punzalan FE[3], delos Santos AA[1], Natividad RB[1], Macabeo R[1], Shiu L[1]

[1]*Manila Doctors Hospital, Manila, Philippines,* [2]*Manila Doctors Hospital; University of the Philippines College of Medicine, Manila, Philippines,* [3]*Manila Doctors Hospital; University of the Philippines College of Medicine & Philippine General Hospital, Manila, Philippines*

OBJECTIVES: To describe the available health care providers and the number and type of health care facilities where Congestive heart failure (CHF) patients were hospitalized in 2014. **METHODS:** This is a cross-sectional descriptive study of patients aged ≥ 19 years old, admitted for heart failure in Philippine Health Insurance (PhilHealth) accredited hospitals. Data were collected from the PhilHealth database and from the website of three specialists, namely: Family Medicine physicians, Internists and Cardiologists. Qualitative data were expressed as frequency and percentage. **RESULTS:** There were 17 regions in the Philippines. The highest number of hospitalized CHF cases was in Region IV-A (13.5%), while least number of cases was 2.2%, found in Region IV-B and Region XIII. Among the specialists, Internists had the number of members (56%) practicing in the Philippines, while Cardiologists were the least (9.0%). National capital region (NCR) had the most number of the cardiologists (58%), Internists (49%) and family medicine doctors (26%). Among the three specialists, Cardiologists had the most number of CHF patients to attend to across 16 regions in the Philippines (excluding Region IV-B). The region with the highest ratio was Region XII (281 cases to one cardiologist). In terms of type of facilities, 68.7% was categorized as tertiary, while 28.9% was secondary. Region IV-A had the highest numbers of tertiary (14%) and secondary hospitals (13.4%). Region IV-B had the lowest number tertiary facilities (0.62%). **CONCLUSIONS:** Region IV-A had the highest number of patients hospitalized for CHF, the highest number of tertiary and secondary hospitals and belonged to the top five regions with the most number of specialists but ranked 9th in the ratio of patients to cardiologist (86 patients for every one cardiologist) The information can help the health advocates/policy-makers identify areas that need more attention in terms of health providers and facilities.

PHS159

KAP ASSESSMENT REGARDING BREAST CANCER: AWARENESS AMONG PAKISTANI FEMALES

Saeed N[1], Azhar S[1], Khan R[2], Bukhari A[1], Khalid S[2], Syed A[1], Saeed H[3]

[1]*Department of Pharmacy, COMSATS Institute of Information Technology, Abbottabad, Pakistan,* [2]*Comsats Abbottabad, Abbottabad, Pakistan,* [3]*COMSATS Institute of Information Technology, Abbottabad, Pakistan*

OBJECTIVES: Aim of the study is to assess the awareness, knowledge, attitude and practice regarding breast cancer, its early detection and preventive measures. **METHODS:** Cross-sectional descriptive study was conducted in the using Breast Cancer Awareness Measure (B-CAM) v2 of validated survey instrument. Chi square and logistic regression statistical tools were chosen for the analysis of study dependent variables and to evaluate the association strength between parameters on SPSS 20. P value of ≤ 0.05 was considered statistically significant. **RESULTS:** More than half of the respondents had insufficient knowledge of sign and symptoms, risk factors and breast cancer screening methods available but 89% respondents showed positive attitude towards breast cancer. On the other hand, poor practice of the screening strategies has been seen by 71% respondents. Age, occupation, monthly income and ethnicity were significantly associated with the knowledge and attitude towards breast illness. Students were twice more likely to practice breast cancer screening methods in comparison to employed females. Major barrier encountered by females in practicing screening methods was unavailability of educational forums. **CONCLUSIONS:** Educational programs and interventional study plans along with risk reduction strategies should be organized for healthy community for their self-prevention and disease management to cope up the elevating fatality and mortality rate of the ailment.

PHS160

ASSESSMENT OF PUBLIC KNOWLEDGE ABOUT LUNG CANCER IN ABBOTTABAD KPK, PAKISTAN

Khalid S[1], Azhar S[2], Bukhari A[2], Saeed N[2], Syed A[2], Saeed H[3]

[1]*Comsats Abbottabad, Abbottabad, Pakistan,* [2]*Department of Pharmacy, COMSATS Institute of Information Technology, Abbottabad, Pakistan,* [3]*COMSATS Institute of Information Technology, Abbottabad, Pakistan*

OBJECTIVES: To assess public knowledge regarding lung cancer about the disease symptoms and risk factors. **METHODS:** A prospective cross-sectional study was conducted in Abbottabad, Khyber Pakhtunkhwa, Pakistan. **RESULTS:** Lung Cancer Awareness Measure (CAM) and a section of general CAM were employed for assessing public awareness about lung cancer. Simple random sampling technique was deployed with 385 sample size calculated by raosoft calculator. The cronbach's alpha value of questionnaire was 0.731. Respondent's knowledge about disease was categorized as poor, average or good on the basis of disease knowledge score. SPSS version 20 was used for statistical analysis of data by employing chi square test of independence and Mann Whitney U test of difference. P value of ≤ 0.05 was considered statistically significant. Majority of the respondents had good knowledge about the signs and symptoms of lung cancer but were unaware of the risk factors associated with this illness. Public knowledge was statistically significantly associated with gender, marital status, educational status, residency and smoking status of the respondents. None of these associations were strong according to gamma values. In case of any health related complaint, majority respondents experienced emotional barriers in approaching physician as compared to practical and service related barriers. There was no statistically significant difference in the responses of various population groups. **CONCLUSIONS:** Lack of public knowledge about disease risk factors highlights the importance of conducting awareness campaigns with prime focus on the disease causing agents. It can help in controlling the spread of this enervating ailment. Implementation of smoking cessation strategies should be emphasized to combat the most prevalent risk factor of cigarette smoke.

PHS161

HEART RATE RECOVERY IN INFLAMMATORY BOWEL DISEASE (IBD)

Ünsal O, Ünsal Y, Beyan E, Dal K, Bulur O, Uzman M

keçiören research hospital ANKARA /TURKEY, Ankara, Turkey

OBJECTIVES: İnflammatory bowel disease (IBD) is a chronic idiopathic inflammatory disease which includes Ulcerative colitis (UC) and Crohn disease (CD). Various types of dysfunctions associated with cardiovascular system were documented in these patients. It has been shown that heart rate recovery (HRR) after exercise was an estimate of impaired parasympathic tone and predictor of all cause and cardiovascular mortality. The aim of the study was to assess HRR in patients with inflammatory bowel disease. **METHODS:** 52 consecutive patients, admitted to clinics of Keçiören Training and Research Hospital, with diagnosis of inflammatory bowel disease and 50 healthy subjects were included in the study. Heart rate recovery index was defined as the decrease in the heart rate from peak exercise value to 1 min and 2 min after the termination of the exercise. This HRR was calculated for the first (HRR1) and the second (HRR2) minutes of recovery phase. **RESULTS:** According to basic clinical and demographic characteristics, groups were similar with regard to age and gender. No significant differences were observed in the initial systolic blood pressures or maximal systolic blood pressures or resting heart rates between three groups. All patients and control group participants had sinus rhythm and normal 12 lead ECG results at rest. The maximal heart rate and baseline heart rate during exercise stress test were similar in UC, CD and control groups (153,8±12,7 vs 152,7±13,6 vs. 156,6±13,3, p=0,432; 94,05±14,8 vs. 86,5±13,9 vs. 93,18±16,37, p=0,313, respectively). The first and the second minute HRR indices of patients with UC and CD were similar to those of the control group (HRR1: 30,7±11,8, 34,5±8,8, 33,9±13,5, p=0,403; HRR2: 51,4±15,4, 54,1±14,6, 55,1±16,9, p=0,807). **CONCLUSIONS:** The HRR index, which is calculated by an exercise stress test and associated with autonomic nervous system function, is not affected in UC and CD.

PHS162

THE IMPACT OF A CARE MANAGEMENT ENTITY ON PSYCHIATRIC EMERGENCY DEPARTMENT VISITS AND HOSPITALIZATIONS AMONG YOUTH WITH SEVERE MENTAL OR BEHAVIORAL DISORDERS

Tai M[1], dosReis S[1], Lee B[2], Zito JM[1], Reeves GM[3], Onukwugha E[1]

[1]*University of Maryland School of Pharmacy, Baltimore, MD, USA,* [2]*University of Maryland School of Social Work, Baltimore, MD, USA,* [3]*University of Maryland School of Medicine, Baltimore, MD, USA*

OBJECTIVES: Care management entity (CME) model is a coordinated, intensive, short-term care delivery model that improves functional outcomes symptoms among youth with serious emotional and behavioral disorders. Few studies have examined clinical outcomes after youth are discharged from CME care and the sustainability of this care intervention is unclear. The study objective was to examine the association between receiving CME care and mental health outcomes one-year post discharge. **METHODS:** Data from CME administrative claims were linked with Medicaid claims for youth enrolled in CME anytime from December 2009 through December 2013. Inverse probability treatment weighting (IPTW) was used to balance baseline characteristics between CME-enrolled youth and a non-CME comparison group. Study outcomes were psychiatric inpatient and emergency department (ED) visits one-year following CME discharge. A two-part model was used where the first part modeled the probability of any psychiatric service and the second part modeled the number of visits for each outcome. **RESULTS:** A total of 2,381 IPTW-adjusted study cohort (488 CME and 1,893 non-CME youth) was identified. In part 1 of the two-part model, the impact of CME care was associated with a significantly lower likelihood of any use of the psychiatric service (any psychiatric ED visit: OR=0.65, p=0.017; any psychiatric hospitalization OR= 0.60,

p=0.011). In part 2, no significant differences were observed between the CME care model and number of psychiatric ED visits or hospitalizations. **CONCLUSIONS:** Reduced psychiatric inpatient and ED services following CME care could be sustainable after youth are discharged from the model. Coordinated, high quality services may have prevented subsequent intensive service needs. Further multi-agency collaboration will be needed to enrich the ability to assess outcomes in broader perspectives.

PHS163

NEWS AT HOME , A SAFE AND EFFICIENT TRACK AND TRIGGER MECHANISM

Yaya-Oye M[1], Emmanuel J[2]
[1]Queen Mary university of london, London, UK, [2]Barts health NHS trust and QMUL, London, UK

OBJECTIVES: To evaluate the safety and feasibility of an acute hospital at home model of care using the national early warning score (NEWS) as an early predictor of need for hospital transfer **METHODS:** Suitable patients in the ED requiring admission were offered a choice of hospital at home versus inpatient treatment. Patients were transferred home from the ED or acute ward under the hospital at home team. NEWS is recorded at admission and daily thereafter on a tablet by the nurse attending the patient at home. All patients' record and NEWS data are available electronically to the doctors at the base hospital, who are available 24h/day to review deteriorating patients. We reviewed NEWS data from 502 patients cared for in an acute hospital at home. **RESULTS:** Of the 502 patients, 444 were discharged from home; 58 (11.5%) required transfer to hospital. Mean NEWS at admission of those who were discharged from home was 1.77± 1.90 versus 1.02±1.34 on discharge; mean NEWS for the transfer group was 2.22 ± 2.17 at admission and 3.10 ± 2.79 on transfer. We compared day to day change in NEWS (ΔNEWS) of transfer group to that of the discharge group. At 95 % confidence level there is no significant difference in the ΔNEWS between both group. However, at 90 % confidence level, analysis showed a small but significant difference, 90% CI (0.798 – 0.046), in the change in news from day 3 to 4 between the two groups. Mean Δ3-4 NEWS for the transfer group was + 0.35; Mean Δ3-4 NEWS for the discharge group was – 0.07. **CONCLUSIONS:** The results indicate that NEWS correlates well with clinical deterioration at home. As well as being an efficient track and trigger mechanism, NEWS in the first 4 days of admission may be used to predict which patients will require transfer.

PHS164

THE EVALUATION OF MEDICAL BENEFIT SPECIALTY MEDICATION UTILIZATION MANAGEMENT PROGRAM– 1-YEAR EXPERIENCE

Lee C[1], Chang J[2], Lam A[2], Eng K[2], McCombs J[1]
[1]University of Southern California, Los Angeles, CA, USA, [2]PharMedQuest Pharmacy Services, Brea, CA, USA

OBJECTIVES: To evaluate the effect of a real-time, multidisciplinary medical benefit management (MBM) program for specialty drug on utilization and cost. **METHODS:** A holistic end-to-end MBM program for specialty drugs was implemented by a Medical Services Organization (MSO) that manages multiple independent practice associations (IPAs) in Southern California which are at financial risk for specialty drugs. Specialty drug requests were evaluated by a team of medical specialists, sub-specialists and clinical pharmacists using nationally recognized evidence-based guidelines and peer-reviewed journal publications. Clinical recommendations were provided to the payor for final approval. Claims from the MSO were collected to analyze the specialty drug spend before and after MBM program implementation during the period from 2014 to 2016. A dollars spend per-utilizer-per-month (PUPM) metric was applied for the comparison of medication utilization. All dollar values were reported in 2016 terms. **RESULTS:** 2,684 patients in Southern California utilized the MBM service during the study period. After a 1-year program implementation, the average spend of per-utilizer-per-month (PUPM) decreased 11% among top-10 diagnoses by specialty drug spend: pre-term labor ($1529, -34%, $p<0.05$), colorectal cancer ($3604, -59%, $p<0.05$), cervical cancer ($3132, -61%, $p<0.05$) and melanoma ($15487, -80%, $p<0.1$) have statistically significant average PUPM reductions chronologically. **CONCLUSIONS:** An effective MBM program is capable of reducing the cost of specialty drug therapies. Overall specialty spending and diagnosis-specific specialty spending were reduced effectively after 1-year of program implementation. The long-term benefit on clinical outcomes of the MBM program implementation requires further investigation.

PHS165

BREAST CANCER SCREENING PRACTICES IN ASIAN-AMERICAN COMPARED TO NON-HISPANIC WHITE WOMEN: A BEHAVIORAL RISK FACTOR SURVEILLANCE SYSTEM ANALYSIS

Wei H, Cobran EK, Sattler EL
University of Georgia, Athens, GA, USA

OBJECTIVES: To assess racial and ethnic disparities in breast cancer screening between Asian-American (AAs) and non-Hispanic White (NHW) women in the United States. **METHODS:** The study was a cross-sectional analysis, using pooled data from the 2014 Behavioral Risk Factor Surveillance System. Women aged 40+ years were included. Descriptive analysis was conducted to describe sociodemographic and economic characteristics (age, education, marital status, household income), general health, access to health insurance, health care cost burden, routine health checkups, and mammography screening rates of the analytic sample (means(SD), percentages). Bivariate analysis was used to examine relationships between independent and outcome variables. Multivariable logistic regression models were used to assess receipt of recommended mammography screening as a function of race independent of potentially confounding factors. **RESULTS:** The analytic sample included 179,127 NHW and 2,959 AA women, respectively. The mean age was 63.18 (SD 11.56) years, 41.91% had household incomes < $35,000, and 38.30% had less than or equal to high school education. About 60.42% of the sample was married and 94.12% had 1+ type of health insurance. Among NHWs, 92.99% have ever had mammography and 72.73% have had a mammography within the past 2 years. Among AA women, only 90.04% have ever had a mammography; 74.26% of them have had a mammography within the past 2 years. After adjusting for potential confounders, AAs were significantly less likely to have ever had a mammogram compared to NHWs (OR 0.68 [95% CI 0.67, 0.68]). **CONCLUSIONS:** Our study finds that AA women were less likely than NHWs to receive recommended mammographies. Given the increased prevalence of breast cancer among AA women, future research should examine reasons leading to lower mammography rates in this population.

PHS166

MEDICATION ERRORS (WRONG DOSE ERRORS) IN ADMITTED PEDIATRIC PATIENTS IN SANDEMAN PROVINCIAL HOSPITAL, QUETTA, PAKISTAN

Haq N, Abid Z, Nasim A, Yasmin R, Razaque G
University of Balochistan, Quetta, Pakistan

OBJECTIVES: Study aimed to identify the medication errors (wrong dose errors) in admitted pediatric patients in Sandeman Provincial Hospital, Quetta, Pakistan. **METHODS:** The study was conducted as retrospective study by obtaining the data from the pediatric ward of Sandeman Provincial Hospital, Quetta, Pakistan for period of three months i.e. May to July, 2016. Data was collected from the patients records and were analyzed for correction of doses prescribed to patients on the bases of age and body weight of each patient. **RESULTS:** A total of 203 patients were registered in the pediatric ward of Sandeman Provincial Hospital during the study period. Out of which majority of the respondents (n= 94, 46.3%) were between the age group of 1-6 years and with majority (n=118, 58.1%) were having body weight ranges 1-10kg and were male patients (n=107, 52.7%). The total number of medicines prescribed to all patients were 1036 and the average number of prescribed medicine per patients were 5 with 4 being the most frequent number (21.7%). of medicines prescribed. The results showed 50 (4.9%) medicines were prescribed with wrong dose. **CONCLUSIONS:** Although the results of the study showed that there was only small no of the medicine were prescribed with wrong dose, yet it could be lethal to hospitalized patients whose condition may be critical and the wrong dose could contribute to worsen of the condition. Pharmacist working in the hospitals should thoroughly check the dose of all prescribed medicine to the patients in hospital.

PHS167

ASSESSMENT OF KNOWLEDGE, ATTITUDE AND PRACTICE (KAP) OF PHYSICIANS TOWARDS ADVERSE DRUG REACTION (ADRS) REPORTING AND PHARMACOVIGILANCE IN PUBLIC HOSPITALS OF QUETTA CITY, PAKISTAN

Anwar M[1], ul Haq N[1], Ahmed T[2], Ahmed N[2]
[1]University of Balochistan,Quetta,Pakistan, Quetta, Pakistan, [2]University of Balochistan, Quetta, Pakistan

OBJECTIVES: The study was conducted to assess knowledge, attitude and practice (KAP) of physicians towards adverse drug reaction (ADRs) reporting and pharmacovigilance in public hospitals of Quetta city, Pakistan. Additionally, the study aimed to evaluate the correlation between knowledge, attitude and practices towards ADR reporting. **METHODS:** A cross-sectional study was conducted whereby physicians practicing at seven public hospitals of Quetta city, Pakistan were targeted for data collection. A self-administered questionnaire was used for data collection. Descriptive analysis was conducted through SPSS v. 20 to identify the KAP towards ADR. Spearmen rank correlation was used to identify the association among study variables and $p<0.05$ was taken as significant. **RESULTS:** Three hundred and fourteen physicians responded to the survey. Male dominated the cohort (n= 185, 70.1%) having age ranges between 24 – 34 years (n= 175, 55.7%) and experience of between 1-10 years (n= 192, 61.1%). Majority, 230 (73.2%) of the respondents had poor knowledge about pharmacovigilance and ADR reporting system. However, 297 (94.6%) had positive attitude towards pharmacovigilance and ADR reporting system. Moreover, majority of the respondents 182 (58%) had poor practices of ADR reporting. Correlation analysis revealed significant positive association between knowledge-attitude ($r=0.230$, $p<0.01$) knowledge-practice ($r=0.399$, $p<0.001$) and attitude–practice ($r=0.649$, $p<0.026$). **CONCLUSIONS:** The study indicates that the respondents have an inadequate knowledge yet positive attitude toward ADR reporting and pharmacovigilance. The positive associations reveal a relationship between knowledge, attitude and practices that reports a need for educational and training programs for physicians regarding pharmacovigilance system and ADRs reporting.

PHS168

IMPACT OF INTRODUCTION OF NEW TECHNOLOGIES FOR MATERNAL FETAL MONITORING AT CLINICA MATERNIDAD RAFAEL CALVO C, CARTAGENA - COLOMBIA

Herrera Rodriguez M[1], Edna Estrada F[2], Alvis Zakzuk NR[3], Zakzuk Sierra J[4], Alvis Guzman N[4]
[1]Centro de Investigación para la Salud Materna Perinatal y de la Mujer. Clinica Maternidad Rafael Calvo C, Cartagena de Indias, Colombia, [2]Centro de Investigación para la Salud Materna Perinatal y de la Mujer. Clinica Maternidad Rafael Calvo C., Cartagena de Indias, Colombia, [3]ALZAK Foundation. Universidad de Cartagena. Centro de Investigación para la Salud Materna, Perinatal y de la Mujer. Clínica Maternidad Rafael Calvo C., Cartagena de Indias, Colombia, [4]ALZAK Foundation. Universidad de Cartagena., Cartagena de Indias, Colombia

OBJECTIVES: Establish the impact of the introduction of new technologies for maternal-fetal monitoring in the epidemiological indicators at the Clinica

Maternidad Rafael Calvo C -**CMRC-. METHODS:** Cross-sectional and descriptive study. The target population was formed by patients who attended CMRC from January 1, 2013 to April 30, 2016.The information on this population was extracted from the databases and clinical records of the Department of Statistics and Epidemiological Surveillance of the CMRC. Statistics tests such as Wilcoxon rank-sum and Pearson correlation test were applied. The discontinuity regression model and Chow test were used to evaluate possible structural changes in the series. **RESULTS:** Perinatal Mortality and Late Neonatal, stillbirths and vaginal deliveries had changes in their trend with the introduction of new technologies. The regression showed that before the new technologies, detected cases of congenital defects increased at a rate of 5.2% [CI95%= -14.8-25.3] and those of extreme maternal morbidity at 6.5% [CI95%= 5.7-18.7]. In the new technologies exposure period, the average rate of congenital defects decreased at a rate of 8.4% [CI95%= -17.6-0.7] and extreme maternal morbidity at 1% [CI95%=-6.6-4.5), implying a real growth rate of 3% and 5% respectively. Regarding the number of procedures performed with the new medical equipment, a 1% increase before the technologies implied a decrease of 0.44% [CI95%= -3.2-2.3] in diagnoses of congenital defects and one of 0.3% [CI95%= -1.9-1.3] in the diagnoses of extreme maternal morbidity. After one year, 1% increase effect on procedures turned into an average increase of 1.3% [CI95%= 0.1-2.5] in diagnoses of congenital defects and 0.6% in extreme maternal morbidity [CI95%= -0.1-1.3]. **CONCLUSIONS:** The new medical equipment allows us to make more complex diagnoses, providing the opportunity to intervene and impact in a timely manner and thus avoid and mitigate problems in the fetus and the mother.

PHS169

DRUG UTILIZATION PATTERNS AMONG "HEAVY DRUG USERS" IN AN ELDERLY HOSPITALIZED POPULATION IN PUNJAB, PAKISTAN

Qamar-Uz-Zaman M[1], Atif M[1], Rehan Sarwar M[1], Scahill S[2]
[1]*The Islamia University of Bahawalpur, Bahawalpur, Pakistan,* [2]*Massey University, Auckland, New Zealand*

OBJECTIVES: To evaluate the drug utilization pattern among the elderly hospitalized patients who were heavy drug users. **METHODS:** A descriptive, cross-sectional study was carried out from December 2015 to March 2016 in six tertiary-care hospitals of the Punjab province of Pakistan. The study population was patients aged ≥60 years, taking ≥5 medicines/day and being hospitalized in the hospitals. Data was collected from 600 hospitalized elderly patients (100 patients per hospital). All medicines prescribed in each in-patient chart were noted on a pre-designed pro-forma and were classified under ATCl classification system. Multiple linear regression analysis was used to find the independent factors associated with heavy drug use. A P-value of $< .05$ was considered statistically significant. **RESULTS:** In 600 hospitalized in-patient (male 52.7% and female 47.3%) charts, 3,179 medicines were prescribed. The most commonly prescribed drug classes were: A: alimentary tract and metabolism 80% (A02: drugs for acid related disorders 64.5%, A03: drugs for functional gastrointestinal disorders 21.5%, etc.), N: nervous system 66.3% (N02: analgesics 67.2%, N03: antiepileptic's 11.2%, etc.), J: anti-infectives for systemic use 62.2% (J01: antibacterial for systemic use 82.5%, J04: antimycobacterials 15.3%, etc.) and C: cardiovascular system 48.3% (C07: beta blocking agents 19.8%, C10: lipid modifying agents 16.5%, etc.), respectively. The most commonly prescribed active substances were: A02BC01 (omeprazole 51.3%), N02BE01 (paracetamol 50.8%) and J01DD04 (ceftriaxone 40.2%), respectively. In multiple linear regression analysis, male gender (95% CI -.205, -.006, $p = .039$), being divorced (95% CI -.604, -.136, $p = .002$) and presence of comorbidity (95% CI .068, .267, $p = .001$) were the independent predictors of heavy drug use. **CONCLUSIONS:** The rational use of medicines is of utmost importance, most particularly in the elderly population. It is highly recommended that more consideration should be given to the elderly hospitalized patients who are heavy drug users.

PHS170

A NATIONWIDE SURVEY ON IN-HOSPITAL CLINICAL PHARMACIST'S ACTIVITY IN INFECTION CONTROL TEAM AT A HOSPITAL ALLOWED TO CALCULATE PREFERENTIAL INFECTION PREVENTION COUNTERMEASURE FEE IN JAPAN

Nishimura N[1], Hirose M[2], Naora K[1]
[1]*Shimane University Hospital, Izumo, Japan,* [2]*Shimane University, Izumo, Japan*

OBJECTIVES: The preferential Infection prevention countermeasure fee (PIPCF) requires the full-time assignment of a pharmacist at the infection control team of a hospital with PIPCF 1 in 2012. This study aims to investigate the actual situation of the infection control activity including the role of a pharmacist at hospitals with the PIPCF. **METHODS:** A nationwide survey was performed at hospitals with the PIPCF under the social medical fee schedule by using a questionnaire. **RESULTS:** Of 3,680 target hospitals (all 8,484 domestic hospitals in 2015) in Japan, 718 hospitals responded, and the statistical analysis was performed for 708 eligible hospitals, 304 hospitals with PIPFC 1 and 404 hospitals with PIPFC 2. The number of hospitals assigned part-time pharmacists for infection control team at hospitals with PIPCF 1 and 2 were 173 (59.6%) and 141 (34.9%), being similar to the assignment of physicians and medical technologists. However, the number of hospitals assigned full-time pharmacists at hospitals with PIPCF 1 and 2 were only 3 (1.0%) and 12 (3.0%), respectively. These results were the lowest among health care professionals. The working hours of pharmacists at hospitals with PIPCF 1 (13.7 person-hours) were higher than those at hospitals with implementing PIPCF 2 (8.8 person-hours). Furthermore, the amount of participation in infection control of pharmacists was less than other professionals, especially at hospitals with PIPCF 1. Although the participation rate of pharmacists in walk rounds were 94.4% at PIPCF 1 and 84.2% at PIPCF 2 hospitals, the numbers of participating pharmacists were 1.2 at PIPCF 1 and 0.3 at PIPCF 2 hospitals per an walk round. **CONCLUSIONS:** Although the working hours of pharmacists for infection control was limited due to the routine practice at a hospital, pharmacists play an important role in infection control by contributing to the walk round and the confirmation of permission and registration system.

PHS171

A NATIONWIDE SURVEY ON INFECTION CONTROL ACTIVITIES WITHIN HOSPITALS ALLOWED TO IMPLEMENT PREFERENTIAL INFECTION PREVENTION COUNTERMEASURE FEE IN JAPAN

Hirose M[1], Nishimura N[2], Naora K[2]
[1]*Shimane University, Izumo, Japan,* [2]*Shimane University Hospital, Izumo, Japan*

OBJECTIVES: The preferential Infection prevention countermeasure fee (PIPCF) was revised in April, 2012 in Japan, and it was divided into PIPCF 1 and 2 in case of meeting the requirement for securing infection prevention within a hospital. This study aims to explore the current status of infection control activities in hospitals allowed to calculate the PIPCF. **METHODS:** We nationwide surveyed the situation of infection control activities in hospitals implementing the PIPCF by using a questionnaire. **RESULTS:** Of 3,680 target hospitals (all domestic hospitals: 8,484 in 2015), 718 hospitals responded, and the statistical analysis was performed for 708 eligible hospitals, 304 hospitals with PIPCF 1 and 404 hospitals with PIPCF 2. With regard to the staff assignments for infection control of physicians, nurses, pharmacists and laboratory technicians, full-time nurses were working at 277 hospitals (91.1%) of hospitals with PIPCF 1. However, full-time nurses were working at only 38 hospitals (9.5%) of 404 hospitals with PIPCF 2. More than 90% of any health care professionals were participating in in-hospital walk round at 304 hospitals with PIPCF 1. However, less than 70% of physicians were participating in in-hospital walk round at 404 hospitals with PIPCF 2, and the participation rate of in-hospital walk round for physicians was the lowest among health care professionals. No pharmacist and laboratory technicians participated in in-hospital walk round for infection control at 404 hospitals with PIPCF 2. **CONCLUSIONS:** The hospitals with implementing PIPCF 2 were owned by small-scale and private corporations, and it was difficult for hospitals with PIPCF 2 to set up the in-hospital infection control system. This suggested that this issue has to be considered when performing infection control in near future.

PHS172

ANALYSIS OF CHANGES IN COSTS AND CLAIMS FOR CAPSULE ENDOSCOPY FOLLOWING THE INTRODUCTION OF SELECTIVE HEALTH BENEFIT IN KOREA

Park JH, Yoo MY, Jang IS, Hong MY, Kim KA
HIRA, wonju, South Korea

OBJECTIVES: This study attempted to examine the changes in costs and the use of capsule endoscopy after the medical service became a selective health benefit. **METHODS:** This study investigated the changes in costs and use of capsule endoscopy since September 2015, when the National Health Insurance began to cover it as a selective health benefit (with a coinsurance rate of 80%). As such, this study examined the results of a 2014 survey on the prevailing charges for medical services at five major hospitals to extract the costs of capsule endoscopy before it became a selective health benefit. As for demand for the service, the study reviewed sales of companies that manufacture devices for endoscopy.Finally, it utilized the HIRA Service's data on claims to measure the use of capsule endoscopy. **RESULTS:** Patients, who undergo capsule endoscopy, are now charged 555,910 won, which is about 43% less than the lowest cost of the service at 971,000 won before it became a selective health benefit. Since the shift, patients' deductible expenditure has reduced by approximately 54% from 971,000 won to 444,728 won. In the use of capsule endoscopy in two years after the shift, it grew about twofold from 1,120 cases to 3,250 cases. Meanwhile, cases of small bowel radiological special study, conducted on patients, as an alternative to capsule endoscopy, reduced from 13,212 to 10,654, marking a decrease of about 20%. **CONCLUSIONS:** This study performed the first analysis of costs, coinsurance rate, and use of a medical service that has become a selective health benefit. However, this study showed that the listing of the service as a selective health benefit has reduced patient burden considerably and made it easier to manage the use of the service within the National Health Insurance program, indicating that the new system is successfully achieving its purpose.

PHS173

ASSOCIATION OF FINANCIAL INCENTIVES WITH PATIENT-CENTERED MEDICAL HOME ADOPTION AMONG PRIMARY CARE PHYSICIANS

Merrell MA, Haider MR, Qureshi Z
University of South Carolina, Columbia, SC, USA

OBJECTIVES: To understand the associations between PCMH adoption and physician compensation with characteristics of primary care practices. The National Ambulatory Medical Care Survey (NAMCS), a nationally representative, annual dataset of physician visits, was used for this study. The sample size was 1,356 physicians for 2012. **METHODS:** A cross-sectional study using logistic regression was performed. NAMCS variables were used to construct a medical home infrastructure score and to identify practice-level characteristics for analysis. **RESULTS:** 70% of physicians in the study practiced in settings with PCMH infrastructure present. Physician compensation structure and size of the practice were significantly associated with PCMH infrastructure. Financial incentives based on quality were significantly associated with physicians' compensation structure, employment status, managed care payer mix, and regional location. **CONCLUSIONS:** Although the adoption of PCMH is at the highest level to date, small practice settings are lagging behind. Financial incentives for physicians appear to contribute to the adoption of PCMH.

PHS174

ASSESSMENT OF KNOWLEDGE, ATTITUDE AND PERCEPTION AMONG FUTURE PHARMACISTS TOWARDS PHARMACOVIGILANCE IN PUNJAB, PAKISTAN

Masood I[1], Rasool A[1], Hassan A[2], Javaid S[1], Waqas M[1], Rehman A[1], Saba H[1]
[1]The Islamia University of Bahawalpur, Bahawalpur, Pakistan, [2]Bahawal Victoria Hospital, Bahawalpur, Pakistan

OBJECTIVES: The present study was aimed to evaluate the knowledge, attitude and perception of future pharmacists towards pharmacovigilance. **METHODS:** A cross-sectional study was conducted for a period of 5 months from December 2015 to April 2016 using a pre validated semi-structured questionnaire distributed to senior pharmacy students at different universities of Punjab, Pakistan. To demonstrate students' demographic data and their response to the questionnaire items descriptive statistics were used. Chi square test was applied to assess the association of gender, institution and academic year of students to their response. **RESULTS:** The overall response rate was 84.4%. The mean score for knowledge about pharmacovigilance was 9.52 out of 18. Students of private institutes had slightly lower score (8.86) than those of Government i.e. 9.63. 44.9% respondents were able to define the pharmacovigilance correctly while 53.1% (448) participants knew about the pharmacovigilance as a part of National Drug Policy and 48.3% knew about the organization involved in ADR reporting in Pakistan. 60.4% students were willing to report ADRs in future while 51.5% (435) participants considered it necessary to add ADR reporting procedure in Pharmacy course. Furthermore 54.7% (462) respondents suggested the pharmacovigilance as a core topic in pharmacy education and 64.5% (544) suggested it as compulsory. **CONCLUSIONS:** It was concluded that pharmacy undergraduates do have basic theoretical knowledge of pharmacovigilance but there is lacking in practical approach towards ADR detection and reporting. However, pharmacy undergraduates have positive attitude towards pharmacovigilance and are willing to report ADRs in future.

PHS175

HOSPITAL UTILIZATION PATTERNS AMONG PATIENTS DIAGNOSED WITH PRIMARY BILIARY CIRRHOSIS

Belk K[1], Craver CW[2]
[1]Vizient Inc., Mooresville, NC, USA, [2]Vizient Inc., Huntersville, NC, USA

OBJECTIVES: Primary biliary cirrhosis (PBC) is an auto-immune disease in which the bile ducts in the liver are slowly destroyed. The objective of this study is to examine drivers of hospital utilization in patients diagnosed with PBC. **METHODS:** A retrospective descriptive study was conducted on a cross-section of PBC discharges in the MedAssets health system data for inpatient (N=1238) and outpatient (N=6043) visits from October 2015 through September 2016. Multivariable logistic regression was used to identify significant drivers of inpatient admission and mortality. **RESULTS:** The sample included 4028 unique patients from 285 hospitals. The population was predominantly female (89.0%) with an average age of 61.7 years and average Charlson comorbidity score of 2.8. The most common comorbid conditions were diabetes (19.1%), chronic pulmonary disease (19.0%) and renal disease (13.9%). Only 17% of patients were admitted as an inpatient, however the average length of inpatient stay was 7.3 days and the average cost of inpatient admissions was $16,697. In the inpatient population 4.7% expired during the hospital stay. Hepatic encephalopathy (OR=7.3, $p<.0001$), myocardial infarction (6.0, $p<.0001$), portal hypertension (OR=5.7, $p<.0001$), osteoporosis (OR=3.7, $p<.0001$), and plegia (OR=3.6, p=.0016) were the largest predictors of inpatient admission. The largest predictors of mortality included hepatic encephalopathy (OR=13.9, $p<.0001$), old myocardial infarction (OR=9.2, p=.0304), cerebral vascular accident (OR=3.4, p=.0018), and renal disease (OR=3.1, p=.0004). **CONCLUSIONS:** Patients diagnosed with PBC have a large number of comorbidities and complications, particularly chronic conditions. Improvements in disease management may lead to better patient outcomes and a reduction in hospital utilization and healthcare costs.

PHS176

COST CONSEQUENCE ANALYSIS OF A RENAL DISEASE MANAGEMENT MODEL CURRENTLY IMPLEMENTED IN A COLOMBIAN PAYER

Ariza JG[1], Bunch A[2], Sanabria M[3], Ceballos J[4], Ardila F[2], Cataño A[1], Vesga J[3]
[1]BAXTER, BOGOTA, Colombia, [2]Renal Therapy Services, BOGOTA, Colombia, [3]RTS, Bogota, Colombia, [4]Mederi, BOGOTA, Colombia

OBJECTIVES: To assess, from the payer perspective, the cost and consequences of RTS-Baxter's Renal Disease Management Model (DMM) for patients in dialysis, that is currently implemented in a Colombian Payer since 2013. **METHODS:** A one year Markov model, applying a three stages structure, was used to project ambulatory care, hospitalizations and deaths from 2.500 dialysis patients with and without DMM. Hospitalization and death rates were obtained from retrospective real world patient level data from RTS-Baxter registries. Ambulatory costs were estimated from referent dialysis tariffs. Inpatient care costs were collected from administrative database in a referent health care provider. Outcomes included: direct costs, events of hospitalizations, days in hospitalization and deaths. Both deterministic and probabilistic sensitivity analyses were done. **RESULTS:** Base case results for 2,500 cohort with DMM**:** Total cost COP 96,759,074,327; Inpatient care cost COP 24,804,142,382; Hospitalizations 2,572; Days of hospitalization 21,550; deaths 302. Base case results for 2,500 cohort without DMM**:** Total cost COP 98,266,101,230; Inpatient care cost COP 29,549,539,186; Hospitalizations 3,076; Days of hospitalization 24,453; deaths 332. Deterministic analysis: Dialysis tariff, hospitalization rate and hospitalization costs are sensitive parameters. Probabilistic analysis: The DMM is dominant in 60% of the simulations. **CONCLUSIONS:** DMM is a cost saving alternative from the perspective of the analyzed payer, improving hospitalization outcomes and mortality.

PHS177

ADULT PATIENT SATISFACTION WITH INPATIENT NURSING CARE AND ASSOCIATED FACTORS IN AN ETHIOPIAN REFERRAL HOSPITAL, NORTHEAST, ETHIOPIA

Amdie FZ, Haile K, Adane AA
University of Gondar, Gondar, Ethiopia

OBJECTIVES: The aim of this study was to assess adult patients' satisfaction with inpatient nursing care and associated factors in an Ethiopian referral hospital, Northeast Ethiopia, 2013. **METHODS:** Institution based quantitative cross-sectional study was conducted among patients admitted in medical, surgical, orthopedics, gynecology and ophthalmology wards of Dessie referral hospital from March 24 – April 30, 2013. All admitted patients who stayed in the study wards for at least two days during the data collection time were interviewed. The data collection technique was structured interview by using standard questionnaire adapted from Newcastle Satisfaction with Nursing Scale. Data were entered into EPI-Info version 3.5.3 and exported to SPSS version 20 for analysis. Multiple Logistic regression and odds ratio with their 95% confidence interval were used to identify factors associated with patient satisfaction with nursing care and control confounding effect. **RESULTS:** The overall patient satisfaction rate was 52.5 %. Respondents' sex (AOR= 2.20, 95%CI:1.30,3.73), age (AOR=4.77, 95%CI:1.97,11.55), admission ward (AOR= 9.99, 95%CI:3.47,28.79), self reported health status (AOR=2.07, 95%CI:1.27,3.37) and class of admission (AOR=2.56, 95%CI:1.41,4.67) were the variables significantly associated with patient satisfaction with nursing care. **CONCLUSIONS:** The rate of patient satisfaction with nursing care was found to be low in this study. Being female, age group 18 – 30 years old, good self reported current health status, being admitted in ophthalmology ward and first class of admission were significantly associated with patient satisfaction with nursing care. In-service training programs for nurses, with special emphasis on communication skills are recommended.

PHS178

HOSPITALIZATIONS AND THE PRIMARY HEALTH PROVIDER IN THE NC MANAGED MEDICAID POPULATION

Carnes KJ, Farrow-Chestnut T, Brandon WP
University of North Carolina at Charlotte, Charlotte, NC, USA

OBJECTIVES: Patients' involvement in a medical home is thought to advance the objective of minimizing client hospitalizations, a key objective of managed care. We investigated the association between a client's relationship with a personal health provider (PHP) and overnight hospitalizations in the adult North Carolina Medicaid population. We also evaluated other key potential drivers of hospitalization. **METHODS:** A 2015 survey of 3,596 Medicaid patients using the Consumer Assessment of Healthcare Providers and Systems provided 6 previous months' utilization and health status data. Relevant variables were overnight hospital stays, having a PHP for at least 6 months (vs. none identified), health status, and patient demographics. We conducted binary logistic regression of hospitalizations on PHP presence alone and after adjusting for patient clinical and demographic factors. **RESULTS:** The presence of a PHP was associated with hospitalization (odds ratio(OR)=1.409; $p<0.0001$; unadjusted). Adjustment for the number of specialist visits (compared to 0) was associated with hospitalization at OR of 1.686, 2.902, and 4.157 for 1, 2-3, and 4 or more visits, respectively, (each with $p<0.001$). Receiving care for the same condition $>=3$ times (OR=1.761; $p<0.0001$) and overall health status of fair/poor (OR=1.399; p=0.001) were also associated with hospitalization. The final adjusted model failed to show an association between PHP and hospitalization (OR=0.946; p=0.683), patient sex, age, race, or education. **CONCLUSIONS:** The strong positive association between a PHP relationship and hospitalizations was surprising given the belief that quality primary care prevents hospitalization compared with similar populations lacking a PHP. The adjusted model noted very significant positive associations between 3 measures of chronic illness and hospitalization but could not determine the impact of a PHP. Further research might consider whether in similar Medicaid populations, PHP diagnostic acumen can overcome long-term health deficits, leading to fewer short-term hospitalizations for those with provider relationships.

PHS179

DECREASED RATES OF HEALTH PLAN DISENROLLMENT FOR PATIENTS WITH RHEUMATOID ARTHRITIS

Chung H, Kern DM, Willey V, Quimbo R, Deshpande G, Cochetti PT
HealthCore Inc., Wilmington, DE, USA

OBJECTIVES: To estimate the time to and rates of health plan disenrollment for rheumatoid arthritis (RA) patients compared with a matched group of non-RA patients. **METHODS:** RA patients ($\geq$18 years) were identified from the HealthCore Integrated Research Database (HIRD) and matched to non-RA patients using exact 1-to-1 matching according to demographic characteristics, primary policy holder status, ACA plan, and length of pre-index enrollment. Patients were identified as having RA if they had $\geq$1 claim with a diagnosis of RA and $\geq$1 claim with DMARD use. Non-RA patients were those who did not meet the criteria for RA. Index date for RA cases was the earliest date at which they met the criteria for RA during 1/1/2007-12/31/2014. Non-RA patients were assigned same index date as their matched RA case. All patients were required to have 12 months of pre-index enrollment. **RESULTS:** 63,908 members were matched (31,954 per cohort). Median follow-up time was 3.1 years for RA and 1.9 for non-RA patients. Members with RA had lower rate of disenrollment compared with non-RA members (rate ratio=0.60; 95% CI=[0.59, 0.61]). Within those who disenrolled, time to disenrollment was longer for RA patients (median=806 vs 470 days). Cox regression showed similar results (hazard ratio (HR)=0.61) and results were consistent across sensitivity analyses: (1) including death as disenrollment (HR=0.61) and (2) excluding patients who died during the first 30 days of follow-up (HR=0.63). Results were

mainly driven by higher disenrollment during the first 12 months in the non-RA group, with the difference between the cohorts weakening over time. **CONCLUSIONS:** RA patients stayed with health plan longer and were less likely to disenroll than non-RA patients. This may be due to phenomenon called job-lock in which patients with chronic disease are reluctant to leave their job due to the fear of losing their health insurance.

PHS180

RACIAL AND ETHNIC DISPARITIES IN THE UPTAKE OF THE COLORECTAL CANCER SCREENING

Hong Y, Deshmukh AA
University of Florida College of Public Health and Health Professions, Gainesville, FL, USA

OBJECTIVES: To evaluate whether the provision of ACA has increased being up-to-date on colorectal cancer (CRC) screening (blood stool test, sigmoidoscopy, or colonoscopy) among age-eligible population with private insurance and to examine racial and ethnic disparities in the uptake of CRC screening **METHODS:** This was a quasi-experimental study using data from the Medical Expenditure Panel Survey 2007-2014. We examined changes in the prevalence of being up-to-date on the CRC screening by race/ethnic groups between pre-ACA (2007 to 2010) and post-ACA (2011 to 2014). Our study population included nonelderly US adults aged 50 to 64 years with family income at 138% or more of the Federal Poverty Level (FPL) and private insurance plans. We included the uninsured as a comparison group not directly affected by the ACA. **RESULTS:** Our study sample comprised 25,298 individuals, representing 303,358,483 US adults aged 50-64 years with private insurance (weighted n=169,187,558 in pre-ACA and 176,782,642 in post-ACA period). Overall prevalence of being up-to-date on the CRC screening increased from 59.8% in the pre-ACA to 63% in the post-ACA period (p=0.001). By race/ethnicity, we observed significant increases ranged from 3% among non-Hispanic (NH) whites (p=0.005) to 7.2% among Hispanics (p=0.001). However, using difference-in-differences analysis, we found that those changes in screening uptake were not associated with the provision of the ACA (i.e., elimination of the cost-sharing). Prevalence of being up-to-date was significantly lower among NH Asians, compared with NH whites in both Pre-and Post-ACA (44% vs. 61.4%, $p<0.0001$ in the pre-ACA and 48.5% vs. 64.5%, $p<0.0001$, respectively). NH black had the highest prevalence (65.4%) followed by NH whites, others (56.6%), and Hispanic (55.5%) in the post-ACA ($p<0.0001$). **CONCLUSIONS:** Although the prevalence of being up-to-date on CRC screening among age-eligible US population increased slightly after the implementation of the ACA, the ACA has not reduced racial and ethnic disparities in screening uptake.

PHS181

PHARMACISTS' PATIENT SAFETY CULTURE IN JAPAN

Hirose M[1], Nishimura N[2]
[1]*Shimane University, Izumo, Japan,* [2]*Shimane University Hospital, Izumo, Japan*

OBJECTIVES: This study aims to explore pharmacists' factors of patient safety culture in Japan using Hospital Survey on Patient Safety Culture developed by AHRQ. **METHODS:** We surveyed nationwide the situation of patient safety culture in 37 hospitals by using a questionnaire in 2011 and 2012. The questionnaire consists of four composites including the communication, organizational activity for patient safety, organizational learning-continuous improvement and frequency of events reported. **RESULTS:** Number of the valid data was 16,670 persons including 1,160 physicians, 9,308 nurses, 498 pharmacists, and others. The overall average positive response rates (PRRs) of the 12 patient safety factors were 50.9% for physicians, 51.5% for nurses, and 51.7% for pharmacists. The average PRRs of five factors regarding the communication for pharmacists (50.0%) was the lowest among three professionals (physicians: 54.7%, nurses: 52.8%), and those of other five factors regarding the organizational activity for patient safety for pharmacists (47.7%) was the highest among three professionals (physicians: 46.7%, nurses: 45.8%). Although the composite of communication includes five factors with factor 1: Communication openness, factor 2: Feedback and communication about errors, factor 11: Teamwork across units, factor 12: Teamwork within units, and factor 4: Hands-offs and transitions, the PPRs for pharmacists of factor 1, factor 2, factor 11, factor 12, and factor 4 were 43.9%, 59.1%, 70.5%, 40.2%, and 36.1%. For example, factor 1 includes three items, c2: Staff feel like their mistakes are held against them, c4: Staff will freely speak up if they see something that may negatively affect patient care, and c6: Staff are afraid to ask questions when something does not seem right, and the PPRs of them were 52.1%, 32.5%, and 47.7%. **CONCLUSIONS:** Therefore, it is possible to foster patient safety culture for pharmacists by making an effort to improve the item with low PPR among items.

PHS182

APPLICATION OF INDIVIDUAL LEVEL DCE MODEL INTO PATIENT CENTERED CARE: LITERATURE REVIEW AND SIMULATION TEST

Cheng X
University of South Carolina, Columbia, SC, USA

OBJECTIVES: Measuring individual patient's true preferences(trade-offs) across treatment outcomes and assessing them precisely in a consistent manner is essential for patient centered care (PCA). However, the recognition of individual heterogeneity by current DCE studies usually confounds estimates of the aggregated (population) mean and variance of random uncertainty, ignoring the patient's specific scale of random components based on their clinical condition and other personal characteristics. The purpose of this study is twofold: 1. Recognize individual level estimation techniques based on systematic literature review, tracing back to basic linear probability estimation since the inception of discrete choice model. 2. Provide empirical evidence by simulation, which tests the applicability of estimation techniques for PCA in terms of decision rules (assumptions), convergence status, statistical efficiency and accuracy. **METHODS:** Systematic review of individual level estimation techniques of DCE was conducted to determine the use of linear probability estimation and nested logit estimation. Simulation was constructed for 1000 pseudo patients in the routine care setting under two most common scenarios of individual decision rules (lexicographic and compensatory). Based on previous qualitative results from clinical setting, each pseudo patient answered 6-12 question in a well-balanced orthogonal DCE design, including five treatment outcome attributes and each attribute has two levels. **RESULTS:** Considerable heterogeneity remains, as evidenced by the range of the estimates and standard deviation. The linear probability estimation yielded the similar pattern of coefficients indicating trade-offs as nested logit estimation did, while the logit exhibited poorer convergence and statistical power. **CONCLUSIONS:** Since we are not aiming at predicting choice probability but understanding patient's trade-offs of treatment outcomes, linear estimation can be served better at individual level. The preliminary results are the subject of ongoing research, further research are needed because the applicability of estimation techniques in PCA is conditioned on survey design and clinical environments as well.

PHS183

DECREASED RATES OF HEALTH PLAN DISENROLLMENT FOR PATIENTS WITH CHRONIC OBSTRUCTIVE PULMONARY DISEASE

Kern DM, Willey V, Quimbo R, Chung H, Deshpande G, Cochetti PT
HealthCore Inc., Wilmington, DE, USA

OBJECTIVES: To quantify the time to and rates of health plan disenrollment for patients with Chronic Obstructive Pulmonary Disease (COPD) compared with a matched group of patients without COPD. **METHODS:** Patients ≥40 years old were identified from the HealthCore Integrated Research Environment (HIRE) as having COPD if they had ≥1 inpatient claim with primary diagnosis of COPD; or, ≥1 ED claim or ≥2 outpatient/SNF/inpatient claims with non-primary COPD diagnosis. The index date for COPD cases was the earliest date at which they met the criteria for COPD during 1/1/2007-12/31/2014. Non-COPD patients include those who did not meet the criteria for COPD. COPD patients were matched to non-COPD patients using exact 1-to-1 matching according to age, gender, health plan type, region, primary policy holder status, ACA plan, and length of pre-index enrollment. Non-COPD patients were assigned an index date equal to that of their matched COPD case. All patients were required to have 12 months of pre-index enrollment. **RESULTS:** 657,766 health plan enrollees were matched (328,883 per cohort). Median follow-up time was 2.5 years for COPD and 1.7 for non-COPD patients. During follow-up, 55% of COPD patients disenrolled compared with 63% of non-COPD patients (rate ratio=0.69; 95% CI=[0.69, 0.69]); within those who disenrolled, time to disenrollment was longer for COPD patients (median=688 vs 346 days). Accounting for censoring, Cox regression showed similar results (hazard ratio (HR)=0.71) and were consistent across sensitivity analyses: (1) including death as a disenrollment event (HR=0.77), (2) excluding patients who died during the first 30 days of follow-up (HR=0.77). **CONCLUSIONS:** Presence of COPD was found to be associated with a longer duration of health plan enrollment and decreased risk of disenrollment. This may be due to job-lock, in which patients with chronic medical conditions do not leave their employer due to the threat of losing their health insurance.

PHS184

FIVE DIMENSIONS TO EVALUATE BREAST CANCER DIAGNOSTIC PROCESS

Pulido DC[1], Alvis LF[1], Acuña L[2], Bryon A[3], Sanchez P[1]
[1]*Cuenta de Alto Costo, Bogota D.C., Colombia,* [2]*Cuenta de Alto Costo, Bogotá, Colombia,* [3]*HEORT, Bogota, Colombia*

OBJECTIVES: Determine the minimum variables to be taken into account to perform an integrated breast cancer diagnosis process that facilitates decision-making under care characteristics of the Colombian Health System. **METHODS:** A literature review was made with the following terms: ("Breast Neoplasms"[Mesh]) AND "Quality Indicators, Health Care"[Mesh]; (("Quality Indicators, Health Care"[Mesh]) AND "Breast Neoplasms"[Mesh]) AND "Diagnosis"[Mesh]. Based on the review of original articles, observational studies and Clinical Practice Guidelines, a panel of experts defined the variables and established the categories of measurement for each. **RESULTS:** 110 determinant variables were defined in breast cancer diagnostic process, grouped into 5 dimensions: 1) Histopathological diagnosis, 37.2% (41 variables), ; 2) First time care (attending and primary care physician), 25.4% (28); 3) Imaging diagnosis, 15.4% (17); 4) Staging, 11.8% (13). Finally, Sociodemographic variables 10%, (11) were taken into account. Approximately, 13.6% (15) were dates variables related with request and registration of histopathological and images reports, as well as, dates of staging and request for first attending physician care. About 31% of histopathological diagnosis (13 variables) were related with treatment defining biomarkers as Her2. **CONCLUSIONS:** The analysis by dimensions will make it possible to compare and give them weight, so through consensus, the impact of their evaluation can be determined within the diagnostic process. Evaluation of breast cancer diagnostic process through dimensions will enable decisions-making in order to improve the health care of women with breast cancer.

PHS185

COMPARATIVE ASSESSMENT OF THE BRICS HEALTHCARE SYSTEM

Hussain S
Jamia Hamdard, Hamdard University, New Delhi, India

OBJECTIVES: Brazil, Russia, India, China, and South Africa (BRICS) bear half of the population burden at the same time are the fastest growing economies of the

world. However, the healthcare system of BRICS nation faces unique challenges due to demographic burden and inadequate healthcare infrastructure. Hence, an assessment of the healthcare system of BRICS nation was done. **METHODS:** Secondary research was done to collect data pertaining demographic profile, national health workforce strength, health resources and financing, immunization programmes and other health indicators for BRICS nations and were extracted on a pre-specified template. Latest data was considered and adjusted accordingly. **RESULTS:** Russia is at the top position in terms of gross national income per capita (23$), While China has the maximum GDP in the year 2015. In terms of health workforce Russia is leading with more than four physicians per 1000 peoples, while India and South Africa had less than one physician per 1000 peoples. India has only seven hospital beds per 10,000 people. The out-of-pocket (OOP) expenditure as total expenditure on health was highest for India (62.42%) whereas lowest for South Africa (6.49%). Among the broad range of health indicators, South African healthcare system was found heavily burdened with worst life expectancy at birth (60 yrs). Indian healthcare system was second worst performer with lowest life expectancy at age 60 (17), infant mortality rate (38) and sanitation facilities (40%). Brazil was found to be the best performer with highest life expectancy at birth (75 yrs.) & at age 60 (22 yrs.), lowest crude mortality (6), TB incidence (44), and more than 80% improved sanitation facilities. **CONCLUSIONS:** Among the BRICS nations, South Africa & India are struggling for improvement in health sector. For India high OOP could be one potential reason while for South Africa the shortage of health workforce is also of concern.

PHS186

ASSESSMENT OF HEALTHCARE QUALITY AND PATIENT SATISFACTION LEVEL TOWARDS HEALTHCARE SERVICES PROVIDED IN THE HOSPITALS: A CROSS-SECTIONAL SURVEY

Nazir A[1], Masood I[2], Ahmad M[2], Arooj S[1], Naz M[1], Amir S[1]
[1]*The Islamia University Of Bahawalpur, Bahawalpur, Pakistan,* [2]*The Islamia University of Bahawalpur, Bahawalpur, Pakistan*

OBJECTIVES: The study aimed to determine the health care quality in public and private hospitals of Punjab province of Pakistan and to recognize the shortage of facilities and numerous provider and facility factors in hospitals that seriously affect the patients' health status. **METHODS:** A cross-sectional questionnaire based survey was conducted from December 2015-March 2016. A total of 424 patients were selected who were admitted and utilizing the services of different public and private hospitals of selected cities using systemic random sampling technique. Data was summarized by applying descriptive statistics like frequencies, percentages, mean, median, standard deviation and inter quartile range while significant association and difference between various dependent and independent variables was determined by chi square test, Mann-Whitney U test and Kruskal Wallis tests. A p value less than 0.05 was determined as significant level. **RESULTS:** On an average 46% respondents had good expectations towards healthcare services provided in the hospitals (before their visit) but when we assessed their satisfaction level (after their visit) it was found that majority of the respondents (n=320; 80%) had overall satisfaction score below the average expectation score (median=6, IQR=4; 46% of total expectation score). Only 20% (n=80) of the respondents had percent satisfaction score greater than the percent average expectation score. The overall satisfaction score in private sector hospitals was significantly greater ($p<0.05$) than public sector hospitals. **CONCLUSIONS:** Results of study demonstrated that patients were more satisfied with the services provided by private hospital services but respondents were especially dissatisfied from the insufficient time given by the doctors for their proper examination and diagnosis.

PHS187

STUDENTS' HEALTH STATUS IN A PRIVATE UNIVERSITY OF MALAYSIA: A CROSS-SECTIONAL STUDY

Prajapati SK[1], Iqbal DM[2], Sahu VK[3], Akram W[4], Verma MK[5], Paliwal N[6], Tahir M[7], Mohiuddin SG[8], Ahmed MU[7]
[1]*AIMST University Malaysia, Sungai Petani, Malaysia,* [2]*AIMST University, Bedong, Kedah Darul Aman, Malaysia, Malaysia,* [3]*Maharana Pratap College of Pharmacy MPCP, Kanpur, India, Kanpur, India, Pakistan,* [4]*AIMST University, Bedong, Kedah Darul Aman, Malaysia, Pakistan,* [5]*New pulse Hospital Kalyanpur, India, Kanpur, India, Pakistan,* [6]*AIMST University Malaysia, Sungai Petani, Pakistan,* [7]*University of Veterinary and Animal Sciences, Lahore Pakistan, Lahore, Pakistan,* [8]*AIMST University, Sungai Petani, Malaysia*

OBJECTIVES: To access health of medical and paramedical students and find out current major and minor illnesses and also evaluate the correlation of illnesses with last year illnesses. **METHODS:** A cross-sectional, descriptive study carried out using convenience sampling. A pre-validated questionnaire is distributed in university. The response items were on close-ended and likert scale options. Descriptive statistics (SPSS version 20) is applied, means, standard deviations, and frequency distributions calculated. Pearson coefficient of correlation test also used to analyze data and $p \leq 0.05$ is considered s significant for all study variables. The reliability of the questionnaire was assessed via Cronbach's Alpha measure (0.704). **RESULTS:** 400 students of a various departments were participated, 149 students (37.2%) from MBBS, 122 students (30.5%) from Pharmacy, 117 students(29.25%) from BDS, 12 students (3.0%) from Nursing department. 61 students (15.3%) found that their health was excellent, 101 students (25.3%) found that their health was very good, 191students (47.8%) found that their health was good,42 students (10.5%) found that their health was fair, and 5 students (1.3%) found that their health was poor. From Pearson bivariate correlation analysis, this study found that illnesses in last one month has a correlation with illnesses in last 12 months ($r = 0.60$, $p = 0.01$). **CONCLUSIONS:** The Cross sectional study indicates that most of the students of surveyed university were healthy and their health statuses were still in the scale of excellent or good and with a definite correlation as last year illness.

PHS188

EFFECTIVENESS OF KNOWLEDGE TRANSLATION (KT) INTERVENTIONS TO IMPROVE PATIENTS AND COMMUNITY ADHERENCE TO CLINICAL PRACTICE GUIDELINES (SYSTEMATIC REVIEW)

Garzón-Orjuela N, Eslava-Schmalbach J, Ospina N
National University of Colombia, Bogota, Colombia

OBJECTIVES: To assess the effectiveness of knowledge translation (KT) interventions to improve patients and community adherence to clinical practice (CPG) **METHODS:** Systematic Review of KT interventions compared with a classical developed guideline for patients or community. The risk of bias (ROB) was tested with the Risk of bias Cochrane tool and the quality of evidence was tested using the Grading of Recommendations Assessment, Development and Evaluation (GRADE). Two independent raters qualified relevance, ROB and quality of included studies **RESULTS:** 2653 (CPG) were initially scanned. After deleting duplicates 2607 (CPG) papers were tested. Seven studies were finally included related with CPG. The follow-up time of interventions was between 6 and 18 months. Patients adherence to recommendations was observed in 2 studies. There was a high heterogeneity because of the variability of the population and of measurement tools. Randomized controlled studies had low ROB in the majority of the categories. We did not find in the studies the inclusion of costs or equity issues of the interventions, considering potential inclusion of disadvantaged populations or potential differences related to a different effectiveness of the intervention on them. **CONCLUSIONS:** Research to improve patients adherence to CPG using KT interventions are recent. The use of KT strategies improves the outcomes in the implementation of the guidelines. However, new studies with less heterogeneity are necessary to confirm these results

PHS189

KNOWLEDGE OF RISK FACTORS REGARDING THYROID CANCER AMONG COMSATS UNIVERSITY STUDENTS IN ABBOTTABAD PAKISTAN

Iqbal A[1], Azhar S[2], Murtaza G[2], Rashida B[2], Kalsoom U[2], Ilyas Z[2]
[1]*COMSATS Institute of Information and Technology Abbottabad 22060, Pakistan, Abbottabad, Pakistan,* [2]*Department of Pharmacy, COMSATS Institute of Information Technology, Abbottabad, Pakistan*

OBJECTIVES: Study focuses on accessing knowledge and perception of students about thyroid cancer risk factors and awareness. **METHODS:** A cross-sectional study was conducted using self-administered questionnaire from August 2015 – December 2015 in Comsats Institute of Information technology Abbottabad Pakistan. Data analysis was done using SPSS 23 and Pearson Chi square was used for correlations between dependent and independent variables. **RESULTS:** Questionnaire were filled giving the response rate of 87.6%. Among respondents 22% students perception was that neck swelling or a lump is a sign of thyroid cancer. However 21% of students was aware that neck palpation method is commonly used to detect thyroid cancer. Out of all respondents, 42% people believed old age, radiation and positive family history of thyroid cancer are significant risk factors of thyroid cancer. Almost all students perceived that females are more prone to thyroid cancer as compared to males. **CONCLUSIONS:** Study shows moderate knowledge about risk factors of thyroid cancer in Comsats University students. The results show a clear need of health educational activities for educating more people about thyroid cancer knowledge, risk factors, early detection signs and prognosis of early detected thyroid cancer which will eventually lead to better health outcomes and decreased prevalence of thyroid cancer in Pakistan.

PHS190

PREDICTION OF HOSPITALIZATION COST IN DIALYSIS PATIENTS

Ariza JC[1], Bunch A[2], Ceballos J[3], Sanabria M[4], Perez CA[5], Vesga J[4], Cataño A[1]
[1]*BAXTER, BOGOTA, Colombia,* [2]*Renal Therapy Services, BOGOTA, Colombia,* [3]*Mederi, BOGOTA, Colombia,* [4]*RTS, Bogota, Colombia,* [5]*Ecoanalitica, BOGOTA, Colombia*

OBJECTIVES: To assess, the hospitalization episode cost, and the clinical / demographical determinants from the payer perspective, for patients in dialysis currently treated in RTS Disease Management Program. **METHODS:** Data collection**:** Episodes of hospitalization, demographic and clinical variables were identified by reviewing RTS Disease Management Program clinical records. Each episode was matched with the billing data base from a referent high complexity hospital in order to collect the cost per episode charged to the payer. A harmonized, adjusted and validated data base was built with 59 variables and 752 episodes. Descriptive analysis: measures of central tendency and variability were applied for continuous variables, and proportions for categorical variables. Correlations among episode cost and other explicative variables were assessed. Inferential analysis: A log lineal and quantile regression analysis was used to study covariates that influence the hospitalization episode costs. **RESULTS:** hospitalization episode cost estimation: mean COP 7,088,009, median COP 3,507,080 and Standard Deviation COP ±13,008,555. Covariates with downsized effect on cost: hypertension as unique cause of renal disease ($p<0.05$), high socioeconomic level ($p=0.08$), albumin > 4 mg/dl ($p=0.05$), hemoglobin > 9mg/dl ($p<0.01$), normal KTV ($p=0,09$). Covariates with expanded effect on cost: Length of stay ($p<0.01$), Diabetes Mellitus ($p<0.05$), cardiac valve disease ($p=0,09$), peripheral artery disease ($p<0.01$), cardiovascular disease ($p<0.05$), intensive care unit requirements ($p<0.01$), surgery ($p<0.01$) and overweight ($p=0.05$). F test of the model $p < 0.000$ R-squared = 0.6. **CONCLUSIONS:** hospitalization episode cost in dialysis patients is a skewed variable that the in average is estimated in COP 7,088,009. Thirteen clinical and demographic covariates were found to explain some of the variability in the hospitalization episode cost.

PHS191

THE EVIDENCE BEHIND 'CHOOSING WISELY' RECOMMENDATIONS: A BIBLIOMETRIC ANALYSIS

Chenoweth MD
Tufts University, Medford, MA, USA

OBJECTIVES: To evaluate the current list of Choosing Wisely recommendations, and assess the quality and quantity of evidence used to characterize "low value" services. **METHODS:** All recommendations presented on the Choosing Wisely initiative's website were identified, along with the references that accompany each recommendation. In addition to standard reference elements, Medical Subject Headings and MEDLINE publication type assignment data were collected. References not indexed in Pubmed were verified using online websites to obtain complete details pertaining to the source and type of publication. **RESULTS:** The Choosing Wisely initiative consists of 475 recommendations produced by 74 specialty societies. Each specialty society describes recommendations in detail and presents evidence supporting that determination. All included specialty societies describe the process by which their recommendations were developed. A variety of clinical services were targeted by Choosing Wisely recommendations. The majority (238, 50.1%) were clinical tests that relate to patient diagnosis, prognosis, or monitoring. The quality, quantity, and applicability of the cited evidence were highly variable. A total of 1,768 citations were retrieved. Out of 1,548 peer-reviewed references, 77.71% were published between 2005 and 2016. Clinical guidelines (578, 32.7%) and real world evidence (405, 22.9%) represented the most common types of evidence. 89 (18.7%) specialty society recommendations made economic claims of cost or value; however, only 20 (22.47%) cited supporting economic evidence. **CONCLUSIONS:** These findings suggest that the Choosing Wisely initiative's recommendations should be based on systematic reviews of the evidence and should be developed in a structured, clear, and transparent manner. Clear evidentiary justification for the selection of low value services is necessary for the ongoing success and sustainability of the Choosing Wisely initiative. Potential explanations for the observed variation include the amount of evidence available, the thoroughness of the relevant specialty society, and the evolving nature of the clinical evidence base.

PHS192

A QUALITATIVE STUDY EXPLORING PERCEPTIONS OF POLICY MAKERS ABOUT COMMUNITY PHARMACY PRACTICE AND EXTENDED PHARMACY SERVICES IN LAHORE, PAKISTAN

Hashmi FK[1], Hassali MA[1], Saleem F[2], Babar Zu[3]
[1]*Universiti Sains Malaysia, Penang, Malaysia,* [2]*University of Baluchistan, Quetta, Pakistan,* [3]*University of Auckland, Auckland, New Zealand*

OBJECTIVES: The focus of pharmacy practice has shifted from product- to patient-focused services. This transition of role is least reported from developing countries. The present study aimed to explore the perception of health policy makers (PMs) about practice change and provision of extended pharmacy service (EPS) by community pharmacist (CP) in the city of Lahore, Pakistan. **METHODS:** A qualitative approach was used to gain an in-depth knowledge of the issues. Government officials involved in regulation and policy making were targeted for the study. Seven conveniently sampled respondents were interviewed through a validated semi-structured interview guide. All interviews were audio-taped, transcribed verbatim, and were then analysed for thematic contents by the standard content analysis. **RESULTS:** Thematic content analysis (TCA) yielded four major themes, (1) Current standard of community pharmacy practice, (2) Current knowledge of EPS, (3) Practice change and readiness of CPs toward practice change and (4) Barriers towards practice change. Only one respondent had knowledge about EPS while for majority of the PMs, EPS was a new concept. They were not confident about the current status of community pharmacy practice in Lahore, however, in Lahore the standard was perceived to be slightly better. In their view the practice should be changed as government had recently introduced new rules and regulations. The barriers and limitations indicated were the lack of pharmacists' professional attitude, mindset and interest, academia, and lack of acceptance of pharmacists as health team member in society and by other health professionals. The prevailing Drug Act 1967 was considered as the one of the major barriers toward the practice change. **CONCLUSIONS:** The government, policy makers, academicians, and health professionals to work together to bring about the change in practice of community pharmacy. Amendments in existing laws and evidence-based legislation regarding extended roles of pharmacist are needed in Pakistan.

PHS193

DISEASE STATUS, SYMPTOMOLOGY, AND REMISSION RATES OF NON-RADIOGRAPHIC AXIAL SPONDYLOARTHRITIS AND ANKYLOSING SPONDYLITIS PATIENTS IN THE UNITED STATES

Hunter TM[1], Sandoval D[1], Lobosco S[2], Moon R[3], Birt J[1], Milligan G[3]
[1]*Eli Lilly and Company, Indianapolis, IN, USA,* [2]*Adelphi Real World, Macclesfield, UK,* [3]*Adelphi Real World, Bollington, UK*

OBJECTIVES: To better understand the symptoms and clinical characteristics of non-radiographic axial spondyloarthritis (nr-axSpA) patients and how they compare to ankylosing spondylitis (AS) patients in the United States. **METHODS:** Data from the 2015 SpA Disease Specific Programme, a cross-sectional, multi-national survey of patients and rheumatologists conducted in the United States were analyzed. Rheumatologists (n=92) completed forms containing patient demographics, clinical results and symptomology. Symptoms, disease activity, and disease status (defined as improving, stable, unstable, and deteriorating) of ankylosing spondylitis and non-radiographic axial spondyloarthritis patients were compared. **RESULTS:** A total of 980 patients (AS: 498; nr-axSpA: 482) were included in this analysis. A higher proportion of AS patients were male (77% vs. 56%), older (Mean Age: 46.1 vs. 42.6), had a higher mean BMI and were employed when compared to nr-axSpA patients. Nr-axSpA patients' current disease status were less likely to be stable (p=0.0259) in comparison to AS patients. Nr-axSpA patients were also less likely to be in remission (p=0.0027). AS patients had more axSpA symptoms, such as sacroilitis, spinal fusion, and loss of movement, however, nr-axSpA patients were more likely to have inflammatory back pain, enthesitis, or no reported symptoms currently. **CONCLUSIONS:** In the US, nr-axSpA and AS patients share many similar clinical features with few differences between them. In spite of these similarities, nr-axSpA patients show lower rates of stability and are less likely to be in remission. These findings may suggest that nr-axSpA is as burdensome as AS, and that both conditions may warrant similar treatment approaches from an early stage.

PHS194

AVAILABILITY OF ESSENTIAL OBSTETRIC DRUGS AND EQUIPMENT AND MATERNAL MORTALITY IN PRIMARY HEALTH CARE SETTING IN INDIA

Sriram S, Khan M
University of South Carolina, Columbia, SC, USA

OBJECTIVES: Primary health centers (PHCs) are important source of maternal health services in India. The average maternal mortality ratio in India is 178 per 100,000 live births. This study aims to find out whether the drugs and equipment in PHCs are adequate according to Indian Public Health Standards and whether there is any effect of their availability on maternal mortality. **METHODS:** The study was conducted in 3 districts of Andhra Pradesh state of India. 30 PHCs were selected in each district using simple random sampling. 90 PHCs were visited and data was collected. The study was done between May 2012 and April 2013. Maternal mortality data was obtained from records of each primary health centers for the year 2012-2013. Regression analysis using Maternal Mortality as dependent variable and availability of essential drugs and equipment as independent variables is done. **RESULTS:** Only 30% of PHCs had an emergency obstetric drug tray consisting of all the essential drugs. Only 60% of PHCs had labor table and Suction machine. Oxygen administration facility was available in 40% of PHCs and sterilization equipment in 50%. Normal delivery kits were available in 90%, while complete assisted delivery kits were present in less than 10%. Average maternal mortality in surveyed PHCs was 97/100,000 live births. For every unit increase in availability of Emergency Obstetric kit with all 6 contents, maternal mortality decreased by 8/100,000 live births and for the availability of a fully equipped sterile labor room, the maternal mortality decreased by 11/100,000 live births. **CONCLUSIONS:** PHCs in India show poor availability of essential drugs and delivery equipment even after 5 years of full implementation of IPHS of National Rural Health Mission. Availability of emergency obstetric drugs and supplies significantly reduce maternal mortality. India should ensure continuous availability of emergency obstetric drugs, supplies and equipment for rapid improvements in maternal mortality.

PHS195

FACTORS OF CARDIOVASCULAR DISEASE RISK SCREENING UPTAKE AMONG POPULATIONS WITH LOW SOCIOECONOMIC STATUS: A SYSTEMATIC REVIEW

Lim KK[1], Lim C[2], Kwan YH[3], Tan CS[2], Chan SY[2], Fong W[4], Tay HY[5], Ostbye T[1]
[1]*Duke NUS Medical School, Singapore, Singapore,* [2]*National University of Singapore, Singapore, Singapore,* [3]*Duke-NUS Medical School, Singapore, Singapore,* [4]*Singapore General Hospital, Singapore, Singapore,* [5]*Singapore Heart Foundation, Singapore, Singapore*

OBJECTIVES: Populations with low socio-economic status (SES) are at higher risks of cardiovascular morbidity and mortality. This systematic review aimed to identify, classify and present factors associated with cardiovascular disease (CVD) risk screening uptake into appropriate themes. **METHODS:** We systematically searched and screened articles from databases, complemented with hand-searching of references in included articles. We included full-text articles of studies which identified factors associated with CVD risk screening uptake among the adult population with low SES. We excluded review articles, book chapters and those not published in English. We extracted study characteristics, classified the factors and recorded the magnitude and direction of association for each factor with screening uptake, as well as the strength of the evidence for the association. **RESULTS:** Five out of 1363 articles were included which examined screening conducted in healthcare facilities, participants' homes or nearby community centers, as well as screening conducted as an outreach program. We identified and categorized 33 factors positively or negatively associated with screening uptake into 6 themes. Besides lack of awareness and poor health beliefs, the factors influencing the screening uptake of low SES population include opportunity cost from missing work, concerns about judgmental screening staff and absence of companion to attend screening together. **CONCLUSIONS:** Our findings provide a comprehensive overview of factors associated with CVD risk screening uptake among population with low SES. The findings are particularly useful for clinicians, researchers and policy makers who are developing interventions and screening programs targeting the low SES group. Studies are required to identify other unique factors associated with CVD risk screening in this group.

PHS196

ASSOCIATION BETWEEN ACCESS TO HEALTH-PROMOTING FACILITIES AND PARTICIPATION IN CARDIOVASCULAR DISEASE (CVD) RISK SCREENING AMONG POPULATIONS WITH LOW SOCIOECONOMIC STATUS (SES) IN SINGAPORE

Lim KK[1], Lim C[2], Kwan YH[3], Ostbye T[1], Tay HY[4], Chan SY[2], Fong W[5], Tan CS[2]
[1]*Duke NUS Medical School, Singapore,* [2]*National University of Singapore, Singapore,* [3]*Duke-NUS Medical School, Singapore,* [4]*Singapore Heart Foundation, Singapore,* [5]*Singapore General Hospital, Singapore*

OBJECTIVES: Little attention has been given to associations between physical environment and screening participation. This study examined associations between minimum distances (proxy of access) to health-promoting facilities and door-to-door, cardiovascular disease risk screening participation, among

populations with low socioeconomic status (SES) residing in public rental flats in Singapore. **METHODS:** We obtained corresponding block screening participation rates from 66 blocks housing a total of 2619 residents, from Health Mapping Exercises conducted from 2013-2015. Uni- and multi-variate negative binomial regression were used to test associations between minimum distances to facilities (private subsidized clinics, certified healthy eateries, polyclinics and parks) and block screening participation rate, adjusting for age, ethnicity, gender and planning region. We also repeated the multi-variate analyses, to test if the associations varied according to regions. **RESULTS:** Uni-variate analyses showed an association between block screening participation rate and minimum distance to polyclinics – which disappeared in multi-variate analyses. After adjusting for interaction, 3 independent variables, minimum distance to subsidized private clinics (IRR 1.52, 95% CI 1.12–2.05) in the East region, as well as polyclinics (IRR 0.92, 95% CI 0.88–0.96) and parks (IRR 1.42, 95% CI 1.11–1.81) in the North/North-East regions were shown to be significant. No association was observed for healthy eateries for all 3 regions. **CONCLUSIONS:** These findings could be important considerations in the planning of future door-to-door screenings in urban cities, for efficient prioritisation of resoures. To increase participation rates among this low SES population, access to health-promoting facilities in each region and their perception of such facilities should be considered.

PHS197

THE ROLE OF PHARMACISTS IN THE PREVENTION AND TREATMENT OF HOSPITAL-ACQUIRED INFECTIONS

Peasah S, Marshall L
Mercer University College of Pharmacy, Atlanta, GA, USA

OBJECTIVES: Background: Required public reporting and reimbursement penalties have contributed to the increased focus by hospitals to reduce hospital-acquired infections (HAI). Although management of HAI requires a multidisciplinary approach, we explore the different roles and contributions of hospital pharmacists to summarize approaches that could be adopted by pharmacists and pharmacy directors in other institutions. **METHODS:** Face-to-face guided interviews of eight pharmacists from eight different hospitals were conducted on the role of pharmacists in addressing HAI. The interviews were transcribed and summarized using NVIVO thematic analysis. **RESULTS:** The most common HAI reported by the pharmacists was Clostridium difficile. Interventions to prevent these infections included antibiotic stewardship, hygiene, and effective catheter management policies. All respondents saw the role of pharmacists as stewards of appropriate use of antibiotics to prevent and treat HAI. Although some mentioned an interdisciplinary approach, working with physicians and nurses, the majority of pharmacists deferred to nurses on the question of prevention and to pharmacists on the question of treatment. Clostridium difficile management remains a challenge but most of the respondents consider that policies in place to reduce infections are generally effective. Not all had an antibiotic stewardship program. **CONCLUSIONS:** Pharmacists are actively involved in designing and implementing strategies to reduce HAI. Pharmacists view antibiotic stewardship as the area where pharmacists can have the most impact

PHS198

AVAILABILITY AND ALLOCATION OF HEALTHCARE SERVICES AND THE EFFECT ON HEALTH OUTCOMES IN FLORIDA: A SPATIAL PERSPECTIVE

Mallow P
University of Cincinnati, Cincinnati, OH, USA

OBJECTIVES: This study assessed the availability and allocation of healthcare services in the State of Florida with respect to their effect on health outcomes as measured by age-adjusted mortality (AAM) rates and mortality amenable to healthcare (MAH) rates. **METHODS:** This retrospective cross-sectional study examined the availability and allocation of healthcare services in the State of Florida at the county level. Data was obtained from the US Census, the Area Resource File, and the Florida Department of Health for 2010. AAM rate was calculated at the county level. The MAH rate for each county was calculated based on the age of the individual's death and primary cause of death being associated with conditions that could have been prevented. A gravity model was implemented to measure the availability and allocation of health care services. Separate multivariable regression models were performed to assess the effect of health care services on AAM and MAH. Sensitivity analyses were performed to ascertain if differences existed in urban or rural counties. **RESULTS:** In the overall analysis, the allocation and availability of primary care physicians and physician assistants were found to account for an approximately 2% ($p < 0.05$) decrease in the AAM rate. However, these results did not hold when examining the MAH rate. In the urban counties primary care physicians, nurse practitioners, and physician assistants were associated with a 2% ($p < 0.05$) decrease in the MAH rate. In the rural counties the availability and allocation of health care services was not significantly associated with the AAM rate or MAH rate. **CONCLUSIONS:** This study found that the allocation and availability of healthcare services in Florida does not meaningfully impact AAM or MAH. Caution in evaluating the proposed benefits of programs that are designed to increase availability and/or allocation of healthcare services is warranted.

A ZIKA COSTING MODEL FOR SOCIAL INSURANCE SYSTEMS: THE CASE OF THE NATIONAL INSURANCE BOARD OF TRINIDAD AND TOBAGO

Prescod JP
National Insurance Board Trinidad and Tobago, Newtown, Trinidad and Tobago

OBJECTIVES: To compare the total cost of Zika to the National Insurance System (NIS) and the Productivity Loss as a result of the absenteeism of employees in Trinidad and Tobago during the Financial Year (FY) 2016. **METHODS:** An average of the likely Cases of Dengue Fever reported by the Pan American Health Organization (PAHO) Epidemiological Weeks for calendar: EW 52 (2013), EW 52 (2014) and EW 53 (2015), an Expansion Factor of 15% and an estimated 20% Symptomatic cases were used to derive a comparative sample of likely Zika cases of 54555. Additionally, a ratio of the Labour Force, 645,300, and the country's population, 1324699 (2010) was expressed as a proportion of likely cases to derive 26575. Further, the NIS Actively Insured Persons (FY2015), 519926, and the country's Paid Employees (2015), 494828, were expressed as a proportion of the likely cases to obtain an adjusted sample of 27922. This was further adjusted to obtain a representative sample of the NIS by deriving a ratio, .007, based its claimants for Influenza (ICD-10, 168) and Flu (Unspecified) to the total Sickness Beneficiaries for the financial year July 1 to June 30 from 2013 to 2015. The result was expressed as a proportion of the likely Zika cases to obtain an adjusted sample of 188. To estimate the cost of absenteeism to the NIS, .007/188 was used to derive a Confidence Interval of ± 4 for a 4-day period using its respective rates. Productivity Loss was calculated using Daily per capita GDP PPP$ (2015) with a 3.3 conversion rate. **RESULTS:** The estimated Total Cost to the NIBTT was between PPP$50,188.03 and PPP$47,305.38. The estimated Productivity Loss was PPP $119,778.41. **CONCLUSIONS:** The estimated Cost to the economy as a result of absenteeism was greater than the cost to the National Insurance System of Trinidad and Tobago.

EVALUATION OF RISK FACTORS AND THE PERCEPTION OF PREGNANT FEMALES REGARDINGS FACTORS ASSOCIATED WITH CAESAREAN IN DIFFERENT HOSPITALS OF QUETTA, PAKISTAN

Haq N, Mumtaz F, Nasim A, Yasmin R, Razaque G
University of Balochistan, Quetta, Pakistan

OBJECTIVES: The current study was done to evaluate the risk factors and the perception of pregnant females regarding factors associated with Caesarean in different hospitals of Quetta, Pakistan. **METHODS:** A cross sectional study was conducted from March to September 2016 in the public and private hospitals of Quetta by using a pre-validated questionnaire. Five hundred and ten (510) women were registered in the different hospitals at the time of the study out of 310 were agreed to participate. The primary source of data was revalidated self-administrative questionnaire. Inferential statistics ($p < 0.05$) were used to assess the significance among study variables by using SPSS vs 20. **RESULTS:** A total of 310 pregnant women who were in their third trimester and expect to deliver soon were enrolled in the study. The results show that increase number of pregnancies was associated with caesarean (67.1%). Majority of the females (n=229, 73.1%) preferred to caesarean as their current type of birth. Most of the females (n=107, 34.5%) had their one previous Caesar. Overall the only 58.1% (n=180) had adequate knowledge regarding the risk factors associated with cesarean. But the small number of respondents (n=89, 28.7%) were not familiar with the factor that the age of the mother can affect the complications which leads to caesarean birth. **CONCLUSIONS:** The study concludes that females preferred caesarean rather than a vaginal delivery. And large number of females had poor knowledge regarding risk factors associated with cesarean. The factors associated with high Caesarean rates may be reduced if females were provided with better education, facilities, & ante natal care that care which provided throughout the pregnancy. It is also important to educate woman that childbirth is a normal process and vaginal birth can be achieved in women safely.

ANALYSIS ON THE CURRENT SITUATION OF HEALTH EDUCATION OF REPRODUCTIVE AGE WOMEN IN SHANGHAI

Chen M
Shanghai Medical Information Center, Shanghai, China

OBJECTIVES: To investigate the health education state among reproductive age women and explore improvement strategy of health service in Shanghai. **METHODS:** From September to December in 2015, convenience sampling was adopted to investigate reproductive age women in nine districts, who accorded with the inclusion and exclusion criteria. The general condition (age, occupation, education, income, pregnancy, childbirth, household register) and health education channels (number, type, content) were surveyed by self-designed questionnaire. **RESULTS:** We distributed 226 questionnaire and recovered 204 questionnaire, with an effective returning rate of 90.3%. Among the women, the age ranges from 18 to 24, 60.3% for 21 to 30, 68.5% for enterprises, 81.3% for college degree or above, 61.3% for income over 5000 CNY, 71.6% for non-pregnancy, 64.7% for unbearing, 97.1% for ready pregnant and 83.3% for locality household register. The income level of nonlocal women was higher than local women ($P<0.05$). Education channels of nonlocal women were less than local women ($P<0.05$).The channels were no statistical difference ($P>0.05$) between different age women. The utilization rate of web education was higher than traditional media, family member and social activities among 21 to 30 and 31 to 40-year-old women in education channels ($P<0.05$). The utilization rate of traditional media was less than social activities among 21 to 30-year-old women ($P<0.05$). Baidu, friends and BBS were the top three education channels in 14 active channels. Magazines or books, friends and mother or mother-in-law were the top three channels in 14 passive channels. **CONCLUSIONS:** The health education degree of nonlocal women was lower than local women. In all education channels, the utilization rate of internet was higher than traditional media, family member and social activities among 21 to 30 and 31 to 40-year-old. The government should explore multi-sectoral cooperation mechanisms and supervise the credibility of internet information to improve maternal health care services.

THE PREVALENCE OF CANCER RELATED DISTRESS AMONG URBAN-DWELLING VETERANS: A PILOT STUDY

Azizoddin DR[1], Feeley S[1], Bartoszek G[1], Hilton B[2], Martin J[1], Molokie R[1], Payvar S[1], Lehman K[1]

[1]Jesse Brown VA, Chicago, IL, USA, [2]Captain James A Lovell Federal Health Care Center, North Chicago, IL, USA

OBJECTIVES: The National Comprehensive Cancer Network and American College of Surgeons Commissions on Cancer requires cancer centers to evaluate psychosocial distress and provide appropriate triage and treatment for all patients (Standard 3.2). Clinically-significant distress includes biopsychosocial stressors which are highly prevalent in individuals with cancer and lead to negative health outcomes. Currently programs identifying veteran's distress are limited and can help clarify treatment needs and improve future outcomes. **METHODS:** Participants were screened during their initial oncology consult visit utilizing the biopsychosocial "NCCN Distress Thermometer and Problem List for Patients"(n=53). The majority of patients were men(87%), mean age 70(SD=8.16) presenting with cancer of the lung(23%), prostate(15%), GI(13%), ENT(13%), and others. Distress scores ranging between 0 and 3 resulted in documentation in the electronic medical record; those >4 received telephone follow-up and triage to appropriate care clinics. **RESULTS:** The mean distress score was 3.72, falling below the "significant distress cutoff" with the median of 4.00, meeting significant distress. Overall, 47 percent reported significant distress related to physical, psychological, social, and spiritual needs(score>4). Eight percent reported severe, significant distress(score>7). Further analysis identified fatigue(47%), pain(43%) worry(41%), and insurance/financial concerns(31%) as primary symptoms of distress. For the 47% who reported significant distress, symptoms included significant worry(67%), pain(59%), fatigue(51%), nervousness(48%), sleep(44%), and loss of interest(41%), with primarily emotional health symptoms and physical health symptoms secondary. Interestingly, 33% reported distress scores below 4, yet marked experiencing significant symptoms physical and psychological symptoms. Three patients reported active suicide ideation/plan and were provided care accordingly. **CONCLUSIONS:** A large majority of veterans receiving oncological care reported significant cancer-related distress and unmet needs, with elevated symptoms of emotional and physical demands. There may be a continued trend towards under-reporting among veterans, such that as individuals reporting low scores of distress nevertheless endorsed emotional and physical symptomatologies to marked degrees.

PHS205

HOSPITAL-LEVEL TRENDS IN PATIENTS' PERSPECTIVE OF OVERALL EXPERIENCE AS MEASURED THROUGH THE HCAHPS PATIENT SURVEY: ANALYSIS OF HOSPITAL COMPARE DATA (2011-2014)

Carroll ER[1], Gavaghan MB[2], Reaves JM[2]

[1]GfK, New York, NY, USA, [2]GfK, Wayland, MA, USA

OBJECTIVES: The Centers for Medicare and Medicaid Services (CMS) Hospital Compare website provides information about the quality of care at over 4,000 Medicare-certified hospitals nationwide. One of the goals for these data is to encourage hospitals to improve the quality of care they provide. The purpose of this research was to examine the Hospital Compare database HCAHPS Patient Survey to observe trends in patient satisfaction with care over time. **METHODS:** We accessed HCAHPS Patient Survey data from 2011-2014. Patients rate their overall satisfaction on a scale from 0 (lowest) to 10 (highest). We defined the lowest ranking hospitals as those with the highest percentage of patients rating their hospital a score of 6 or lower. Low ranking hospitals were tracked for four years to observe trends in overall satisfaction. A subgroup analysis was performed on select hospitals to determine whether any specific survey components contributed to overall improvement in satisfaction with care. **RESULTS:** In 2011, there were 3,572 hospitals with reported data on HCAHPS scores. In the lowest 30 ranking hospitals, 22% to 33% of patients gave their hospital a rating of 6 or lower. Of these hospitals, 25 had data available in 2011-2014 to follow trends. Of the hospitals examined, 21 showed improved patient satisfaction in 2012. Of these 21 hospitals, 18 improved further in 2013 and 10 improved even further in 2014. Only two hospitals showed a downward trend in patient satisfaction from 2011 to 2014. **CONCLUSIONS:** When examining a publicly available, self-reported database, the majority of hospitals with low rates of patient satisfaction in the initial year then had higher patient satisfaction in subsequent years. These trends indicate that hospitals modify their behavior to increase patient satisfaction, though more research is needed to determine what other factors impact patient satisfaction scores over time.

PHS206

HOSPITAL-LEVEL TRENDS IN CENTRAL LINE ASSOCIATED BLOODSTREAM INFECTIONS: ANALYSIS OF HOSPITAL COMPARE DATA 2011 - 2013

Gavaghan MB[1], Carroll ER[2], Reaves JM[1]

[1]GfK, Wayland, MA, USA, [2]GfK, New York, NY, USA

OBJECTIVES: The Centers for Medicare and Medicaid Services (CMS) Hospital Compare website provides information about the quality of care at over 4,000 Medicare-certified hospitals nationwide. One of the goals for these data is to encourage hospitals to improve the quality of care they provide. The purpose of this research was to examine one data element of the Hospital Compare database (central line associated blood stream infections – CLABSI) to observe trends in rates over time. **METHODS:** We accessed hospital-level Hospital Compare CLABSI rates for the years 2011 – 2013. We then ranked hospitals based on their 2011 CLABSI rates to identify hospitals with the highest rates of CLABSI and tracked those hospitals for the subsequent two years to observe trends in data. A subgroup analysis was performed to determine whether there were any specific hospital demographics or other quality of care measures that may contribute to these trends. **RESULTS:** There were 1,937 hospitals with reported data on CLABSI rates in 2011. Of those, 46 hospitals had both a CLABSI rate of 2.0 per 1,000 discharges or greater in 2011 and data available in 2012 and 2013 to examine trends. Of the 46 hospitals examined, 43 hospitals had lower CLABSI rates in 2012 compared to 2011. Of those 43 hospitals with lower CLABSI rates in 2012, 19 hospitals then had increased CLABSI rates in 2013. Only one of those hospitals had higher CLABSI rates in 2013 than in 2011. **CONCLUSIONS:** When examining a publicly available, self-reported database, the majority of hospitals with high rates of infection in the initial year then went on to have lower rates of infection in subsequent years. This would support the hypothesis that hospitals improve the quality of care they provide, though more research is needed to determine what other factors impact hospital infection rates over time.

PHARMACEUTICAL POLICY IN NEPAL: RECENT DEVELOPMENTS AND THE NEED OF PHARMACOECONOMICS

Poudel BK[1], Ishii I[2]

[1]Department of Drug Administration (DDA), Kathmandu, Nepal, [2]Chiba University Hospital, Chuoku, Chiba, Japan

OBJECTIVES: Need and feasibility study of Pharmacoeconomics and Outcomes Research (POR) in Nepal **METHODS:** Field study and personal communication with stakeholders conducted on the need and feasibility of POR in Nepal. **RESULTS:** Few researchers have identified and stressed the need of Pharmacoeconomics and Outcomes Research (POR) in Nepal, however then, the inference is largely undermined. Poor access to safe and quality medicines, price variation among brands, scarcity of specialists, poor stakeholders' (pharmaceutical companies, researchers and payers) concern, inadequate health care investment are among several factors for its confounding growth. Few Asian countries have considered Health Technology Assessment, HTA (in making drug use reimbursement decisions); and Nepal has also conducted HTA programs (but with poor attention on the cost of medicines). Therefore, to initiate POR, the Department of Drug Administration (DDA), medicines regulatory authority of Nepal, with my contribution as well, has recently fixed prices of 117 common/long term use medicines and we are now working to identify causes of price variation of different registered brands. Recently implemented National Health Policy (NHP) has now made a strategy for basic health services (free of cost), quality health services (universal health coverage) and financial protection of health expenditure. **CONCLUSIONS:** Therefore, for implementing above objectives of NHP and incorporating spirit of POR in National Medicines Policy (which is in process of revision), an approach to develop a national capacity on POR is urgently needed.

PHS208

UNITED STATES (US) REAL-WORLD TREATMENT PATTERNS IN ELDERLY PATIENTS WITH NEWLY-DIAGNOSED GLIOBLASTOMA (GBM) USING SURVEILLANCE, EPIDEMIOLOGY, AND END RESULRS (SEER)-MEDICARE DATA

Aly A[1], Singh P[2], Korytowsky B[2], Botteman M[1], Chen Z[1], Norden A[3]

[1]Pharmerit International, Bethesda, MD, USA, [2]Bristol-Myers Squibb, Princeton, NJ, USA, [3]Dana-Farber/Brigham and Women's Cancer Institute, Boston, MA, USA

OBJECTIVES: The standard of care for first-line (1L) therapy in GBM, a high-grade brain tumor with poor prognosis, is maximal safe resection followed by radiation therapy (RT) concurrent with temozolomide and maintenance temozolomide. However, beyond 1L, there is no standard of care that improves overall survival and there are limited treatment options, especially for elderly/frail patients. This analysis characterized real-world treatment patterns for US elderly GBM patients. **METHODS:** Newly diagnosed patients ≥66 years of age with histologically confirmed GBM between 2007 and 2011 were identified from the SEER-Medicare linked database. Patients were followed from diagnosis to death, Medicare disenrollment, HMO enrollment, or 12/31/2013 to characterize their treatment patterns with respect to receipt of systemic treatments—in 1L, second-line (2L) and third or subsequent lines (3L+). The proportion of patients receiving RT was reported. **RESULTS:** Among 3,012 eligible GBM patients (median age: 74 years; male: 53%; Charlson comorbidity index [CCI] ≥2: 13%; and median follow-up: 5 months), 1,459 (48.5%) received systemic therapy ± RT, 841 (27.9%) received RT alone, and 712 (23.6%) did not receive any intervention. Among patients who received 1L (n=1,459), 1,169 (80.1%) received temozolomide. Of 1L patients, 483 (33.1%) and 126 (8.6%) received 2L and 3L+, respectively. The most prevalent 2L and 3L systemic therapies were bevacizumab/chemotherapy (44.7% of 2L; 58.7% of 3L) followed by bevacizumab monotherapy (32.9% of 2L; 19.1% of 3L). Median (IQR) durations of 1L, 2L, and 3L therapies were 72 (43–196), 98 (43–207), and 84 (41–162) days, respectively. **CONCLUSIONS:** Only about half of elderly GBM patients received systemic therapy at 1L (mostly temozolomide), and about a third of those were given a subsequent line of systemic (mostly bevacizumab-based) therapy. This analysis documents an unmet medical need for elderly GBM patients despite a host of clinical trial activity, especially in later lines.
