SPONSORS & EXHIBITORS

The University of New Hampshire inspires innovation and transforms lives in our state, nation and world. More than 16,000 students from all 50 states and 71 countries engage with an award-winning faculty in top-ranked programs in business, engineering, law, health and human services, liberal arts and the sciences across more than 200 programs of study. As one of the nation's highest-performing research universities, UNH partners with NASA, NOAA, NSF and NIH, and receives more than \$110 million in competitive external funding every year to further explore and define the frontiers of land, sea and space.

INTEGRATED SYSTEMS ENGINEERING

Manufacturing is recognized as one of the four strategic growth areas for The Ohio State University's College of Engineering. Manufacturing research has a long tradition at The Ohio State University, which also was the location of the 2004 NUMIFORM, and will be hosting the 2020 International Conference on the Technology of Plasticity (ICTP) next July. The College of Engineering graduate program is ranked first in Ohio and 16th among all public universities in U.S. News & World Report's 2019 Best Graduate Schools issue. The Department of Integrated Systems Engineering placed 13th overall in the industrial/manufacturing specialty, offering both an M.S. and Ph.D. in Industrial and Systems Engineering.

QForm software simulates the most complex metal forming problems and provides quick and easy solutions to difficult forming problems. QForm has been designed from the ground up to meet the requirements of the most demanding forge plants, academics and researchers from Universities. It is used around the world for the simulation of: all forging types of processes, extrusion, ring rolling, cold forming, heat treatment and microstructure evolution. It is the first metal forming simulation program based on a hybrid approach combining the advantages of Voronoi Cells and Finite-Element Method. This allows us to run simulations faster and obtain more accurate results than other purely FEM codes. New QForm builds on the famous ease-of-use of previous versions, but now allows for fast simulation of even the most complex problems. With advanced features like user-defined algorithms, impressive graphics and thermally/mechanically coupled simulations, QForm delivers easy and accurate simulations at a reasonable price.

U.S. Steel produces products that range from mild and bakehard steels (BH) for class A applications to high strength low alloy (HSLA) and dual phase (DP) steels for components requiring more strength. Our recent advances with XG3™ and Mart-Ten™ have expanded our capabilities to offer solutions to more complex vehicle crash events. XG3™, the leading grade in Generation 3 steels, solves the past dilemma of "more strength or more formability" by giving the design engineer both. 980 XG3™ steel offers almost twice the strength, with more formability than the typical 590 Dual Phase. For those applications requiring as much strength as possible, the Mart-Ten™ steels offer products from 900 MPa to 1700 MPa. Our material provides industry leading flatness allowing complex shapes to be roll formed, with dimensionally stable results. The 1500 MPa steel was the winner of the Altair Enlighten Award in 2018. U. S. Steel became the first steel company to ever win this prestigious award.
